IN the ſame coaſt of Africk which regards Italy there growes Lotos, which they cal Celtis. A notable tree it is and of ſpeciall marke: found alſo here among vs now in Italy, but together with the ſoile it hath changed the nature. The faireſt and goodlieſt of them be about the Syrtes and the Naſamones: they be as big and tall as Peare trees, howſoeuer *Nepos Cornelius* ſaith they are but little and low. The leaues be thick cut and indented: otherwiſe they are like to thoſe of the Ilex or Holme tree. Many ſorts there be of the Lote tree, and thoſe for the moſt part according to their diuers and ſeuerall fruits. Howbeit ordinarily the fruit is as big as a bean, and of yellow colour as Saffron; yet before it is full ripe it changeth into ſundry colors like as grapes do. It growes thick among the branches of the tree in manner of myrtle berries, and not like to the cherries in Italy: and in thoſe plants aboue named the meat thereof is ſo ſweet and pleaſant, that it hath giuen the name both to a nation and countrey, inſomuch as the people be called Lotophagi: and withall, ſo welcome be all ſtrangers thither, and ſo well contented with their entertainment, that they forget their owne natiue ſoile, for the loue they haue to this fruit when they haue once taken to it. By report, whoſo eats thereof is free from the diſeaſes of the belly. This fruit is counted the better which hath no kernell within: for there is another kind wherein the ſaid kernell ſeems as hard as a bone. Moreouer, out of this fruit there is preſt a wine like to Mede, which the aboue named *Nepos* ſaith will not laſt aboue ten daies: who reporteth beſides, that the inhabitants do ſtamp the berries thereof with wheat or frumentie into a paſt, and ſo put it vp in great barrels or ſuch like veſſells for the prouiſion of their food. Moreouer, we haue heard ſay that whole armies paſſing to and fro through Africke, haue fed thereof and had no other meat: the wood is blacke of colour, and much ſought for it is to make pipes and fifes: of the root whereof hafts of daggers and kniues be made, beſides other pretty deuiſes of ſmall vſe. Thus much as touching the nature of the Lote tree in thoſe parts: for there is an herb alſo of that name [called Melilote.] As for the Egyptian Lotus it is a plant bearing a ſtalke, and growes in the mariſhes of Egypt: for when the waters of Nilus are fallen which drencht the countrey, this plant comes vp in the flat and waterie leuell along the riuer, with a ſtem like to the [Egyptian] bean, with leaues thruſt cloſe and thick together, howbeit ſhorter and leſſe than thoſe of the bean: in the top of which ſtalk it bears fruit in maner of an head, for cuts and chamfers and euery thing els like thoſe of Poppy: within which be conta ned certain grains or ſeeds reſembling Millet. The inhabitants of that countrey do pile together in heaps thoſe heads, and ſo let them putrifie: afterwards they ſeparate them, waſh them faire, and when they be dry, ſtamp and mold them, and therof make their bread. A ſtrange and wonderful thing it is that is reported beſides, namely, That when the Sun goes down, thoſe heads cloſe vp and be couered with leaues, and remaine ſhut vntill the morning, at what time they open againe: and thus continné this courſe vntil they be ripe, and that the floure which is white doth fall of it ſelfe.

Chap. XVIII.

¶ *Of the very ſtalke, ſcape or ſtem, and root of Lotus.*

IT is ſaid moreouer as touching this Egyptian Lotus, That in Euphrates the very head of the ſtalk together with the floure, vſeth in the euening to be plunged & drowned vnder the water vntil midnight, and ſo deep to ſettle toward the bottom, that a man with his hand canot reach thereto, nor find any part of it: but after that time it begins to riſe by little and little, and by Sun-riſing appeares aboue water and opens the floure, and ſtill mounteth higher and higher a good height from the water. This Lotos hath a root as big as a Quince, couered with a black rinde or barke much like to the huske of a Cheſtnut. The ſubſtance within is white and delectable to eat, but more pleaſant being either ſodden in water, or roſted vnder embers, than raw: and Hogs will feed fat with nothing better, than with the pills and parings of this root.

G

Chap. XXI.

¶ *Of Paliurus, the Pomegranate, and the floure of the Pomegranat.*

THe region of Cyrenaica in Africk makes more account of their Paliurus than of Lotus: for the Paliurus ſhoots forth more twigs and branches, and hath a redder fruit than the Lotus: beſides, the fruit and the kernell be eaten apart; and in truth pleaſant it is of it ſelfe alone, but more pleaſant with wine; yea, and the iuice therof giueth a better taſt to wine if it be put into it. The inland parts of Africk, as far as to the Garamants and the deſarts, be wel planted with Date trees faire and great, bearing goodly and pleaſant dates, and thoſe eſpecially in that quarter of Barbary which lieth about the temple of *Iupiter Hammon*. But the territorie of Carthage challengeth to it ſelfe the Punick apple: ſome call it the Pomegranat, & they haue made ſeuerall kinds thereof, calling that Apyrinon, which hath no woody or hard kernell within: and indeed theſe pomegranats are naturally more white, the graines within more pleaſant, and diuided with membranes and pellicles between, nothing ſo bitter as the other: for in both ſorts they be framed and faſhioned within like to hony combs. As for thoſe pomegranats which haue ſuch kernels or ſtones, there be fiue kinds of them, to wit, ſweet, ſoure, temperat between both, ſtyptick or auſtere, and taſting of wine. But the pomegranats of Samos and Egypt haue this difference one from another, That ſome haue red floures on the head, and are therefore called Erythrocoma: others are white, and ſuch they name Leucocoma. The rind of ſoure pomegranats is better for tanners and curriors to dreſſe their leather with, than of the reſt. The floure is called Baliſteum, both medicinable and alſo good for to dyt cloth: and hereof commeth the colour of Puniceus [*i.* a light red, or a bay] taking the name of the apple Punicke, or Pomegranat.

H

I

Chap. XX.

¶ *Of the Shrubs in Aſia and Greece.*

IN Aſia & Greece there grow certain ſhrubs, to wit, Epipactis, which ſome call Elleborine, with ſmall leaues, which being taken in drink are good againſt poyſon, like as the leaues of Erice [*i.* Heath or Lings] withſtand the ſtinging of ſerpents.

K

Chap. XXI.

¶ *Of Thimelæa or Chamelæa, Tragacanth: of Tragium or Scorpio. Alſo of Myrice, Brya, and Galla.*

THe ſhrub or buſh which beares the graine Gnidium, that ſome call Linum, is after ſome writers named Thymelæa, according to others Chamelæa: there be that call it Pyrosachne: ſome again giue it the name of Cneſton, others of Cneoros. This plant howſoeuer it be named reſembleth the wild Oliue, but that the leaues be narrower and gummy to the teeth, if a man bite them: for height and bigneſſe anſwerable to the myrtle: the ſeed thereof is for colour and faſhion like to the grain of wheat, and ſerueth only for phyſicke.

L

As touching the plant Tragium, it is to be found in the Iſle Candy onely. It hath a reſemblance of the Terebinth, like as the ſeed alſo, which, by report, is moſt excellent and effectuall to heale wounds made by darts and arrowes. The ſame Iſle hath the buſh Tragacanth growing in it, the root whereof is like to that of Bedegnar: and the ſame Tragacanth is much preferred before that which growes either in Media or Achaia. A pound of Tragacanth is worth 30 deniers Roman. As for the plant Tragium or Scorpio, it grows likewiſe in Aſia. A kind of bramble or brier it is without any leaues, bearing fruit of berries much like to red grapes, whereof there is good vſe in phyſicke.

M

Touching Myrice, which others call Tamarix; and Achaia Brya the wilde; Italy brings it forth: this ſpecial propertie it hath, that the tame kind thereof only, namely that which grows in gardens, beareth fruit like galls. In Syria & Egypt this groweth plenteouſly, and the wood thereof we cal Vnhappy: but the more vnluckie and vnfortunate be thoſe of Greece: for there groweth Oſtrys, named alſo Oſtrya, a ſolitary tree about watery and moiſt rocks, hauing barke

and

20030
copy 1

A and branches like to the Aſh,but Peare-tree leaues,ſaue that they be ſomwhat longer & thicker,with long cuts or lines wrinkled and riuiled thoroughout: and the ſeed in forme and color is like to barley. The wood of it is hard and ſtrong:and ſome ſay if any peece therof be brought into an houſe where a woman is in trauaile of child-birth, ſhe ſhall haue difficult labour, and hardly be deliuered: and whoſoeuer lyeth ſicke there,ſhall die a miſerable death.

Chap. XXII.

¶ *Of Euonymus or the Spindle tree of Adrachne, Congygria, and Thapſia.*

B IN the Iſland Lesbos,there groweth a tree named Euonymos, no better nor more lucky than Oſtrya beforeſaid. Much vnlike it is not the Pomegranat tree. As for the leafe that it beares, it is of a middle ſize between that of the Pomegranat and the Bay; otherwiſe for ſhape and ſoftneſſe,it reſembles that of the Pomegranat.the floure is whiter; the ſmell and taſt wherof is peſtiferous and menaces preſent death: it beares cods like to Seſama,within which be grains or ſeeds foure ſquare and thick,but deadly vnto all creatures that eat them. The leafe alſo is as venemous as the graine,yet otherwhiles there enſues therof a fluxe and gurrie of the belly,which ſaues their life, or elſe there were no way but one.

Alexander Cornelius called that tree * Eone,whereof the famous ſhip Argo was made; and like it was (by his ſaying) to the Oke that carries Miſſelto, the timber whereof neither water C wil putrifie,nor fire conſume,no more than the Miſſelto it ſelfe. But ſo far as euer I could learn, no man knew that tree but himſelfe. * Or Ἔαπλε

As for the tree Adrachne, all the Greeks in manner take Porcellaine for it; whereas indeed Porcellaine is an hearb, called in Greeke *Andrachne*;ſo as they differ in one letter:but Adrachne is a tree of the wild forreſts growing vpon mountaines,and neuer in the plaines beneath; reſembling the Arbut or Strawberrie tree, ſaue that the leaues be leſſe, and neuer fade nor fall. And for the barke,rough and rugged indeed it is not, but a man would ſay it were frozen and al an yce round about, ſo vnpleaſant it is to the eye.

Like in leafe to Adrachne, is the tree Congygria, but otherwiſe it is leſſe and lower. This propertie it hath, To loſe the fruit wholly, together with the ſoft downe that it beareth,which D they cal Pappus;a qualitie that no other tree hath,beſide it. Like to Andrachne alſo is Apharce,and beares fruit twice in one yeare,as well as it. The former is ripe,when the grape begins to bud and bloom;the latter, in the beginning of winter: but what manner of fruit this ſhould be, I haue not found written.

As touching the Ferula, it will not be amiſſe to ſpeake therof among forrain plants,yea and to range it among trees:for (as hereafter we wil diſtinguiſh in the diuiſion of trees) ſome plants are of this nature, To ſhew al the wood they haue,where the bark ſhould be;that is to ſay,without forth: and where the heart of the wood ought to be,they haue nought but a light and ſpongeous pith,as the Elder;or elſe nothing at all, as Canes and Reeds. But to come to our Ferula aboue named,it growes in hot countries beyond-ſea, with a ſtalk or ſtem full of knotty ioints. E Two kinds be knowne of them:for that which the Greeks call Marthex,groweth tall;but Narthecia is always low. The leaues that put forth at the ioints,be euer biggeſt toward the ground: this plant otherwiſe is of the nature of Dill,and the fruit is not vnlike. There is not a plant in the world lighter than it for the bigneſſe:being eaſie therfore to weld and carrie,the ſtem therof ſerues old men in ſtead of ſtaues,to reſt vpon. The ſeed of this Ferula or Fennell-gyant, ſome haue called Thapſia,but herin they be deceiued,for that Thapſia doubtleſſe is a kind of Ferula by it ſelfe, leafed like Fennel,with an hollow ſtalke,and neuer exceeds in hight the length of a walking-ſtaffe:the ſeed is like to that of the Ferula, and the root white:cut it,there iſſues forth milke;ſtampe it,you ſhall ſee it yeeld plenty of juice. Neither is the barke of the root reiected and caſt aſide, although both it,the milke, and the juice, be very poiſons: for ſurely the root is F hurtfull to them that dig it vp;and if neuer ſo little of the aire therof breath vpon them (ſo venomous it is) their bodies will bolne and ſwell, their faces will be all ouerrun with a wild fire: to preuent which miſchifes, they are forced to anoint their bodies with a cerot. Howbeit as dangerous as they be, Phiſicians make vſe thereof in the cure of many inward diſeaſes,ſo they be wel corected and tempered with other ſafe medicines. In like maner they ſay,that the juice

of Thapſia is ſingular good for the ſhedding and falling of the haire, alſo againſt the blacke & G
blew markes remaining after ſtripes: as if Nature furniſhed not Phyſicians ſufficiently with o-
ther wholſom remedies, but that needs they muſt haue recourſe to ſuch poiſonful and miſchie-
uous medicines. But this is the caſt of them all, to pretend ſuch colourable excuſes, for their
handling of poiſons: and ſo impudent and ſhameleſſe are ſome beſides, that they baſh not to a-
uow the vſe of them, bearing vs in hand, that Phyſick canot ſtand without poiſon. The Thapſia
in Affricke is the ſtrongeſt of all others. Some vſe to ſlit or cut the ſtem about harueſt, and in
the very root make an hollow trough to receiue the juice that runs downe, and when it is dried,
they take it away. Others againe do bruiſe and ſtamp in a mortar, both leafe, ſtalke, and root; and
when the juice that is preſſed there-from, is thoroughly dried in the Sun, they reduce the ſame
into certain Trochiſques. *Nero Cæſar* the Emperor in the beginning of his Empire, gaue great H
credit to Thapſia: for vſing (as he did) to be a night-walker, and to make many ryots and much
miſrule in the darke, he met otherwhiles with thoſe that would ſo beat him, as that he carried
away the marks black and blew in his face: but (as he was ſubtil & deſirous to auoid the ſpeech
of the people) an ointment he had made of Thapſia, Frankincenſe, and Waxe, wherewith hee
would anoint his face, and by the next morning come abroad with a cleare skin, and no ſuch
marks to be ſeene; to the great aſtoniſhment of all that ſaw him. To conclude, the Ferula ma-
keth the beſt matches to keep fire, by all mens confeſſion: and thoſe in Ægypt excell the reſt, for
that purpoſe.

Chap. XXIII. I

¶ *Of Capparis, or Cynosbatos, or Opheoſtaphyle: and of Sari.*

Likewiſe in Ægypt growes Capparis, a ſhrub of a harder and more wooddy ſubſtance: well knowne for the ſeed and fruit that it carries, commonly eaten with meats, and for the moſt part the Capres and the ſtalke are plucked and gathered together. The outlandiſh Capres (not growing in Ægypt) we muſt take good heed of and beware: for thoſe of Arabia be peſtilentiall and venomous: they of Affricke be hurtfull to the gumbs, and principally the Marmarike are enemies to the matrice, and breed ventoſities. The Apulian Capres cauſe vomit, and make lubricitie both of ſtomack and belly. Some call the ſhrub Cynosbatos: others Opheoſtaphyle. Moreouer, there is a plant of ſhrubs kind, called Sari, it growes along Nilus, almoſt two cubits high, it beareth an inch in thickneſſe, and hath leaues like to Papyr-reed, and men do chew and K
eat it after the ſame manner. As touching the root, it is ſingular good for Smiths cole to burne in their forges, ſo hard it is and durable.

Chap. XXIIII.

¶ *Of the Royall thorn of Babylon: and of Cytiſus.*

I May not ouer-paſſe that plant, which about Babylon is ſowed vpon Thornes only: for otherwiſe it knowes not how to liue no more than Miſſelto, but on trees: howbeit this plant that I ſpeake of, is ſowed vpon that Thorne alone called the Royall Thorne. And a ſtrange thing it is of this plant, That it ſprings and grows the very ſame day that it is ſet or ſowed. Now the L
ſeaſonable time of ſowing it, is at the very riſing of the Dog-ſtar: and notwithſtanding the Suns heat, right quickly ouerſpreads it the tree or ſhrub, onwhich it is caſt. The Babylonians vſe to aromatize their wine therwith; and for that purpoſe are they ſo carefull to ſow it. But the foreſaid Thorne tree groweth alſo about the long walls of Athens [reaching from the tower to the hauen Pyræeum.]

Noreouer, a ſhrub there is, called Cytiſus, highly commended and wondrous much praiſed by *Ariſtomachus* the Athenian, for feeding of ſheep; as alſo for fatting of ſwine, when it is drie: and he promiſeth and aſſureth, That an acre of land ſowed therwith, although it be none of the beſt ſoile, but of a meane and ordinarie rent, will yeeld yearely [*communibus annis*] 2000 Seſterces to the maſter. As great profit commeth therby, as of the pulſe like Vetches, called Ervum: M
but ſooner will a beaſt be ſatisfied therewith, and a very little therof will ſerue to fat the ſame: inſomuch as if horſes or any ſuch labouring cattell may meet with that prouender, they will not care for barley: neither is there any other graſſe or fodders, that yeeldeth more or better milke,

20030
copy 1

A milk than it: but that which paſſeth all, the paſturage of Cytiſus, preſerueth ſheep, goats, and ſuch like cattell, ſound and ſafe from all diſeaſes whatſoeuer. Ouer and beſides, if a nourſe want milke, *Ariſtomachus* preſcribes her to take Cytiſus dry, and ſeeth it in water, and ſo to drink it in wine, whereby not onely her milke will come againe in great plenty, but the babe that ſucketh thereof will be the ſtronger and taller. He giueth it alſo to hens and pullein whiles it is green, or ſteeped and wet if it chance to be dry. *Democritus* and *Ariſtomachus* both do promiſe and aſſure vs, that Bees will neuer miſcarry nor faile, if they may meet with Cytiſus to feed vpon. And yet there is not a thing of leſſe charge to maintaine than it. Sowne it is commonly in the ſpring with barley, I mean the ſeed thereof, as they mean to ſow Leekes or Porret ſeed: or els they ſet plants and ſlips thereof from the ſtalke, in Autumne before mid-winter. If the ſeed be ſowne, it ought to be ſteeped and moiſtned before: yea, and if there fall no ſtore of raine after
B it is in the ground, it had need to be watered. As for the plants when they be a cubit long, are replanted in a trench a foot deepe. Otherwhiles the tender quicke-ſets are planted about the Equinoxes, to wit, in mid-March and mid-September. In three yeares they come to their full growth. They vſe to cut it downe in the Spring-Equinox, when it hath done flouring: a worke that a very lad or old woman may do, euen ſuch as can skill of nothing beſides. This Cytiſus is in outward hew white: and in one word, if a man would pourtray the likenes thereof, it reſembleth for all the world a ſhrub of Trifolie or Clauer-graſſe, with narrower leaues. Being thus gathered, it is euer giuen to beaſts once in three daies. And in Winter, that which is dried ought to be wet before they haue it. Ten pound of it is a ſufficient foddering for an horſe: and
C for other ſmall cattell according to the proportion. But by the way this is not to be omitted, that it is good to ſet garlicke and ſow onions ſeed betweene the rewes and rankes of Cytiſus where it groweth, and they will thriue more plenteouſly. This ſhrub was firſt diſcouered and known in the Iſland Cythnus, and from thence tranſlated into all the other Cyclades: and ſoon after brought to all the cities of Greece; whereupon followed great increaſe of milke, & plentie of cheeſe. I maruel therefore very much that it is ſo geaſon and rare in Italy: and a plant it is that feareth neither heate nor cold, no iniury of haile, nor offence by ſnow; and as *Hyginus* ſaith, it is not afraid ſo much as of the enemie; the reaſon is, becauſe the wood thereof is nothing beautifull to the eye.

D

Chap. XXV.

¶ *Of ſhrubs and trees growing in our Mediterranean ſea, in the red ſea, and in the Indian ſea.*

EVen the very ſea affordeth ſhrubs and trees: but thoſe of the Mediterranean ſea be far leſſe than of other ſeas; for the red ſea and all the Levant Ocean is full of woods. That which the Greeks call φῦκος, hath no other name in any language. As for Alga, is a word appropriate rather to weeds or ſea-herbs, called Reik: but this Phycos is a very ſhrub, bearing broad leaues of a green colour, which ſome call Praſon, others Zoſter. A ſecond kind there is of Phycos, with an hairy leafe like to Fennell, and groweth vpon rockes. As for the former called Zo-
E ſter, it is found among the ſhelues and ſhallow waters not far from the ſhore: both the one and the other appeare in the Spring, and be gon in Autumne. That of this kind which groweth in Candy about rocks, is much vſed of dyers for the purple color: and namely on the North part of that Iſland, and among ſponges, for that is moſt commendable for this purpoſe. A third ſort there is like vnto the graſſe called *Coich*, or *Dent-de-chien*, hauing a root full of ioynts, and a ſtalk likewiſe in maner of a reed.

Another ſhrub there is in that ſea called Bryon, with leaues like Lettice, ſaue onely they be more wrinkled and crumpled together: but this growes more inward and farther into the ſea. Mary in the deep groweth both Fir and Oke to the height of a cubit. Among theſe branches, the Cockles and Muskles, and ſuch like ſhell fiſhes do ſettle and ſticke vnto them. As for that
F kind of ſea-Oke, ſome ſay it is of good vſe to dye wooll withall: as alſo that it beareth Maſt or Acorns in the deep: the knowledge of all which we come vnto by thoſe that diue into the bottom of the ſea, and ſuch as haue ſuffered ſhipwracke and eſcaped. Moreouer, by report, there be other exceeding great trees, and namely about Sycione. As for the ſea vine it groweth euerie where: but the fig tree there is without leaues, & hath a red bark. There be alſo date trees found

in the ſea,but as little as ſhrubs. Without *Hercules* pillers,or the ſtreight of Gebraltar, there G
are ſhrubs to be ſeen, bearing leaues reſembling leek blades : and others leaued like to the bay tree, or to the herbe Thyme : and both kinds being caſt vp a land turne into the pumiſh ſtone. But in the Eaſt parts it is a wonderous matter to thinke,that ſo ſoon as euer a man is paſt Coptus,he ſhall find nothing to grow in all the wilderneſſe,but only a kind of thorne or thiſtle,called the thirſty or dry thorne,and the ſame but here and there in very few places : whereas in the red ſea whole woods do liue,and namely of Baies and Oliues bearing their berries : alſo when it raineth,certaine Muſhromes,which no ſooner be caught with the Suns heat,but they turne into the pumiſh ſtone. As touching the ſhrubs there growing, they be commonly three cubits high,and thoſe ſo full of ſea dogs and curres, that a man ſhall hardly looke out of the ſhip in ſafety,for that many times they will take hold of the very ores and aſſaile them. The ſouldiers H
of *Alexander* the Great who ſailed into India made report,That the branches and leaues of the ſea trees,ſo long as they were vnder the water looked green,but when they be taken forth, preſently dried with the heate of the Sun,and became ſalt. Alſo,that about the ſhore they found ſtony ruſhes and reeds,like vnto naturall ruſhes indeed. Moreouer,in the deep ſea they light on certain little trees branched and full of boughes,in colour of an Ox horne, but the head or top of them was red:handle them in your hand they were as brittle as glaſſe:put them into the fire they would be red hot like iron : quench them again,they returned to their former colour. In the ſame tract there be ſome tides ſo high, that the ſea ouerfloweth and couereth the Woods growing within the Iſlands,although there be trees in them taller than the higheſt Planes or Poplars. And thoſe trees beare leaues like Lawrell,and floures for ſmel and colour reſembling I
the Violet. Their berries be like to Oliues,and thoſe of a pleaſant and ſweet ſauor, which they bring forth in the Autumne : and their leaues neuer ſhed but continue all the yeare long. The lower ſort of theſe trees the floud couereth all and whole:but the greateſt beare vp their heads aboue the ſea, whereunto the mariners do faſten and tie their veſſels at a high water : but when it is ebbe,at the very root. Moreouer,by their ſaying, they ſaw other trees in the ſame ſea,with leaues euer green vpon them,carying a fruit like to Lupines. King *Iuba* reports, That about the Iſlands of the Troglodites,there groweth a ſhrub within the ſea,called Iſidos Plocamos,[*i. Iſis haire*] reſembling coral,and void of leaues : cut a branch of it from the ſtock, it becomes hard, changeth colour,and is black : if it fall it is ſo tender that it will breake like glaſſe. He ſpeaks moreouer of another called Charito-blepharon, which is of great force in amatorious matters K
to procure loue : and thereof women (quoth he) make them carkanets and pendant ornaments to hang about their necks. To conclude,he affirmes that this ſhrub hath a certain intelligence when a man would take hold of it, and therefore waxeth as hard as an horne, inſomuch as it is able to turne the edge of a knife or bill, that vnneth or hardly it may be cut : but in caſe it be intrapped and drawne vp with cords without any edge toole,it preſently turneth to be a ſtone.

THE

20030
copy 1

THE FOVRTEENTH BOOK OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

Containing the Treatiſe of Trees bearing Fruit.

The Proeme.

THus far forth haue we diſcourſed of all forreine and ſtrange trees in a manner, ſuch I meane as know not how to liue in any other places but where they naturally firſt did grow, and which willingly go not into other countries, nor can abide their ſoile or aire. Good leaue may I now haue to write of Plants and Trees common to all lands, and namely, to ours of Italy, which may ſeeme to be the very Hort-yard and naturall garden that bare them all. This onely would I aduertiſe the Readers and Learners to remember, that for this preſent we purpoſe to deſcribe their natures and vertues onely, leauing out the manner of husbandrie that belongeth vnto them: albeit in their tending and keeping appeareth the greateſt part of their properties, and of Natures workes. And verily, I cannot chuſe but maruell ſtill and neuer giue ouer, how it comes to paſſe, that the remembrance, yea, and the verie names of ſome trees which antient Writers haue deliuered in their bookes, ſhould be quite gone and aboliſhed. For who would not thinke, that our life ſhould ere this haue gained much by the Maieſtie of the Romane Empire; haue diſcouered all things by the meanes of the commerce we haue had with the vniuerſall world, by the traffick, negotiation, and ſocietie I ſay that we haue entered into during the bleſſed time of peace which we haue inioyed? conſidering that by ſuch trade and entercourſe, all things heretofore vnknowne, might haue come to light. And yet for all this, few or none (beleeue me) there are who haue attained to the knowledge of many matters which the old writers in times paſt haue taught and put in writing. Whereby wee may eaſily ſee, that our anceſtours were either far more carefull and induſtrious, or in their induſtrie more happie and fortunate. Conſidering withall, that aboue two hundred yeares paſt Heſiodus (who liued in the very infancie of Learning and good letters) began his worke of Agriculture, and ſet downe rules and precepts for husbandmen to follow. After whoſe good example, many others hauing trauelled and taken like paines, yet haue put vs now to greater labour. For by this means we are not onely to ſearch into the laſt inuentions of later writers, but alſo to thoſe of antient time which are forgotten and couered with oblition, through the ſupine negligence and generall idleneſſe of all mankind. And what reaſons may a man alledge of this drowſineſſe, but that which hath lulled the world aſleepe? the cauſe in good faith of all, is this and no other, Wee are readie to forgoe all good cuſtomes of old, and to embrace noueltie and change of faſhions: mens minds now a daies are amuſed and occupied about new fangles, and their thoughts be rolling; they wander and roue at random; their heads be euer running; and no arts and profeſſions are now ſet by and in requeſt, but ſuch as bring pence into our purſes. Heretofore whileſt Kings and Potentates contained themſelues within the Dominion of their owne Nations, and were not ſo ambitious as now they bee, no maruell if their wits and ſpirits kept ſtill at home: and ſo for want of wealth and riches of Fortune, were forced to employ and exerciſe the gifts of their minde: in ſuch ſort as an infinite number of Princes were honoured and renowned for their ſingular knowledge and learning. Yea, they were more braue in port, and carried a goodlier ſhew in the World for their skill in Liberall Sciences, than others with all their pomp or riches: beeing fully perſuaded and aſſured, that the way to attaine vnto immortalitie and euerlaſting Fame, was by literature and not

by

by great possessions and large seignories. And therefore as learning was much honoured and rewarded in G
those dates, so arts & sciences tending to the common good of this life daily increased. But afterwards when
the way was once made to inlarge their territories farther in the world, when princes and states beganne to
make conquests and grow rich and mighty, the posterity felt the smart and losse thereby. Then began men to
chuse a Senator for his wealth, to make a iudge for his riches, and the election of a ciuill magistrate and mar-
tiall captain, to haue an eie and regard only to goods and substance, to land and liuing: when rents and reue-
nues were the chiefe and onely ornaments that made men seeme wise, iust, politicke, and valiant. Since time
that childlesse estate was a point looked into, and aduanced men into high place of authoritie and power, pro-
curing them many fauorites in hope of succession, since time I say that euery man aimed and reached at the
readiest meanes of greatest lucre and gaine, setting their whole mind, and reposing their full content and ioy H
in laying land to land, and heaping together possessions: downe went the most precious things of this life, and
lost their reputation: all those liberall arts which tooke their name of liberty and freedome (the soueraigne
good in this world which were meet for princes, nobles, gentlemen and persons of great state) forwent that
prerogatiue, and fell a contrarie way, yea, and ran quite to wracke and ruine: so as in stead thereof, base slaue-
rie and seruitude be the only waies to arise and thriue by: whiles some practise it one way, some another, by
flattering, admiring, courting, crouching, and adoring: and all, to gather good and get mony. This is the one-
ly marke they shoot at, this is the end and accomplishment of all their vowes, praiers and desires. Insomuch,
as we may perceiue euery where, how men of high spirit and great conceit are giuen rather to honor the vi-
ces and imperfections of others, than to make the best of their owne vertues and commendable parts. And
therefore we may full truly say, that life indeed is dead; Voluptuousnesse and Pleasure alone is aliue, yea and I
beginneth to beare all the sway. Neuertheless, for all these enormities and hindrances, giue ouer will not I
to search into those things that be perished and vtterly forgotten, how small and base soeuer some of them be;
no more than I was affrighted in that regard, from the treatise and discourse of liuing creatures. Notwith-
standing that I see Virgil *(a most excellent Poet) for that cause only forbare to write of gardens and hort-*
yards, because he would not enter into such petty matters: and of those so important things that he handled,
he gathered only the principall floures, and put them downe in writing. Who albeit that he hath made men-
tion of no more than 15 sorts of grapes, three kinds of Oliues, and as many of Peares, and setting aside the
Citrons and Limons, hath not said a word of any apples; yet in this one thing happy and fortunate hee was,
For that his worke is highly esteemed, and no imputation of negligence charged vpon him. But where now K
shall we begin this treatise of ours? What deserueth the chiefe and principall place, but the vine? in which
respect Italy hath the name for the very soueraignty of Vine-yards: insomuch, that therein alone, if there
were nothing els, it may well seeme to surpasse all other lands, euen those that bring forth odoriferous spices
and aromaticall drugs. And yet to say a truth, there is no smell so pleasant whatsoeuer, that out-goeth Vines
when they be in their fresh and flouring time.

Chap. I.

¶ *Of Vines, their nature and manner of bearing.*

VInes in old time were by good reason for their bigneſſe reckoned among trees. L
For in Populonia, a citie of Tuscan, we see a statue of *Iupiter* made of the wood of one entire Vine, and yet continued it hath a world of yeares vncorrupt, and without worme. Likewise at Massiles there is a great standing cup or boll to be seene of Vine-wood. At Metapontum there stood a temple of *Iuno*, bearing vpon pillars of Vine wood. And euen at this day there is a ladder or paire of staires vp to the temple of *Diana* in Ephesus, framed of one Vine-tree, brought (by report) out of the Island Cyptes, for there indeed vines grow to an exceeding bigneſſe. And to speake a truth, there is no wood more dureable and lasting than is the vine. Howbeit, for my part I would thinke that these singular pieces of worke before-named, were made of wild and sauage M
Vines: for that these our tame and gentle vines here planted among vs, are by cutting and pruning euery yere kept downe: so as all their whole strength is either drawne without-forth into branches, or els downward into the root for to put out new shoots euer fresh out of the ground: and regard is only had of the fruit and iuice that they do yeeld diuers waies, according to the temperature of the aire & climat, or the nature of the soile wherin they be planted. In the countrey of Campaine about Capua, they be set at the roots of Poplars, and (as it were) wedded

vnto

20030
copy 1

A vnto them: and ſo being ſuffered to wind and claſpe about them as their husbands, yea, & with their wanton armes or tendrils to climbe aloft, and with their ioints to run vp their boughes, they reach vp to their head, yea, and ouertop them: inſomuch as the grape-gatherer in time of Vintage, puts in a clauſe in the couenants of his bargaine when he is hired, that in caſe his foot ſhould faile him, and he breake his neck, his maſter who ſets him a worke ſhould giue order for his funerall fire and tombe at his owne proper coſt and charges. And in truth Vines will grow infinitly: and vnpoſſible it is to part them, or rather to pluck them from the trees which they be ioined and coupled vnto. *Valerianus Cornelius* making mention of many properties and ſingularities of a vine, thought this among the reſt worthie of eſpeciall note and remembrance, that one onely ſtocke of a vine was ſufficient to compaſſe and inuiron round about a good ferme-
B houſe or country meſſuage, with the branches & pliable ſhoots that it did put forth. At Rome there is one vine growing within the cloiſtures of the Portches and galleries built by the Empreſſe *Liuia*, which running and trailing vpon an open frame of railes, couereth and ſhadoweth the ouvert allies made for to walke in: and the ſame Vine yeeldeth one yeare with another a dozen Amphores of good new wine yearely. An ordinarie thing it is, that Vines will ſurmount any Elms whereſoeuer, be they neuer ſo tall and lofty. It is reported, that *Cyneas* the embaſſador of K. *Pyrrhus*, wondring at the vines of Aricia, for that the grew and mounted ſo high; would needs taſte of the wine that came of their grapes: & finding it to be hard and tart, merrily ſcoffed and ſaid, That by good right and juſtice they had done well, to hang the mother that bare ſuch vnpleaſant wine vpon ſo high a gibbet. Beyond the riuer Po in Italy, there is a tree grow-
C ing which the peaſants there cal Rumbotinus, & by another name * Opulus; it puts forth great armes and boughs, and thoſe ſpread abroad and beare a round compaſſe; howbeit, the vines that be planted at the root of theſe trees, do fill and couer the ſaid boughes: for yee ſhall haue the very old crooked branches of the Vine (bare as they be and naked of leaues) to wind about the armes, and crawle in manner of a ſerpent or dragon along the broader and flatter baſe of the boughes, and then the new ſhoots, top-twigs, and tendrils, wil diuide themſelues to the vtmoſt branches and ſhoots of the tree, that they will lode and clog her withal. Theſe vines again grow ſomtime no taller than the ordinary height of a man of middle ſtature, and beeing ſupported and vnderpropped with ſtakes and forks, cleaue and cling thick together, and in this order fill whole vineyards. Others alſo there be, which with their exceſſiue creeping vpon frames, with
D their ouergrowne branches, and ſome artificiall help of the maſters hand, ſpred ſo far euery way, that they take vp wide and large courts, ouerſpreading not only the ſides, but the very middeſt thereof. See what ſundry ſorts of vines euen Italy alone is able to affoord! But in ſome prouinces without Italy, ye ſhall ſee a vine ſtand of it ſelfe without any prop or ſtay at all, gathering and drawing in her boughs and branches together: thus indeed ſhe groweth but ſhort, howbeit ſo cloſe couched and truſſed round, that the thickneſſe makes amends for all. And yet otherwhiles in ſome coaſts the winds are ſo big and boiſterous, that they wil not ſuffer them thus to grow vpright; as namely in Affrick, and Languedoc, the prouince of Narbon Vines being thus debarred to run vp in height, reſting vpon their owne ioints and branches, and euer like to thoſe that be laid along whiles they are a trimming, by deluing about their roots, and pruning their
E ſuperfluous branches, traile and creepe too and fro along the ground, as weeds and herbes; and all the way as they ſpread, ſuck the humor of the earth into their grapes: by which meanes, no maruell it is, if in the inland parts of Africke there be found ſome of thoſe grapes bigger than pretty babes. And in no countrie are the grapes of a thicker skin than thoſe of Africk, whereupon it may well be, that they tooke the name * *Duracina* (*i.* hauing hard skins.) For infinite ſorts there be of grapes, according to the difference obſerued in their quantity and bigneſſe, in their colour, taſte, ſtones, or kernels: and yet more ſtil, in regard of the diuers wines made of them. In one place they are of a freſh and bright purple, in another, of a glittering, incarnate, and roſate colour: and ye ſhall haue them of a faire and liuely greene. As for the white and black grapes, they be common euery where. The grapes Bumaſti haue their name, for that they be ſo ſwel-
F ling and round, like ſtrutting paps or dugs. The Date-grapes Dactyli, are long, both grape and kernel, faſhioned in manner of fingers. Moreouer, Nature ſeems to take her pleaſure and make good ſport in ſome kind of them; where ye ſhal find among them ſome that be exceeding great, others again that be as ſmall, howbeit pleaſant they are, and as ſweet as the reſt: and ſuch be called Leptorrhagæs. Some laſt al winter long, being knit in bunches together, & ſo hanged aloft

* *Opimi*

* *Quaſi duris acinis.*

arch-

arch-wiſe in manner of a vault: with others they make no more adoe, but put them vp preſently as they come from the Vine, into earthen pots, whiles they be freſh & in their vigor; and afterwards they are beſtowed, well lapped ouer with their leaues, in other greater veſſels ouer them; and for to keep them better, they be ſtopt cloſe with kernels heaped and piled vpon, ſweating round about, to condite and preſerue them in their naturall heat. Others they ſuffer to be dried in the ſmoke of ſmiths forges, wherby they get the very taſt of infumed wine, ſo ordered in the ſmoke. And in truth, *Tiberius Cæſar* the Emperor gaue eſpecial credit & name by his example to ſuch grapes dried in the furnaces of Africk. For before his time, the Rhetian grapes & thoſe that came out of the territory of Verona, were ordinarily ſerued vp to the table firſt, for the very beſt. As for the Raiſins called Paſſæ, they took that name in Latine of their patience to indure their drying & confiture. Some grapes there be that are condite in Muſt or new wine, and ſo they drinke their owne liquor wherein they lie ſoking, without any other ſeething. Others againe are boiled in Muſt aboueſaid, vntill they loſe their owne verdure, and become ſweet and pleaſant. Moreouer, yee ſhall ſee old grapes hang ſtill vpon the Vine their mother, vntill new come: but within glaſſes, that a man may ſee them eaſily through: howbeit, to make them to laſt and continue in their full ſtrength, as well thoſe which be preſerued in barrels, tuns, and ſuch like veſſels aforeſaid, they vſe the helpe of pitch or tarre, which they poure vpon the ſtalks that the cluſter hangs to, and wherewith they ſtop cloſe the mouth of the ſaid glaſſe. It it not long ſince that there was a deuiſe found, that wine of it ſelfe (as it came naturally from the grape growing vpon the vine) ſhould haue a ſmack and ſent of pitch. And ſurely this kind of * Pitch wine, brought the territory about Vienna into great name reputation: & before that this vine was known, thoſe of Auern, Burgundy, and the Heluij, were in no requeſt at all. But theſe deuiſes as touching vines & wines, were not in the daies of the Poet *Virgil*, who died about 90 yeres paſt. But behold what I haue to ſay more of the Vine tree: the vine wand is now entred into the camp, and by it our armies are ranged into battalions: nay, vpon the direction thereof depends the main eſtate of our ſoueraigne Empire: for the Centurion hath the honour to carry in his hand a Vine-rod: the good guidance and ordering whereof aduanceth after long time the centeniers (for a good reward of their valorous and faithfull ſeruice) from the leading of inferior bands, to the captainſhip of that regiment and chiefe place in the army, vnto which the maine ſtandard of the Ægle is committed: yea, and more than that, the Vine wand chaſtiſeth the treſpaſſes and lighter offences of the ſouldiers; who take it for no diſhonor nor diſgrace to be thus puniſhed at their Centurions hand. Ouer and beſides, the planting of Vineyards hath taught martiall men how to approch the wals of their enemies, to giue an aſſault vnder a frame deuiſed for the purpoſe, which therupon took the name of Vinea. Laſtly, for medicinable vertues in phiſick, the Vine is ſo profitable to mans health, that the vſe of it alone is a ſufficient remedy for the diſtemperature of mans body, cauſed by wine it ſelfe.

* *μεθύσκει γὰρ οἶνος.* Plutarch.

Chap. II.

¶ *Of the diuers kindes of vines.*

Democritus was the onely Philoſopher euer known, who made profeſſion to reduce all the ſorts and kinds of vines to a certaine number, and indeed he vaunted and made his boaſt that he had the knowledge of all things that were in Greece. All others beſides himſelfe and thoſe comming neerer to the truth (as ſhal appeare more euidently by the variety of wines) reſolutely haue ſet downe, that there be infinit ſorts of Vine-trees. Looke not therefore at my hands, that I ſhould write of them all, but onely of the principall: for that in truth there bee in manner as many and as ſundry kinds of them, as are of grounds. Wherefore I will content my ſelfe, and thinke it ſufficient to ſhew thoſe that be ſingular and moſt renowned among them, or ſuch as haue ſome ſecret propriety worthadmiration. And firſt to begin with the Aminean Vines, all the world giueth them the chiefe praiſe and greateſt name; as wel for their grapes, of ſo laſting and durable a nature, as for the wine made thereof, which in all places continues long in vigor, & is euer the better for the age. And hereof there be fiue ſundry ſorts. Of which, the kindly Vines named Germanæ, haue both leſſe grapes and grains within, but they burgen and bloom better than others: and after the floure is gon, they can abide both rain and tempeſt: but the ſecond kind (which is the greater) is not ſo hardy: howbeit, leſſe ſubiect to wind and weather

20030
copy 1

A ther when they be planted to run vp a tree, rather than to creepe vpon a frame. A third ſort are called Gemellæ, for that their grapes grow double like twins. & they be very harſh and in taſte vntoothſome, howbeit their vertue and ſtrength is ſingular. The ſmaller ſort of theſe take harm by the South wind: but all other winds nouriſh them, as we may ſee in the mount Veſuvius, and the little hils of Surrentum: for in all other parts of Italy, ye ſhal neuer finde them but wedded to trees, and growing vpon them. As for the fift kind of theſe Amminean vines, they be called Lanatæ, ſo freezed they are with a kind of down or cotton, inſomuch as we need not wonder any more at the Seres or Indians for their cotton and ſilken trees. The firſt kind of theſe Ammineean grapes come ſooneſt to their ripeneſſe and perfection, and moſt quickly do they rot & putrifie. Next to theſe Amminean vines, thoſe of Nomentum are in moſt account: and for that their wood is red, ſome haue called them Rubellæ. Theſe grapes yeeld no great plenty of wine, but
B in ſtead thereof their ſtones and kernels, and other refuſe remaining, grow to an exceeding big cake: howbeit, this property they haue. The froſt they will indure paſſing well, leſſe harme they take alſo by raine than drought, and thriue better in cold than heat: and therefore in cold and moiſt grounds they excell and haue no fellow. Of theſe vines, they are more plentifull which beare grapes with ſmaller ſtones, and leaues with leſſe cuts and iags indented. As touching the Muſcadell vines, Apianæ, they tooke that name of bees, which are ſo much delighted in them and deſirous to ſettle and feed of them. Of two ſorts they are: and both carry cotton & down. Howbeit, this difference is between them, that the grapes of the one wil be ſooner ripe than the other, and yet there is neither of them both but be haſty enough. Theſe Muſcadell grapes like wel and loue cold countries: and yet none ſooner rot than they, if ſhowers take them. The muſ-
C cadell wines are at the firſt ſweet: but with age become harſh and hard, yea, and red withal. And to conclude, there is not a grape that ioies more to hang vpon the vine, than it doth. Thus much of the very floure of Vines, and the principall grapes that be familiar and proper vnto our countrey of Italy, as their natiue ſoile.

The reſt be ſtrangers come out of Chios or Thaſos. As for the Greeke grapes of Corinth, they be not in goodnes inferior to the Aminean aforeſaid. They haue a very tender ſtone within: and the grape it ſelfe is ſo ſmall, that vnleſſe the ſoile be exceeding fat and battle, there is no profit in planting and tending ſuch vines. The quick-ſets of the vine Eugenia were ſent vnto vs from the Taurominitane hils in Sicily, together with their ſyrname pretending a noble & gen-
D tle race. Howbeit, they are neuer in their kind with vs, but only in the Alban country: for if you tranſplant them, they proue very baſtards and changelings preſently. And in faith, ſome vines there be that take ſuch an affection and loue to a place, that all their goodneſſe and excellency they wil leaue there behind them, and neuer paſſe into another quarter whole and entire as they be in their own nature. Which euidently is to be ſeen in the Rhetian vine, & that of Savoy and Daulphnie, of which in the chapter before wee ſaid, that it gaue the taſte of pitch to the wine made thereof: for, theſe Vines at home in thoſe countries are much renowned for the ſaid taſt: but elſwhere if they be tranſplanted, they looſe it whole, and no ſuch thing may a man acknowledge in them. Howbeit, plentifull ſuch are, and for default of goodneſſe, they make amends & recompence in abundance of wine that they yeeld. As for the vine Eugenia, it takes well in hot grounds. The Rhetian likes better in a temperat ſoile. The Allobrogian Vine of Savoy and
E Daulphine delights moſt in cold quarters: the froſt it is that ripens her grapes, and commonly they are of colour black. Of all the grapes aboue rehearſed, the wines that be made, the longer they be kept, the more they change colour, and in the end become white, yea, though they came of blacke grapes, and were of a deep colour at firſt. Now for all other grapes whatſoeuer, they are reckoned but baſe in compariſon of the former. And yet this is to be noted and obſerued, that the temperature of the aire may be ſuch, and the ſoile ſo good, that both the grapes wil indure long, and the wine beare the age very well. As for example, the Vine Fecenia, and likewiſe Biturica, that bloometh with it, which beare grapes with few ſtones within: their floures neuer miſcarry, for they euer preuent and come ſo timely, that they be able to withſtand both winde
F and weather. Howbeit, they do better in cold places than in hot: in moiſt alſo, than in dry. And to ſay a truth, there is not a vine more fruitful, & yeelding ſuch ſtore of grapes growing ſo thick together in cluſters: but of all things it may not away with variable and inconſtant weather: let the ſeaſon be ſtaied and ſetled, it matters not then whether it be hot or cold, for wel it wil abide the one & the other alone, hold it neuer ſo long. The leſſer of this kind is held for the better.

Howbeit

Howbeit, in chuſing of a fit ſoile for this vine, it is much ado to pleaſe and content it: in a fat ground it ſoone rots; in a light and lean, it will not grow at all: very choiſe it is therefore, dainty, and nice, in ſeeking a middle temper betweene, and therefore it taketh a great liking to the Sabine hils, and there it loues to be. The grapes that it bears, be not ſo beautiful to the eie, but pleaſant to the tooth: if you make not the more haſt to take them preſently when they be ripe, they will fall off, although they be not rotten. This vine puts forth large and hard leaues, which defend the grapes well againſt haile-ſtones. G

Now there are beſides certain notable grapes of a middle colour between black and purple, and they alter their hue oftentimes; whereupon ſome haue named them Variæ: and yet the blacker they be, the more they are ſet by: they beare grapes but each other yeare, that is to ſay, this yere in great plenty, the next yere very little: howbeit, their wine is the better when they yeeld fewer grapes. Alſo there be 2 kinds of vines called Pretiæ, differing one from the other in the bigneſſe of the ſtones within the grape: full of wood and branches they are both: their grapes are very good to be preſerued in earthen pots: and leafed they be like to Smallach: they of Dyrrhachium do highly praiſe the Roial vine Baſilica, which the Spaniards cal Cocolobis. The grapes grow but thin vpon this plant: they can well abide all South winds, and hot weather: they trouble and hurt the head, if a man eat much of them. In Spaine they make 2 kindes of them; the one hauing a long ſtone or grain within, the other a round: theſe be the laſt grapes that are gathered in time of vintage The ſweeter grape that the Cocolobis bears, the better is it thought: howbeit that which was hard and tart at the firſt, will turne to be pleaſant with keeping; and that which was ſweet, will become harſh with age: and then they reſemble in taſt, the Albane wine; and men ſay, there is an excellent drinke made thereof, to help diſeaſes and infirmities of the bladder. As touching the wine Albuelis, it bears moſt grapes in the tops of trees, but Viſula is more fruitfull beneath toward the root: and therfore if they be ſet both vnder one and the ſame tree, a man ſhall ſee the diuerſitie of their nature, and how they will furniſh and inrich that tree from the head to the foot. There is a kind of blacke grape named Inerticula, as a man would ſay, dull and harmleſſe; but they that ſo called it, might more iuſtly haue named it The ſober grape: the wine made therof is very commendable when it is old, howbeit nothing hurtfull* for neuer makes it any man drunke: and this property hath it alone by it ſelfe. As for other vines, their fruitfulneſſe doth commend them; and namely aboue all, that which is called Heluenaca; whereof be two kinds, the greater, which ſome name The long: and the ſmaller called Arca: not ſo plentifull it is as the former, bat ſurely the wine thereof goes downe the throat more merily. It differs from the other in the perfect and exquiſit roundneſſe of the leafe, as it were drawn by compaſſe: but both the one and the other is very ſlender, and therefore of neceſſitie they muſt be vnderpropped with forkes, for otherwiſe they will not beare their owne burden, ſo fruitfull they be. They delight greatly to grow neare the ſea ſide, where they may haue the vapors of the ſea to breath vpon them: and indeed their very grapes haue a ſent and ſmell of a brackiſh dew. There is not a vine can worſe brooke Italy. Her grapes are ſmall, they hang thin and rot euen vpon her: and the wine made thereof, will not laſt aboue one Summer: and yet on the other ſide there is not a vine that liketh better in an hungry and lean ground. *Græcinus* (who otherwiſe compiled his worke out of *Cornelius Celſus* in manner word for word) is of this opinion, That this Vine could loue Italy well enough, and that of the owne Nature it miſlikes not the Countrey; but the cauſe why it thriueth no better there, is the want of skil and knowledge to order and husband it as it ought to be; for that men ſtriue to ouercharge it with wood, and load it with too many branches: and were it not that the goodneſſe of a fat and rich ſoile maintained it ſtill, beginning to faint and decay, the fruitfulneſſe thereof were enough to kill it. This vine (by report) is never blaſted: a ſingular gift verily of Nature, if it be true, That any plant or tree ſhould be ſo exempt from the juriſdiction (as it were) of the Heauens, that they had no power to doe it harme. The Vine Spionia, which ſome call Spinea, feareth no extremitie of heat: her grapes proſper well in Autumne and much abundance of rain: This is the only grape that is nouriſhed with foggie miſts, and therfore it likes no place well but the territorie of Rauenna. The vine Venicula (which is counted one of the beſt for kindly blooming & ſhedding the floures, and for grapes moſt meet to be preſerued and kept in pots) the Campaines rather name Sirculus; others Stacula: and they of Tarracina call it Numiſiana: and as they ſay, the grape therof hath no ſingularity nor vertue in it ſelf, but only according to the ſoile where

* Amethyſtos, *Cglumell.*

it

20030
copy 1

A it groweth: howbeit thoſe that grow about Surrentum, haue the moſt ſtrength, and are excellent to be preſerued in veſſels; I mean, as far as vp to the hill Veſuvius: for there alſo is the vine Murgentina, the beſt of all thoſe that come out of Sicily, which ſome call Pompeiana, of Pompeij, a town within the kingdome of Naples: & being got once into Latium, it beares grapes abundantly: like as the vine Horconia in Campaine, yeeldeth plenty of grapes with the beſt, but good they are for nothing ſaue onely to be eaten at the table. As for the grape Mærica, it will laſt and indure a long time; it feareth neither winde nor tempeſt, nor any blaſt of planet: blacke it is, and hath black ſtones: howbeit the wine that it maketh, waxes red with age, namely, if it be long kept.

B

Chap. III.

¶ *Of the diuers kindes likewiſe of Vines, according to the propertie of the places and regions where they grow.*

Hitherto we haue treated of the ſundry ſorts of vines in general: now wil we write of them according to the nature of the places and regions, which are proper and familiar vnto them; or, as they be mingled one with another, by tranſplanting or graffing. And firſt and formoſt, the vine Tudernis, alſo Florentia (bearing the name of the city Florence) are peculiar to the Tuſcans: but about Aretium, there is no talke both for plenty and goodneſſe, but of the Talpana, Eteſiaca, and Conſeminia. The Talpane grape is blacke as the Mouldwarpe,
C whereof it taketh the name, but yet doth it yeeld a white wine. The Eteſiacke vine (ſo called of the wines Eteſiæ) is a deceitfull plant, and often miſſeth and faulteth; but the more grapes it beareth, the better wine it yeeldeth and more commendable: mary this is ſtrange and wonderfull in it, In the mids of this fruitfulneſſe of hers, ſhe giueth ouer ſuddenly and dieth. The vine Conſeminia, bringeth blacke grapes: the wine will not laſt, but the grapes will keepe and continue paſſing long: the vintage thereof is fifteene daies after all other: it beareth ordinarily her full burden, but the fruit is onely good for meat to be eaten, and not for wine to be drunke. The leaues of this vine (in manner of the wilde vine Labruſca) before they fall, become as red as bloud. This property happeneth to ſome others beſides; but take it for a certaine token of the worſt vines. The vine and grape Irtiola, is proper vnto Vmbria, to the territorie of the Meue-
D nates, and the Picene countrey: like as that which they call Pumula, to the Amiternine region. They haue among them alſo another kinde, named Bannanica: and although it oftentimes doth not take, yet they loue the plant and cheriſh it. There is a grape which they call the Borrough or Burgeois grape, after the name of the burrough town Pompeij; and yet there is more plenty of them about the city Cluſium: the Tiburtins alſo, named their grapes after their town Tybur: yet of late daies they haue found another ſort, which of the reſemblance of oliues, is called the Oliue grape: and in truth, this is the laſt grape of any account, to this day known to haue bin found out. The Sabins and Laurentines only are acquainted with the grape Vinaciola: for wel I wot, that the vines Gauranæ came firſt out of the territory of Falerij, and thereupon were named Falernæ: but tranſplant them from thence whitherſoeuer you will, they wil very quick-
E ly degenerat in all places, and proue baſtard. Moreouer, ſome haue made a ſeueral kind by it ſelf of the Tarentine vine, which brings forth an exceeding ſweet grape. As for the grapes called Capnias, Bucconiatis, & Tarrupia, there is no vintage of them in the vineyards of the hils about Thurinum, before the cold froſt. As for the citizens of Piſæ, they ſet great ſtore by the grapes Phariæ: like as Modenna by thoſe called Pruſiniæ; which are very black ſtone & al: yet the wine thereof with 4 yeres wil turn to a paller and whitiſh colour. A ſtrange thing it is which men report of a certaine grape, that euermore will turne with the Sunne: and thereupon it is called Streptos: as alſo that we in Italy are delighted with the French grapes: and they in France beyond the Alpes, are as much in loue with ours in the Picene countrey. *Virgil* hath made mention of other grapes, namely, Thaſiæ, Mareotides, and Lageæ, beſides many other outlandiſh
F plants, not at this day to be found throughout al Italy: howbeit there be yet many vines of good mark & wel accepted of, not for any wine that they yeeld, but only for their grapes which they carry: to wit, Ambroſiaca, and Duracina, which may be kept hanging ſtill vpon the vine, without any veſſell to incloſe them: ſo durable be they and hardy, againſt cold, heat, wind, and raine, or any weather whatſoeuer. As for the vine Orthampelos, it needs neither tree to climb on, nor

forkes to ſupport it,but is able to maintain and vphold it ſelfe vpright.But the Dactylides(ſo G
called for that they beare not wood aboue a finger thicke)cannot ſo do: for they muſt be ſho-
red and vnderpropped. Of all vines,the Columbines yeeld moſt gleaning,for that the gatherers
leaue behind them greateſt ſtore of ſmall grapes:and ſo do the purple grapes, named alſo Bi-
mammiæ(as one would ſay,with two teats or bigs)more than the reſt; ſeeing that they beare
not ſmall grapes,but put forth new great ones indeed,after the other be gathered and gone. In
like manner,the vine Tripedanea,which took that name of the meaſure of 3 foot. Semblably
the vine Scirpula,the grapes wherof ſeem as if they were Raiſins of the ſun,dried already. More-
ouer in the maritime Alps toward the ſea-ſide,there is a kind of Rhetian vine,but far inferior to
that other aboue-mentioned and ſo much commended for the relliſh of pitch that it giueth to H
the wine made of her grapes:for theſe about the Alps be little and ſmall;and albeit they beare
grapes thick,yet the wine thereof comes far ſhort of the other,and is more degenerat:howbeit
the skin of the grapes is of all other the thinneſt,hauing but one kernel within,which they call
Gigarton,and the ſame very ſmall; and a man ſhall not find a bunch, without one or two paſ-
ſing great grapes aboue the reſt:there is alſo a kind of black Aminean grape,which ſome name
Syriaca:likewiſe the grape of Spain,which of the baſe and common kinds carries the greateſt
credit,and is moſt commended. As touching both vines and grapes that run and traile vpon
frames;there be thoſe which are called Eſcariæ,good only for to eat, and namely thoſe which
haue grains or ſtones like to Ivie berries,as well white as black. Grapes reſembling great dugs,
named therupon Bumaſti,both black and white,are carried vpon frames in like ſort. But al this I
while we haue not ſpoken of the Ægyptian and Rhodian grapes, ne yet of the Ounce-grapes,
whereof euery one weighes a good ounce,and thereupon tooke that name. *Item*, the grape Pu-
cina,the blackeſt of all others:the Stephanitis alſo,wherein Nature hath ſeemed to diſport her
ſelfe,for the leaues run among the grapes in manner of a garland plaited with them. Moreouer,
the market-grapes called Forenſes,they grow and are ripe with the ſooneſt;vendible at the very
firſt ſight,and ſold with the beſt,and moſt eaſie to be carried from market to market. But con-
trariwiſe,the aſh-coloured grape Cinerea,the ſilk-ruſſet grape Ravuſcula, the aſſe-hued grape
Aſiniſca,pleaſe not the eie,but are preſently reiected: and yet the Fox-tailed grape Alopecis,
(for that it reſembles Rainards taile) is not ſo diſpleaſant nor ſo much diſcommended as the K
former. About a cape or creſt of the hill Ida,which they call Phalacra,there is a vine named A-
lexandrina,ſmal of growth, and puts forth branches of a cubit in length:the grapes be black, as
big as beans;the pepin or kernell within,ſoft,tender,and exceeding ſmall;the bunches are croo-
ked,full of grapes,paſſing ſweet;and finally the leaues little,round,and not cut or iagged at all.
Within theſe ſeuen yeres laſt paſt,about Alba Eluia,a city in Languedock or the prouince of
Narbon,there was found a vine,which in one day both floured and ſhed her floures: by which
meanes moſt ſecured it was from all dangers of the weather. They call it Narbonica, or the
vine of Languedock: and now it is commonly planted all that prouince ouer, and euery man
deſireth to ſtore his vineyard therewith.

L

Chap. IIII.

¶ *Notable conſiderations about the husbandrie and ordering of Vineyards.*

THat noble and worthy *Cato*,the firſt of that name,renowned among other dignities for his
honorable triumph,and the incorrupt adminiſtration of his Cenſorſhip, and yet more fa-
mous and renowned to poſterity for his ſingular knowledge and learning: and namely for
the good precepts and ordinances tending to all vertues and commendable parts,which he left
in memory for the people of Rome:& principally touching agriculture[as he was by the com-
mon voice and generall accord of that age wherein he liued reputed for an excellent husband- M
man,and one who in that profeſſion had neither peere nor ſecond that came neere vnto him.]
This *Cato* (I ſay)hath in his workes made mention but of a few kinds of vines:and yet ſome of
them already be growne out of knowledge, ſo as their verie names are quite forgotten. Yet
neuertheleſſe his opinion and judgement would be ſet downe in particular,as it may be gathe-
red out of his whole treatiſe: to the end that we might both know in euery kind of vine which
were of moſt account in his daies(to wit,in the 600 yere after the foundation of Rome, about
the

20030
copy 1

A the time that Carthage and Corinth were forced and woon, when he departed this life:) and alſo learn how much we haue profited and proceeded in good husbandry and agriculture, from his death vnto this preſent day, namely for the ſpace of 230 yeares. As concerning vines and grapes therefore, thus much hath *Cato* deliuered in writing, and in this manner following. *All places or grounds* (quoth he) *expoſed to the Sun-ſhine, and which in other regards ſhall be found good for to plant vineyards in, ſee they bee employed for the leſſe Aminean, for both the Eugenian Vines, and the ſmaller Heluine. Item, In euery tract that is more groſſe, thicke, and miſtie, looke that you ſet the greater Aminean, or the Murgentine: the Apician alſo, and the Lucane Vine. All other vines, and the common mingled ſort eſpecially, will agree well enough with any ground. The right keeping of grapes, is in a ſmall thinne wine of the ſecond running. The grapes Duracinæ, and the greater Amineans, are*
B *good to be hanged, or elſe dried before a blacke-ſmithes forge, and ſo they may be well preſerued and goe for Raiſins of the Sun.* Loe what the precepts of *Cato* be; neither are there any of this argument more antient, left vnto vs written in the Latine tongue. Whereby we may ſee, that we liue not long after the very firſt rudiments and beginnings of knowledge in theſe matters. [But by the way, the Amineans laſt named, *Varro* calleth Scantians.] And in very truth, few there be euen in this our age, who haue left any rules in forme of Art, as touching the abſolute skill in this behalfe. Yet ſuch as they be, and how few ſoeuer, we muſt not leaue them behinde, but ſo much the rather take them with vs; to the end it may be knowne, what reward & profit they met with, who trauelled in this point of husbandry: reward, I ſay, and profit, which in euery thing is all in all.

C To begin therefore with *Acilius Sthenelus* [or *Stelenus*,] (a mean commoner of Rome, deſcended from the race of Libertines or Slaues newly infranchiſed) he attained to the higheſt glory and greateſt name of all others: for hauing in the whole world not aboue 60 acres of land lying all in vineyards within the territory of Nomentum, he plaied the good husband ſo well therein, that he ſold them again at the price of 400000 Seſterces. There went a great bruit and fame likewiſe of one *Verulenus Aegialus*, in his time a man but of baſe condition by birth, and no better than the former, (namely, come of the ſtocke of freed-men) who by his labor & husbandry, greatly inriched a domain or liuing at Liternum in Campaine: and the more renowned he was by occaſion of the fauour of ſo many men affectionate vnto *Africanus*, whoſe very place of exile he held in his hands and occupied ſo well: for vnto *Scipio*, the aboueſaid Liternum, appertained. But the greateſt voice and ſpeech of men was of *Rhemnius Palæmon* (who otherwiſe by
D profeſſion was a famous and renowned Grammarian) for that he by the means and helpe of the foreſaid *Sthenelus*, bought a ferme within theſe twenty yeares for 600000 Seſterces in the ſame territorie of Nomentum, about ten miles diſtant from Rome, lying ſomewhat out of the high way. Now is it well knowne farre and neare, of what price and account all ſuch fermes are, and how cheape ſuch ware is lying ſo neere to the city ſide: but amongſt the reſt, this of *Palæmons* in that place was eſteemed moſt cheap and loweſt priſed, in this regard eſpecially, That he had purchaſed thoſe lands, which through the careleſneſſe & bad husbandry of the former owners, lay neglected and fore-let, & were not of themſelues thought to be of the beſt ſoile, choſen and piked from among the worſt. But being entred once vpon thoſe grounds as his owne liuelode
E and poſſeſſion, he ſet in hand to husband and manure them, not ſo much of any good mind and affection that he had to improue and better any thing that he held, but vpon a vaine glory of his own at the firſt, whereunto he was wonderouſly giuen: for he makes fallows of his vine-plots anew, and delueth them all ouer again, as he had ſeen *Sthenelus* to do with his before: but what with digging, ſtirring, and medling therewith, following the good example and husbandry of *Sthenelus*, hee brought his vineyards to ſo good a paſſe within one eight yeares, that the fruit of one yeares vintage was held at 400000 Seſterces, and yeelded ſo much rent to the lord: a wonderfull and miraculous thing, that a ground ſhould be ſo much improoued in ſo ſmall a time! And in very truth, it was ſtrange to ſee what numbers of people would run thither, onely to ſee the huge and mighty heaps of grapes gathered in thoſe vineyards of his: and ill idle neigh-
F bors about him, whoſe grounds yeelded no ſuch increaſe, attributed all to his deepe learning, and that he went to it by his book, & had ſome hidden ſpeculation aboue other men; obiecting againſt him, that he practiſed Art Magicke, and the blacke Science. But laſt of all, *Annæus Seneca*, eſteemed in thoſe daies a ſingular clerke, and a mighty great man (whoſe ouermuch Learning and exceeding power coſt him his ouerthrowing in the end) one who had good skill and

judgement in the world,and vſed leaſt of all others to eſteeme toies and vanities, brought this ferm into a greater name and credit:for ſo far in loue was he of this poſſeſſion, that hee bought out *Palæmon*,and was not aſhamed to let him go away with the pricke and praiſe for good huſbandry,and to remoue him into other parts where he might ſhew the like cunning: and in one word, paid for theſe foreſaid vineyards of his fourfold as much as they coſt,not aboue ten yeres before this good husbandry was beſtowed vpon them. Certes,great pity it is,that the like induſtry was not ſhewed and imploied in the territories about the hils Cecubus,& Setinus, where (no doubt) it would haue well quit all the coſt,conſidering that many a time afterwards, euery acre of vineyard there,yeelded ſeuen Culei,that is to ſay,140 Amphores of new wine one yere with another. But leſt any man ſhould thinke, that wee in theſe daies haue ſurpaſſed our anceſtors in diligence,as touching good husbandrie;know he, that the aboue named *Cato* hath left in writing, How of an acre of vineyard there hath ariſen ordinarily * ten Culei of wine by the yeare. Certainly theſe be effectuall examples and pregnant proofes, that the hardy and aduenturous voiages by ſea,are not more aduantageous; ne yet the commodities and merchandiſe, and namely Pearls,which be fet as far as the red ſea and the Indian Ocean, are more gainefull to the merchant,than a good ferm and homeſtall in the countrey,well tilled and carefully huſbanded.

*15 according to *Ful. Vrſinus.*

As touching the wines in old time,*Homer* writes,that the Maronean wine made of the grapes growing vpon the ſea coaſts of Africk,was the beſt,& moſt excellent in his daies. But my meaning is not to ground vpon fabulous tales & variable reports,as touching the excellency or antiquitie of wine. True it is,that *Ariſtæus* was the firſt, who in that very nation mingled honey with wine;which muſt needs be a paſſing ſweet and pleaſant liquor,made of two natures ſo ſingular as they be of themſelues. And yet to come againe to the foreſaid Maronean wine, the ſame *Homer* ſaith,That to one part therof,there would be but 20 parts of water:and euen at this day,that kind of wine continues in the ſaid land of the ſame force,and the ſtrength thereof will not be conquered nor allaied. For *Mutianus* who had bin thrice conſul of Rome,& one of thoſe that lateſt wrote of this matter,found by experience(being himſelfe perſonally in that tract) that euery ſextar or quart of that wine,would beare 8 of water: who reporrs moreouer,that the wine is of colour blacke,of a fragrant ſweet ſmell, and by age comes to be fat and vnctious. Moreouer,the Pramnian wine(which the ſame *Homer* hath ſo highly commended) continueth yet in credit and holds the name ſtill:it comes from a vineyard in the countrey about Smyrna, neere to the temple of *Cybele* the mother of the gods. As for other wines, no one kind apart excelled other.

One yere there was,when all wines proued paſſing good;to wit,when *L. Opimius* was Conſul, at what time as *C. Gracchus* a Tribune of the Commons (practiſing to ſow ſedition within the city among the common people)was ſlaine:for then ſuch ſeaſonable weather happened,and ſo fauorable for ill fruit,that they called it (Coctura) as a man would ſay, the ripening time; ſo beneficiall was the Sun to the earth:and this fell out in the yere after the natiuity and foundation of the city of Rome, 634.

Moreouer,there be ſome wines ſo durable,that they haue beene knowne to laſt two hundred yeares;and are come now by this time to the qualitie and conſiſtence of a rough, ſharpe, and auſtere kind of hony: and this is the nature of all when they bee old: neither are they potable alone by themſelues,vnleſſe the water be predominant; ſo tart they are of the lees, and ſo muſty withall,that they are bitter againe. Howbeit a certaine mixture there is of them in a very ſmall quantity with other wines,that giues a prety commendable taſt vnto them. Suppoſe now that according to the price of wine in thoſe daies of *Opimius*,euery Amphore were ſet but at an hundred Seſterces,yet after the vſurie of ſix in the hundred yearly (which is the ordinary proportion and a reaſonable intereſt among citizens, for the principall that lieth dead and dormant in ſtock)by the hundred and ſixtieth yere after the ſaid Amphor was bought (which fell out in the time that *C. Caligula Cæſar* the ſon of *Germanicus* was Emperor)no maruell if an ounce in meaſure of the ſame wine(to wit,the twelfth part of a Sextarius) coſt*ſo many Seſterces: for as we haue ſhewed by a notable example,when we did ſet downe the life of *Pomponius Secundus* the Poet,and the feaſt that he made to the ſayd Prince *Caligula*, there was not a * Cyathus of that wine drawne,but ſo much was paied for it. Loe what a deale of mony lieth in theſe wine-cellars,for keeping of wine! And in very truth,there is nothing more gainfull nor groweth to a better

* *Bud.* 22. Seſt.

* 1. an ounce and a halfe.

20030
copy 1

A better reckoning than it, for twenty yeres ſpace after it is laid vp: neither is there greater loſſe againe by any thing, if ye paſſe that terme, by reaſon that the price will not grow and ariſe accordingly: for ſeldom hath it bin knowne to this day (and neuer but at ſome exceſſiue riot and ſuperfluous expence of wine) that an Amphore hath beene ſold for a thouſand Seſterces. True it is indeed, that they of Vienna only haue made better reckoning of their wines, and ſold them deerer; I meane thoſe that giue a taſte of pitch (the ſeuerall kinds whereof wee haue deliuered before:) but they are thought ſo to do among themſelues only, and for the loue of their countrey, that it might haue the names of wines, ſo deere and coſtly. To conclude, this wine of Vienna, is reputed colder than the reſt; when the queſtion is of cold drinke, and that the body is to be cooled.

B

Chap. V.

¶ *Of the Nature of Wine.*

THe nature and property of wine, is to heat the bowels within, if it be drunke; and to coole the exterior parts, if it be applied outwardly. And here it ſhall not be amiſſe to rehearſe in this very place, that which *Androcydes* (the noble, ſage, and wiſe Philoſopher) wrote vnto K. *Alexander* the Great, for to correct and reforme his intemperate drinking of wine, whereto he was very prone and ouermuch giuen. *My good Lord* (ſaith he) *remember when you take your wine, that you drinke the very bloud of the earth: Hemlock (you know ſir) is poiſon to man, euen ſo is wine to Hemlock.* Now if that Prince had bin ſo wiſe as to haue obeied theſe precepts of his, certes, he could ne-
C uer haue killed his beſt friends as he did, in his fits of drunkenneſſe. In ſum, this may be truely ſaid of wine, that being taken ſoberly and in meaſure, nothing is more profitable to the ſtrength of the body; but contrariwiſe, there is not a thing more dangerous and pernicious, than the immoderate drinking thereof.

Chap. VI.

¶ *Of kindly Wines made of the beſt Grapes.*

WHo doubteth, that ſome Wines be made more pleaſant and acceptable than others? nay out of the very ſame vat ye ſhall haue wines not alike in goodneſſe, but that ſome
D go before their brethren, preſſed though they be at one time, and from the ſame kinde of grape: which may be long either of the veſſell whereinto they be filled, or of ſome accidentall occaſion: and therefore as touching the excellency of wine, let euery man be his own taſter and judge. The Empreſſe *Iulia Auguſta* would commonly ſay, That ſhe was beholden to the Pucine wine for liuing as ſhe did 82 yeares: for ſhe neuer vſed to drink any other. This wine came of the grape that grew along the Adriaticke ſea, or Venice gulfe, vpon a ſtony and raggie hill, not far from the ſource or ſpring of the riuer Timavus, nouriſhed with the vapors breathed from the ſea; and many Amphores there were not drawne thereof at a vintage: and by the iudgement of all men, there is not a wine more medicinable than it is. I would thinke verily therefore, that the wine Pyctanon (which the Greekes ſo highly praiſe) is the very ſame; for it commeth from
E the coaſts of the Adriaticke ſea. The Emperor *Auguſtus Ceſar* preferred the Setine wine before all others: and after him in manner, all the Emperors his ſucceſſors, for the ordinary experience they found thereby, That lightly the liquor of that wine would not hinder digeſtion nor breed raw humors in the ſtomack: and this wine commeth of the grape about the towne Forum Appij. Before that time, the wine Cæcubum was in beſt account; and the vines which yeelded it, grew to the Poplars in the mariſh grounds within the tract of Amyclæ. But now is that Wine cleane gone, as well through the negligence of the peiſants of that countrey, as the ſtreights of the place: and ſo much the rather, by reaſon of the ditch or trench which *Nero* cauſed to be made nauigable, beginning at the lake or gulfe Baianus, and reaching as far as to Oſtia. In the ſecond degree of excellency, are ranged the wines of the Falerne territorie, and principally that which
F came from the vineyards Fauſtian: and this excellency it grew vnto by paſſing good order and carefull husbandry. Howbeit this wine alſo in theſe daies beginneth to grow out of name and requeſt, whiles men loue rather to haue plenty from their vines, than otherwiſe lay for the goodneſſe thereof. Now theſe Falerne vineyards, begin at the Campaine bridge on the left hand as men go to the city-colony erected by *Sylla*, and lately laid to Capua, & vnder the iuriſdiction thereof.

therof. But the Fauſtian vineyards lie about 4 miles from a village neere Cediæ, which village G
is from Sinueſſa ſix miles diſtant. And to ſay a truth, this Fauſtian wine is inferiour to none in
reputation: ſo piercing and quicke it is, that it will burne of a light flame; a propertie that you
ſhall not ſee in any other wine. Three ſorts there be of theſe Falerne wines: the firſt be hard and
harſh; the ſecond ſweet and pleaſant; the third, thin and ſmall. But ſome haue diſtinguiſhed
them in this wiſe: thoſe that come from the top of the hills, be called Gaurane wines; from the
mids, Fauſtian; and laſt of all from the bottom and foot thereof, the Falerne. But by the way
this would not be forgotten, That the grapes whereof be made theſe wines ſo ſingular and ex-
cellent, are nothing pleaſant to the taſt for to be eaten. As touching the Albane wines from a-
bout Alba neere the city of Rome, they reach to the third ranke in goodneſſe, for a certain va-
rietie they haue in their taſt: ſweetiſh they be, and yet otherwhiles they haue an vnripe & harſh H
relliſh of the wood, & taſt like the hedge-wine. In like maner the wines of Surrentum, & name-
ly thoſe of grapes growing only in vineyards, are excellent good for weak perſons that be new-
ly recouered of ſickneſſe, ſo ſmall they are, and wholeſome withal. And in truth, *Tyberius Cæſar*
was wont to ſay, That the Phyſitians had laid their heads together, and agreed to giue the Sur-
rentine wine ſo great a name; for otherwiſe it was no better than a very mild and pleaſant vine-
gar: and *C. Caligula* (his ſucceſſor in the Empire) vſed to ſay of it, That for a wine that had loſt
the heart and was a going, it was very good. The Maſſike wines, which come from the Gaurane
hils looking toward Puteoli and Bajæ, come nothing behind the reſt, but ſtriue to match them
euery way. For as touching the Statane vineyards, that confine and border vpon the Falerne,
their wines doubtleſſe are now come to be the principall and chiefe of all the reſt: whereby it is I
euidently ſeen, that euery territory and vine-plot hath their times and ſeaſons, like as all other
things in the world, one while riſe and another while fall. For in times paſt the Calene wines
made of the grapes growing hard by Rome, were wont to go before all others: as alſo the Fun-
dane vines had their time, as well thoſe that are planted in vineyards, as they which runne vpon
trees: like as thoſe of the other ſide, neere alſo to the city of Rome, & namely from Veliternum
and Priuernum. For as touching the wine of Signia, it is held for a medicine only; and by rea-
ſon of an aſtringent verdure that it hath, it is excellent good to ſtay the flux of the belly. In the
fourth place of this race of vines, *Iulius Cæſar* (late Emperor of famous memory) hath raunged,
(for to ſerue the publick and ſolemne feaſts of the city) the Mamertine wines, from about Meſ-
ſana in Sicily: for he was the firſt (as appears by his letters miſſiue) that gaue credit and autho-
rity vnto them. And of thoſe, the Potulane wines (ſo called of them who firſt planted the vines K
whereof they came) are moſt commended, and namely thoſe that are vpon the next coaſt of Ita-
ly. Within the ſame Sicily, the Tauromenitane vines are highly eſteemed, inſomuch, as many
times they go for Meſſana wine, and are ſo ſold by whole pottles. Now for all other wines from
about the coaſt of the Tuſcane ſea Northward, good reckoning is made of the Prætutian and
ſuch as come from Ancone: alſo of the Palmeſian wines, which haply tooke that name, for that
the firſt plant of that vine came from a palme or Date tree. But in the midland parts of Italie
within the firme land, good regard there is of the Ceſenatian and Mecænatian wines. Within
the territory of Verona, the Rhetian wine carrieth the price: which *Virgill* ranged next after the
Falerne wines. Anon you come to the wines Adriane, and thoſe that grow far within the tract L
of the Venice gulfe. Now from the nether ſea about Lions, ye haue the Latinienſian, the Gra-
uiſcane, and the Statonian wines. Throughout all Tuſcane, the wines about Luna beare the
name: like as thoſe of Genes, for Liguria. Betweene the Pyrenean hills and the Alpes, Maſſiles
hath the commendation for wines of a double taſte: for the vines there, do yeeld a certain thick
and groſſe wine, which they call Succoſum, [*i.* full of juice and liquor] good to ſeaſon other
wines, and to giue them a prety taſt. When ye are paſſed once into France or Gaule, the wine of
Beterræ is in chiefe requeſt. As for the reſt within Languedoc and the Prouince of Narbon,
I am not able to auouch any thing for certainty, ſuch a brewing and ſophiſtication of them
they make, what with fuming, perfuming, and colouring them: and would God they put not
in ſome herbes and drugs among, that be not good for mans body. For certaine it is that they M
commonly buy Aloe to giue the wine both another taſt and alſo a counterfeit color. Moreouer
in the farther and more remote coaſts of Italy toward the Auſonian ſea, there be wines which
are not without their praiſe and commendation, and namely thoſe of Tarentum, Seruitium,
and Conſentia: likewiſe of Tempſa, Bauia, and Lucania: howbeit the Thurine wine goeth be-

fore

copy 1

A fore them all. As for the wines of Lagaria, which be made of the grapes not farre from Grumentum, there goes a right great name of them, by reaſon that *Meſſala* vſed ordinarily to drink thereof, and thereby was ſuppoſed to preſerue his health ſo well. Of late daies there be certaine wines in Campaine growne into credit (like as they haue gotten new names) by good ordering and husbandrie, or by chance, I know not whether; namely, thoſe of Tribellia, foure miles from Naples, of Caulium neare to Capua: and laſt of all, the Trebulaine wines within their own territorie: for before time they were euer counted no better than common wines for euery man to drink, no more than the Triſolines, from whence they vaunt of their deſcent. As for the wine of Pompeij, a towne in the kingdome of Naples, neither it nor the vine whereof it commeth, will laſt aboue ten yeres at the moſt: after which tearme, the elder they both be, the worſe they
B are. Beſides, they are found by experience to cauſe the head-ach, inſomuch, as if a man drinke thereof ouer-night, he ſhall be ſure not to haue his head in good tune vntill noone the morrow after. By which examples aboue rehearſed, it is plaine in my conceit, that the goodneſſe of the wine ſtandeth much vpon the ſoile and the climate, and not in the grape: ſo as a needleſſe and endleſſe matter it is to reduce all kind of wines to a certaine number, conſidering that one and the ſelfe ſame Vine planted in diuerſe plaçes, hath ſundrie operations, and maketh varietie of wines. Now as concerning the wines of Spaine, the Laletane vineyards are much ſpoken of for the plentie and abundance of wine that they yeeld: but thoſe of Tarracon, Arragon, and Laurone, are much praiſed and renowned for the fine and neat wines which they make. As for the wines that come out of the Iſlands, and namely, the Baleares, they are comparable to the very
C beſt in Italie.

I am not ignorant, that moſt men who ſhall read this Treatiſe, will thinke that I haue omitted and ouerpaſſed many wines: for euery man likes his own; and as ones fancie leadeth, ſo goes the voice and the cry, and there runs the Hare away. It is reported, that one of *Auguſtus Cæſars* freed men (reputed for the fineſt taſter that he had about his court, and who knew beſt what would content his pallat, and pleaſe his tooth) vpon a time when he taſted the wine that was for the Emperors bourd, at what time as he made a feaſt, ſaid to one of the gueſts at the table, That the ſaid new wine indeed had a new and ſtrange taſt, and was none of the beſt, and thoſe that were in name, howbeit (quoth he) this is for the Emperors cup, and willingly wil he drink of no other, notwithſtanding it be but a homely wine made hereby in the countrey, and not far
D fetched. And now for a finall concluſion of this matter, I cannot denie but that there bee other wines which deſerue to be numbred among thoſe that are right good and commendable, howbeit, ſuffice it ſhall to haue written of theſe, which by the common opinion and conſent of the world are held for the better.

Chap. VII.

¶ *Of Wines beyond-ſea.*

IT remaineth now to ſpeake of outlandiſh Wines beyond the ſea. Firſt and formoſt therfore next to thoſe wines renowned by the Poet *Homer*, and whereof we haue written before, beſt
E eſteemed alwaies were the wines of the Iſlands Thaſos and Chios: and namely that of Chios which they call Aruſium or Aruiſium. *Eraſiſtratus* the moſt famous Phyſician of his time, matched with theſe the Lesbian wine; and his authoritie gaue credite vnto it: and this was much about the ſix hundred yeare after the foundation of Rome. But in theſe daies there is no wine to that of Clazomene, euer ſince that they began to put therto leſſe ſea-water for to ſeaſon it, than their cuſtome was. As for the wine of Lesbos, it hath a ſent and reliſh of the ſalt water naturally of it ſelfe. Neither is the wine that comes from the hil Tmolus in any regard, as a wine to be drunke alone, but it ſerues as a ſweet cuit to mingle wiith other wines that be hard: for thereby their greene verdure wil ſeeme more mild and pleaſant, yea, and withall to haue their ripeage: for no ſooner is it tempered therwith, but they taſt preſently elder than they be. Next to theſe
F in goodnes, follow in their courſe the wines of Sycione, Cypres, Telmeſſus, Tripolis, Berytus, Tyrus, and Sebennys. As for this wine laſt rehearſed, it is made in Ægypt, a countrey much renowned for three kinds of grapes there, to wit, Thaſia, Æthalos, and Peuce. Next in price & account be theſe following, the Hippodomantian, the Myſtick, Cantharite, & the Gnidian wine of the firſt running and vnpreſſed, alſo that of Catacecaumene, a region ſo called, for that it ſeemeth

meth all burnt; of Petra, and Mycone. As for the wine Mesogites, it is knowne to make head-ach: neither is the wine of Ephesus holesome and healthfull, because it is sophisticated with a kind of cuit halt sodden, called Defrutum, and sea-water. As for the wine of Apamea, by report it comes very neare to a kind of Mede, and will very well agree withall, like as Prætutium in Italy. For otherwise, this is the property in generall of al sweet wines, that they will not well sort together, & be good still. Touching the wine Protagium, it is now grown out of remembrance: and yet the Physicians of *Asclepiades* his sect and schoole, gaue praise vnto it next the Italian wines. The learned Physician *Apollodorus*, in his treatise that he compiled of good wines, which he recommended vnto King *Ptolomæus* for to drinke, as meet for the health of his person, (for default of Italian wines then vnknown) highly praised the wines in Pontus, & principally that which is called Naspercenites: next to it the Oroeotik; the Oeneates, that of Leucadia, of Ambracia; and (which he preferreth aboue all the rest) the wine of Peparethus: and yet he said, that there went the lesse name and opinion of it, because after sixe yeares it loseth the strength and pleasant tast that it had.

Chap. VIII.

¶ *Seuen kinds of salt wine.*

THus far forth haue we discoursed of the very floure of good wines, according to the regions where naturally they come of the grape. Now are we to treat of wines compounded. And first, among such wines is that, which they call Bixon (an inuention of the Greeks) which aboue all others is most esteemed: and great reason, for deuised it was for the cure of many maladies, as we shall shew hereafter in our treatise of Physick. The making wherof is in this manner: Take grapes gathered somwhat before they be ripe: let them lie to drie and parch in the hot Sunne for three daies, and be turned duly thrice a day: vpon the fourth day presse them forth for wine, put the liquor vp in barrels, and so let it worke in the Sun. Howbeit, hereto they put a good quantity of salt sea-water. But this deuise was learn'd first of a false theeuish knaue who hauing robbed his maister and drunk vp a good deale of his wine, filled vp the vessel again and made just measure with sea-water. White wine if it be ordered in this sort, is called Leucochrum by the Greekes: but in other nations the like wine so made is named Tethalassomenon. As for Thalassites, it is a kind of wine so called, for that the vessels when the wine is new tunned, be cast into the sea, and there let to remaine for a time, by which means the wine will soon seeme old and readie to be drunke. Furthermore, Cato also here among vs hath shewed the way how to make the Greekish Wine Coum, of our owne Italian Wine: but aboue all he hath set down an expresse rule, to let it first take the maturitie and perfection 4 yeres in the Sun. As for the wine of Rhodes, it is much like to that of Coos. But the Phorinean wine is more salt than the wine of the Isle Coos. Finally, all transmarine or beyond-sea wines are thought in seuen or six yeares at the least, to come vnto their middle age.

Chap. IX.

¶ *Fourteene sorts of sweet wines.*

ALwaies the sweeter that they be in tast, the lesse fragrant & odoriferous they be: the thinner and smaller that they be, the more euer they smell to the nose. Of wines there be four principall colours, white, yellow, red, and blacke. As for Psythium and Melampsythium, they be certaine kinds of cuit, hauing a seuerall tast apart by themselues, not resembling wine indeed. And for Cicibelites made in Galatia, it tasts alwaies like new wine: so doth Halyntium in Sicily. For as touching Syræum, which some call Hepsema, & we in Latine Sapa [*i.* Cuit] it is a meer artificiall thing, the deuise of mans wit, and no worke of Nature: namely, when new wine is sodden away a third part: for when it boiles to the halfe, we then call it Defrutum. And in very deed, all these be inuentions to sophisticate and counterfeit honie. But those beforenamed retaine the naturall tast of the grape and the soile, whereof they doe consist. Next to these cuit-wines of Candie, those of Cilicia, Affrick, Italy, and the prouinces confronting therupon, are held for the best. Certain it is, That they be made of one grape, which the Greekes call Stica, and we Apiana [*i.* the Muscadell] and of another named Scirpula: the which haue been suf-

fered

20030
copy 1

A fered a long time to hang in the Sunne vpon the Vine vntill they be ſcorched and parched; or elſe ouer the vapor of ſcalding oile. Some there be that make them of any ſweet grapes whatſoeuer, ſo that they be let to concoct before in the Sun, vntil they be white and drie, ſo farre forth, as little leſſe than half of their weight be conſumed: which done, they ſtamp them and ſo gently preſſe them. Then looke how much liquor they haue preſſed foorth, ſo much pit water they put to the cake that is preſſed, that thereof they may haue a cuit of a ſecond running. But they that be more curious & take vpon them to make a daintier cuit, dry the grapes in maner aforeſaid, but they take forth the ſtones and graines within: they ſtrip them alſo from the ſteeles and railes that they hung by: and ſo after they be well drenched and infuſed in ſome excellent wine vntill they be ſwelled and plumpe, they preſſe them. And certainly this faſhion is ſimply the beſt of all others. Put to the cake thereof, water as before, and after the ſame manner yee ſhall
B haue a cuit of a ſecond ſort. Now there is a kind of wine which the Greeks call Aigleuces, that is to ſay, alwayes ſweet like new wine, of a middle nature between the common ſimple wine and the ſweet: and this commeth not vnto it by kind, but by heed taken in the boiling; for it is not ſuffered to ſeeth and work: and this is the term, whereby is ſignified the alteration of new Muſt into wine. To hinder therfore that it work not, (as naturally it will) they haue no ſooner tunned or filled it out of the Vat, but immediatly they douſſe the veſſels full of new Muſt in the water, and let them there continue till mid-December be paſt, and that the weather be ſetled to froſt and cold, and likewiſe the time expired of the working within the ſaid veſſells. Moreouer, there is another kind of wine naturally ſweet, which in Prouance and Languedoc is called Dulce [i. ſweet] & namely, in the territorie of the Vocontians. For this purpoſe they let the grapes hang
C a long while vpon the Vine, but firſt they wryth the ſteele that the bunch hangs to. Some make inciſion into the very Vine branch, as far as to the pith and marrow within (to diuert the moiſture that feeds the grape:) others lay the cluſters a drying vpon tile-houſes: and all this is done with the grapes of the Vine Heluenaca. There be that range in a ranke of theſe ſweet wines, that which they cal Diacyton. For which effect, they drie the grapes againſt the Sun (howbeit in a place well encloſed) for 7 daies together, vpon hardles, 7 foot likewiſe from the ground: in the night ſeaſon they ſaue them from all dewes, and ſo on the eight day they tread them in the wine preſſe: and thus they draw forth a wine of an excellent ſauor and taſt both. A kind of theſe ſweet wines, is that which they name Melitites, [in manner of a Braget, Meade, or Metheglin.]
D Howbeit, different it is from the mead or honied wine which the Latines call Mulſum, made of old wine that is hard, and a little honie: whereas the foreſaid Melitites conſiſts of 5 gallons of new tart wine ſtill in the verdure, whereto is added one gallon of honie, and a *cyath of ſalt, and ſo boiled all together. But I muſt not forget to place among theſe ſundry kinds of drinke, the liquor Protropum, for ſo ſome call new wine running it ſelf from the grapes, before they be troden and preſſed. But to haue this good, and ſo to ſerue the turne, ſo ſoon as it is put vp into proper veſſells for the purpoſe, it muſt be ſuffered to work: and afterwards to reboile and work againe for fortie daies ſpace the Summer following, euen from the very beginning of the dog daies, and ſo forwards

*an ounce and a halfe.

E

Chap. X.

¶ *Of weake and ſecond Wines, three kinds.*

THe ſecond wines, which the Greeks call Deuteriæ, *Cato* and we Romans name Lora) cannot properly and truly be called Wines, being made of the skins and ſeeds of grapes ſteeped in water: howbeit, reckoned they are among courſe houſhold wines for the hines and meinie to drinke. And three kinds there be of them. For ſomtime to the tenth part of the new wine that hath beene preſſed out, they put the like quantity of water, and ſuffer the foreſaid refuſe of the grapes to ſoke therin a day and a night: which done, they preſſe it forth againe. A ſecond ſort there is, which the Greeks were wont to make in this manner: They take a third part
F of water in proportion of the wine that was preſſed forth, and after a ſecond preſſing, they ſeeth it to the waſting of the third part. The third is that which is preſſed out of the wine lees, and this *Cato* cals Phœcatum, [i. Wine of lees.] But none of theſe wines or drinks will endure aboue one yeare.

G

Chap. XI.

¶ *What neat wines began of late to be in requeſt in Italie.*

IN this treatiſe of wines I cannot omit this obſeruation: That whereas all the good wines, properly ſo called and known in the whole world, may be reduced in fourſcore kinds or therabouts; two parts of three in this number, may well be counted wines of Italie: which in this regard farre ſurpaſſeth all other nations. And hereupon ariſeth another thing more deepely to be noted, That theſe good wines were not ſo rife nor in ſuch credit from the beginning, as now they be.

H

Chap. XII.

¶ *Obſeruations touching wine.*

TO ſay a truth, Wines began to grow in reputation at Rome, about ſixe hundred yeares after the foundation thereof, and not before. For king *Romulus* vſed milk when he ſacrificed to the gods, and not wine: as may appeare by the cerimonial conſtitutions by him ordained, as touching religion; which euen at this day be in force, and are obſerued. And king *Numa* his ſucceſſor made this law Poſthumia in his later daies, *Let no man beſprinckle the funerall fire with wine.* Which edict no man doubteth, but he publiſhed and enacted in regard of the great want and ſcarſitie of wine in thoſe daies. Alſo by the ſame Act he expreſſely did prohi-
I
bite to offer in ſacrifice to the gods, any wine comming of a Vine-plant that had not beene cut and pruned: intending by this deuiſe and pretence of religion, to enforce men to prune their Vines, who otherwiſe would ſet their minds on husbandrie only and plowing ground for corne, and be ſlow enough in hazarding themſelues for to climbe trees, whereunto Vines were planted. *M. Varro* writeth, That *Mezentius* the king of Tuſcane aided the Rutilians of Ardea in their warres againſt the Latines, for no other hire and wage but the wine and the vines which then were in the territorie of Latium.

Chap. XIII.

¶ *Of the ancient vſage of wine: and the wines in old time.* K

IN ancient time, women at Rome were not permitted to drink any wine. We read moreouer in the Chronicles, That *Egnatius Mecennius* killed his owne wife with a cudgell, for that hee tooke her drinking wine out of a tun; and yet he was cleared by *Romulus*, and acquit of the murder. *Fabius Pictor* in his Annales reports, That a certaine Romane dame, a woman of good worſhip, was by her owne kinsfolke famiſhed and pined to death, for opening a cupbord, wherein the keis of the wine-ſellar lay. And *Cato* doth record, that hereupon aroſe the manner and cuſtome, That kisfolk ſhould kiſſe women when they met them, to know by their breath whether they ſmelled of Temetum: for ſo they vſed in thoſe daies to tearme Wine: and thereof drunkenneſſe was called in Latine Temulentia. *Cn. Domitius* (a judge in Rome) in the like caſe pro-
L
nounced ſentence judicially againſt a woman defendant, in this forme, *That it ſeemed ſhe had drunke more wine without her husbands knowledge, than was needfull for the preſeruation of her health*, and therefore afterward definitiuely, That ſhe ſhould loſe the benefit of her dowrie. Certes, the Romanes for a long time made great ſpare of wine. *L. Papyrius* lord Generall of the Romane armie, when he was at the point to joyne battell with the Samnites, made no other vow, but this, That he would offer vnto *Iupiter* a little cup or goblet of wine, in caſe he atchieued the victorie and woon the field. Ouer and beſides, we find in hiſtories, that among donatiues and preſents, certaine ſextars or quarts of milke haue beene many times giuen, but neuer any of wine. The fame *Cato* abouenamed, after his voiage into Spain (from whence he returned with a notable victorie, and in a triumphant manner) in a ſolemne ſpeech that hee made vnto the people,
M
proteſted in theſe words and ſaid, *No other wine I haue drunke ſince I went, than the very marriners haue.* How farre vnlike was he to men in theſe daies, who ſitting at the table, haue their cup of ſtrong wine by themſelues, and giue vnto their gueſts, for the moſt part, other ſmall wines to drinke: or if they ſuffer them to drinke all one and of the beſt at the beginning of the feaſt, they will

20030
copy 1

A will be ſure to change and to ſerue them with worſe ſoon after. In old time, the beſt wines vſed at feaſts were aromatiſed and ſpiced with ſweet Myrrh, as appeares in the Comedie of *Plautus*, entituled Perſa. And yet it ſhould ſeeme there, that ſweet Calamus was to be added beſides. And hereupon it commeth, that ſome haue thought, how our forefathers in times paſt tooke moſt delight in ſuch ſpiced cups and Ippocras wines. But *Fabius Dorſenus* the Poet ſufficiently declareth and decideth this point in theſe verſes, when he ſaith,

Mittebam vinum pulchrum, Murrhinum.

I ſent neat wine,
Which hight Myrrhine.

B And againe in his Comedie *Achariſtio*:

Panem & Polentam, vinum Murrhinam.

Both bread and grewell I did preſent,
And Myrrhine wine of pleaſant ſent.

I ſee moreouer, that *Scævola*, *Lælius*, and *Atteius Capito* were of the ſame mind. For in the Comedie of *Plautus* entituled *Pſeudolus*, thus it is written:

Quod ſi opus eſt vt dulce promat
Indidem, ecquid habet? (Char.) *Rogas?*
C *Murrhinam, paſſum, Defrutum, mella.*

Of dulcet wine if there be need,
What hope is there from thence to ſpeed?
Char. Why aske you that? he furniſh'd is
With Murrhin, Cuits, and Meade ywis.

By which a man may ſee euidently, that Murrhina was not onely counted a wine, but reckoned alſo among the ſweet and delicate wines.

D

Chap. XIIII.

¶ *Of wine ſtore-houſes: and of Opimian wine.*

THat there were wine ſellars at Rome, and that they vſed there to tun vp Wine in the 633 yeare after the foundation thereof, appeareth plaine by a good proofe of the Opimian wine: and euen in thoſe daies Italy knew her owne good, and what it was to maintaine vineyards. Howbeit, as yet were not thoſe wines in credit, which now are ſo rife and in ſo great account. And therfore it is, that all the wines of that time bear the only name of that one Conſull, and be called Opimian. And thus afterwards alſo in proceſſe of time, the wines that came from beyond the ſeas for a long ſpace, were in much requeſt, euen vntil our grandfathers daies:
E yea, and after that, the Falern wines were in name and called for, as may appeare by that Verſe of the Comicall Poet;

Quinque Thaſij vini inde depromam, Falerni bina.

To meaſures fiue of Thacian wine,
I will draw twain of Falerne fine.

In the 675 yeare after the foundation of Rome, *Pub. Licinius Craſſus*, and *L. Iulius Cæſar*, Cenſors for the time being, publiſhed an Edict, and proclaimed, *That no man ſhould ſell any Greek*
F *wine, or Aminean, but after eight Aſſes the Amphor or Quadrantum.* For theſe be the verie expreſſe words of the ſaid Edict. Now was Greeke Wine of ſo great price and eſtimation, that a man was but allowed one draught thereof at a meale, were the cheare neuer ſo great, and the feaſt right ſumptuous. But what wines were in requeſt ordinarily at the boord, *M. Varro* doth ſhew in theſe words: *L. Lucullus* (quoth hee) while he was a boy, neuer ſaw at his fathers bord

Greeke

Greeke wine ſerued vp but once at a meale, how good ſoeuer the fare was otherwiſe. Howbeit, himſelfe when he returned out of Aſia, in a congiarie or largeſſe that he gaue vnto the people, made a dole and diſtribution of more than an hundred thouſand meaſures of gallons apiece. *C. Sentius*, whom of late daies we ſaw Pretor of Rome, teſtified, that he neuer ſaw any wine of Chios brought into his houſe, before the Phyſition preſcribed and ſet it down for the *Cardiaca paſſio*, or the trembling of the heart, whereto he was ſubiect. But contrariwiſe *Hortenſius* when hee died left aboue ten thouſand barrels full of that Wine vnto his heire. And thus much out of *M. Varro*.

Chap. XV.

¶ *Of Cæſars bountie and liberalitie in Wine.*

BVt what ſhould we ſay of *C. Iulius Cæſar* Dictator? In that ſolemne feaſt of his which hee made at his triumph, did not he diſtribute among his gueſts Falerne wines by whole barrels, and Greek wine of Chios by the rundlets? After his returne out of Spain with victorie and triumph, he likewiſe gaue away a largeſſe of wine as well Chian as Falern. But at the royall dinner which he made when he entred vpon his third Conſulſhip, he cauſed all the Hall to be ſerued thorowout with Falern, Chian, Lesbian, and Mamertine wines: which was the firſt time that euer any man ſaw the ſeruice of 4 ſeuerall wines at one feaſt. Now in farther proces of time, and namely about 700 yeares after Rome cities foundation, all other Wines began to beare a name and come in requeſt.

Chap. XVI.

¶ *Of Artificiall or made Wines.*

COnſidering all that hath bin written, I nothing maruel at ſuch an infinite number of compound and artificiall wines deuiſed in old time, all for the vſe of Phyſick, wherof we will now treat in more ample maner. To begin therefore with wine-Verjuice, called Omphacium, how it ſhould be made, for perfumes and odoriferous ointments, we haue ſhewed in the former booke. As for the wine named Oenanthinum, it is made of Labruſca, that is to ſay, the wild Vine, in this wiſe: Take two pound of the floures of the wild vine aforeſaid, let the ſame be ſteeped in a meaſure of new wine containing about 12 *gallons, for the ſpace of 30 dayes, and then be changed out of that veſſell into another. Moreouer, the root and grapes of the ſayd wild Vine are good for curriers to dreſſe their leather. The ſame grapes a little after they haue done blooming are taken to be a ſingular remedie for to coole thoſe that be troubled with hot and ardent diſeaſes, for naturally they be, as men thinke, exceeding cold: and indeed many of theſe grapes die in the hot time of Summer before the reſt which are called Solſtitiales: but all of them neuer come to full and perfect ripeneſſe. Now if you would keep Pullein from pecking grapes, take theſe of the wild Vine before they be throughly ripe, mingle and ſeeth them with their meat: for this will take away all their appetite that way, and breed a loathing after all grapes.

*12 congios.

To come now vnto the artificiall wines beforenamed: the firſt of them, namely that which they call Adynamon [*i.* without ſtrength] is made of very wine in this ſort: Take of new white wine 20 Sextars [*i.* quarts:] of water halfe as much: let them boile together vntill the meaſure of water beforeſaid be conſumed. Some take of ſea water ten Sextares, of raine water as much: and when they be mingled together, ſuffer them to worke in the hot Sun for the ſpace of fortie daies. This drinke they vſe to giue vnto patients, for ſuch maladies as they feare wine would be hurtfull to. A ſecond made wine there is called Millet Wine, after this ſort: Take of Millet ſeed that is ripe, huske, head, and all, a pound and a quarter, put it into two gallons of Muſt, or new wine: after that it hath lien there infuſed ſeuen moneths, let the liquor run from it into another veſſell, and keepe it for your vſe. As touching the wines of Lotus, as well the tree and ſhrub, as the herbe, we haue ſhewed ſufficiently how they ought to be made. Moreouer, there be many wines made of ſundry fruits, which we will write of hereafter more at large: with a ſupplement and addition of ſuch interpretations only as be neceſſarie. And in the firſt place commeth the date wine, which the Parthians, Indians, and all the Nations of the Eaſt in generall

20030
copy 1

A nerall do ordinarily vſe. A Modius or pecke of ripe and ſweet dates, which they call Chideæ, they let lie to ſteep in 3 gallons of water, and ſo preſſe for a liquor for the Date wine. Alſo the Fig-wine Sycites, of the fig which ſome cal Palmiprimum (as a man would ſay, Dates fellows, or next to Dates) others Catorchites, is made after the ſame faſhion. But if a man liſt not to haue it ſo ſweet, in ſtead of water they vſe to put ſo much of the ſtones, skins, & ſeeds of grapes. Of the Fig of Cypres there is an excellent Vinegre made, yea and a better than it of the Alexandrine Figs, to wit, growing vpon the Sycomore. Likewiſe a wine is made of the fruit in Syria called Siliquæ; as alſo of peares and all kind of apples. As for the wine of Pomegranates, the Greeks name it Rhoites: beſides the fruit of the Corneil or wild Cherry tree, Medlars, Seruices, dry Mulberries, and Pine-nuts, doe yeeld ſeuerall ſorts of wine. As for thoſe pine nuts,
B they muſt lie ſteeped in new wines, before the wine be preſſed out of them. The reſt all be pleaſant enough of themſelues, and will ſerue alone for to make wines. The maner of making Myrtle wine, according to the receit and preſcription of *Cato*, we will declare ſoon hereafter. For the Greekes haue another way of their owne, to wit, when they haue ſodden in white Muſt or new wine the tender branches of the Myrtle, together with the leaues, and then ſtamped the ſame, they put a pound thereof in three gallons more of Muſt, and cauſe it to boile vntill ſuch time as a third part of the wine be conſumed. Now that which is made after the ſame maner of the wild Myrtle berries, they call Myrtidanum; and this will colour and ſtaine ones hands blacke.

Furthermore, the herbs of the garden do afford vs many wines, namely Radiſh, Sperage, Sa-
C vory, & Majoran, Origan, Smallach ſeed, Southernwood, wild Mints, Rue, Nep, or Calaminth, running Thyme, or Horehound. To make theſe wines, take of the herbes aboueſaid two handfulls, and when they be ſtamped, put them into a little barrell of new Wine containing twelue or thirteen gallons, together with a wine quart of Cuit ſodden to the thirds, and a pint of ſea-water. But for the wine of Navews, you muſt take eleuen drams of them, and two quarts of new wine, and ſo put them together in maner aforeſaid. In like ſort alſo the wine Squilliticum is made of the root of Scilla, or the ſea Onion.

To proceed vnto wine made of floures, you haue firſt and formoſt wine Roſat, after this man-
ner: Take the weight of 40 deniers [*i.* fiue ounces] of Roſe leaues well ſtamped, put them into a linnen cloth, together with a little weight, that they may ſettle downward, & not flote aloft;
D let them hang thus in 20 Sextars [*i.* three gallons] and two wine quarts of Muſt; keep the veſſell cloſe ſtopped in any caſe for 3 moneths, then open it and ſtrain the ſaid floures vnto the liquor. In like maner is there a wine made of the Celtick Spikenard, as alſo of the Nard ſauage. I find alſo, that they vſe to make a kind of ſpiced wine or Ipocras, not for ſweet perfumes and ointments only, but alſo for to drinke. At firſt (as I haue ſhewed) they made theſe aromaticall wines with myrrh only, but ſoone after they added thereto Nard Celticke, ſweet Calamus, and Aſpalathus, either ſlicing theſe drugs, or putting them by gobbits into new Muſt or ſome dulcet wine. Some aromatiſe their wine with Calamus, Squinanth, Coſtus, Spikenard, Amomum, Caſia, Cinamon, Saffron, Dates, and Azara-bacca, put therto in like maner by gobbets. Others take Spikenard and Malabathrum, of each halfe a pound to two gallons of new wine. Much af-
E ter the ſame maner we ſpice our wines now adaies alſo, but that we adde pepper and hony therto: which ſome call Condite, others Pepper wines. Moreouer, there is deuiſed a Wine called Nectarites, made of Elecampane, named by ſome Helenium, of others Medica, Symphyton, Idæa, Oreſtion: and there be alſo that term this herb Nectarea. Now the order of it is to take of the root forty drams, to ſix Sextars of Muſt or new wine, and hang it in a cloth together with a weight in maner aboue ſaid. Moreouer, there be wines made of other herbs, to wit, of wormwood, in this ſort: Take of Ponticke Wormwood one pound, ſeeth it in forty Sextars [about ſix gallons and a halfe] of new Wine, vntill a third part be conſumed: or without boiling, put certain handfulls or bunches thereof into a veſſell of Wine, and ſo let it lie infuſed. After the
F ſame ſort is Hyſſop wine made, to wit of three ounces (which is a quarter of a pound) of Cilician Hyſſope caſt whole as it is into two gallons of Muſt, and ſo let them worke together: or elſe ſtampe the Hyſſop, and ſo put it into wine. But both theſe wines are made another maner of way, namely by ſowing or ſetting wormwood & Hyſſop at the very root of the Vine-plant: for ſo *Cato* teacheth vs to make Ellebore wine, of blacke Ellebore or Beare-foot growing at the Vine root. And in like maner alſo is made the Scammonite wine. A wonderfull nature and

propertie theſe vines haue,to draw and ſucke into them the very taſte of other herbs and plants that are ſet neere vnto them: for euen ſo all the grapes about Padua haue a relliſh of the Willows and Oſiers that grow there in the mariſh grounds. Thus the men of Thaſos do plant and ſow either Ellebore,or wild Cucumber,or els Scammonea,about their Vines,to make thereof their diuelliſh wine Pthorium,ſo called,becauſe it cauſes a ſleep,and procures vntimely birth. Of more herbs beſides there be other wines made,the vertues of which herbs we wil ſet downe elſewhere in place conuenient: and namely of Stœchos, the root of Gentian, of Tragoriganum,of Dictamum,Aſarabacca,of Daucus,or yellow Carot,Sauge,Panace,Acorus, or Galangal,Conyza,or Cunilago,Thyme,Mandragoras, and Squinanth. More ſuch wines there were yet,which the Greeks called Scyzinum,Itæomelis, and Lectiſpagites; but as they be growne now out of vſe,ſo the manner of making is vnknown. G H

As touching wines made of trees & ſhrubs,their maner was to ſeeth the berries of the green wood of both the Cedars,the Cypres,the Bay,Iuniper,Terebinth,Pine,Calamus,and Lentisk, in new wine. In like maner,the very ſubſtance of Chamelæa,Chamæpithys, and Germander. Laſt of all,the floures alſo of the ſaid plants ſerue to make wines,namely,by putting into a gallon of new wine in the vat,the weight of ten deniers or drams of the floures.

Chap. XVII.

¶ *Of Hydromel and Oxymel,* [i.*Honied water, and Honied vineger.*]

THere is a wine called Hydromel,made of water and hony onely: but to haue it the better, ſome do preſcribe rain water,and the ſame kept fiue yeares for that purpoſe. Others who are more wiſe and skilfull herein,do take raine water newly fallen,and preſently ſeethe it vntill a third part be boiled away: then they put therto a third part alſo of old hony in proportion to it: and ſo let them ſtand together in the Sun for forty daies together, from the riſing of the Dog-ſtar. Others,after they haue remained thus mingled and incorporate together ten daies,put it vp & reſerue it cloſe ſtopped,for their vſe; and this is called Hydromel,which being come to ſome age hath the very taſt of wine, & no place affords better than Phrygia. I

Moreouer,Vineger was wont to be tempered with hony, [See how curious men haue bin to try concluſions in euery thing!] which they called Oxymel; and that in this manner: *Recipe,* of hony ten pounds or pints: of old vineger fiue pints; of ſea ſalt one pound;of rain water fiue Sextares[*i.*a gallon within one quart:]boile them al together at a ſoft fire,vntil they haue had ten plawes or walmes: which done,poure them out of one veſſell into another,and ſo let the liquor ſtand and ſettle a long time vntil it be ſtale. All theſe wines & compoſitions thus brued, *Themiſon* (an Author highly renowned) hath condemned and forbidden expreſſey to be vſed. And to ſay a very truth,it ſeems that the vſe of them was neuer but in caſe of neceſſity: vnleſſe a man would beleeue and ſay,that Ipocras,ſpiced wines,& thoſe that be compounded of ointments,are Natures work; or that ſhe brought forth plants and trees to no other end, but that men ſhould drink them down the throat. Howbeit,the knowledge ſurely of ſuch experiments be pleaſant and delectable vnto men of great wit and high conceit, whoſe noble ſpirits cannot be at reſt,but euer inuentiue and ſearching into all ſecrets. Now to conclude this point,certain it is and paſt all queſtion,that none of all theſe compoſitions, vnles it be thoſe which come to their perfection by age and long time, will laſt one yeare full out, nay moſt of them will not keep good one moneth to an end. K L

Chap. XVIII.

¶ *Certaine ſtrange and wonderfull ſorts of wine.*

WIne alſo hath prodigious and miraculous effects: for, by report, in Arabia there is a wine made,which being drunk will cauſe barren women to beare children; and contrariwiſe driue men into madnes. But in Achaia principally about Carynia,the wine makes women fall into vntimely trauell: nay if a woman great with childe do eat but the verie grapes, they will ſlip the fruit of their wombe before their time: and yet both grape and wine differ not in taſt from others. They that drinke the wine comming from the cape Trœzen,ate thought vnable for generation. It is reported,that the Thaſiens do make two kinds of wine of M

contrarie

20030
copy 1

A contrarie operations; the one procures ſleep, the other cauſeth watching. Among them there is a vine called Theriace, the grape whereof, as alſo the wine, cureth the ſtings and biting of ſerpents, as it were a moſt eſpeciall Treacle. As for the vine Libanios, it carrieth the odour and ſmell of Frankincenſe, and therefore is vſed in ſacrifices to the gods. But contrariwiſe another named Aſpendios is vtterly condemned for that purpoſe, and no wine thereof is imployed at the altar: they ſay alſo that no fowle will touch the grapes thereof. There is a kind of grape in Egypt which they call Thaſia, exceeding ſweet it is, and looſeth the belly. But contrariwiſe there be in Lycia that binde as much and cauſe coſtiueneſſe. The grapes Ecbolides in Egypt if they be eaten, cauſe women with child to be deliuered before their time. Some wines there be that as they lie in the very cellar will turn and proue ſoure about the riſing of the Dog-ſtar; but afterward wil recouer their verdure and become quick and freſh again. In like maner there
B be wines which vpon the ſea will change: howbeit the agitation thereof cauſeth thoſe Wines which endure it to the end to ſeem twice as old as they be indeed.

Chap. XIX.

¶ *What Wines they be that may not be vſed in ſacrifices: and what waies there are to ſophiſticate new wines.*

FOraſmuch as our life ſtands much vpon religion and diuine ſeruice, wee are to vnderſtand, That it is held vnlawfull to offer vnto the gods before ſacrifice, the Wine of any vine that hath not bin cut and pruned; or that hath bin ſmitten or blaſted with lightening, or ſtan-
C ding neere to a jebbit or tree whereon a man hath hanged dead; or the grapes whereof haue bin troden by men whoſe legs or feet haue been wounded; neither is that wine allowable for this purpoſe, which hath bin preſſed and run from the refuſe of grape ſtones and skins once bruiſed and cruſhed in the preſſe; or laſt of all, if the grapes haue bin filed by any ordure or dung fallen from aboue thereupon. Moreouer, Greeke Wines are reiected from this holy vſe becauſe they haue water in them. Furthermore, the vine it ſelf is holden good to be eaten, namely, when the burgens and tendrils be firſt ſodden, and afterwards preſerued and kept in vineger, brine, or pickle. Ouer and beſides, it were very meet and conuenient to ſpeake alſo concerning the manner of preparing and ordering of wine, ſeeing that the Greeks haue trauailed in that point ſeuerally, and reduced the rules belonging therto, into the form of an Art; and namely, *Euphronius*,
D *Ariſtomachus*, *Coniades*, & *Hiceſias*, are therein great profeſſors. The Africans vſe to mitigate and allay the tartneſſe of their wines with plaſtre, yea and in ſome parts of their country with lime. The Greeks contrariwiſe do fortifie and quicken them with clay, with pouder of marble, with ſalt or ſea water: and in ſome places of Italy they vſe to the ſame effect, the ſhauings and ſcrapings of ſtone-pitch. Alſo it is an ordinary thing in Italy and the prouinces thereto confining, for to condite their new wines & to ſeaſon them with roſin: yea and in ſome places they mingle therewith the lees of other old wine or vinegre. Oftentimes alſo they make ſliber-ſauces of it ſelfe without any other mixture; namely, when they boile new wine ſufficiently to the proportion of the ſtrength, vntill the hardneſſe do euaporate, and that it wax mild and ſweet: but being thus ordered, it will not laſt, they ſay, aboue one yere. In ſome countries they vſe to ſeeth
E their new wine to the conſumption of a third part, and make it Cuit, with which they are wont to delay the ſharpnes and ſtrength of other wines, & make them pleaſant. But both in this kind of wine and in all other, the veſſels ought to be prepared for the purpoſe, & ſeaſoned with pitch: the treatiſe of which we will put off vnto the next booke, where we purpoſe to treat thereof, and the manner of making it.

Chap. XX.

¶ *Of diuers kinds of Pitch and Roſins: the manner of the ſeaſoning and confecture of new Wines. Alſo of Vineger and ſalt.*

F

AMong trees that yeeld from them a liquid ſubſtance, ſome there be in the Eaſt countries, and others in Europ, which ingender Pitch and Roſin. Aſia likewiſe between both, hath of either ſide it ſome ſuch trees. As for the Eaſt, the Terebinths put out Turpentine, the beſt and cleereſt Roſin of all others: next to them, the Lentiskes alſo haue their Roſin, which

they call Maſtick. After which, the Cipres brings forth a third roſin, but it is of a moſt ſharpe G
and biting taſte. All theſe trees (I ſay) carry roſin only, and the ſame thin and liquid: but the
Cedar ſendeth forth a thick ſubſtance, and good to make pitch & tar. As for the roſin or gum
Arabick, it is white in colour, ſtrong of ſmell, vntoward and troubleſom to him that ſhall boile
it. That of Iury is harder, yea, and of a ſtronger ſauor than Turpentine. The Siriack gum reſem-
bleth the hony of Athens. The Cyprian excelleth all others: of a fleſhy ſubſtance it is, & like
in colour to hony. The Colophonian is deeper of colour, and reddiſh: beat it to pouder in a
mortar it proueth white: but it carieth a ſtrong ſmel with it, which is the reaſon that the per-
fumers and makers of ointments haue no vſe thereof. As for that which the pitch trees of Aſia
do yeeld, it is paſſing white, and the Greeks call it Spagas. All roſins generally will diſſolue in
oile. Some think verily, that Potters clay will likewiſe do the ſame. But I am abaſhed & aſha- H
med to report, how in theſe daies the ſame pitch whereof we ſpeake, ſhould be in ſo great ac-
count as it is, for making of pitch plaiſters, to fetch off the haire of mens bodies, & all to make
them more ſmooth and effeminat. Howbeit, the maner of ſeaſoning new Muſt therewith (that
when it is perfect wine, it may ſmell of pitch, and bite at the tongues end) is to beſtrew it with
the pouder of pitch at the firſt working, the heate whereof is commonly paſt and gone in nine
daies. And ſome think that the wine will be the ſtronger, if the raw and green floure of the Ro-
ſin, as it iſſueth freſh out of the tree, be put therein; for it will quicken a ſmall and weak wine.
Now this mixture and medicine of wine [called Crapula] made thus of roſin, hath contrary ef-
fects: for if the wine be ouer-heady and ſtrong, it allaieth & mortifieth the hurtful force ther-
of: but if it be too weak, or drink dead & flat, it reuiueth againe, and giueth it a ſtrong taſte. In I
Liguria, and principally along the Po, they vſe to ſeaſon their wines, and bring them al to their
ſeuerall perfections in this maner. If the wine when it is new be mighty and ſtrong, they put in
the more of this medicine or confection called Crapula: if it be mild and ſmall, then the leſſe
goes into it: and keeping this gage with their hand, they make both good. Some would haue
one wine brued with another, the weaker with the ſtronger, and ſo (forſooth) there muſt needs
ariſe a good temperature of both together: and verily there is not a thing in the world againe
which hath in the nature thereof ſo great varietie.

In ſome countries, if new wine worke of it ſelfe a ſecond time, it is thought to be a fault and
means to corrupt it: and indeed vpon ſuch a chance & vnhappy accident, it loſeth the verdure
and quick taſt: whereupon it gets the name of Vappa, and is clean turned to be dead or ſoure: in K
which regard alſo we giue a man that name by way of ſcorne and reproch, calling him Vappa,
when he is heartleſſe, void of reaſon and vnderſtanding. If it were vineger indeed it were ano-
ther matter: for ſurely though wine degenerate into it by way of corruption and putrefaction,
yet a vertue and force it hath good for many ſpeciall vſes, and without which it were not poſſi-
ble to liue ſo delicatly at our table as we do. Moreouer, the world is ſo much giuen to keepe a
bruing, tempering, and medicining of wines, that in ſome places they ſophiſticate them with
aſhes, as it were with plaiſter: in other, they fortifie, recouer, and make them againe by ſuch de-
uiſes as are before ſpecified. But to this purpoſe they take the aſhes to chuſe, of vine cuttings,
or of the oke wood, before any other. And forſooth if there be occaſion to occupie ſea water
for this purpoſe, they preſcribe them to fetch ir far from land in the deep ſea; & kept alſo from L
mid-March or the Spring Equinox, or at leaſtwiſe from mid-Iune, or ſummer Sunne-ſtead, and
drawn in the night, & when the North wind blowes: but if it be got neere the time of vintage,
then it ought to be wel boiled before it wil ſerue the turn. As for the pitch in Italy, that of Bru-
tium or Calabria is reputed for the beſt, to trim thoſe veſſels which are to keep wine. There is
made of the roſin of the tree Picea (as alſo in Spain there comes from the wild Pines) a certain
pitch which is the very worſt; for the roſin of thoſe trees is bitter, dry, & of a ſtrong ſauor. The
difference and ſundry kinds of pitch, as alſo the manner of making the ſame, we will declare in
the booke next following, in the treatiſe of wild and ſauage trees. The faults and imperfections
of pitch, ouer and beſides thoſe euen now rehearſed (to wit, bitternes, drynes, & ſtrong ſent) are
known by the ſourneſſe, ſtinking ſmoke, and the very aduſtion thereof. But ye ſhall know good M
pitch by theſe experiments, if the pieces broken from it do ſhine, if between the teeth it relent
and be clammy like glew, and haue a pleaſant ſharpnes and ſoure taſt withall of the vineger. In
Aſia the pitch is thought beſt which comes of the trees in mount Ida. The Greeks eſteem the
trees of the hil Pieria chief for this purpoſe: and *Virgil* commends that of Narycia before all.

But

20030
copy 1

A But to returne againe to our brewing and ſophiſtication of wines, they that would ſeeme to be cunninger, or at leaſtwiſe more curious than their fellowes, do mingle therwith blacke Maſticke, which is engendred in Pontus, and is like to Bitumen; and therto adde the root of Iris or the floure de luce, and oile. For this is found by experience, That if the veſſells be ſered with wax, the wines therin will not hold, but turne ſoure quickly. Moreouer, we daily ſee, that better it is to put vp wine into thoſe veſſels, wherin vinegre hath been kept afore, than into ſuch as had dulcet or homied wine. *Cato* ſets downe a receit to trim and concinnate wine (for that is the very tearme which he vſes) in this manner: Take of lie aſhes ſodden with cuit boiled to the halfe; one fortieth part, temper it with a pound and a half of penniroyall, or ſalt: and otherwhiles with marble braied & beaten into pouder among. He makes mention alſo of brimſtone, but roſin he
B names with the laſt. But aboue al he wills to refreſh and renue the wine when it now begins to come to maturity and perfection, with new wine which he calls Tortivum; and I take it, that he means that which ran laſt out of the wine-preſſe: which he preſcribeth alſo to be put vnto new wines for to get them a freſher color, as the very tincture of wine: and ſo it wil be alſo of a more fattie ſubſtance, and goe down more glib and merrily. See, ſee, how many deuiſes of medicines and ſlibber ſauces the poore wine is forced to endure, and all to pleaſe our pallat, our eye, and other ſences: and yet ywis we marueil that it is ſo hurtfull to our bodies. Well, would you haue an experiment to know when wine is going, or enclining to be dead and ſoure; dip therein a thin plate of lead; if it change color, take it for a ſigne, that it is in the way of decaying. Of all liquors, wine hath this propertie to vinew, to pal, & into change in vinegre. But a thouſand me-
C dicines it doth affoord, and books of Phyſick are full thereof. Moreouer, wine-lees being dried, will ſerue as a match to keep fire: and without any other fewell to feed it, ye ſhall haue it burne and flame of it ſelfe. The aſhes thereof is of the nature of Nitre, and hath the ſame vertues: and in this regard ſomewhat more, for that it is found to be more fattie and vnctuous.

Chap. XXI.

¶ *Of wine-cellars.*

NOw when wine is made and tunned vp in maner aforeſaid, there is as great difference and diuerſitie in the beſtowing of it in cellars. They of Piemont about the Alpes, doe put vp
D their wines in woodden barrels, bound well with hoopes, for warmth: and moreouer, if the winter be very cold, they make fires in their cellars or butteries, to keep them for being frozen. I will tell you a ſtrange wonder, yet true and to be verified, not by heareſay but plaine eie ſight. There were ſeen vpon a time whole heaps & huge lumps of wine congealed into ice, by occaſion that the hoopes of the hogſheads burſt that contained the wine: and this was held for a prodigious token. For indeed wine of it owne nature will not congeale and freeze, only it will loſe the ſtrength, and become apalled in extremitie of cold. In warmer climats and more temperat, they fil their wines into great ſtands and ſteanes of earth, which they ſet into the ground, either ouer the head all whole, or elſe by halfe; deeper or ſhallower, according to the ſituation & temperature of the region. Likewiſe they giue the wine open aire in ſome places: whereas in other
E they keep it cloſe within houſe in tauernes and cellars. And thereto belong theſe and ſuch like rules. Firſt, that one ſide of the wine-cellar, or at leaſtwiſe the windows, ought to ſtand open to the North, or to the Eaſt in any wiſe, where the Sunne riſeth at the time of the Æquinoctiall. *Item*, that there be no muckhils nor priuies neer: no roots of trees, nor any thing of a ſtrong and ſtinking ſauor: for that wine is of this nature, to draw any ſmell very quickly into it: and aboue all, Fig trees (as well the wild as the tame) be hurtfull to wine-cellars. *Item*, as touching the order of placing the wine-veſſels, they ought to ſtand a pretty diſtance one from another: for fear of contagion, for that wine is alwaies moſt apt to catch infection very ſoon. Moreouer, it matters much of what proportion and faſhion the pipes, tubs, and ſuch veſſels be made. Thoſe with great bellies and wide mouths, are not ſo good. Alſo they muſt be nealed with pitch, preſently
F vpon the riſing of the dog-ſtar: afterwards douſed and waſhed all ouer either in the ſea or elſe ſalt water, then to bee ſeaſoned and ſtrewed with vine aſhes or cley, and being ſcoured, they ought to ſweeten them with a perfume of Myrrhe; which were good to be done alſo to the very cellars oftentimes. Furthermore, if the wines be weak and ſmal, they had need to be kept in tubs and hogſheads, let downe within the ground: but the ſtrong and mighty wines may lie aboue

ground in the open aire. Prouided alway, that wine veſſels be neuer filled top full: but the void G
part that is left, and ſtands aboue the wine, would be thoroughly dight with thicke wine made of withered grapes, or ſodden wine to the halfe, and ſaffron mingled withall, yea, and old pitch, together with cuit. Thus alſo ought the lids and bungs of the veſſels to be ordered, with an addition beſides of maſtick and pitch. In the deep of Winter they muſt not be vnſtopped and opened in any caſe, vnleſſe the weather be faire and cleare: Neither when the wind is Southerly, or the Moon in the full. This alſo is to be noted, that the floure or mantle which the wine caſts vp to the top, is good when it is white, if it be red, it is a very bad ſigne, vnleſſe the wine it ſelfe be of that color. Moreouer, if the veſſels be hote, or the lids do ſweat, it is no good ſigne. Note alſo, that the wine which ſoone begins to mantle and caſt vp a floure incontinently, or to veeld another ſmell than the own, wil not continue long good. As for the cuits, whether they be ſod- H
den to the half or the thirds, they ought to be boiled & made when the skie is without a Moon, that is to ſay, in the change, and vpon no day elſe. Moreouer, the decoction muſt be in leads, and not in coppers; with walnuts among to receiue al the ſmoke, which otherwiſe might infect the cuit. In Campaine they let their beſt wines lie abroad in veſſells, euen in the open aire, to take the Sun, the Moone, raine, and wind, and all weathers that come: and this is thought to bee beſt for them.

Chap. XXII.

¶ *Of auoiding Drunkenneſſe.*

IF a man marke and conſider well the courſe of our life, we are in nothing more buſie and I
curious, nor take greater paines, than about wine: as if Nature had not giuen to man the liquor of water, which of all others is the moſt wholſom drink, and wherwith all other creatures are wel contented. But we thinking it not ſufficient to take wine our ſelues, giue it alſo to our Horſes, Mules, and labouring beaſts, and force them againſt Nature to drink it. Beſides, ſuch pains, ſo much labor, ſo great coſt and charges we are at, to haue it, ſuch delight and pleaſure we take in it; that many of vs think, they are borne to nothing elſe, & can skill of no other contentment in this life: notwithſtanding, when all is don, it tranſports & carries away the right wit & mind of man, it cauſes fury and rage, and induces, nay, it caſts headlong as many as are giuen thereto, into a thouſand vices and miſdemeanors. And yet forſooth, to the end that we might take the more cups, and poure it downe the throat more luſtily, we let it run thorough a ſtrainer, for to a- K
bate and gueld (as it were) the force thereof: yea, and other deuiſes there be to whet our appetite thereto, and cauſe vs to quaffe more freely. Nay, to draw on their drinke, men are not afraid to make poiſons, whiles ſome take hemlocke before they ſit downe, becauſe they muſt drinke perforce then, or els die for it; others, the powder of the * pumiſh ſtone, & ſuch like ſtuff, which I am abaſhed to rehearſe and teach thoſe that be ignorant of ſuch leaudneſſe. And yet wee ſee theſe that be ſtouteſt and moſt redoubted drinkers, euen thoſe that take themſelues moſt ſecured of danger, to lie ſweating ſo long in the baines and brothel-houſes for to concoct their ſurfet of wine, that otherwhiles they are carried forth dead for their labour. Ye ſhall haue ſome of them again when they haue been in the hot houſe, not to ſtay ſo long as they may recouer their beds, no not ſo much as to put on their ſhirts: but preſently in the place, all naked as they are, L
puffing & laboring ſtill for wind, catch vp great cans and huge tankards of wine (to ſhew what luſtie and valiant champions they be) ſet them one after another to their mouth, pour the wine downe the throat without more adoe, that they might caſt it vp againe, and ſo take more in the place; vomiting or revomiting twice or thrice together that which they haue drunke, and ſtill make quarrell to the pot: as if they had been borne into this world for no other end but to ſpill and mar good wine: or, as if there were no way els to ſpend and waſt the ſame, but thorow mans body. And to this purpoſe, were taken vp at Rome theſe forreine exerciſes, of vaulting and dancing the Moriſk; from hence came the tumbling of wraſtlers in the duſt and mire together; for this, they ſhew their broad breaſts, beare vp their heads, and carrie their neckes far backe. In all which geſticulations, what do they elſe but profeſſe that they ſeek means to procure thirſt and M
take occaſion to drink? But come now to their pots that they vſe to quaffe and drink out of: are there not grauen in them faire pourtrais think you of adulteries? as if drunkenneſſe it ſelf were not ſufficient to kindle the heart of luſt, to pricke the fleſh, and to teach them wantonnes. Thus is wine drunke out of libidinous cups: and more than that, he that can quaffe beſt and play the drun-

* *Vide lib. 36. cap. 21.*

20030
copy 1

A drunkard moſt, ſhal haue the greateſt reward. But what ſhal we ſay to thoſe (would a man think it?) that hire one to eat alſo as much as he can drink, and vpon that condition couenant to yeeld him the price for his wine drinking, and not otherwiſe. Ye ſhall haue another that will inioine himſelfe to drinke euery denier that he hath won at dice. Now when they are come to that once and be throughly whitled, then ſhall yee haue them caſt their wanton eies vpon mens wiues; then fall they to court faire dames and ladies, and openly bewray their folly euen before their jealous and ſterne husbands; then (I ſay) the ſecrets of the heart are opened and layed abroad. Some ye ſhal haue in the mids of their cups, make their wils, euen at the very board as they ſit: others againe caſt out bloudy and deadly ſpeeches at randon, and cannot hold but blurt out thoſe words which afterwards they eat againe with the ſwords point: for thus many a man by a lauiſh tongue in his wine, hath come by his death and had his throat cut. And verily the world
B is now growne to this paſſe, That whatſoeuer a man ſaith in his cups, it is held for ſooth; as if Truth were the daughter of Wine. But ſay they eſcape theſe dangers: certes ſpeed they neuer ſo well, the beſt of them all neuer ſeeth the Sun-riſing, ſo drowſie and ſleepy they are in bed euery morning, neither liue they to bee old men, but die in the ſtrength of their youth. Hence comes it, that ſome of them looke pale, with a paire of flaggie blabd-cheekes; others haue bleared and ſore eies: and there be of them that ſhake ſo with their hands, that they cannot hold a full cup, but ſhed and poure it downe the floore. Generally they all dreame fearfully (which is the very beginning of their hell in this life) or els haue reſtleſſe nights: & finally, if they chance to ſleep (for a due guerdon and reward of their drunkenneſſe) they are deluded with imaginary conceits of *Venus* delights, defiled with filthy and abominable pollutions: and thus both ſlee-
C ping and waking they ſin with pleaſure. Well, what becomes of them the morrow after? they belch foure, their breath ſtinketh of the barrell, and telleth them what they did ouer night; otherwiſe they forget what either they did or ſaid, they remember no more, than if their memory were vtterly extinct and dead. And yet our iolly drunkards giue out and ſay, That they alone inioy this life, and rob other men of it. But who ſeeth not, that ordinarily they loſe not onely the yeſterday paſt, but the morrow to come? In the time of *Tiberius Claudius* the Emperor, about 40 years ſince, certaine out-landiſh Phyſitians and Monte-banks, who would ſeem to ſet themſelues out by ſome ſtrange nouelties of their own, & ſo get a name, brought vp at Rome a new deuiſe and order, to drink faſting, and preſcribed folk to take a good hearty draught of wine be-
D fore meat, and to lay that foundation of their dinner. Of all nations, the Parthians would haue the glory for this goodly vertue of wine-bibbing: and among the Greeks, *Alcibiades* indeed deſerued the beſt game for this worthy feat. But here with vs at Rome *Nouellius Torquatus* a Millanois, wan the name from all Romans & Italians both. This Lombard had gone through all honourable degrees of dignity in Rome, he had bin Pretor, and attained to the place of a Proconſull. In all theſe offices of ſtate he woon no great name: but for drinking in the preſence of *Tiberius*, three gallons of wine at one draught and before he tooke his breath again, he was dubbed knight by the ſyrname of *Tricongius*, as one would ſay, * The three gallon knight: and the Emperor, ſterne, ſeuere, and cruell otherwiſe though he was, now in his old age (for in his youthfull daies he was giuen ouermuch to *drinking of wine) would delight to behold this renowned and worthy knight, with great wonder and admiration. For the like rare gift and commendable
E qualitie, men think verily that *C. Piſo* firſt riſe; and afterwards was aduanced to the Prouoſtſhip of the city of Rome, by the ſaid *Tiberius*; & namely, for that in his court being now emperor, he ſat 2 daies and 2 nights drinking continually, and neuer ſtirred foot from the boord. And verily *Druſus Cæſar* (by report) in nothing more reſembled his father *Tiberius*, than in taking his drink. But to return again to noble *Torquatus*, herein conſiſted his excellency, That he did it according to art (for this you muſt take withall, there is an art of Drinking, grounded vpon certain rules and precepts.) *Torquatus* (I ſay) drank he neuer ſo much, was not known at any time to falter in his tongue, neuer eaſed himſelf by vomiting, neuer let it goe the other way vnder boord: how late ſoeuer he ſat vp at the wine ouer night, he would be ſure to relieue the morning watch
F & ſentinel. He drunk moſt of any man at one entire draught before the pot went from his head: and for ſmaller draughts beſides, he went before all other in number; his winde he neuer tooke while the cup was at his mouth, but iuſtly obſerued the rule of drinking with one breath; he was not known to ſpit for all this: & to conclude, he would not leaue in the cup, ſo much as would daſh againſt the pauement, & make the leaſt ſound to bee hard: a ſpecial point and preciſe law

to

* not the thrice gallant knight * Whereupon he was called *Biberius Mero*, for *Tiberius Nero*.

to preuent the deceit of thoſe that drinke for a wager. A ſingular glory no doubt in him, and a G
rare felicity. *Tergilla* challenged *M. Cicero* the younger, ſon to that *M. Cicero* the famous Orator,
and reproched him to his face, that ordinarily he drunk 2 gallons at once: and that one time a-
boue the reſt when he was drunke, he flung a pot at *M. Agrippa* his head. And truly this is one of
the fruits and feats of drunkenneſſe. But blame not young *Cicero*, if in this point yet he deſired
to ſurmount him that ſlew his father, *M. Antonius* I mean; for he before that time ſtrained him-
ſelfe, and ſtroue to win the beſt game in this feat, making profeſſion thereof, as may appeare by
a booke that he compiled and ſet forth with this title, *Of his owne drunkenneſſe*: wherein hee was
not aſhamed to avow and juſtifie his exceſſe and enormities that way: and thereby approoued
(as I take it) vnder pretence and colour of his drunkenneſſe, all thoſe outrages of his, all thoſe
miſeries and calamities that he brought vpon the whole world. This treatiſe he vomited and H
ſpued out a little before the battell of Actium, wherein he was defeated: whereby it may ap-
peare very plainly, that as he was drunken before with the bloud of citizens, ſo ſtill hee was the
more bloud-thirſty. For this is a property that neceſſarily followeth this vice, That the more a
man drinketh, the more he may, and is alwaies dry. And herein ſpake to good purpoſe a certain
Embaſſadour of the Scythians, ſaying, That the Parthians the more they drunke, the thirſtier
they were.

As touching the nations in the Weſt part of the world, they haue their drinks alſo by them-
ſelues made of * corn ſteeped in water, whereof they will drinke to the vtterance, and be drunk:
and namely in Spaine and France, where the manner of making the ſame is all one, howſoeuer I
they haue * diuers names: and in Spain they haue deviſed means that theſe drinks (Ale or Beer)
wil abide age, & continue ſtale. In Egipt likewiſe they haue inuented ſuch kind of drinks made
of corn: ſo that no part or corner of the world there is, but drunkenneſſe reigneth. And verily
theſe liquors howſoeuer they be named, they vſe to drinke entire as they bee, and made of the
very ſtrength of Malt: neuer delaying the ſame with water, as we do wines. But it may be ſayd,
That Nature hath endowed & inriched thoſe countries with abundance of corn, and therefore
they may wel do it. Oh how induſtrious we are to maintain our vices! There is a deuiſe found,
(would euer any man haue thought it?) how water alſo ſhould make men drunke. Two liquors
there be, moſt pleaſing and acceptable to mens bodies, wine within, & oile without. Both pro-
ceed from two ſpeciall trees, howbeit, of the twaine, Oile is neceſſary, and Wine may be better K
ſpared. And verily, men haue not bin idle in the making of good oile: howbeit, they haue beene
more addicted and giuen to make Wines for drink; as may appeare by this, that reckoning but
the generall kinds thereof, a man may find 195 ſorts of wine: but if a man would ſubdiuide and
deſtribute thoſe heads into their branches, he ſhould meet almoſt with twice as many: but of
Oyles there bee not ſo many kindes by farre. Whereof we purpoſe to treat in the booke next
following.

* *i.* Malt.

* Zythus and Curm, Ale and Beere.

Chap. I.

¶ *The natures of trees that beare Fruit.*

THere were no oliue trees grew in Italy, but vpon the coaſt ſide, and that within 40 miles of the ſea, about the 440 yere after the foundation of the city of Rome; if it be true that *Theophraſtus* ſaith, who was one of the moſt famous and renowned Authors among the Greeks. *Feneſtella* writeth moreouer, and affirmeth, that during the raigne of *Tarquinius Priſcus* (which was much about the 183 yeare from the foundation of the city of Rome) there were no Oliue trees at all to be found, either in Italy, Spaine, or Africke: whereas now at this day they are ſeene all Italy ouer, yea and be come as far as the regions beyond the Alps, euen into the mids and very heart of France and Spaine. Indeed, in the yeare after the foundation of Rome 505 (which was when *Appius Claudius*, the nephew of that great *Appius Claudius* ſyrnamed the Blind, and *L. Iunius* were Conſuls together) a pound of the oile was ſold for twelue Aſſes: and not long after (namely, in the 680 yeare) *M. Seius* the ſon of *Lucius* (one of the Ædiles Curule for the time beeing) brought downe the market ſo well, that a man might haue bought ten pound for one As; and at that price he ſerued the people of Rome throughout all that yeare. Leſſe cauſe therefore a man hath to maruell hereat, who knoweth how not paſt 22 yeares after that (namely when *Cn. Pompeius* was the fourth time Conſull) Italy was able to furniſh other nations and prouinces with oile of Oliues. *Heſiodus* alſo (who was eſpecially addicted to the ſtudy of husbandry, and of all things thought it moſt neceſſarie to be taught and publiſhed for the good of mankinde) wrote thus much concerning the Oliue, That neuer a man was knowne to that day for to haue gathered the fruit of that Oliue tree, which himſelfe had planted: ſo late of growth were thoſe trees in his time, and ſo ſlowly came they forward. But now adaies they come vp of kernels and ſtones ſet in plots of ground for the purpoſe: and being tranſplanted againe, they beare Oliues the ſecond yeare after. *Fabianus* ſaith, That Oliues loue not to grow either in the coldeſt or the hotteſt grounds.

Virgill hath ſet downe 3 kind of Oliues, to wit, Orchitæ [*i.* the great round Oliues:] Radij, [*i.* the long Oliues:) and thoſe which are called Pauſiæ. He ſaith moreouer, That the Oliue trees require no tending or dreſſing at all, and need neither the hooke to be pruned, nor the rake and harrow to be moulded; ne yet the ſpade to be digged about. Doubtleſſe, the goodneſſe of the ſoile, and the temperature of the climat eſpecially, are very requiſit and much materiall alone, without farther helpe: howbeit they vſe to be cut and pruned, yea, they loue alſo to be ſcraped, poliſhed, and clenſed between where the branches grow ouer-thicke, euen as well as vines, and at the ſame ſeaſon.

The time of gathering Oliues enſueth preſently vpon the vintage of grapes; but greater induſtry and skil is required to the making and tempering of good oile, than about new wine: for ye ſhall haue one and the ſelf ſame kind of oliue to yeeld a different juice, and diuers oiles: firſt and formoſt, of the greene oliue and altogether vnripe, there is drawne the Oile-oliue; which hath of all other the beſt verdure, and in taſt excelleth the reſt: and of this oile, the firſt running that commeth from the preſſe, is moſt commended: and ſo by degrees better or worſe, as the

oile

oile is drawn before or after,out of the preſſe:or,according to a late inuention,by treading them G
with mens feet in little panniers,and vpon hardles made of ſmall and fine oziers. This is a rule, The riper that the oliue is,the fatter will the oile be,and more plentifull; but nothing ſo pleaſant in taſt. And therefore the beſt ſeaſon to gather Oliues, both for goodneſſe and abundance of oile,is when they begin to ſhew black. And ſuch halfe-ripe Oliues we in Latine call Drupæ, and the Greekes Drypetæ. To conclude,it skilleth very much whether the berries be ripe vpon the tree,or mellow within their preſſe:alſo whether the tree be watered,that is to ſay,the oliues hanging thereupon be drenched and refreſhed with ſprinkling water,or haue no other moiſture than their owne,and that which they receiue by dews and raine from heauen.

Chap. II. H

¶ *Of Oyle.*

OIle-Oliue commeth to haue a rank and vnpleaſant taſt if it be old kept and ſtale,contrary to the nature of wine,which is the better for age. And the longeſt time that oile will continue good,is but one yere. Wherein ſurely if a man would well conſider,he may obſerue the great prouidence of Nature. For ſeeing that wines are made to ſerue for intemperance and drunkenneſſe,there is not that neceſſitie to drinke much thereof, and to ſpend them out of hand: and more than ſo,the daintie taſt that they haue when they be ſtale, induceth men to lay them vp and keep them long. But contrariwiſe,ſhe would not haue vs make ſuch ſpare of oile: and therefore by reaſon of the generall vſe and need thereof, ſhe hath made it vulgar and com- I
mon to all.

As touching this benefit and gift of Nature beſtowed vpon mankind, Italy of all other nations in the world carrieth the name for the goodneſſe thereof: but principally the territory or county of Venafrum,and namely,that quarter lying toward Licinia,which yeelds the oile called Licinianum:wherupon there be no oliues comparable to them of Licinia,both for to ſerue the perfumers,in regard of the pleaſant ſmel which that oile doth giue,ſo appropriat vnto their ointments:as alſo to furniſh the kitchin and the table(as they ſay that be fine-toothed,& haue a delicate taſte:)which is the cauſe(I ſay)that this oile carrieth the only name. And yet theſe oliues of Licinia haue this priuiledge beſides,that birds loue not to come neere them. Next to theſe Licinian oliues,the queſtion is between them of Iſtria & Bætica,whether of them ſhould K
go away with the price for their goodneſſe? and hard it is to ſay,which is the better of the two. A third degree there is vnder theſe twoaboue named,namely,of the Oliues that come from all other prouinces,ſetting aſide the fertile ſoile of that tract in Africke,which yeeldeth ſo great increaſe of corn. For it ſhould ſeeme that Nature hath ſet it apart for graine onely, ſeeing it ſo fruitfull that way: and hath not ſo much enuied it the benefit of wine and oile,which ſhe hath denied thoſe parts,as thought it ſufficient that they might glory, and haue the name for their haruеſts. As for other points belonging to oliues,men haue erred and bin deceiued very much: neither is there in any part concerning our life,to be found more confuſion, than is therein:as we will ſhew and declare hereafter,

Chap. III. L

¶ *The nature of the Oliue berries: alſo of yong Oliue Plants.*

THis fruit called the Oliue,conſiſts of a ſtone or kernell, of oile,a fleſhy ſubſtance,and the lees or dregs:now by theſe lees (called in Latine Amurca) I mean the bitter liquor of the grounds that the oile yeelds. It comes of abundance of water: and therefore as in time of drought there is leaſt thereof, ſo in a rainy and watery conſtitution, you ſhall haue ſtore and plenty. As for the proper juice of the oliue,it is their oile;and the chiefe is that which comes of thoſe that are vnripe,like as we haue ſhewed before,when we treated of Omphacium, or the Oliue verjuice. This oilie ſubſtance doth increaſe and augment within the Oliue vntill the ri- M
ſing of the ſtar Arcturus,to wit, 16 daies before the Calends of October;after which time,their ſtones and carnous matter about them do rather thriue. But marke, when there followes a glut of raine and wet weather preſently vpon a dry ſeaſon,the oile in them doth corrupt and turn all (well neare) into the lees abouеſaid,which may eaſily be perceiued by the colour: for it cauſeth

20030
copy 1

A ſeth the Oliue berrie to looke blacke. And therefore when this blackneſſe begins to appeare, it is a ſign that they haue ſomwhat (although very little) of the lees; but before that, they had non at all. And herein men are foulely deceiued taking this marke for the beginning of their ripeneſſe: which blacke hew indeed is a ſigne of their corruption, and betokens that then they are in the way to be ſtark naught. They erre alſo in this, that they ſuppoſe an Oliue the more grown it is in carnoſitie, to be the fuller of oile: whereas in very truth, all the good juice in them is converted then into the groſſe and corpulent ſubſtance thereof, and thereby alſo the ſtone and kernell come to be big and maſſie: which is the cauſe, that they had need of watering at that time, moſt of all. Which being done by great paine and labour of man, or happening through raine and plenty of ſhowers; vnleſſe there inſue a drie ſeaſon & faire weather to extenuate that groſſe
B ſubſtance into which the Oliue had turned the foreſaid iuice and humor, all the oile is conſumed and loſt. For it is heat & nothing els (as *Theophraſtus* ſaith) which ingendreth oile: & therfore both about the preſſe at firſt, & alſo in the very garners where Oliues be laid after, they vſe to keep good fires, by that means to draw the more oile forth. A third default there is in oile, and that comes of two much ſparing and niggardiſe: for ſome men there are, who being loth to be at coſt to pluck and gather Oliues from the tree, wait ſtill and looke that they ſhould fal of themſelues. And ſuch folke as would ſeeme yet to keepe a meane herein, namely, to take ſome paines and be at a little coſt; beat and pell them downe with perches and poles: whereby they do offer wrong to the poore trees, yea, and hinder themſelues not a little the yeare following, when they ſhall find how much it is out of their way, thus to break their boughes and branches.
C Whereupon the law in old time prouided well for this inconuenience, by an expreſſe inhibition to all gatherers of Oliues, in theſe words, *No man ſo hardie as to breake, ſtrike, and beat the Oliue tree.* But they that go moſt warily and gentl to worke, ſtand vnder the tree, and with ſome canes ſhake the boughes and branches therewith, or lightly ſmite them: but in no caſe let driue and lay at them either with full down-right or croſſe-blowes. And yet as heedfull as they be in ſo doing, this good they get by ſtriking and knapping off the young ſhootes and ſprigs which ſhould beare the next yeare, that they haue the trees carry fruit but once in two yeares for it. The like hapneth alſo, if a man ſtay till they fall of themſelues: for by ſticking on the tree beyond their due time, they rob the oliues to come after, of all their nutriment wherewith they ſhould be fed, and detaine the place likewiſe where they ſhould come forth and grow. An eui-
D dent proofe hereof is this, That oliues vnleſſe they be gathered before the ordinary & yearely weſtern winds do blow, they gather heart again vpon the tree, & wil not ſo eaſily fall as before. Men vſe therefore to gather the Pauſian Oliues firſt after Autumne, which are fulleſt of carnoſity, not ſo much by nature, as by miſgouernement and diſorder: ſoone after, the round Orchite, which haue plenty of oile, & then the oliues Radij: and theſe, foraſmuch as they be moſt tender, and ſooneſt ouercome with abundance of the lees (which we called before Amurca) are therby forced to fal. Howbeit, ſuch oliues as be thick skinned and hard; tough alſo and admitting no wet & rain (by which means they are the leaſt of all others) wil abide on the tree til March: and namely, the Licinian Oliues, the Cominian, Contian, & Sergian, which the Sabins call roial: all which change not colour & look black before the foreſaid Weſtern wind blowes, that is, about
E the 6 day before the Ides of February; for by that time folk think they begin to ripen. Now for as much as the beſt & moſt approued oile is made of them, it ſeems that reaſon alſo being conformable to this defect of theirs, juſtifies, & aproues the ſame in the end. And this is commonly receiued and held among them, that cold winters breed ſcarcity and dearth: but ful maturity brings plenty, namely when they haue leiſure to ripen on the tree: howbeit this goodnes is not occaſioned by the time, but by the nature rather of thoſe kind of oliues, which be long ere they turn into the foreſaid dregs Amurca. Men are alſo as much deceiued in this, that when Oliues be gathered, they keep them vpon borded floors in ſellars and garners, & will not preſſe them before they haue ſwet: whereas, in truth, the longer they lie, the leſſe oile they yeeld, & the more dregs of lees. For by this means the ordinary proportion they ſay is, to preſſe out of euery Mo-
F dius of Oliues, not aboue 6 pound of oile. But no man makes any reckoning of the lees, how much it increaſes in meaſure day by day, in one & the very ſame kind of Oliues, the longer that they be kept ere they be preſſed. In one word, it is a common error ſetled euery where, that men do think the abundance of oile is to be eſteemed according to the bignes of the oliues: conſidering that the plenty of oile conſiſts not in the greatnes of the fruit: as may appeare by thoſe that

of

of ſome are called Roiall, of others Majorinæ, and Phauliæ, which euery man knoweth, are the biggeſt and faireſt Oliues to ſee to, & yet otherwiſe haue leaſt oile in them of any others. Likewiſe in Ægypt the oliues are moſt fleſhie & ful of pulp, howbeit, leaſt oleous. As for the country Decapolis of Syria, the oliues indeed be very ſmal there, & no bigger than Capers: yet commended they are for their carnoſity. And for that cauſe, the oliues from the parts beyond ſea are preferred before the Italian, for goodneſſe of meat, and as better to be eaten; yet thoſe of Italy yeeld more oile. And euen within Italy, the Picene and Sidicine oliues ſurpaſſe the reſt. For in truth, theſe are firſt confected and ſeaſoned with ſalt: or els (as all others) prepared & condite either with lees of oile, or wine cuit. Some oliues there be, which they ſuffer to ſwim alone as they be, in their owne oile, without any help and addition of other things; and ſuch be called Colymbades. And the ſame they vſe otherwhiles to bruiſe and cleanſe from their ſtones, and then confect them with green herbs, which haue ſome pleaſant & commendable taſte. Others there are, which being otherwiſe very green and vnripe, are preſently brought to maturity, and made mellow, by lying infuſed and ſoking in hot ſcalding water. And a wonder it is to ſee, how Oliues wil drink in a ſweet liquor, and how by that means they may be made toothſome, yea, and to carry the taſt of any thing that a man would haue them. Among oliues there be alſo that are of colour purple, like to thoſe grapes which change colour when they begin to ripen. Moreouer, beſides the aboue named ſorts of oliues, there be ſome named Superbæ [*i.* proud.] Alſo there are Oliues to be found, which being dried by themſelues onely, are paſſing ſweet, yea, and more delicate than raiſins: mary theſe are very geaſon, and yet ſuch are in Africke and about the city Emerita in Portugall.

As touching the very oile it ſelf, the way to preſerue it from being ouerfat and thick, is with ſalt. If the barke of an Oliue tree be ſlit and cut, it will receiue the rellice and ſmell of any medicinable ſpice, and the oile thereof wil ſeem aromatized: otherwiſe pleaſant in taſt it is not, like as wine is: neither is there ſuch difference in ſo many kinds of oliues as there is in wine: for ſurely we cannot at the moſt obſerue aboue three degrees in the goodneſſe of oiles, namely, according to the firſt, ſecond, and third running out of the preſſe. Finally, the thinner that oile is, and the more ſubtill, the finer and daintier is the ſmell thereof: and yet the ſame ſame ſent, in the very beſt of them all, continueth but a ſmall time.

Chap. IIII.

¶ *The nature of Oile Oliue.*

THe property of oile is to warm the body, and to defend it againſt the iniuries of cold: and yet a ſoueraigne thing it is to coole and mitigate the hot diſtemperature of the head. The Greekes, whom wee may count the very fathers and foſters of all vices, haue peruerted the true and right vſe thereof, to ſerue for all exceſſe and ſuperfluitie; euen as far as to the common annointing of their wraſtlers with it, in their publick place of exerciſe. Known it is for certain, that the gouernors and wardens of thoſe places, haue ſold the oile that hath beene ſcraped from the bodies of the ſaid wraſtlers for 80 Seſterces at a time.

But the ſtately maieſty of Rome contrariwiſe hath done ſo great honour to the Oliue tree, that euery yere in Iuly, when the Ides come, they were wont to crowne their men of armes and gentlemen marching by their troups and ſquadrons in ſolemne wiſe, with chaplets of oliue, yea and the manner was of captains likewiſe to enter ouant in pety triumphes into Rome, adorned with Oliue coronets. The Athenians alſo honoured their conquerors with Oliue garlands. But generally the Greekes did ſet out their victors at the games of Olympia, with branches of the wild-oliue.

Chap. V.

¶ *The manner how to order Oliues.*

NOw will I report the precepts and rules ſet down by *Cato*, as touching oliues. His opinion is, that the greater long Oliue Radius of Salentum, the big Orchites, the Pauſia, the Sergiana, Cominiana, and the Albicera, ſhould be planted in hot and fat grounds. He addes moreouer (as hee was a man of ſingular dexterity and prudent ſpirit) which of them in the neigh-

20030
copy 1

A neighbour territories and places adioining, were taken for the beſt. As for the Licinian Oliues, he ſaith, They would be planted in a weely and cold hungry ground: for if it be a fat ſoile and a hot, the oile wil be corrupt and naught, and the very tree it ſelf wil in ſhort time be killed with ouermuch fertility and bearing too great a burden. Moreouer, they will put forth a red kind of moſſe, which eateth and conſumeth the tree. To conclude, his mind is, that Oliue hort-yards ſhould be expoſed to the ſun, yet ſo, as they regard the Weſt wind alſo in any caſe, for otherwiſe he commendeth them not.

Chap. VI.

¶ *How to keep Oliues, and the way to make oile of them.*

B *Cato* alloweth of no other means to keep and preſerue oliues (and ſpecially the great ones, made like cullions, named thereupon Orchita, and the Pauſiæ) but either in brine and pickle when they are greene, or elſe among Lentisk branches when they are bruiſed and broken. The beſt oile is made (ſaith he) of the greeneſt and foureſt oliues. Moreouer, ſo ſoon as euer they be faln, they muſt be gathered from off the ground; and if they be fouled and beraied with the earth, they ought to be waſhed clean, and then laid to dry three daies at the moſt. Now if it fall out to be weather diſpoſed vnto froſt, they ſhould be preſſed at 4 daies end. He giueth order alſo, to beſtrew and ſprinkle them with ſalt: ſaying moreouer, that if they be kept in borded ſollors or garners, the oile will be both leſſe in quantitie, & worſe withal. So it wil be alſo, if it be let lie long in the lees, or together with the cake and grounds, when they be bruiſed and
C beaten: for this is the very fleſhie and groſſe ſubſtance of the Oliues, which cannot chuſe but breed filthy dregs. And therfore he ordaineth, that oftentimes in a day it ſhould be poured out of one veſſell into another, & ſo by ſetling clarified from the grounds, & then to put it vp afterwards into pans and panchions of earth, or els into veſſels or kimnels of lead, for braſſe mettall wil mar oile. All this ſhould be done within cloſe preſſes and rooms, and thoſe kept ſhut, where no aire or wind may come in, that they might be as warm and hot as ſtouves. He forbids alſo to cut any wood or fuel there, to maintain fire; for that the fire made of their ſtones and kernels, is moſt kindly of any other. To the end alſo that the grounds & lees ſhould be liquified and turn into oile, euen to the very laſt drop, the oile ſhould be let run out of thoſe veſſels or kimnels a-
D foreſaid into a vat or ciſtern; for which purpoſe the veſſels are often to be cleanſed, & the ozier paniers to be ſcoured with a ſponge, that the oile might ſtand moſt pure & clear. But afterward came vp the deuiſe to waſh oliues firſt in hot water, & then immediatly to put them whole as they are, into the preſſe; for by that means they ſquize forth lees & all: and then anon to bruiſe and cruſh them in a mil, & ſo preſſe them in the end. Moreouer, it is not thought good to preſſe the ſecond time aboue 100 Modij, which is the full proportion of one preſſure, & it is called Factus. That which after the mil comes firſt, is named the floure of the oile, or the Mere-gout. Laſtly, to preſſe 300 Modij, is thought to be foure mens work ordinarily in one night and a day.

Chap. VII.

E ¶ *Of Oile Artificiall*

IN *Cato* his time there was no artificiall Oiles, I meane, no other but that of the Oliue; and therefore I ſuppoſe it was, that he made no mention thereof: but now adaies there be many kinds. Firſt will we treat of thoſe that are made of trees, and principally before all the reſt, of the oile of the wild oliue: thin it is, and much more bitter than that of the other gentle & true Oliue, but good for medicines onely.

Very like to it, is that which is made of Chamelæa, an herb or ſhrub growing in ſtony places to the heigth of a ſpan & no more, with leaues and berries reſembling thoſe of the wild oliue.

The next is that which commeth of Cici, or Ricinus, [*i*, Palma Chriſti] a plant which groweth plentifully in Ægypt, which ſome call Croto, others Trixis or wild Seſam; but long it hath not been there. In Spaine likewiſe this Ricinus is found of late to riſe ſuddenly to the heigth of an Oliue tree, bearing the ſtalke of Ferula or Fennel-Geant, clad with leaues of the vine, and repleniſhed with ſeed reſembling the graines or kernels of ſmall and ſlender grapes, and of a pale colour withall: we in Latine call it Ricinus, of the reſemblance that the ſeed hath to a ticke,

which is a vermin that annoies ſheepe. For to gather an oile thereof, the manner is to ſeeth the ſeeds in water; the oile wil ſwim aloft, and ſo it is ſcummed off. But in Egypt (where there is abundance thereof) they neuer vſe any fire or water about it; only they corn it well with ſalt, and then preſſe out the oile, which is very fulſome and naught to be eaten, good only for lamps. G

The oile of Almonds, which ſome cal Metopium, is made of the bitter Almonds, dri'd ſtamped, and reduced into a maſſe or lumpe, which being ſprinkled and ſoked with water, and then beaten againe in a mortar, is put into a preſſe or mill, and the oile drawne therout.

There is an oile made alſo of the Bay, together with the oile of ripe oliues ready to drop from the tree. Some take the Bay berries only, and thereout preſſe oile de-Baies: others vſe the leaues and nothing els: and there be againe, who with the leaues take alſo the rind of the Bay berries; yea and put thereto Storax Calamita, and other ſweet odors. Now for this purpoſe, the Laurell with broad leaues, growing wild, and bearing blacke berries, is the beſt. H

Like vnto this oile, is that which they make of the blacke Myrtle; and the broad leafed kind thereof is the better: the berries of it ought to lie infuſed firſt in hot water, and afterwards to be boiled. Some ſeeth the tendereſt leaues that it hath in Oile-Oliue, and then preſſe them forth. Others put the leaues firſt in the oile, & then let them ſtand confected in the ſun, and there take their ripening.

After the ſame manner is the oile made of the garden Myrtle; but that of the wilde which hath the ſmaller ſeed is the better: and this Myrtle ſome call Oxymyrſine, others Chamæmyrſine; and ſome againe name it for the ſmalneſſe, * Acaron, for ſhort it is and full of little branches. I

* Indiuiſible, or, ſo ſmal that it cannot be cut.

Moreouer, there be oiles made of the Citron and Cypreſſe trees: likewiſe of wall nuts which they call Caryinon: alſo the fruit of the Cedar, named Cedrelæon.

Semblably of the graine called Gnidium, to wit, the ſeed of Chamelæa and Thymelæa, well clenſed and ſtamped. In like manner of the Lentisk. As for the oile Cyprinum, how it ſhould be made of the Egyptian nut and of Ben for to ſerue perfumers, hath bin ſhewed before. The Indians (by report) do make of Cheſt-nuts, of Seſame ſeed, & Rice. The people Ichthyophagi as they liue by eating fiſh only, ſo they make oile of fiſhes. And in caſe of neceſſity, otherwhiles men vſe to draw an oile out of the berries of a Plane tree alſo, beeing ſteeped in water and ſalt, which ſerues for lamp oile. Yea and there is an oile made of the wild vine Oenanthe, as we haue ſaid already in the treatiſe of Ointments. K

As touching the oile which the Greeks call Gleucinum, it is made with new wine and oile-oliue, boiled at a ſoft fire. Others there be that let the wine conſume all into oile, and without any fire at all, do compaſſe the veſſell wherein this compoſition is made, with the cake and the refuſe of grapes when they be preſſed, and couer it all ouer for the ſpace of 22 daies, ſo as twice a day they be all mixed throughly together. Some there be who put therto not only Majoram, but alſo the moſt precious and exquiſite odors that they can meet withal: and our common fencing-halls, and places of publick exerciſes be perfumed with theſe ſweet oiles, and do ſmell of them; but ſuch they be as are the cheapeſt of all other.

Ouer and beſides, there is made an oile of Aſpalathus, ſweet Calamus, Balme, Iris or Flour-de-lis, Cardumome or grains of Paradiſe, Melilot, French Nard, Panace, Marjoram, Elecampane, and the root of Cinamon, taking all theſe and letting them lie infuſed in oile, and ſo preſſing out the iuice thereof. So is oile Roſat made of Roſes: the oile of Squinanth of the ſweet ruſh, which is moſt like to the Oile Roſat. Likewiſe of Henbane, Lupines, and the Daffadil: the Egyptians get great ſtore of oile out of Raddiſh ſeed, or the graſſe called Gramen (which is Dent-de-chien or Quich-graſſe) and this oile they call Chortinon. After the ſame manner the Seſame-ſeed doth yeeld an oile; as alſo the Nettle, which in Greeke they call Cnecinon, or rather Cnidinum. As for the oile of Lillies, it is made in ſome places, where they feare not to let it ſtand abroad in the aire infuſed to take both Sun and Moon-ſhine, yea and froſty weather. L

They that inhabit between Cappadocia and Galatia, do compound a certain oile of herbes growing among them, which is a ſoueraigne remedy for ſinewes either wounded or otherwiſe grieued, and they call it Selgiticum: it is much in effect like to that oile which is made in Italie of Gums, by the people Eguini.

Now for the oile of Pitch, which they call Picinum, it is made of the vapors and ſmoke that ariſe from Pitch whiles it boileth, and receiued in fleeces of wooll ſpread ouer the pots mouth wherein

20030
copy 1

A wherein the ſaid Pitch is ſodden: which fleeces afterwards are well wrung, and the oile is preſſed out thereof. The beſt oile is that which commeth from the Brutian or Calabrian pitch: the ſame is moſt fat of all others, and fulleſt of Roſin. The colour of the oile is reddiſh.

Vpon the coaſts and maritime parts of Syria, there is an oile engendereth of it ſelfe, which the Greeks call Elæomeli: a fatty and greaſie ſubſtance it is, thicker than honey, and thinner than Roſin, of a ſweet taſt, iſſuing out of trees; and is onely medicinable and good in Phyſicke.

As touching old oile, it ſerues in right good ſtead for ſundry ſorts of maladies. It is thought alſo very ſingular for to preſerue Iuory from putrefaction, for this is certaine, that the image of *Saturne* at Rome is full of oile-oliue all within.

B

Chap. VIII.

¶ *Of the lees or dregs of Oile-oliue, called Amurca.*

Cato hath highly commended aboue all, the lees of Oile-oliue: for he would haue the barrels, hogſheads, and other veſſels which hold oile, to be therewith beſmeared, that they ſhould not drink vp the oile. He deuiſed alſo, that the threſhing floors ſhould be wrought and tempered with oile lees, that they might not chawn & gape, nor no Ants breed within the chinks and cranies thereof. Moreouer, he thinks it very good that the mortar, plaiſter, and parget vſed about the wals of corn barns, as alſo their floors, ſhould be well ſprinkled and tempred with the ſaid lees; yea, and the preſſes and wardrobes where apparell is kept, ought to be rub-
C bed therewith to keep out mothes, worms, ſpiders, and ſuch vermine that do hurt to cloths. He affirmeth beſides, that is good againſt certain diſeaſes of four-footed beaſts, as alſo to preſerue trees, yea and excellent for inward vlcers of a mans body, but eſpecially thoſe of the mouth. Being ſodden, it is ſingular good (as he ſaith) for to annoint and make gentle and ſupple all bridle reins, leather thongs, ſhooes, and axletrees of carts and wagons; likewiſe to keepe all veſſels of braſſe from ruſt, and alſo to giue them a bright and pleaſant colour: moreouer, all the woodden implements of an houſe generally throughout, and veſſels made of earth and clay, wherein one would keep dry figs in their verdure, would be annointed therewith: or if one were deſirous to preſerue the Myrtle, leaues, fruit, and all, vpon the branches, or any ſuch thing, there is nothing
D better than the ſaid Amurca. Laſt of all, he ſaith, that what wood ſoeuer for fewell is dipped in theſe lees, it will burne cleare without any ſmoke.

M. Varro affirmeth, that if a Goat chance to licke with his tongue, or to brouſe an oliue when it buddeth the firſt ſpring, the ſame tree will ſurely be barren and lie in great danger to miſcary and die. Thus much of the Oliue tree, and of the oile of Oliues.

Chap. IX.

¶ *All kinds of Fruit good to eat, and their Nature.*

E AS for all other fruits of trees, they are hardly to be numbred and reckoned by their forme and figure; much leſſe by their ſundry taſts and diuers juices that they yeeld, ſo intermingled they are together by varietie of graffing one into another.

Chap. X.

¶ *Of Pine-nuts, or Pine-apples, foure ſorts.*

THe Pine nuts (which are tht biggeſt of that kind and hanging higheſt vpon the tree) doe contain and nouriſh ſlender kernels encloſed within certaine hollow beds ful of holes, and beſides clothed and clad with another coat or husk of a dark murrey colour: wherein may be ſeen the wonderfull care and prouidence of Nature, to beſtow the ſeedes ſo ſoft. A ſecond kinde there be of theſe Nuts called Terentines, hauing a ſhell or huske verie brittle and eaſie to be cruſhed between ones fingers; and as ſoon are they pecked through with birds bils, who after
F that manner filch and ſteale them from off the tree. A third ſort yet there is of them, that come of the gentle pitch trees, hauing their kernels couched within a thin husk or skin more like than a ſhell, and the ſame ſo ſoft, that it may be chewed and eaten together with the kernell. Now there is a fourth fruit growing of the wild Pine, and called thoſe nuts are of the Grecians, Pity-

dia;and theſe be ſingular good againſt the cough. The Taurines in Calabria, haue a deuice to G
confect Pine-nut kernels,by ſeething them in hony;and being thus condite,they call them A-
quiceli. To conclude,at the ſolemne and feſtiuall games holden at Iſthmus, they who win the
beſt prize,are woont to be crowned with a chaplet of the Pine .

Chap. XI.

¶ *Of the Quince.*

NExt to Pine apples,for big and large,are the Quinces which we call Cotonea,the Greeks
Cydonea,becauſe they were firſt brought out of Candy. So heauy and maſſie they be,that
they bend the boughs to the ground as they hang vpon the tree, and will not ſuffer their H
mother to grow.

Many kinds there be of Quinces,to wit,Chryſomela,of a colour inclining to gold,and diui-
ded by certain cut lines. Secondly,there be the quinces of our own country, & ſo called : theſe
be whiter,and of an excellent ſmell. They alſo that come out of the realm of Naples,be highly
eſteemed. Now there be a ſmaller ſort of the ſame kind called Struthea (*i.* the Peare-quince)
and thoſe do caſt a more odoriferous ſmell:late they be ere they come to ripeneſſe or perfecti-
on;whereas contrariwiſe the green quinces called Muſtea,be as haſty and ſoon melow. Now if a
man do graffe the great quinces vpon the Struthea,the tree wil bring forth a kind of quinces by
themſelues called Muluiana;and theſe are the quinces alone of all other that may be eaten raw.
In ſum,all the ſort of theſe are come now adaies to be entertained within the waiting or pre- I
ſence chambers of our great perſonages, where men giue attendance to ſalute them as they
come forth euery morning;and in bed-chambers alſo they are to garniſh the images ſtanding
about the beds-head and ſides.

There are beſides ſmall wild quinces,next to the Peare quince Struthea, for pleaſant and o-
doriferous ſmell;and they grow commonly in hedge-rowes.

Moreouer,as wel Peaches as Pomegranats,notwithſtanding they be of a diuers kind,yet wee
call Mala(*i.*apples.) As for the Pomegranats,we haue ſpoken of nine ſorts of them in our trea-
tiſe of their trees,and others in Africk:and theſe are full of certaine graines or kernels lying in-
cloſed vnder their rinde; whereas Peaches haue in ſtead thereof,a groſſe ſtone or wooddy ſub-
ſtance within the carnous pulpe of the fruit. To conclude,there be certaine peares weighing a K
pound,in regard of which poiſe and bigneſſe that they beare,called they are Libralia.

Chap. XII.

¶ *Of the Peach,and foure kinds thereof.*

OF all Peaches,the principall be thoſe which are named Duracina, for the ſolid ſubſtance
of the meat within them. As for the French and Aſiaticke Peaches,they beare the name
of the regions and nations from whence they come. This fruit ordinarily waxeth ripe af-
ter the fall of the leafe,or Autumne:but the Abricocts are ready to be eaten in Summer. Theſe
haue not bin known full 30 yeares,and at their firſt comming vp,were ſold for Roman deniers a-
peece,whereof there be two ſorts; Supernatia,which we haue from the high countries,& name- L
ly the Sabines;and Popularia,which grow common euery where. Theſe fruits be harmleſſe,and
much deſired of ſicke folke : and for that they are in ſuch requeſt, there would be giuen other-
whiles 30 Seſterces for one of them; which is a price as high as of any other fruit whatſoeuer:
whereat we may maruell the rather,for that there is not any ſooner gone,and laſteth leſſe while
than they:for being once gathered from the tree,they will not be kept aboue two daies at the
moſt,and therefore muſt of neceſſitie be ſold and ſpent out of hand.

Chap. XIII.

¶ *Of the Plum-tree,eleuen kinds of them.* M

TO come now to Plums,there is a world of them:ſome of ſundry colours,others black, and
ſome againe white. There be that are called Hordearia,becauſe they be ripe in barly-har-
ueſt:and ſome there be of the ſame colour, yet later ere they ripen, and bigger beſides;

and

20030
copy 1

and for that they be of ſmall reckoning, named they are Aſinina [i. *Aſſe-plums.] Ye ſhal haue of them that be black, howbeit the yellow wheat-plum like virgin-wax, and the purple, are better eſteemed. Moreouer, there are a kind of Abricots come from a forraine nation, and they be called thereupon Armeniaca, which alone for their ſmell alſo are commendable. But there is a peculiar brauerie and a ſhameleſſe, which thoſe Plums haue by themſelues that are graffed in Nut-tree ſtocks; they retain the face and forme ſtill of the mother graffe, but they get the taſte of the ſtock wherein they are ſet, as it were by way of adoption: of them both they carry the name, and are called nut-plums. Now, as wel theſe, as Peaches, yellow wheat-plums, & the wild Bullaiſe, may be kept and preſerued as grapes in Autumn, within certain barrels or earthen veſſels, and ſo they will continue good till new come. As for all other plums, as they be ſoon ripe, ſo they are as ſoone gone. *As our horſ plums.

B It is not long ſince, that in the realm of Granado and Andaluſia, they began to graffe plums vpon apple-tree ſtocks, and thoſe brought forth plums named Apple-plums: as alſo others called Almond-plums, graffed vpon Almond-ſtocks; theſe haue within their ſtone a kernel like an Almond: and verily there is not a fruit again wherein is ſeene a wittier deuiſe to conioine and repreſent in one and the ſame ſubiect, two diuers ſorts.

As for the Damaſcene-plums (taking name of Damaſco in Syria) we haue ſufficiently ſpoken thereof in our treatiſe of ſtrange trees: and yet long ſince they haue bin knowne to grow in Italy: which although they haue a large ſtone and little carnoſity about them, yet they neuer wither into wrinkles and riuels when they be dry, for that they want the ful ſtrength of the kind Sun which they had in Syria.

C We ſhould do wel to write together with them, of the fruit Sebeſten, which alſo come from the ſame Syria, albeit now of late they begin to grow at Rome, being graffed vpon Soruices. As touching peaches in generall, the very name in Latine, whereby they are called Perſica, doth euidently ſhew that they were brought out of Perſis firſt; and that it is a fruit not ordinary either in Greece or Natolia, but a meere ſtranger there. Contrariwiſe wilde plums (as it is well knowne) grow euery where. I maruell therefore ſo much the more, that *Cato* made no mention thereof, conſidering that of purpoſe he ſhewed the maner, how to preſerue and keep diuers wild fruits, till new came: for long it was firſt ere Peach trees came into theſe parts, and much adoe there was before they could be brought for to proſper with vs, ſeeing that in the Iſland Rhodes
D (which was their place of habitation next to Ægypt) they beare not at all, but are altogether barren. And whereas it is ſaid, That Peaches be venomous in Perſia, & do cauſe great torments in them who do eat therof; as alſo that the KK. of Perſia in old time cauſed them to be tranſported ouer into Ægypt by way of reuenge to plague that country; and notwithſtanding their poiſonous nature, yet through the goodnes of that ſoile they became good and holeſom: all this is nothing but a meere fable & a loud lie. True it is indeed, that the beſt writers who haue been painful aboue others to ſearch out the truth, haue reported ſo much concerning the tree Perſea; which is far different from the Peach tree Perſica, & beareth fruit like to Sebeſten, of color red, and willingly would not grow in any country without the Eaſt parts: and yet the wiſer & more learned Clerkes do hold, That it was not the ttee Perſea which was brought out of Perſis into
E Egypt, for to annoy and plague the country, but that it was planted firſt by K. *Perſeus* at Memphis. Whereupon it came, that *Alexander* the Great ordained, That all victors who had won the prize at any game there, ſhould be crowned with a chaplet of that tree, to honor the memoriall of his great grandſires father. But how euer it be, certaine it is that this tree continueth greene all the yere long, and beareth euermore fruit one vnder another, new and old together. And to returne again to our Plum-trees, euident it is that in *Cato's* time they were not knowne in Italy, but all the Plum-trees which we now haue, are come ſince he died.

Chap. XIIII.

F ¶ *Of nine and twenty kinds of Fruits, contained vnder the names of Apples.*

OF Apples (that is to ſay, of fruits that haue tender skins to be pared off) there bee many ſorts. For as touching Pome-citrons, together with their tree, we haue already written. The Greekes call them Medica, according to the name of the country from whence they firſt came in old time. As for Iujubes, as alſo the fruit Tuberes, they bee likewiſe ſtrangers as

well as the reſt; and long it is not ſince they arriued firſt in Italy; the one ſort out of Africk, G
the other, namely Iujubes, out of Syria: & *Sextus Papinius* (whom my ſelf in my time ſaw Conſul of Rome) was the firſt man that brought them both into theſe parts; namely in the later end of *Auguſtus Cæſar* the Emperor, and planted them about the rampiers of his campe, for to beautifie the ſame. Howbeit, to ſay a truth, their fruit reſembled rather berries than apples; yet they make a goodly ſhew vpon the rampiers: and no maruell, ſince that now adayes whole groues of trees begin to ouertop and ſurmount the houſes of priuat perſons.

Concerning the fruit Tuberes there be two ſorts thereof, to wit, the white and the reddiſh, called alſo Sericum, of the colour of ſilke.

The Apples named Lanata are held in manner for ſtrangers in Italy, and are knowne to grow but in one place thereof, and namely within the territory of Verona. Couered they be all ouer H
with a kind of down or fine cotton, which albeit both quince and peach be clad and ouergrown with in great plenty, yet theſe alone cary the name thereof: for otherwiſe, no ſpecial propertie are they known by to commend them.

A number of apples there are beſides, that haue immortaliſed their firſt founders and inventers, who brought them into name, & cauſed them to be known abroad in the world; as if therin they had performed ſome worthy deed beneficiall to all mankinde. In which regard, why ſhould I think much to rehearſe & reckon them vp particularly by name? for if I be not much deceiued, thereby will appeare the ſingular wit that ſome men imployed in graffing trees; and how there is not ſo ſmall a matter, ſo it be wel and cunningly done, but is able to get honor to the firſt author, yea, and to eterniſe his name for euer. From hence it comes, that our beſt apples I
take their denominations of *Matius*, *Ceſtius*, *Manlius*, & *Claudius*. As for the quince-apples, that come of a quince graffed vpon an apple ſtock, they are called Appiana, of one *Appius* who was of the *Claudian* houſe, and firſt deuiſed and practiſed that feat. Theſe apples cary the ſmel with them of quinces: they beare in quantitie the bigneſſe of the Claudian apples, and are in color red. Now leſt any man ſhould think that this fruit came into credit by reaſon only of partiall fauor, for that the firſt inuentor was a man deſcended from ſo antient & noble a family, let him but think of the apples Sceptiana, which are in as great requeſt as they for their paſſing roundneſſe; and they beare the name of one *Sceptius* their firſt inuentor, who was no better than the ſon of a ſlaue lately infranchiſed. *Cato* maketh mention of apples called Quiriana, as alſo of Scantiana, which he ſaith the maner is to put vp in veſſels and ſo keep them. But of all others, K
the laſt that were adopted, and tooke name of their patrons and inuentors, be Petiſia: though they be little, yet are they paſſing ſweet and pleaſant to be eaten.

Other apples there are that haue ennobled the countries from whence they came, and caried their names, to wit, Camerina and Græcula. All the reſt took name either vpon ſome occaſion or propertie that they haue: to wit, of brotherhood, as the twin-apples Gemella, which hang one to another by couples, and neuer are found ſingle, but alwaies grow double: of their color, as the Serica, which for their freſh hew are ſo called: of kinred and affinitie, as the Melapia: for their reſemblance and participation of apples and peares together, as a man would ſay, Peare-apples, or pom-poires: of their haſty ripeneſſe, as the Muſtea [*i.* haſty apples;] which now of their ſweet taſt of hony, are called Melimela [*i.* hony apples:] alſo of their exquiſit roundneſſe L
like a bal, as the Orbiculata [*i.* the round apples.] That theſe apples came firſt from their natiue country Epirus, appeareth by the Greeks, who call them Epirotica. Again, ſome there be that take their denomination of their forme, reſembling womens paps or breaſts, as namely Orthomaſtica, [*i.* the Breſt-apples.] Others, for that their condition is to haue no pepins or ſeed within them, be called of the Belgians, Spadoma, as one would ſay, Guelded apples. As for the Melofolia, [*i.* the leafe apples] they be ſo called, becauſe they haue one leafe and otherwhile twain breaking forth of their ſide in the very mids. The ragged apples Pannucea take this name, for that of all others they ſooneſt be riueled. The Puffes named Pulmonea are houen fooliſhly, and ſwell I cannot tell how, with little or nothing in them. Some in colour reſemble bloud, they are ſo red, becauſe at firſt they were graffed vpon a mulberry. But all apples ordinarily are red M
on that ſide that regardeth the Sun.

As for wildings and crabs, little they be all the ſort of them, in compariſon: their taſt is well enough liked, and they cary with them a quick and ſharp ſmel: howbeit this gift they haue for their harſh ſourene ſſe, that they haue many a foule word and ſhrewd curſe giuen them, and that they

20030
copy 1

A they are able to dull the edge of any knife that ſhal cut them. To conclude, the Dacian Apples are of all others in manner leaſt accepted, notwithſtanding they be firſt mellow, and would be gathered betimes.

Chap. XV.

¶ *Of Peares. And of the varietie of graffing.*

VPon the ſame cauſe there be Peares alſo reproched with the name of Pride, and are called the Proud-peares: little they are, but quickley ripe, and as ſoone gone. Of all others the Cruſtumine peares be moſt delicate and pleaſant in taſt. Next to them in requeſt are the
B Falern peares, ſo called for their great abundance of liquor, as it were wine, wherof they be full. And theſe are likewiſe named the milk-peares: but ſuch of them as are of color black, be called the Syrian pears. As for other pears, they haue ſundry names according to the countries wherein they grow. Howbeit theſe peares following, retain their name ſtill in all places, and repreſent alwaies the memoriall of thoſe that firſt planted or graffed them, to wit, Decimiana of one *Decimus*, a known citizen of Rome: of which is alſo a baſtard kind which they call Pſeudodecimiana. Likewiſe, the Dolobellian peare, of one *Dolobella*: and thoſe are of all other the longeſt tailed. As touching the Pompeian peares, which be alſo called the Pap or Teat-peares, the Licerian, the Seuerian, and of their race the Tyrannian, they differ one from another in the length of their ſteale. The red Fauonian peares be ſomwhat greater than the abouenamed Proud-pears.
C As for the Laterian and Anitian, which be not gathered nor ripen vntill Autumne be paſt, they haue a prettie tart and ſouriſh taſt, but natheleſſe pleaſant ynough. The Tyberian peares beare the name of *Tiberius* the Emperor, for that of all others he loued that fruit beſt: they might go for Lycerians well ynough, ſo like they be vnto them, ſaue onely that they grow big, and are more deeply coloured with the Sunne.

Moreouer, there are peares which are knowne by no other name than of the countries where they grow, namely, thoſe of Ameria which be more lateward than any other: the Picentine, Numantine, Alexandrine, Numidian, Grecian, and among them the Tarentine. Alſo the Signine peares, which many call Teſtacea, of the color of earthen pots that they reſemble; like as others be named Onychium, for that they repreſent the Onyx ſtone, or a mans naile; as likewiſe thoſe
D which be called Purple-peares.

Furthermore, peares take their name of the odour which they yeeld: thus there be Myrapia, to wit, Aromaticall-peares, Laurell, and Nard-pears. Of the time alſo when they be ripe, as the Barley-pears: of the forme of their neck, as the Bottle-peares called Ampullacea: of their thick skin, as the Coriolana. As for the Gourd-pears, they are by nature of a brutiſh or ſauage kind; ſo harſh, ſo ſoure and eager a liquor they doe yeeld

Many ſorts of peares there are, whereof we can giue no certain reaſon for their denomination, namely, the Barbarian and Venerian peares, which alſo be called Colored: likewiſe, the roiall peares, which hang or rather ſticke flat to the tree, ſo ſhort a ſteele they haue. The Patritian alſo and Voconian peares, which are both green and long. Moreouer, *Virgil* hath ſpoken of the
E Volemian peares or wardens, which he had from *Cato*, who alſo nameth the Sementine or the haſty and ſoon ripe peares. So as in this point verily the world is growne alreadie to the higheſt pitch, inſomuch, as there is not a fruit, but men haue made trial and many experiments, for euen in *Virgils* daies the deuiſe of graffing ſtrange fruits, was very rife: conſidering that he ſpeakes of the Arbute tree graffed on Nut-trees, the Plane vpon Apple-trees, and the Elme vpon Cherrie ſtockes. In ſuch ſort, as I ſee not how men can deuiſe to proceed farther. And certes for this long time, there hath not beene a new kind of Apple or other fruit heard of.

And yet as induſtrious as men haue been that way, they are not permitted to graffe all manner of trees indifferently one in another, no more than it is lawfull to graffe vpon buſhes and thornes: ſeeing that it is not ſo eaſie a matter to appeaſe lightenings: for looke how many ſorts
F of trees are thus engraffed contrarie to nature, ſo many kinds of lightenings and thunderbolts by report, are flaſhed and ſhot at once.

Peares naturally are more ſharpe-pointed at one end than Apples. And among them, the Greeke peares, the Gourd and Laurell peares are laſt of all others ripe, for they hang vpon the tree vntil Winter, and they mellow with very froſt: like as the Amerine and Scantiane apples.

Furthermore, peares are kept and preſerued as grapes, and after ſo many waies: but none of them

them are put in barrels as plums be. Finally, Peares and Apples both, haue the properties of wine: and in like sort Physicians be wary how they giue them to their patients. Howbeit, when they be sodden in wine and water, they serue in stead of a broth or grewell: & so do no fruit els but Pome and Peare-Quinces. G

Chap. XVI.

¶ *The manner how to preserue Apples.*

THe generall rules to keep and preserue Apples, are these, *Imprimis*, That the solars be wel planked and boorded in a cold and drie place; prouided alwaies, that the windows to the North do stand open, especially euery faire day. *Item*, to keep the windows into the South H shut, against the winds out of that corner: and yet the North winds also where they blow, doe cause Apples to shrink and riuell illfauouredly. *Item*, That Apples be gathered after the Æquinox in the Autumne: and neither before the full of the Moone, nor the first houre of the day. Moreouer, that all the Apples which fell, be seuered from the other by themselues, and laid apart: also that they be bedded vpon straw, mats, or chaffe vnder them: that they be so couched as that they touch not one another, but haue spaces between to receiue equall aire for to bee vented. To conclude, this is well knowne, that the Amerine Apples doe last and keepe good long, whereas the honie Apples will abide no time.

Chap. XVII. I

¶ *How to keep Quinces, Pome-granats, Peares, Sorvises, and Grapes.*

FOr the good keeping and preseruing of Quinces, there must be no aire let into them where they are enclosed: or else they ought to be confected in sodden honey, or boiled therein.

Pomegranats should be plunged into sea-water boiling, and so hardened therein: and after that they be dried in the Sun three daies, (so as they be not left abroad in the night to take dew) they would be hanged vp in a solar, and when a man list to vse them, then they must be wel washed in fresh water. *M. Varro* sets downe the manner to keep them within great earthen vessels, in sand. And if they be not ripe, he would haue the earthen pots bottomes broke off, and so the Pomegranates to be put in, and couered all ouer with mould: but the mouth therof must be K well stopped for letting any aire in; prouided alwaies, that the steele and the branch wherto the fruit groweth, be pitched. For so (quoth he) they will not giue ouer to grow still, yea, and proue bigger than if they had remained vpon the tree. As for other Pomegranats [*i.* that are ripe] they may be wrapped and lapped one by one in fig-leaues, such as are not fallen, but plucked from off the tree greene, and then to be put into twigge paniers of oifiers, or else daubed ouer with potters blay.

He that would keep Peares long, must put them in earthen vessels turned with the bottomes vpward, well varnished or annealed within, couered also with saw dust or fine shauings, and so enterred. As for the Tarentine Peares, they abide longest on the tree ere they be gathered. The Anitian Peares be well preserued in cuit-wine. L

As for Soruisses, they are kept also in trenches within the ground, but the couer of the vessel whereinto they are put, ought to be well plastered all ouer, and so stand two foot couered with earth: also they may be set in a place exposed open to the Sun, with the bottome of the vessells vpward: yea, and within great barrels they may be hung vp with their branches and all, after the manner of grape-clusters.

Some of our moderne writers handle this argument more deepely than others, and fetch the matter farre off, giung out rules in this manner, saying, That for to haue Apples or Grapes *de garde*, that is to say, fit to be preserued, and to last long; the trees that beare the one and the other, ought to be pruned and cut betimes, in the waine of the Moone, in faire weather, and when the winds blow drie. Likewise they affirme, That fruits to be preserued, would be chosen from M drie grounds: gathered before they be full ripe: and this would be looked vnto in any hand, that the Moon at the gathering time, be vnder the earth, and not appearing in our hemisphære. And more particularly, for Grape bunches they would be gathered with a foot or heele from the old hard wood, and the Grapes that are corrupt and rotten among the rest, be clipped off with a

paire

20030
copy 1

A paire of ſheers, or plucked out with pincers: then to be hung vp within a great new earthen veſſell well pitched; with the head or lid thereof thoroughly ſtopped and plaſtered vp cloſe, to exclude all aire. After which manner, they ſay Soruiſſes and Peares may be kept, but ſo, as in any caſe the twigs ond ſteeles whereby they hang, be well beſmeared with pitch. Moreouer, order would be giuen, that the barrels and veſſells wherein they are kept, be far ynough from water. Some there be again who keep Grapes together with their branch, after the ſame maner in plaſter: but ſo, as both ends of the ſaid branch ſticke in the head of the ſea-Onion Squilla: and others let Grape-cluſters hang within hogſheads and pipes hauing wine in them: but ſo, as the Grapes touch not the wine in any caſe. There be alſo that put Apples and ſuch fruits in ſhallow pans or pancheons of earth, and let them ſwim and flote aloft vpon the wine within their
B veſſels: for beſides that this is a way to preſerue them, the wine alſo (as they think) will thereby get a pleaſant & odoriferous taſt. Others ye haue beſides, that chuſe rather to preſerue al theſe fruits, as well Apples, Pears, &c. as Grapes, couered in Millet ſeed. Howbeit, the moſt part dig a trench or ditch two foot deep in the ground, they floore it with ſand in the bottome, and lay their fruits thereupon; then they ſtop the top with an earthen lid, and afterwards couer al with earth. Some there are which ſmeare their bunches of Grapes all ouer with potters clay; and when they are dried in the Sun, hang them vp in ſolars for their vſe: and againſt the time that they ſhould occupie them, ſteep them in the water, and ſo waſh off the foreſaid clay. But for to keep Apples that are of any worth, they temper the ſame clay with wine, and make a morter, thereof, wherein they lap the ſaid Apples. Now if thoſe Apples be of the beſt kind and right
C ſoueraigne, after the ſame ſort they couer them with a cruſt of the like paſt or morter, or elſe clad them within a coat of wax: and if they were not fully ripe afore, they grow by that meanes and break their cruſt or couer what euer it be. But this would not be forgotten, that they vſe alwaies to ſet the Apple or fruit vpright vpon the taile, howſoeuer they be kept. Some there are who gather Apples and ſuch like fruit with their ſlips and ſprigs, hide them within the pith of an Elder tree, and then couer them in earth, as is before written. And others there are, who for euery Peare or Apple, haue a ſeuerall earthen pot, and after that their lids be well cloſed and ſtopped with pitch, then they encloſe them again with great veſſels or tuns. Nay ye ſhal haue ſome to lap them with flocks and wooll, and ſo put them in caſes, and them they ſee wel luted with morter made of clay and chaffe tempered together. Some order them in the ſame ſort,
D but they put them in earthen pans: and others make no more adoe, but dig a hole in the ground, floore the bottom with a courſe of ſand, put the Apples or fruit within, & then anon when they are thus buried, couer all with mould. Theſe be that vſe Quinces in this wiſe; they take them, anoint them with wax comming out of Pontus, and let them afterwards to ly couered in hony.

Columella mine Author reporteth, That fruits will keep well in earthen pots thoroughly pitched, and afterwards ſet in pits, and drenched in ceſternes of water. In the maritime coaſts of Liguria next to the Alpes, they vſe to take Grapes after they be dried in the Sun & wrap them within bands of ruſhes and reeds, put them vp in little barrels, and ſtop them cloſe with plaſter. The Greeks haue the ſame faſhion: but they take for that purpoſe, the leaues of the Plane-tree, of the vine it ſelfe, or elſe the fig-tree, after they be dried one day in the ſhade: and when
E they be in the barrell, betweene euery bed of grape cluſters, they couch a courſe of grape kernels, and ſuch refuſe remaining after the preſſe. And in this manner are the grapes of Coos and Berytus preſerued: and for ſweetneſſe and pleaſant taſt, there are no better to be found. And ſome there be, that for to counterfeit theſe excellent Grapes, beſmeare them with lie aſhes ſo ſoon as euer they be pulled from the Vine, and preſently drie them in the Sunne: which done, they enwrap them within leaues, as hath been ſaid before, and ſo couch them cloſe within the cake of preſſed grapes. Neuertheleſſe, there be diuers that chuſe rather to keepe Grapes in the ſaw duſt or ſhauings of Firre-wood, Poplar, or Aſh. Some are afraid to let grapes hang neer to Apples, Pomegranates, and ſuch like fruit, and therefore giue in charge to let them preſently after they be gathared, for to be hung vp in garners or bourded lofts: ſuppoſing that the duſt
F which they gather from aboue, is the beſt couer to defend and preſerue them. The remedie to keepe Weſpes from them, is to ſpurt or ſquirt oile out of a mans mouth vpon them. And thus much concerning the way to preſerue Grapes and other fruits aforeſaid. As for Dates, we haue ſpoken ſufficiently before of them.

CHAP.

G

Chap. XVIII.

¶ *Of Figs, 29 ſorts of them.*

OF all other fruits that haue tender pils or skins, and are called in Latine, Poma, Figges are the biggeſt: for ſome of them are found to be as great as Peares. As touching the Sycomores of Ægypt and Cypres, and of their admirable fruit we haue written ynough in the treatiſe of forraine Trees. The Idæan Figs that come from the mountaine Ida, are of color red, of the bigneſſe of Oliues, only rounder they be, & in taſt reſemble Medlars. In the region about Troas neare to the ſaid hill Ida, they call that fig-tree Alexandrina. It is as thicke as a mans arme about at the cubite or elbow, and full of branches: the wood thereof is tough and ſtrong, howbeit, pliable to wind and bend which way a man would haue it. Void of milky ſubſtance it is, clad with a green barke, bearing leaues like the Tillet or Linden tree, but that they be ſoft. *Oneſicritus* writes, that the Fig-trees in Hyrcania beare more pleaſant fruit than ours in Italie, without all compariſon: alſo that they carrie a greater burden, and be farre more plentifull, inſomuch, as one of them ordinarily yeelds 270 Modij of Figs. We haue here alſo in Italie many Fig-trees brought out of other forrain countries, to wit, from Chalcis and Chios: wherof there be many ſorts. For both our Lydian Figs which are of a reddiſh purple color, and alſo the Mamillane or teat-Figs, haue a reſemblance of the ſaid Chalcidian and Chian Figs, yea, and the Caliſtruthion Figs beyond others not a little, in goodnes of taſt: and theſe of all the reſt are the coldeſt. As touching the Affricane Figs, which many men preferre before all others, they hold the name of Affricke, as if it were their natiue countrey: and yet there is a great queſtion thereabout, and I wot not well what to ſay thereof, conſidering that it is not long agoe that Affrick begun firſt to haue Fig-trees. For the Alexandrine Figs are of the blacke kind, hauing a white rift or chamfre, and are ſurnamed Delicate. The Rhodian Fig is likewiſe blacke of hue: and ſo is the Tiburtine, which alſo is of the haſtie kind, and ripe before others.

H

I

Moreouer, there be certaine Figs which beare the names of thoſe that brought them firſt into Italy: namely, the Liuian and Pompeian, and ſuch are fitteſt to be dried in the Sun and ſo to be kept all the yeare long for a mans vſe: like as the illfauoured, fooliſh and gaping Figs Mariſcæ: as alſo thoſe that are ſpeckled with ſpots like the leaues of Laconian reeds.

There are beſides the Herculanean, Albicerate and Aratian white Figges, which of all other are moſt flat and broadeſt, and withal haue the leaſt taile or ſteele wherby they hang. The Porphyrite Figs firſt ſhew vpon the tree, and ordinarily be longeſt tailed. The ſmalleſt Figs called the popular Figs, which alſo are of al others the baſeſt & of leaſt account, come next after and beare the Porphyrites companie. Contrariwiſe, the Chelidonian Figges be the laſt: and ripen againſt Winter.

K

Moreouer, certain Figs there be which are both early, & alſo lateward: namely, ſuch as bear twice a yeare: and be both blacke and white: for they are ripe firſt in haruеſt, and afterwards, in time of vintage. Late alſo it is before the Duracinæ be ripe, ſo called of the hard skin which they haue. Alſo ſome there be of the Chalcidian kind which beare thrice a yeare. At Tarentum there grow none but ſuch as are exceeding ſweet, and thoſe they call Omas [or rather Oenadas, taſting of wine.]

L

Cato in his treatiſe of Figs writes thus, The vnſauorie Fig dotes, Mariſcæ, would be ſowne in an open, light, and chalkie ground. But the Affricane, Hirculane, and the Winter Saguntine Figges, as alſo the Telliane (which are blacke and long tailed) loue a fatter ſoile, or elſe well dunged.

After this, Figges haue changed into ſo many kinds, and altered their names very often: in ſuch ſort that by this point it is euident, how the world is altered, and to what varietie this life is ſubject. In ſome prouinces, as namely in Mœſia, there be winter Figs that hang all Winter long: but they come to be ſuch, more by art and cunning, than naturally of themſelues. For ſo ſoone as Autumne is paſſed, and Winter approches, they vſe to couer with dung certaine little Fig-trees which they haue, and together with them the green yong Figs that they find on them in Winter: and when they haue continued ſo the ſharpe time of dead Winter, ſo ſoone as the weather beginnes to be more warme and temperate, they diſcharge both fruit and tree of their dung: which being thus let out again (as it were) where they ſeemed buried, and now comming

M

copy 1

A to light; they no ſooner find the freſh aire, & another kind of nouriſhment differing from that, whereby they liued, but doe embrace and receiue the comfort of the new Sun moſt greedily, as if they were new born and reuiued: in ſuch ſort, as that in Mœſia, notwithſtanding it be a moſt cold region, ye ſhall haue the figs of theſe trees to ripen, when others begin to bloſſom, and by this means become early and haſty figs in another yeare.

Now forasmuch as we are fallen to mention the figs in Africk, which were in ſo great requeſt in the time of *Cato*, I am put in mind to ſpeake ſomewhat of that notable opportunity and occaſion which by the means of that fruit he took for to root out the Carthaginians, & raſe their very city. For as he was a man who hated deadly that city, and was otherwiſe carefull to prouide for the quiet and ſecuritie of his poſteritie, he gaue not ouer at euery ſitting of the Senat, to importune the Senators of Rome, and to cry out in their eares, That they would reſolue
B and take order to deſtroy Carthage: and in very truth one day aboue the reſt, he brought with him into the Senat houſe an early or haſty fig which came out of that country, and ſhewing it before all the lords of the Senat, I would demand of you (quoth he) how long ago it is (as you think) ſince this fig was gathered from the tree? And when none of them could deny but that it was freſh and new gotten: Lo (quoth he) my maſters all, this I do you to wit, It is not yet full three daies paſt ſince this fig was gathered at Carthage: ſee how neere to the walls of our citie we haue a mortall enemie. Vpon which remonſtrance of his, preſently they concluded to begin the third and laſt Punick war, wherein Carthage was vtterly ſubuerted and ouerthrown. Howbeit *Cato* ſuruiued not the raſing and ſaccage of Carthage, for he died the yeare immediately
C following this reſolution? But what ſhall we ſay of this man? whether was more admirable in this act, his prouident care and promptneſſe of ſpirit; or the occaſion preſented by the ſudden obiect of the fig? was the preſent reſolution and forward expedition of the Senat, or the vehement earneſtneſſe of *Cato*, more effectuall to this enterpriſe? Certes, ſomewhat there is aboue all, & nothing in mine opinion more wonderful, that ſo great a ſigniory and ſtate as Carthage, which had contended for the Empire of the world for the ſpace of 120 yeres, and that with the great conquerours the Romanes, ſhould thus be ruined and brought vtterly to nought, by occaſion of one fig. A deſigne that neither the fields loſt at Trebia and Thraſymenus, nor the diſgrace receiued at the battell of Canna, wherein ſo many braue Romans loſt their liues, and left their dead bodies on the ground to be interred, could effect: nay not the diſdain that they
D took to ſee the Carthaginians incamped and fortified within 3 miles of Rome, ne yet the brauadoes of *Annibal* in perſon, riding before the gate Collina, euen to dare them, could euer bring to paſſe. See how *Cato* by the means of one poore fig, preuailed to bring and preſent the forces of Rome to the very walls of Carthage.

There is a fig tree called Navia, honoured with great reuerence, in the common Forum and publique place of juſtice at Rome, euen where the ſolemne aſſemblies are held for election of Magiſtrats, neere to the Curia, vnder the old ſhops called Veteres: as if the gods had conſecrated it for that purpoſe: neere (I ſay) it is to the Tribunal named Puteal Libonis, & there planted by *Actius Navius* the Augur, where the ſacred reliques of his miracle, to wit, the Raſor and the Whetſtone, were ſolemnely interred: as if it came of the owne accord from the ſaid Curia
E into the Comitium, and had not bin ſet by *Navius*. This tree if it begin at any time to wither, there is another replanted by the prieſts, who that way are very carefull and ceremonious. But a greater reſpect is had of another in remembrance of the firſt fig tree named Ruminalis (as it were) the nurſe of *Romulus* and *Remus*, the two yong princes fondlings, and founders alſo of the city of Rome: for that vnder it was found a ſhe wolfe, giuing to thoſe little babes the teat (in Latine called Rumen:) and for a memoriall hereof there is a monument of braſſe erected neere vnto it, repreſenting that ſtrange and wonderfull ſtory. There grew alſo a third fig tree before the temple of *Saturne*, which in the yeare 260 after the foundation of the city of Rome, was taken away, at what time as a chappell was builded there by the Veſtal nuns, and an expiatory ſa-
F crifice offered, for that it ouerthrew the image of *Sylvanus*. There is a tree of the ſame kind yet liuing, which came to grow of it ſelf, no man knows how, in the midſt of the Forum Romanum, and in that very place where was the deepe chinke and gaping of the ground, that menaced the ruine of the Roman empire; which fatall and portentuous gulfe the renowned knight *Curtius* filled vp with the beſt things that were to be found in the city, to wit, his Vertue and Piety incomparable, teſtified by a moſt braue & glorious death. In the very ſame place likewiſe there is

an

an Oliue and a Vine,which came thither by as meere a chance,but afterwards well looked and trimmed by the whole people,for to inioy the pleasure and shade thereof. And there also stood an altar,which afterward was taken away by occasion of the solemne shew of sword-fencers, which *Iulius Cæsar* late Emperor,exhibited to do the people pleasure, which were the last that plaied their prizes,and fought at the sharp in the said Forum. To conclude,wonderfull it is to see,how the fruit of this tree maketh hast to ripe: a man would say that Nature therein sheweth all her skill and force to ripen figs altogether at once. G

Chap. XIX.

¶ *Of the wilde Fig trees: and of caprification.*

There is a kind of wild Fig trees,which the Latines call Caprificus,that neuer brings any fruit to maturitie; but that which it selfe hath not, it procureth to others, and causeth them to ripen. For such is the interchangeable course & passage of causes in nature,that as this thing putrifieth,that ingendreth; and the corruption of one is the generation of another. By this it comes to passe,that the wild fig tree breedeth certaine flies or gnats within the fruit thereof: which wanting nourishment, and not hauing to feed vpon in those figs, because they become rotten aud putrified as they hang vpon the tree, they flie vnto the other kinde of gentle and tame fig-trees,where they settle vpon the figs, and greedily nibble thereupon, vntill they haue made way and pierced into them; and by that means let in at first the breath of the warme Sun,and that comfortable and vegetatiue aire besides that helpeth to ripen them. Soon after they suck vp and spend the milky humor which they find there, and which keeps the figs still as it were in their infancie,and hindreth their speedy and timely maturitie. True it is,that the figs in time would ripen of themselues by the power and benefit of Nature only: howbeit skilfull and industrious husbandmen take order alwaies to set these wild fig trees neere to the place where other fig trees grow,but with due regard of the winde side, that when the foresaid gnats breake forth and are ready to fly out,a blast of wind might carry them to the other. And hereupon came the deuise and inuention to bring whole swarms & casts of them, as they hang one to another,from other places,that they might settle vpon the figs to consume the raw moisture within. Now if the soile be lean and hungry, and the fig trees growing therupon exposed to the North wind,there is no such need of this help: for the figs will dry sufficiently of themselues,by reason as well of the scituation of the place,as the clifts and rifts in them,which will effect that which the gnats or flies aboue named might performe. The like effect is to be seen also where much dust is,namely,if a fig tree grow neere vnto a high-way much frequented and trauelled by passengers. For the nature of dust is to dry and soke vp the superfluous moisture of the milke within figs. And therefore when they are thus dried,whether it be by the meanes of dust,or of the said flies feeding,which is called Caprification,they fall not from the tree so easily,by reason they are discharged of that liquid substance which maketh them both tender, and also ponderous,weighty,and brittle withall. H I K

All figs ordinarily are tender and soft in handling. Those which be ripe haue small graines within them: their succulent substance besides,when they begin to ripen, is white like milke: but when they are perfectly ripe it is of the colour of hony. They will hang vpon the tree vntil they be old,and when they are aged,they yeeld a certain liquor which distilleth from them in maner of a gum,and then in the end become dry. L

The better sort of figs haue this honor and priuiledge,to be kept in boxes and cases for the purpose: and chiefly those which come from the Isle Ebusus, which of all others are the very best and largest: yea,and next to them those that grow in the Marrucines country. But where they are in more plenty they put them vp in great vessels called Orcæ, as namely in Asia: also in barrels & pipes,as at Ruspina a city in Barbary. And in very truth,the people of those countries make that vse of them when they be very dry,that they serue both for bread and meat. For *Cato* setting downe an order for dyet and victuals fit and sufficient for labourers,ordained,that they should be cut short of their other pittance,when figs are ripe,and make vp their ful meals with it. And it is not long since the manner came vp to eat fresh new figs with salt and poudered meats, in stead of cheese. And for to be eaten in this sort,the figs called Coctana (whereof we haue written before) and the dried figges Caricæ are commended: as also the Caunæ, M

which

20030
copy 1

A which when *M. Craſſus* ſhould imbarque in that expedition againſt the Parthians (wherein he was ſlain) preſaged ill fortune, and warned him not to go forward: namely, when at the very inſtant that he was ready to ſet foot a ſhip-bord, there was a fellow heard to cry thoſe figs for to be ſold, pronouncing aloud, Cauneas, Cauneas: which word in ſhort ſpeaking was all one with *Cave ne eas* [*i.* Beware of this voiage, and go it not.] All theſe ſorts of figges *L. Vitellius* brought out of Syria, into his ferm or manor that he had neere Alba, hauing L. Gouernor or Lieutenant generall in thoſe parts, namely, in the later end of *Tiberius Cæſar* the Emperor: and the ſame *Vitellius* was afterward Cenſor at Rome.

Chap. XX.

¶ *Of Medlars: three kinds of them.*

B MEdlars and Seruices may well and truely be ranged in the ranke of Apples and Peares: Medlars be of three ſorts; namely, Anthedon, Setania, and the third which they call Gallicum, [*i.* the French Medlar] which is of a baſtard nature, yet it reſembles the Anthedon rather than the other. As for the Setanian Medlar, the fruit is greater and whiter than the reſt; alſo the kernels or ſtones within are of a more ſoft ſubſtance, and not altogether ſo wooddy and hard. The reſt are ſmaller than theſe Setania or common Medlars, but they haue a better ſmell and more odoriferous, and withall will laſt longer. The tree it ſelfe that beareth Medlars is reckoned among the greateſt ſort: the leaues before they fall wax red: the roots be many in number, and run downe right deep into the ground: by which meanes, vnneth or verie C hardly they be quite rooted vp. This tree was not known in Italy by *Cato's* dayes.

Chap. XXI.

¶ *Of Services, foure kinds.*

OF Seruices there be foure ſundry ſorts, differing one from another: for ſome of them are round like apples, others pointed at the end as Peares; a third kinde are faſhioned like egs, as ſome long or tankard apples: and theſe are apt to be ſoon ſoure. For ſweet ſent and pleaſant taſt the round excell all others: the reſt haue a relliſh of wine. The beſt kinde of them are they that haue ſoft & tender leaues about their ſteles whereby they hang. The fourth D ſort they call Torminale, allowed onely for the remedie that they affoord to mitigate the torments and wringing of the colique. This tree is neuer without fruit, howbeit the ſmalleſt of all the reſt, and differeth from the other, for it beareth leaues very like to the Plane. There are none of them that beare fruit before they be three yeares old. Laſtly, *Cato* would haue Seruiſes to be preſerued and condite in Cuit.

Chap. XXII.

¶ *Of the Wall-nut.*

E THe next place to theſe for bignes, the Walnuts doe challenge, which they cannot claime for their credit and authoritie; and yet they are in ſome requeſt among other licentious and wanton Feſcennine ceremonies, at weddings: for leſſe they be than Pine nuts, if a man conſider the groſneſſe of the body outwardly; but in proportion therto they haue a much bigger kernel within. Moreouer, Nature hath much graced and honoured theſe nuts with a peculiar gift ſhe hath endued them with, namely, a double robe wherewith they are clad: the firſt is a tender and ſoft husk; the next, a hard and wooddy ſhel: which is the cauſe that at mariages they ſerue for religious ceremonies, reſembling the manifold tunicles and membranes wherin the infant is lapped and enfolded within the womb: and this reaſon foundeth more probable, than that they ſhould be ſcattered, becauſe in their fall they rebound and make a ratling [to drowne (forſooth) all other noiſes from the bride-bed or chamber.] That theſe Nuts alſo were F brought out of Perſis firſt by commandement of the Kings, is euident by their Greeke names; for the beſt kind of them, they call Perſicon, and Baſilicon; as one would ſay, the Perſian and Royall nut: and theſe indeed were the firſt names. Afterwards, the nut came to be named Caryon, (by all mens confeſſion) for the heauineſſe of head which it cauſeth, by reaſon of the

ſtrong ſmell. Their outward husk ſerues to die wooll: and the little nuts when they come new forth are good to giue the haire of the head a reddiſh or yellow colour. The experiment therof was firſt found by ſtaining folks hands as they handled them. The elder that nuts be & longer kept, the more oleous and fatty they are. The only difference in the ſundry kinds conſiſteth in the ſhel, for that in ſome it is tender and brittle, in others hard; in one ſort it is thin, in another thick: laſtly, ſome haue ſmooth and plain ſhells, others again be as full of holes and cranies. G

Walnuts be the fruit alone that Nature hath incloſed with a couer parted in twaine, and ſo is ioyned and ſet together; for the ſhell is diuided and cleft iuſt in the middle, and each halfe reſembleth a little boat. The kernell within is diſtinguiſhed into foure parts, and between euerie of them there runneth a membrane or skin of a wooddy ſubſtance. As for other nuts, their meat is ſolid and compact, as we may ſee in Filberds and Hazels, which alſo are a kind of nuts, and were called heretofore Abellinæ, of their natiue place, from whence came good ones at firſt. They came out of Pontus into Natolia and Greece, and therefore they be called Pontick nuts. Theſe Filberds likewiſe are couered with a ſoft bearded huske, and as well the ſhell as the kernell is round and ſolid, all of one entire piece. Theſe nuts alſo are parched for to be eaten, and within their belly they haue in the mids a little chit or ſpirt as if it were a nauill. H

As for Almonds, they are of the nature of nuts, and are reckoned in a third ranke. An vpper husk they haue like as Walnuts, but it is thin: like as alſo a ſecond couerture of a ſhell. The kernell differeth ſomewhat, for broader it is and flatter, and their skin more hard, more ſharpe, and hoter in taſte than that of other nuts. Now whether the Almond tree were in Italy during the life of *Cato*, there is ſome doubt and queſtion made; becauſe he nameth the Greeke nuts, which ſome do hold for a kind of walnut. Mention maketh he beſides of the Hazel nuts or filberds, as well the * Galbæ, as the Preneſtine, commended by him aboue all others, which hee ſaith are put vp in pots, and kept freſh and green within the earth. Now adaies the Thaſian and Albeuſian nuts be in great account; and two ſorts beſides of the Tarentine; whereof the one hath a tender and brittle ſhell, the other as hard: and thoſe are the biggeſt of all other, and nothing round. He ſpeaketh alſo of the ſoft ſhaled Filberds Molluſcæ, the kernels whereof doe ſwell and cauſe their ſhels to breake in ſunder. I

* or *Caluæ*, i. Bsld.

But to return again to our Walnuts: ſome to honor them interpret their names Iuglandes, as a man would ſay, the nuts of *Iupiter*. It is not long ſince I heard a knight of Rome, a gentleman of high calling, and who had bin Conſul, profeſſe and ſay, that he had certain walnut trees that bare twice a yeare. As for Fiſticks we haue ſpoken already of them. To conclude, theſe kind of nuts the aboue named *Vitellius* brought firſt into Italy at the ſame time, namely, a little before the death of *Tiberius* the Emperor: and withall, *Flaccus Pompeius* a knight of Rome, who ſerued in the wars together with him, caried them ouer into Spain. K

Chap. XXIII.

¶ *Of Cheſtnuts eight kindes.*

WE entitule Cheſtens alſo by the name of Nuts, although indeed they are more aptly to be called a kind of Maſt. This fruit what euer it be is incloſed within a huske, and the ſame defended and armed all ouer with a rampier and paliſade (as it were) of ſharp pricks like the skin of an vrchin; whereas the Acorn and other Maſt is but half couered, and that defence in them is begun only. And certes, a wonderfull matter it is that we ſet ſo little ſtore by this fruit, which Nature is ſo carefull to hide and defend. Vnder one of theſe husks ye ſhall find ſomtime three Cheſtnuts, and thoſe hauing certain tough pils or ſhells very pliable. But the skin or filme within, and which is next to the body or ſubſtance of the fruit, vnleſſe it be pilled off and taken away, marreth the taſte of it, like as it doth alſo in other nut-kernells. Cheſtnuts if they be roſted are better and more pleaſant meat than otherwiſe. They vſe alſo to grind them to meale, and thereof is made a kind of bread, which poore women for hunger will eat. The firſt Cheſtnuts were known to grow about Sardis, & from thence were brought, wherfore the Greeks call them Sardinian nuts: but afterwards they came to be named Διὸς βαλανοι, [*i. Iupiters* nuts] when as men began to graffe them; for thereby they became more excellent. And this day there be many ſorts of them. The Tarentine be gentle and not hard of digeſtion, and in forme flat and plaine. That which they call Balanitis, is rounder, it will ſoone be pilled and cleanſed, L M

20030
copy 1

A cleanſed,and of it ſelfe will leape out of the skin. And of this kind, the Salarian is more neat, flat,and ſmooth: the Tarentine not ſo eaſie to be handled and dealt withall: the Corellian is more commended than the reſt; as alſo the Meterane, which commeth of it by graffing: the manner whereof we will ſhew when we come to treat of graffes. Theſe haue a red pilling, in which regard they are preferred before either the three cornered, or the blacke common ones, which be alſo called Coctiuæ,[*i.* Cheſtnuts to be boiled.] The beſt Cheſtnuts are they which grow about Tarentum, and Naples in Campaine. All the reſt are good in manner for nothing but to feed ſwine,* ſo cloſe ſticketh the pill or inner skin alſo,as if it were ſoudered to the kernell within, and ſo hard it is to ſeperate the one from the other.

* *Scrupuloſa corticis interioris circa nucleos quoque ferrumination.*

CHAP. XXIIII.

B

¶ *Of Carobes: of fleſhie and pulpous fruits: of Mulberries: of liquid kernels or graines, and of berries.*

THe fruit called Carobes or Caracts, may ſeeme to come neare vnto the foreſaid Cheſtnuts,(ſo paſſing ſweet they be) but that their cods alſo are good to be eaten. They bee as long as a mans finger,and otherwhiles hooked like a faulcheon,and an inch in bredth. As for maſt,it cannot be reckoned among fruit properly called Poma,and therefore we will ſpeak of them apart,according to their nature.

Now are we to treat of the reſt which are of a carnous ſubſtance: and thoſe are diuided into fruits that be ſoft and pulpous,and into berries. The carnoſity in Grapes and Raiſons,in Mul-
C berries,and the fruit of the Arbut tree,differs one from the other. Againe, the fleſhy ſubſtance in Grapes between the skin and the liquid juice, is one,and that in Sebeſten is another. Berries haue a carnoſity by themſelues,as namely Oliues. Mulberies yeeld a juice or liquor within the pulpe thereof,reſembling wine. They be ordinarily of three colours: at the beginning, white; ſoone after,red;and when they be ripe, blacke. The Mulberrie tree bloometh with the laſt,but the fruit ripeneth with the firſt. Mulberries when they be full ripe,ſtaine a mans hand with the juice thereof, and make them blacke: but contrariwiſe being vnripe,they ſcoure them cleane. There is not a tree againe, wherein the wit of man hath bin ſo little inuentiue, either to deuiſe names for them,or to graff them,or otherwiſe,ſaue only to make the fruit fair and great. There
D is a difference which we at Rome doe make, betweene the Mulberries of Oſtia and Tuſculum. There is a kind of Mulberries growing vpon the bramble,but their skin is much harder than the other. Like as the ground-ſtrawberries differ in carnoſitie from the fruit of the Arbut tree, and yet it is held for a kind of Strawberrie, euen as the tree it ſelfe is tearmed the Strawberrie tree. And there is not a fruit of any other tree, that reſembleth the fruit of an hearb growing by the ground,but it.

The Arbut tree it ſelfe ſpreadeth full of branches: the fruit is a whole yeare in ripening: by which means a man ſhall find alwaies vpon the tree,yong and old fruit together one vnder another; and the new euermore thruſts out the old. Whether it be the male or female that is barren,writers are not agreed. Surely the fruit is of baſe and no reckoning at all: no maruell therefore if the Latines gaue it the name Vnedo,for that one of them is enough to be eaten at once.
E And yet the Greeks haue two names for it, to wit, Comarum & Memecylon: whereby it appeareth, that there be as many kinds among the Latines alſo, although it be tearmed by another name, Arbutus. K. *Iuba* ſaith,that theſe trees in Arabia grow to the heigth of fiftie cubites.

As touching Graines and liquid Kernels, there is great difference betweene them: for firſt and formoſt, among very grapes, there is no ſmall diuerſitie in the skin, either for tendernes or thickneſſe: in the inner ſtones or pepins,which in ſome grapes are but ſingle,or one alone; in others double,and thoſe commonly yeeld not ſo much wine as the others do. Secondly,thoſe of Iuie and Elder differ very much,yea and the graines within a Pomegranat are not like to others in their forme, for they alone be made cornered and angle-wiſe; and ſeuerall as they bee,they
F haue not a particular skin of their own,but they are altogether clad within on, which is white: and yet they ſtand all wholly of a liquor and pulpous carnoſitie, eſpecially thoſe which haue within them but a ſmall ſtone or woodie kernell.

Semblably, there is as much varietie in berries: for oliues differ much from Bay berries: likewiſe thoſe of a Lote tree are diuers from them which the Corneil tree beares. The Myrtle alſo differeth

differeth from the Lentisk in the verie berrie. As for the huluer or hollie berries, and the hawes of the white-thorn, they are without any juice or liquor: wheras Cherries be of a middle kind, betweene berries and graines. This fruit is white at the first, as lightly all berries be whatsoeuer: but afterwards some waxe greene, as Oliues and Baies; others turn red, as Mulberies, Cherries, and Cornoiles; but in the end they all become blacke, as Mulberries, Cherries, and Oliues. G

Chap. XXV.

¶ *Of Cherries, eight kinds.*

BEfore the time that *L. Lucullus* defeated K. *Mithridates*, there were no cherrie-trees in Italy: but after that victorie (which was about the 680 yeare from the foundation of the citie of Rome) he was the man that brought them first out of Pontus, and furnished Italie so well with them, that within sixe and twentie yeres, other lands had part therof, even as far as Britain beyond the ocean. Howbeit (as we haue before said) they could neuer be brought to grow in Ægypt, for all the care and industrie employed about them. Of Cherries, the reddest sort bee called Apronia; the blackest, Actia: the Cæcilian be round withall. The Iulian Cherries haue a pleasant tast, but they must be taken new from the tree and presently eaten; for so tender they be otherwise, that they will not abide the carriage. Of all other, the Duracine Cherries be the soueraign, which in Campaine are called Pliniana. But in Picardie, and those low countries of Belgica, they make most account of the Portugall Cherries: as they do also who inhabite vpon the riuer Rhene. They haue a hew with them composed of three colors, between red, black and green, and alwaies look as if they were in ripening still. It is not yet full 5 yeres since the Cherries which they call Laurea, were known: so called they be, because they were graffed on a Bay-tree stocke, and thereof thy take a kind of bitternes, but yet not vnpleasant to the tast. There be moreouer Macedonian Cherries, growing vpon a small tree seldome aboue three cubits high: and yet there be certain dwarfe Cherries not full so tall, called Chameceraſti, [*i.* ground cherry-shrubs.] The Cherry-tree is one of the first that yeelds fruit to his master, in token of thankfulnesse & recognisance of his paines all the yeare long. It delights to grow in cold places and exposed to the North. The Cherrie wil drie in the sun, and may be kept in barrels like Oliues. H I

Chap. XXVI.

¶ *Of the Corneile and Lentiske tree.* K

THe same care is had in conditing the berries of the Corneil and the Lentiske, as in preseruing Oliues: so curious are men to content their tooth, as if all things were made to serue the belly. Thus we see, how things of diuers relishes are mingled together, and one giues a tast vnto another, and causeth to be pleasant at the tongues end. Nay we entermingle all climats and coasts of heauen and earth to satisfie our appetite: for to one kind of meat wee must haue drugs & spices fetcht as far as from India: to another, out of Ægypt, Candie, and Cyrene: and in one word, for euery dish we haue a seuerall land to find vs sawce. To conclude, wee are growne to this passe, that we cease not to sophisticate our viands, euen with hurtfull things, so they tast well: yea and to make dishes of very * poisons, because we would deuoure and send all downe the throat. But more plainely hereof, in our professed discourse of the nature and vertue of Hearbs. * Mushroms: L

Chap. XXVII.

¶ *The diuersitie of tasts and sauours.*

IN the meane time, as touching those things which are common as well to all fruit, as iuices and liquors: first and formost we find of tasts 13 seuerall kinds; to wit, sweet, pleasant, fattie, bitter, harsh and vnpleasant, hot and burning at the tongues end, sharpe and biting, tart or astringent, sowre, and salt. Ouer and besides all these, there be three others of a most strange and wonderfull nature. The first is that, wherin a man may haue a smacke of many tasts together, as in wines: for in them a man shall find an harsh, sharpe, sweet, and pleasant relliſh all at once; and yet these all differ from the natiue verdure of wine. A second sort there is besides, which caries a strange & different tast verily from the thing it self, and yet it hath besides the proper and peculiar M

20030
copy 1

A culiar taſt of the owne ſubſtance,as the Myrtle : for it carrieth a ſeuerall taſt by it ſelfe,proceeding from a certaine kind, mild, and gentle nature, which cannot truly be called either ſweet, fattie,or pleaſant,if we would ſpeake preciſely. Laſt of all,water hath no taſt at all of any juice or liquor whatſoeuer, and yet therein is a flat taſt by it ſelfe, which is called wateriſh, that nothing elſe beſides hath : for if a man do taſt in water a relliſh of any ſap or liquor, it is reputed for a bad and naughtie water.

Furthermore,a great and principall matter of all theſe taſts, lyeth in the ſauour and ſmell; which is connaturall vnto the taſt,and hath a great affinitie with it : and yet in water,is neither one or other to be perceiued:or if any be felt either by tongue or noſe, it is faultie, that is certaine.Finally, a wonderfull thing it is to conſider, that the three principall Elements whereof
B the world is made,namely,Water, Aire,and Fire,ſhould haue no taſt,no ſauor,nor participation of any ſap and liquor at all.

Chap. XXVIII.

¶ The juice and ſap of Fruits and Trees : their colours and odours : the nature of Apples,and ſuch ſoft Fruits : and the ſingular commendation of all Fruits.

TO begin withall,The Peare,The Mulberry,& the Myrtle-berrie, haue a juice or ſap within them,reſembling wine, * no maruell then,of Grapes,if they haue the like. Oliues,Bay-
C berries,Walnuts and Almonds,haue a fattie liquor in them. The Grape, the Fig, and the Date,carie a ſweet juice with them. Plums haue a wateriſh taſt.

There is no ſmall difference in the colour alſo that the juice of fruits do beare : Mulberries, Cherries,and Corneils, haue a ſanguine and bloudie liquor:ſo haue the blacke grapes;but that of the white grapes,is likewiſe white. The juice of Figs toward the head or neck of the fruit, is white like milke;but of another color in all the bodie beſides. In Apples, it is in manner of a froth or fome:in Peaches,of no colour;and yet the Duracina of that kind,be full of liquor; but who was euer able to ſay,what colour it was of?

The odor and ſauor likewiſe of fruits,is as ſtrange and admirable : for the ſmell of Apples is ſharpe and piercing;of Peaches,weake and wateriſh. As for ſweet fruits,they haue none at all:
D for verily we ſee, that ſweet wines likwiſe haue little or no ſmell,wheras the ſmall and thin are more odoriferous : and all things in like manner of a ſubtill ſubſtance, do affect the noſthrills more, than the thicke and groſſer doe:for whatſoeuer is ſweet in ſent, is not by and by pleaſant and delicate in taſt;for ſent and ſmacke are not alwaies of like ſort: which is the reaſon that Pomecitrons haue a moſt piercing and quick ſauor, wheras in relliſh they are rough and harſh: and ſo it fares in ſome ſort with Quinces. As for Figs,they haue not any odor. And thus much may ſuffice in generall, for the ſundrie kinds and ſorts of fruits which are to be eaten,it remaineth now to ſearch more narrowly into their nature.

To begin then with thoſe that are encloſed within cods or husks:yé ſhal haue ſome of theſe cods to be ſweet,and the fruit or ſeed contained within,bitter, and contrariwiſe,many of thoſe
E graines or ſeeds are pleaſant and toothſome enough ; but eaten with the huskes, they be ſtarke naught and loathſome.

As touching berries, there be that haue their ſtone or wooddie ſubſtance within,and the fleſhy pulp without,as Oliues,and Cherries:and there be again,that within the ſaid woody ſtone haue the carnoſitie of the berry as ſome fruits in Ægypt,whereof we haue alreadie written. As for berries carnous without-forth, & pulpous fruit called Apples,they be of one nature. Some haue their meat within,& their woodie ſubſtance without,as nuts:others,their carnoſity without,and their ſtone within,as Peaches and Plums. So that in them we may ſay,That the faultie ſuperfluity is enuironed with the good fruit, wheras fruit otherwiſe is ordinarily defended by the ſaid imperfection of the ſhell. Walnuts and Filberds are encloſed with a ſhell:Cheſtnuts
F be contained vnder a tough rind, that muſt be pulled off before they be eaten; wheras in Medlars,the cornoſitie and it be eaten together. Acornes,and all ſorts of maſt,be clad with a cruſt ; Grapes with a skin, Pomegranats with a rind and a thin pannicle or skin beſides. Mulberies do conſiſt of a fleſhy ſubſtance and a liquor. Cherries,of a skin and a liquid juice. Some fruits there be,the ſubſtance whereof will ſoon part from their woodie ſhell without,or ſtone within,

* *Minimæ quod miremur uvis.* Others diſtinguiſh thus, *Minimæ (quod miremur) uvis*, to this ſenſe: whereas in grapes (and that may be a wonder) there is none ſuch.

as nuts and Dates: others ſticke cloſe and faſt thereto, as Oliues and Bay berries. And there be againe that participate the nature of both, as Peaches: for in thoſe that be called Duracina, the carnous ſubſtance cleaueth hard to the ſtone, ſo as it cannot be plucked from it, wheras in the reſt, it commeth eaſily away. Now ye ſhall meet with ſome fruits, that neither without in ſhell, nor within-forth in kernell, haue any of this woodineſſe, as a kind of Dates [named Spadones.] And there be againe whoſe very kernell and wood is taken for the fruit it ſelfe, and ſo vſed; as a kind of Almonds, which (as we ſaid) doe grow in Ægypt. Moreouer, yee ſhall haue a kind of fruits furniſhed with a double ſuperfluity of excrement to couer them without-forth, as Cheſtnuts, Almonds, and Walnuts. Some fruits haue a ſubſtance of a threefold nature, to wit a bodie without; then, a ſtone or wood vnder it; and within the ſame, a kernell or ſeed, as Peaches. Some fruits grow thick and cluſtred together vpon the tree, as Grapes, and likewiſe Seruiſes, which claſpe about the branches and boughes, bearing and weighing them downe as well as grapes. Others for it, hang here and there very thin, as Peaches. And there be againe that lye cloſe, contained (as it were) within a wombe or matrice, as the kernells of the Pomegranates. Some hang by ſmal ſteles or tailes, as Peares: others in bunches, as Grapes and Dates. Ye ſhall haue ſome fruit grow by cluſters, and yet hang by a long taile, as the Berries of Iuie and Elder: and others againe cleaue faſt to the branch of the tree, as Bay berries: ſome both waies, as Oliues, for there bee of them that haue long ſteles, and others againe ſhort tailed. Some fruits there be alſo, that are formed like cups or mazers, as Pomegranats, Medlars, the Egyptian bean or Lote, and that which groweth about the riuer Euphrates. G H

As for the ſingularities and commendable parts in fruits, they be of diuers ſorts, Dates are moſt ſet by for their fleſhie ſubſtance, and yet they of Thebes aboue in high Ægypt, are eſteemed onely for their outward coat or cruſt that they haue. Grapes, and the Dates called Caryotæ, are in great account and eſtimation for their iuice and liquor: Peares and Apples be moſt accepted for their callous ſubſtance next vnto their skin or paring; but the honey-apples Melimela, are liked for their carnoſitie and fleſhie pulpe within: Mulberies content the taſt with their griſtle or cartilage ſubſtance: and the beſt part of the nut, is the very graine of the kernel. In Ægypt, ſome fruits are regarded only for their vtmoſt skin, as drie Figs: when Figges bee green, the ſame is pilled off and caſt aſide like a ſhell; but be they once drie, the ſaid skin is paſſing good. In all kind of Papyr-reeds, Ferula plants, and the white thiſtle Bedegnar, the verie maine ſtemme is the fruit to be eaten. The ſhoots alſo and tender ſprigs of the Frg-tree, are reputed for good meat, and alſo medicinable. To come vnto the ſhrubs kind, the fruit of Capres is eaten together with the ſtalke. As for Carobe, what is it elſe but a meere woodie ſubſtance that folke do eat? (and yet the ſeed and graines within them, are not altogether to be deſpiſed for the propertie that they haue) although to ſpeak preciſely, it cannot properly be caled eith er fleſh, wood, or griſtle; neither hath it found any other conuenient name to be tearmed by. I K

Chap. XXIX.

¶ *Of the Myrtle, eleuen kinds thereof.*

NAture hath ſhewed her wonderfull power and bounty, eſpecially in the iuice of the Myrtle, conſidering that of all fruits, it alone doth yeeld two ſorts both of oile and wine: likewiſe the mixture or compoſition called Myrtidanum, as we haue ſaid before. Alſo there was another vſe in old time of Myrtle berries: for, before that Pepper was found and vſed as it is, they ſerued in ſtead thereof: from whence tooke name that exquiſite and daintie diſh of meat, which euen at this daie is called Myrtatum. And hereof came that excellent ſauce ſo highly commended for the brawne of the wild Bore, when for the moſt part Myrtle berries are put thereto to dip the meat therein, for to giue a better taſt to that kind of veniſon. L

As for the very tree it ſelfe, the firſt that euer was ſeen within the compaſſe and precincts of Europe (which beginneth at the mountaine Ceraunia) was about Circeij, where ſtood the tombe ſometimes of *Elpenor*; and ſtill it retains the Greeke name: whereby we may well judge, that it is a ſtranger. Howbeit there grew a Myrtle tree in old time, when Rome was firſt founded, euen in that plot of ground where the citie now ſtandeth. For thus goeth the hiſtorie: That vpon a time the Romanes and Sabines being raunged in battaile array, and at the point M

20030
copy 1

A to fight a field, and to try the quarell (for the wrong which the Sabines pretended, was done to them, in regard that the Romans had rauiſhed their daughters being yong maidens) were reconciled and made friends: and thereupon laid downe their armes and weapons, and were there purified with the ſacred branches of Myrtle, in that very place wherein now the temple & image of *Venus Cluacina* ſtandeth: which therupon tooke the name (for that *Cluere* in old Latin, ſignified to purge or cleanſe.) Beſides, that tree otherwiſe doth affoord a kind of ſweet perfume to be burned. Now was this tree choſen for that purpoſe then to make attonement and to ratifie the mariage betweene the Romans and the Sabine Virgins, becauſe *Venus* is the preſident and mother of carnall copulation, and the patroneſſe withall of the Myrtle tree. I will not confidently auouch, but me thinks I may preſume to ſay, that the Myrtle was of all other trees firſt planted
B in the publick places of Rome for ſome memorable preſage and fore-tokening of future euents and things to come. For whereas the temple of *Quirinus* (*i.* of K. *Romulus*) is reputed for one of the moſt antique buildings now extant, there grew euen before it for a long time two old and ſacred Myrtle trees: the one named Patritia (*i.* the Myrtle of the Nobility:) and the other Plebeia; that is to ſay, the Myrtle of the Comminalty. The Patritian proſpered and flouriſhed many yeares together, whiles the Plebeian began to fade and wither. And to ſay a truth, ſo long as the Senate was able to maintaine and vphold their authority, the Myrtle of the Nobles continued freſh and greene, and ſpread her boughes at large; whereas that other of the Commons ſeemed as it had beene blaſted, dried, and halfe dead: but after that the ſtate of the Senat began to quaile and droupe (which was about the time of the war with the Marſyans) as their tree de-
C caied and waſted, ſo the Plebeians Myrtle held vp the head againe: and ſo by little and little, as the Maieſty of the Senatours was taken downe and abated to nothing, ſo their Myrtle waxed poore and barren vntill it became dry and ſtark dead. Moreouer, there ſtood an old chappel and an altar conſecrated to *Venus Myrtea*, whom now at this day they call Murtia.

Cato in his time wrote of three kinds of Myrtle: to wit, the white, the blacke, and the Conjugula (ſo called haply of wedlock or mariage:) & peraduenture it may come of the race of thoſe Myrtles belonging to *Venus Cloacina* aboue named. Howbeit, in theſe daies wee diſtinguiſh our Myrtles otherwiſe; for ſome we repute wild and ſauage, others tame and gentle: and theſe both are likewiſe of two ſorts, to wit, either broader or narrower leaued. To the wilde kind properly belongeth the prickie Myrtle Oximyrſine. As for the tame and gentle Myrtles, they be thoſe
D that are planted in hort-yards and gardens, wherewith gardeners make arbours, knots, and diuers deuiſes. Whereof be ſundry kindes. The Tarentine with ſmall leaues; ours of Italy with broader; and the Myrtle * Hexaſtica, which is very ful of leaues, and ordinarily each branch hath ſix rankes thereof. But theſe are altogether out of requeſt: both the other are full of boughes and branches. As touching the aboue named Conjugula, I ſuppoſe it be the ſame that our common Myrtle here in Italy. But the moſt odoriferous Myrtle of all others, is that which groweth in Ægypt.

* not Exotica, *Turneb.*

Now concerning the wine of Myrtles, *Cato* hath ſhewed vs the manner how to make it: namely, to take the black Myrtle berries, to dry them in the ſhade vntill they haue loſt all their wateriſh humidity, & ſo to put them in Muſt or new wine, & let them lie there infuſed, or in ſteep.
E For certainly, if the berries be not dried before, they would yeeld an oile from them. Howbeit, afterward there was a deuiſe found out to make a white wine of the white Myrtle in this maner. Take of Myrtles wel beaten or ſtamped, the quantity of two * Sextares, ſteep the ſame in three hemires or pintes of wine, and then ſtraine and preſſe forth the liquor.

* i. wine quarts

Moreouer, the very leaues of the Myrtle tree, being dried and reduced into a kinde of meale, are ſingular good for to cure the vlcers in mens bodies: for certaine it is, that this powder doth gently eat away and conſume the ſuperfluous humours that cauſe putrifaction. And beſides, it ſerueth well to coole and repreſſe immoderate ſweats. Ouer and beſides, the Oile alſo of Myrtles (a ſtrange and wonderfull thing to tell) hath a certaine relliſh and taſte of wine: and withall, the fat liquor thereof is indued with a ſpeciall and principall vertue to correct and clarifie Wines; if the bagges and ſtrainers where-through the wine runneth, bee firſt ſooked and
F drenched therewith: for the ſaid oleous ſubſtance retaineth and keepeth with it all the lees and dregges, and ſuffereth nothing but the pure and cleare liquour to paſſe through, and more than that, it carrieth with it the commendable odour and principall vertue of the ſaid oile. Furthermore, it is ſaid, That if a wayfaring man that hath a great journey for to goe on foot, carrie

in

in his hand a ſticke or rod of the Myrtle tree, he ſhall neuer be weary, nor thinke his way long G
and tedious. Alſo *rings made of Myrtle twigs, without any edged iron toole, keep downe and
cure the ſwelling bunch that riſeth in the groine. What ſhould I ſay more? The myrtle inter-
medleth in war affaires: for *Poſthumius Tubertus*, being Conſull of Rome (who was the firſt that
entred in a petty triumph, ouant into the city, becauſe he had eaſily conquered the Sabines,
and drawne in manner no bloud of them) rode triumphant in this manner, to wit, crowned with
a chaplet of Myrtle, dedicated to *Venus Victoreſſe*; and from that time forward the Sabines (euen
his very enemies) ſet much ſtore by that tree, and held it in great reuerence. And euer after, they
that went but ouant into the city after a victory, ware this kind of garland only, except *M. Craſ-
ſus*, who after he had vanquiſhed the fugitiue ſlaues, and defeated *Spartanus*, marched in a coro-
net of Lawrel. *Maßurius* writeth, how Generals when they entred triumphant into Rome, riding H
in their ſtately chariots (which was the greateſt honor of all others) ware vpon their heads, cha-
plets of Myrtle. *L. Piſo* reporteth, That *Papyrius Maßo* (who firſt triumphed in mount Albanus
ouer the Corſians) vſed euer after to come vnto the games Circenſes, and to behold them, crow-
ned with a garland of myrtle. This *Papyrius* was grandfather by the mothers ſide, to the ſecond
Scipio Africanus. Finally, *M. Valerius*, according to a vow that he made in his triumphs, vſed to
weare coronets as well of Lawrell as Myrtle.

* *Virgei annuli.* But *Turnebus* readeth *Virgæ Faculi*, *i.* ſtaues or Iauelines made of their ſtreit boughs. And *Expertes ferri*, *i.* not headed with yron.

Chap. XXX.

¶ *Of the Lawrell or Bay tree, thirteene kinds thereof.*

LAwrel is appropriate vnto triumphs, and beſides groweth moſt pleaſantly before the gates I
of the Emperors court, and biſhops pallace; giuing attendance there as a dutifull portreſſe
or huiſſer, moſt decently. This tree alone both adorneth their ſtately houſes, & alſo keepes
watch and ward duly at the dores. *Cato* ſetteth down two kinds of Lawrel, to wit, the Delphick,
and the Cyprian. Hereunto *Pompeius Lenæus* hath ioined a third, which he called Muſtacea; be-
cauſe in old time they vſed to lay the leaues therof vnder certain cakes or March-panes (which
in thoſe daies they called Muſtacea) as they were in baking: this third kind hath leaues of all o-
thers largeſt, flaggy, hanging, and whitiſh withall. As for the Delphick, it carieth leaues of one
entire colour, greener than the reſt: the baies or berries thereof likewiſe are biggeſt, and of a red-
diſh green colour. With this Lawrell were they wont to be crowned at Delphos, who won the
priſe at any tournoy or ſolemne game; as alſo the victorious captains who triumphed in Rome. K
The Cyprian Lawrell hath a ſhort leafe, black, criſped, or curled, and about the ſides or edges
thereof it turneth vp hollow like a gutter or creſt-tile. Howbeit, afterwards there were ranged in
the rank of Lawrels other trees, to wit, the Tinus, which ſome take to be the wild Lawrel, others
ſay it is a kind of tree by it ſelf: indeed, it differeth from other Lawrels in the colour of the fruit;
for it beareth blew berries. Then came the roiall Lawrel in place, which began to be called Au-
guſta or Imperial. This is a very tal and big tree, with leaues alſo as large in proportion, and the
Baies or berries that it beareth are nothing ſharp biting and vnpleaſant in taſt. But ſome there
be that think this roiall Bay, is not a Lawrel, but a ſeuerall tree apart, as hauing longer & broa-
der leaues than the reſt of the ordinary ſort. And theſe writers ſpeaking of other kinds, call our
common Bay tree, Baccalia, and namely that which is ſo fruitful and beareth ſuch a ſort of ber- L
ries: as for the fruitleſſe and barren of that ſort they name Triumphal, which is, as they ſay, vſed
in triumphs. Whereat I maruell very much, vnleſſe this ordinance and cuſtom began of *Augu-
ſtus Cæſar*, by occaſion of that Lawrell which came to him as ſent from heauen (as I wil ſhew a-
non more at large;) and of all others it is for height loweſt, in leaf ſhort and frizled, very geaſon
and hard to be found. Now there is another kind of Lawrell named Taxa, very fit for greene ar-
bors, and to be wrought into knots. Out of the middeſt of the leafe there growes forth another
little one, in manner of a skirt, tongue, or lappet of the leafe. Alſo without any ſuch excreſſence
there is that, which they name Spadonia, as one would ſay, the guelded Bay, that cares not how
ſhadowie the place be where it grows: for be it neuer ſo remote out of the Sun, or ouerſhadow-
ed howſoeuer, yet it ceaſes not to grow & ouerſpread the ground where it ſtandeth. Moreouer, M
in this rank is to be reckoned the wild ſhrub called Lowrier or Chamædaphne. There is beſides
the Lawrell Alexandrina, which ſome call Idæa, [*i.* Mountaine Lawrel] others Hyppoglottion,
[*i.* Horſe tongue] ſome Daphnitis, others Carpophyllon or Hypelate. This plant putteth forth
branches

20030
copy 1

A branches immediatly from the root, of a ſpan or nine inches long: very proper and handſom to draw workes, or to clad arbors withall in a garden, alſo to make garlands and chaplets. The leaues are more ſharp and pointed, ſofter alſo and whiter than thoſe of the Myrtle, yea, & haue within them a bigger grain or ſeed, of colour red. Great plenty therof groweth vpon the mountaine Ida, likewiſe about Heraclea in Pontus: and in one word, neuer but in hilly and mountain countries.

As for the herb Daphnoeides or Laureola, it hath many names: for ſome terme it Pelaſgum, others Eupetalon, and there are again who would haue it to be Stephanos Alexandri (*i. Alexanders* chaplet.) This plant alſo is full of branches, carrying a thicker and ſofter leafe than the common Lawrell: and if a man taſt therof, it will ſet both the mouth & alſo the throat on a fire:
B the beries that it beareth be blackiſh, inclining to a kind of red. It hath bin noted and obſerued in antient writers, that no kind of Lawrel in old time was to be found in the Iſland Corſica: and yet in theſe daies it is there planted, and thriueth well enough. The Lawrell betokeneth peace: inſomuch, as if a branch therof be held out among armed enemies, it is a ſigne of quietnes and ceſſation from armes. Moreouer, the Romans were wont to ſend their miſſiue letters adorned with Lawrell, when they would giue aduertiſement of ſome ſpecial good newes or ioiful victory: they vſed beſides to garniſh therewith their lances, pikes, and ſpears. The knitches alſo and bunches of rods, born before grand captains and generals of the army, were beautified & ſet out with Bay branches. Herewith they ſtick and bedecke the boſome of that moſt great and gracious *Iupiter*, ſo often as there commeth glad tidings of ſome late & freſh victory. And all this
C honor is don to the Lawrell, not becauſe it is alwaies green, nor for that it pretendeth and ſheweth peace (for in both theſe reſpects the oliue is to be preferred before it) but in this regard, that the faireſt and goodlieſt of them grow vpon the mountain Pernaſſus: and therefore alſo is it ſo acceptable to *Apollo*, for which cauſe (as may appeare by *L. Brutus*) the Roman kings in old time were accuſtomed to ſend great preſents and oblations thither to the temple of *Apollo*: or peraduenture it was in memoriall of that ground that bare Lawrell trees, and which according to the Oracle of *Apollo*, the ſaid *L. Brutus* kiſſed, when he intended the publicke freedom of the city, and minded to deliuer it from the yoke and ſeruitude of the kings: or haply, becauſe it alone either ſet with the hand before the dores, or brought into the houſe, is not blaſted and ſmitten with lightning. And theſe reaſons verily induce me to beleeue, that in times paſt they choſe the
D Bay tree for their triumphs, before any other: rather than as *Maſſurius* would haue it, becauſe the Lawrell ſerued for a ſolemne perfume, to expiate and aſſoile the carnage and execution don vpon the enemies. And ſo far were men in old time from common vſing either Lawrell or oliue, and polluting the ſame in any prophane vſe, that they could not be permitted to burne thereof vpon their altars when they ſacrificed or offered Incenſe, although it were to doe honour to the gods, and to appeaſe their wrath and indignation. Euident it is, that the Bay tree leaues, by their crackling that they make in the fire, do put it from them, and ſeem to deteſt and abhor it. It cureth moreouer the diſeaſes of the guts [the matrice and the bladder] alſo the laſſitude and wearineſſe of the ſinews. It is reported, that *Tiberius Cæſar* the Emperor vſed euer to weare a chaplet thereof when it thundered, for feare of being ſtrucken with lightening.

E Moreouer, certaine ſtrange and memorable euents as touching the Bay tree, haue happened about *Auguſtus Cæſar*. For *Liuia Druſilla* (who afterwards by mariage with the ſaid *Auguſtus*, became Empreſſe, and was honored with the title of *Auguſta*) at what time as ſhe was affianced and eſpouſed to *Cæſar*, chanced as ſhe ſat ſtill, to haue an exceeding white hen to light into her lap (which an Ægle flying aloft, let fall from on high) without any harme at all to the ſaid pullet. Now when this lady or princeſſe aduiſed & conſidered wel the hen, without being aſtonied and amazed at ſo ſtrange & miraculous a ſight, ſhe perceiued that the hen held in her bill a lawrell branch full of Bay berries. The Wiſards and Soothſaiers were conſulted withall about this wonderful occurrent, and gaue aduiſe in the end to preſerue the bird and the brood therof: likewiſe to ſet in the ground the foreſaid branch, and duly to tend and look vnto it. Both the one and the other was done and excecuted accordingly, about a certain houſe in the country belon-
F ging to the *Cæſars*, ſeated vpon the riuer Tyberis, neere the cauſey or port way Flaminia, about nine miles from Rome: which houſe therupon was called, Ad Gallinas, as a man would ſay, The ſigne of the Hens. Well, the foreſaid branch mightily proſpered, and proued afterwards to be a groue of Laurels, which all came from the firſt ſtock. In proceſſe of time, *Auguſtus Cæſar* when

he

he entred in Triumph into Rome, caried in his hand a branch of that Bay tree, yea, and wore a chaplet vpon his head of the same: and so did all the Emperors and *Cæsars* his successors after him. Hereof also came the custome to set againe and replant those branches of Lawrel that emperors held in their hands when they triumphed; & therof continue whole woods & groues distinguished each one by their seuerall names, and perhaps therefore were they named Triumphall. This is the only tree known in the Latine tongue, whereof a man beareth the name. Againe, there is not another tree besides that hath the leafe to cary in the Latine tongue a denomination and name by it selfe apart, as well as the tree: for whereas the plant is named Laurus, the leafe we call Laurea. Moreouer, there is a place likewise within the city of Rome on mount Aventine, retaining stil the name Loretum, which first was imposed vpon it by reason of a lawrell groue which grew there. The Bay tree also is vsed in solemne purifications before the gods: and to conclude, this would be resolued and agreed vpon by the way, That if a branch therof be set, it will prosper and become a tree; although *Democritus* and *Theophrastus* make some doubt thereof. Thus much of Lawrels and other domesticall and natiue trees: it remaineth now to write of those that be wild and sauage, and of their natures.

THE SIXTEENTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

HItherto haue we treated of those Trees that beare Apples and such like fruits: which likewise with their mild iuice and sweet liquors made our meats first delightsome, and taught vs to mingle together with the necessarie food for sustentation of our liues, that which maketh it delicate and pleasant to content our taste: as well those trees that naturally were so in the beginning, as those which through the industry and skill of man, what by graffing and what by wedding them (as it were) to others, became toothsome, and delectable to our tongue: whereby also we haue gratified in some sort wild beasts, and done pleasure to the foules of the aire. It followeth now by order, that we should discourse likewise of trees that beare Mast, those trees (I say) which ministred the first food vnto our forefathers, and were the nources that fed and cherished mankind in that rude wild age and poore infancie of the world: but that I am forced to break the course of mine history, and preuented with a deep study and admiration arising from the truth and ground of experience, to consider, What maner of life it might be, to liue without any trees or shrubs at all growing out of the earth.

Chap. I.

¶ *Of Nations that haue no Trees nor Plants among them. Of wonderfull trees in the Northerly regions.*

WE haue shewed heretofore, that in the East parts verily toward the maine Ocean, there be many countries in that estate, to wit, altogether destitute of trees. In the North also I my selfe haue seene the people called * Cauchi, as well the greater as the lesse (for so they be distinguished) where there is no shew or mention at all of any tree whatsoeuer. For a mightie great compasse, their Country lieth so vnder the Ocean, and

*1. The Low-countries of Zeland, &c.

20030
copy 1

A and ſubiect to the tide, that twice in a day & night by turns, the ſea ouer floweth a mighty deale of ground when it is floud, and leaues all dry again at the ebbe & return of the water: inſomuch, as a man can hardly tell what to make of the outward face of the earth in thoſe parts, ſo doubtfull it is between ſea and land. The poore ſilly people that inhabit thoſe parts, either keep together on ſuch high hils as Nature hath afforded here and there in the plain: or els raiſe mounts with their own labor and handy work (like to Tribunals caſt vp and reared with turf, in a camp) aboue the height of the ſea, at any ſpring tide when the floud is higheſt; and thereupon they ſet their cabbins and cottages. Thus dwelling as they do, they ſeeme (when it is high water, & that all the plain is ouerſpread with the ſea round about) as if they were in little barks floting in the midſt of the ſea: againe, at a low water when the ſea is gone, looke vpon them, you would take
B them for ſuch as had ſuffered ſhipwracke, hauing their veſſels caſt away, and left lying ato-ſide amid the ſands: for ye ſhall ſee the poore wretches fiſhing about their cottages, and following after the fiſhes as they go away with the water: they haue not a four-footed beaſt among them; neither inioy they any benefit of milk, as their neighbour nations do: nay, they are deſtitute of all meanes to chaſe wild beaſts, and hunt for veniſon; in as much as there is neither tree nor buſh to giue them harbor, nor any neare vnto them by a great way. Sea-weeds or Reike, ruſhes and reeds growing vpon the waſhes and meers, ſerue them to twiſt for cords to make their fiſhing nets with. Theſe poore ſouls and ſilly creatures are faine to gather a ſlimy kinde of fatty mud or oaſe, with their very hands, which they drie againſt the wind rather than the Sun: and with that earth, for want of other fuell, they make fire to ſeeth their meat (ſuch as it is) and heat the
C inward parts of their body, ready to be ſtarke and ſtiffe againe with the chilling North winde. No other drink haue they but rain water, which they ſaue in certain ditches after a ſhower, and thoſe they dig at the very entry of their cottages. And yet ſee! this people (ſs wretched and miſerable a caſe as they be in) if they were ſubdued at this day by the people of Rome, would ſay (and none ſooner than they) that they liued in ſlauerie. But true it is, that Fortune ſpareth many men, to let them liue ſtill in paine and miſery. Thus much as touching want of woods and trees.

On the other ſide, as wonderfull it is to ſee the mighty forreſts at hand thereby, which ouerſpread all the reſt of Germany: and are ſo big, that they yeeld both cooling and ſhade to the whole countrey: yea, the very talleſt woods of all the reſt are a little way vp higher in the coun-
D trey, and not farre from the Cauchi aboueſaid: and eſpecially thoſe that grow about the two great loughes or lakes in that tract. Vpon the banks wherof, as alſo vpon the ſea-coaſts, there are to be ſeene thick rows of big Okes, that loue their ſeat paſſing wel, and thriue vpon it in growth exceeding much: which trees happening to be either vndermined by the waues and billowes of the ſea vnder them, eating within their roots, or chaſed with tempeſtuous winds beating from aboue, carry away with them into the ſea (in manner of Iſlands) a great part of the Continent, which their roots doe claſpe and embrace: wherewith being counterpoiſed and ballaiſed, they ſtand vpright, floting and making ſaile (as it were) amid the waues, by the means of their mighty armes which ſerue in ſtead of tackling. And many a time verily, ſuch Okes haue frighted our fleets and armadoes at ſea, and eſpecially in the night ſeaſon, when as they ſeemed to come di-
E rectly againſt their proes ſtanding at anker, as if of purpoſe they were driuen vpon them by the waues of the ſea: inſomuch, as the ſailers & paſſengers within, hauing no other means to eſcape them, were put to their ſhifts, and forced for to addreſſe themſelues, and range a nauall battell in order, and all againſt trees, as their very enemies.

Chap. II.

¶ *Of the huge and great Foreſt Hercynia*

IN the ſame North climat is the mighty forreſt Hercynia. A huge and large wood this is, ſtored with tall and big Okes, that neuer to this day were topt or lopt. It is ſuppoſed they haue been euer ſince the creation of the world, and (in regard of their eternall immortality) ſur-
F mounting all miracles beſides whatſoeuer. And to let paſſe all other reports which happely would be thought incredible, this is knowne for certain, That the roots of the trees rhere, run and ſpread ſo far within the ground, that they encounter and meet one another: in which reſiſtance they ſwell and riſe vpward, yea, and raiſe vp mounts of earth with them to a good height

in

in many places: or, where as the earth followes not, a man shal see the bare roots embowed archwise, and mounting aloft as high as the very boughes: which roots are so interlaced, or els rub one against the other, striuing (as it were) not to giue place, that they make a shew of great portailes or gates standing open so wide, that a whole troupe or squadron of horsmen may ride vpright vnder them in ordinance of battell. G

Chap. III.

¶ *Of trees bearing Mast.*

MAst tres they were all, for the most part, which the Romanes euer so highly honoured and held in best account. H

Chap. IV.

¶ *Of the Ciuicke garland: and who were honoured with chaplets of Tree-leaues.*

FRom Mast trees (and the Oke especially) came the Ciuicke coronets. And in very truth, these were the most honorable badges and ornaments that could possibly be giuen vnto souldiers and men of war, in regard of their vertue and man-hood: yea, and now for a good while, our Emperors haue had this chaplet granted vnto them, in token and testimony of clemency: euer since that by our prophane and vnkind ciuill wars the world is grown to this passe, that it is reputed a singular demerit and gracious act, not to kill a citizen of Rome, but to let him liue. To this kind of garland, none other be comparable: for the Murall and Vallare coronets (bestowed vpon them that either skaled the walls, or entred the breach first into an enemy city, or els mounted ouer the rampier of a camp) albeit they were of gold, and of greater price by far, yet they gaue place to these. Yea, the very Nauall coronets, fashioned like the three forked pikes of ship beake-heads (wherewith they were honored, who had performed some braue seruice at sea) came behind these Ciuicke garlands, due to them who haue rescued citizens and saued them out of the enemies hands: and yet in these our daies there haue bin knowne two in that kind most renowned aboue the rest; whereof the one was bestowed vpon. *M. Varro* by *Pompey* the Great, for defeating the pyrats, and for scouring and clearing the seas of them: the other likewise giuen to *M. Agrippa*, by [*Augustus*] *Cæsar*, for vanquishing the Sicilians, who also were no better than rouers. I K

Now forasmuch as we are light vpon the mention of Naual or Rostrate coronets, this would be noted, That in old time the said brasen beake-heads of ships woon from the enemies, and set vpon the front of the Tribunall or publick pulpit in Rome, serued for an ornament to beautifie the Forum or common place of the city; so as the very body of the people of Rome seemed to be crowned and honored thereby. But after that the Tribunes in making seditious orations began to stamp and fare like mad men there, to trample (I say) vnder foot, and to pollute that sacred place and those goodly ensignes; after that they sel once euery man to make his priuat and particular profit of the common good, without regard to aduance the weale publick; after that each one sought to strengthen and arm himself by the benefit of authority, and that to the weakening of the main state, insomuch as they who were reputed by their place sacrosanct and inviolable, polluted and prophaned all: then the said ornaments of beak-heads, which beautified the place vnder their feet, serued to adorne the heads of Roman citizens. So as, to returne again now to the aboue named *Agrippa*, *Augustus Cæsar* gaue vnto him a Nauall coronet for subduing the Sicilian Pyrats: and himselfe receiued of mankind a Ciuick chaplet, for sparing the bloud, and sauing the liues of so many citizens. L

In antient time they vsed to crowne none but the gods. And hereupon it is, that the Poet *Homer* speaketh of no garlands and chaplets but due to the celestiall & heauenly wights, or at leastwise in the name of a whole army, for victory atchieued in some notable battell: for to one man alone he alloweth not any, no not in regard of the better hand in combate or single fight. And to say a truth, the first that euer set a Garland vpon his owne head, was prince *Bacchus*, and the same was made of Iuie: but afterwards, those that sacrificed to the honour of gods, not only ware chaplets themselues, but also adorned therwith the heads of the very beasts which were appointed to be killed for sacrifice. In the end, the custome was taken vp to honour them with M

gar-

20030
copy 1

A garlands,who wan prizes at thoſe ſacred and ſolemne games,Olympia,Iſthmia,Pythia,and Nemœa. Howbeit the manner was then,and ſo continueth to this day,To giue chaplets to the ſaid victors,not in their own name,but in the behalfe of their natiue country,which by open proclamation they pronounce to be crowned and honored thereby. And hereof it came alſo,that ſuch coronets and chaplets were granted to them that ſhould triumph, yea and ſoone after to thoſe alſo who had won the priſe in any publick games,vpon condition to dedicate them to the temple of the gods.

To diſcourſe what Roman citizen receiued this honor firſt of a chaplet or coronet, were a long peece of worke,and nothing pertinent to our purpoſe and matter in hand;conſidering that they were acquainted with none at all,but in regard of ſeruice performed in the wars. Yet thus
B much I may auer for certain, That no nation vnder heauen,nay put them all together, can ſhew ſo many ſorts of chaplets and coronets,as this one ſtate and people of Rome. K. *Romulus* crowned *Hoſtus Hoſtilius* with a garland of bare greene leaues,for that in the forcing and ruining of Fidena,he brake firſt into the city and made way for the reſt. This man was grandſire to *Tullus Hoſtilius* king of Rome. Semblably in the war againſt the Samnites,wherein *Cornelius Coſſus* the Conſull was L. Generall,the whole army crowned *P. Decius* the father with a chaplet of green leaues,who then was a martiall Tribune or Colonell ouer a regiment of ſouldiers, for that hee had ſaued and deliuered the ſaid army.

But now to come againe to our Ciuicke garland, it was made at firſt of the Ilex or Holme tree leaues: afterwards men tooke a better liking to make it of the Æſculus,a tree conſecrated to *Iupiter*. They ſtaied not there,but changed ſoone after with the common oke; neither made
C they any preciſe choiſe,but tooke the leaues of that which came next hand, whereſoeuer they found it growing;prouided alwaies that it bare acorns: for all the honor of theſe garlands conſiſted principally in the maſt. Moreouer,there belong to theſe Ciuick garlands ſtreight laws and ordinances,in which regard theſe chaplets be proud and ſtately: and we may be bold to compare them with that Paragon-coronet of the Greeks,which paſſeth al others,giuen ſolemnly and publiſhed in the preſence of *Iupiter*, and made of the wilde Oliue dedicated vnto him: comparable (I ſay) to any crowne or chaplet whatſoeuer; euen to that, for which a city in token of ioy,would not ſtick to lay open a * breach in their very wall to receiue it when it ſhould enter in. The lawes ordained in this behalfe run in this forme: *Imprimis,He that is to enioy the honour of a Ciuicke chaplet, ought, firſt to haue reſcued a citizen, and withall to kill the enemie in whoſe*
D *danger hee was. Item, It is required, That the enemies the ſame day held the verie ground and were Maſters hereof,wherein the reſcue was made and the ſeruice performed. Item, That the partie himſelfe ſo ſaued,doe confeſſe the thing, for otherwiſe all the witneſſes in the World auaile not in this caſe. Item, the man thus deliuered, muſt bee a free Citizen of Rome in anie hand: for ſet caſe that hee were a King which was thus reſcued, if hee were a ſtranger, and came onely amongſt the auxiliaries to aide the Romanes, it would not boot, nor gaine any man this honour for to ſaue his life. Item, Say that the Generall himſelfe were reſcued and deliuered out of danger, the partie for his good ſeruice ſhould haue no more honour done vnto him, than if hee had preſerued but a ſimple common ſouldier, ſo hee were a Romane Citizen: for the makers of theſe ordinances aimed chiefely at the life of a Citizen whoſoeuer hee was, without regard of any other circumſtance. Item, Hee that was once crowned with this garland, was endued alſo with*
E *theſe priuiledges: That hee might weare it alwaies after, whenſoeuer it pleaſed him: That ſo often as hee came in place of publicke playes or games, men ſhould accuſtomably riſe vp vnto him, yea, and the verie Senatours themſelues, doe him honour in that ſort: That hee ſhould haue his place allowed him to ſit next vnto thoſe of Senatours degree: That both himſelfe, and alſo his father and grandſire by the fathers ſide, ſhould euer after bee exempt from all ciuile charges, and inioy full immunitie.* Thus much concerning the lawes and priuiledges attending vpon the Ciuicke garland. *Siccius Dentatus* (as wee haue ſpecified before) receiued foureteene of theſe chaplets for his good ſeruice: [*Manlius*] *Capitolinus* ſix,and hee verily had one of them for reſcuing *Seruilius* beeing Generall of the Armie. As for *Scipio Africanus*, hee refuſed this honour when it was offered and preſented vnto him, for ſauing the life of his owne father at the iourney and battaile of Trebia. O the excellent orders and cuſtomes of thoſe times, worthie of immortalitie and euerlaſting memorie!
F O the wiſdome of men in thoſe daies, who aſſigned no other reward for ſo braue exploits and ſingular workes,but honour onely? And whereas all other militarie coronets they enriched and adorned with gold, they would not ſet the life of a citizen at any price. A plaine and euident

* As the manner was to receiue the *Hieronicæ*.

profeſſion of our anceſtors and predeceſſors, That it is an vnlawfull and ſhameful thing to ſeem G
for to ſaue a mans life, in hope of any gaine and profit thereby.

Chap. V.

¶ *Of Maſt, thirteene kinds.*

MAny nations there be euen at this day, and ſuch as inioy peace and know not what warre meaneth, whoſe wealth and riches lyeth principally in Maſt: yea and elſwhere in time of dearth and for want of other graine, folke vſe to dry their maſt, grind it into meale, temper it with water, and thereof make dough for bread. Moreouer, euen at this day throughout Spaine, the manner is to ſerue vp acornes and maſt to the table for a ſecond ſeruice: and ſweeter it is being roſted vnder the cinders and aſhes, than otherwiſe. Ouer and beſides, prouided it H
is by an expreſſe act and law of the twelue tables in Rome, that a man may gather the maſt that falleth from his owne trees into another mans ground.

Diuers and ſundry ſorts there be of Maſt, and their difference conſiſteth in the forme and faſhion of the fruit, in the ſite and ſcituation of the place, in the ſex, and in the taſte: for the maſt of the Beech tree is of one figure and making, the Acorne (which is the maſt of the Oke) another; and the maſt of the Holme or Ilex, differeth from them both: yea & in euery one of theſe kinds, they do vary one from another. Alſo, ſome are of trees growing wild; others more milde and gentle, louing places well tilled and ordered by husbandry. Some like the hilly countries, others the champaine and the plains. Semblably there is maſt comming from the male trees: there is againe that groweth on the female. In like maner, the relliſh & taſt maketh a difference I
and diuerſity in maſt. The ſweeteſt of all, is the Beech maſt: for *Cornelius Alexander* reporteth, That the inhabitants of Chios, when they were ſtreightly beleaguered, indured the ſiege a long time by the benefit & ſubſtance only of that maſt. We are not able diſtinctly to ſpecifie name by name, the ſundry ſorts of maſt and the trees which beare the ſame, conſidering that in euery countrey they alter their names: for we ſee the Robur and the Oke to grow commonly euerie where, but the Eſculus is not ſo rife in all countries. A fourth ſort there is of the ſame kind, that is not known ordinarily in moſt places of Italy. We will therefore diſtinguiſh them according to their nature and properties: yea and when need ſhall require, by their Greeke names alſo.

Chap. VI. K

¶ *Of the Beech maſt, and other Maſts: of Charcole; and the feeding of Hogs.*

THe Beech maſt is like to the kernell of a Cheſtnut, incloſed within a three cornered skin. The leafe of the tree is thin and very light, reſembling that of the Poplar: it turneth yellow paſſing ſoone. In the middle whereof, for the moſt part, and in the vpper ſide, it bringeth forth a little green berrie, pointed ſharpe at the toppe. The maſt of Beech, Rats and Mice are much delighted in: mark therfore when there is ſtore of that maſt, ye ſhal haue as great increaſe of that vermin. It will feed alſo Reremice or Dormice fat: and the Ouſels or Blackbirds take a great liking thereto, and wil flie vnto it. Lightly, all trees are moſt fruitful one yere than another, and beare moſt euery ſecond yeare; but aboue all, Beeches keepe this courſe. As touching L
Maſt (which properly is ſo called) it groweth vpon the Robur, the common Oke, the Eſculus, Cerrus, Ilex, and Cork tree. All kinds of maſt are contained more or leſſe, within a rough cup, which lieth cloſe to the vtmoſt skin rhereof, & claſpeth it about. The leaues of all theſe maſt trees, except the maſt-Holme Ilex, be heauy, fleſhie, large, waued or indented along the ſides, neither be they yellow when they fall, as the Beech leaues are; longer alſo or ſhorter, according to the diuers trees whereupon they grow.

Of the Ilex or maſt-Holme tree, there be two ſorts. Thoſe in Italy differ not much in leafe from the Oliue. Some Greeks call them Smilaces, but in other prouinces Aquifoliæ. The maſt of Ilex, both the one and the other, is ſhorter and ſlenderer than of the reſt. *Homer* calleth it Acylon, by which name he diſtinguiſheth it from other maſt. The male Holmes (men ſay) beare M
no fruit. The beſt maſt and the biggeſt, is the Acorn growing vpon the common Oke: next to it is that of the Eſculus: as for that of the Robur, it is but ſmall. The Cerrus carieth a maſt vnpleaſant to the eie, and rough to be handled, for clad it is with a cup beſet with ſharpe prickes like

to

20030
copy 1

A to the Cheſtnut ſhell. Among the ver / Acornes, ſome haue a ſweeter taſt than others: the female Oke beareth thoſe that be more ſoft and tender; the male, tough, thick, and maſſie: and the beſt ſimply are thoſe that come of the broad leafed Oke, for ſo it is called by reaſon of the large leaues. Moreouer, there is another difference in maſt and acornes, for ſome be bigger than others; againe, there are that haue thin and fine skins incloſing the kernel; and ye ſhal find others for them as thick skinned; likewiſe many of them are couered with a rough and ruſtie tunicle; and as many againe do ſhew immediatly their bare white skin and naked fleſhy ſubſtance. Furthermore, that maſt is accounted good, which at both ends (taking it long-waies) groweth hard in manner of a ſtone: howbeit that which hath an hard ſhell without, and a ſoft body within, is better than that which is hardened in the carnous ſubſtance of the body; and lightly neither of both theſe qualities happeneth to any but the male kind. Ouer and beſides, ſome you ſhall find
B faſhioned long like an egge, others as round as a ball, and a third ſort ſharp pointed. The outward colour alſo yeeldeth variety: for ſome be blacker than other, but the whiter commonly be the better ſet by. Some are bitter toward the ends, and ſweet in the mids. The length alſo & the ſhortneſſe of the ſtele or taile whereto they hang, maketh a difference. The very tree it ſelf cauſeth diuerſity of the fruit: for that Oke which beareth the biggeſt maſt, is named Hemeris. A ſhorter tree this is than the reſt, with a round head, and putting forth many hollow arm-pits (as it were) of boughes and branches. The wood or timber of the ordinary and common Oke is tougher and harder than that of others, and leſſe ſubiect to putrifaction: ful of arms & boughes it is, as the other, but it groweth taller and is thicker in the body. The higheſt of all, is the Ægilops, which loueth to grow in wild and deſart places. Next to it for talneſſe, is the broad leafed
C Oke, but the timber therof is not ſo good and profitable for building, how ſoeuer it be imploied for to make charcole: yet being once ſquared to that purpoſe, & cleft, it is ſubiect to the worm, and will ſoon rot: and for this cauſe, being in quarters, they vſe not to make cole of it clouen, but of the ſolid and round boughs or branches thereof. And yet this kind of charcole ſerueth only the Bloom-ſmithies and furnaces; the hammer-mills alſo of braſſe and copper-ſmithes, whom it ſtandeth in great good ſtead and ſaueth them much fewell; for it burneth and conſumeth no longer than the bellowes goe: let them leaue blowing once, preſently the cole dieth; and ſo it laſteth long: for at euery new blaſt it is renewed againe and refreſhed: otherwiſe it ſparkleth very much and yeeldeth many cinders. But the charcole made of yong trees is the better.
D Now the maner of making them is this: when the wood is cut into many clefts & ſplents, freſh and green, they are heaped vp on high, and hollow, in manner of a furnace or chimney, and then well luted with clay in the top, and all about: which done, the pile of truncheons aforeſaid, is ſet on fire within; and as the outward coat or cruſt of clay beginneth to wax hard, the workemen or colliers pierce it with poles and pearches, and make diuers holes therein for vent, and to let out the ſmokie vapor that doth ſweat and breath from the wood. The worſt of all other for timber or cole, is the oke named Haliphleos; a thicke barke it hath, and as big a body, but for the moſt part hollow and light like a ſpunge or muſhrom: and there is not another beſides it of all theſe kind of trees, that rotteth as it ſtands aliue. Beſides, ſo vnfortunate it is, that the lightning ſmiteth it, as low as it groweth; for none of them ariſeth to any great height: which is the cauſe that it is not lawfull to vſe the wood thereof about the burning of any ſacrifice. Seldome beareth it
E any Acorns, and thoſe few that it hath, be exceeding bitter, ſo as no other beaſt will touch them but ſwine again; nor they neither, but for pure hunger, when they can meet with no other food. Moreouer, in this regard alſo reiected it is, and not emploied in any religious vſe, for that without blowing at the wood and cole thereof continually, it will not burne cleare and conſume the ſacrifice, but goeth out and lieth dead.

But to returne vnto our maſt againe: that of the Beech tree feedeth ſwine quickely, maketh their fleſh and lard faire and pleaſant to the eie, tender to be ſoone ſodden or roſted, light and eaſie of digeſtion, and good for the ſtomacke. The maſt of the Holme cauſeth hogs to gather a more faſt and compact fleſh, their bodies to be neat, ſlender, lanke, and ponderous. Acornes doe engender a fleſhy ſubſtance, more ſquare and ſpreading, and the ſame alſo moſt heauy and har-
F deſt of digeſtion, and yet they are of all other kinds of maſt, moſt ſweet and pleaſant. Next to them in goodneſſe (by the teſtimony of *Nigidius*) is that of the tree Cerrus, neither is there bred of any other a courſer fleſh, howbeit hard it is, faſt, and tough. As for the maſt of Ilex, hogs are endangered by eating thereof, vnleſſe it be giuen them warily by little and little. Hee ſayth

moreouer,that of all other it falleth laſt. Moreouer,the maſt of Eſculus, Robur,and the Corke, G
cauſeth the fleſh to be ſpungeous and hollow. To conclude,what trees ſoeuer beare maſt, carry alſo certaine nuts called Galls:and lightly they are full of maſt but each other yeare. But the oke Hemeris beareth the beſt gals,and fitteſt for the curriors to dreſſe their leather. The broad leafed Oke hath a kinde of Galls like vnto it, but lighter in ſubſtance,and not ſo good by far: it carrieth alſo blacke galls(for 2 ſorts there be)and this is better for the dier to colour wooll.

Chap. VII.

¶ *Of the Gall-nuts : and how many other things Maſt-trees doe beare beſides Maſt.*

THe nuts called Galls,do euer breake out all at once in a night, and namely about the be- H
ginning of Iune,when the Sun is ready to goe out of the ſigne Gemini. The whiter ſort thereof commeth to the growth in one day : and if in the firſt ſpring and breaking foorth thereof it be hot weather,it drieth and withereth out of hand,and commeth not to the full bigneſſe and perfection,namely to haue a kernell as much as a bean. The blacke of this kind continueth longer freſh and green,and groweth ſtill, to the bigneſſe otherwhiles of an apple. The beſt galls be thoſe of Comagena : the worſt is that of the oke called Robur,which are knowne by the holes they haue,that may be ſeen through. The common oke Quercus,ouer and beſides the fruit(which is the maſt)beareth many other things;for it carieth both ſorts of gal,the black and the white:certaine berries alſo like Mulberries, but that they be dry and hard, reſembling I
for the moſt part a buls head,containing within them a fruit much like the kernels of the oliue. Moreouer,there grow vpon it certain little bals not vnlike to nuts,hauing ſoft flox within good to make candle-wiek or matches for lamps;for burn they wil without any oile,like as the black Gals. It beareth alſo other little pils or balls good for nothing,couered ouer with haire, & yet in the ſpring time they yeeld a certain juice or liquor like hony. Furthermore, there breed in the hollow arm-pits(as it were)of the boughes,other ſmall pills ſetled or ſticking cloſe to the wood,and not hanging by any ſteles,which toward the nauill or bottome thereof are whitiſh; otherwiſe they be ſpeckled all ouer with black ſpots, ſaue that in the mids between they are of a ſcarlet red colour:open them,and hollow they are within,but very bitter. Somtimes alſo this oke engendreth certain hard calloſities,like Pumiſh ſtones;yea and other round balls made of the leaues folded one within another : on the backeſide alſo of the leafe where it is reddiſh, yee K
ſhal find ſticking certain wateriſh pearls,white and tranſparent or cleare within,ſo long as they be ſoft and tender,wherein there breed little flies or gnats : howbeit in the end they ripen and wax harder,in manner of Galls.

Chap. VIII.

¶ *Of the Catkin called Cachrys : the graine of Scarlet : of Agaricke,and Corke.*

THe Oke called Robur,bringeth forth likewiſe a certaine pendant chat or catkin,named in Greeke Cachrys:for ſo they terme the little pill,which is of a burning and cauſticke Na- L
ture,and whereof there is vſe in Phyſick for potentiall cauteries. The like groweth vpon Firres,Larch trees,Pitch trees,Lindens or Tillets,Nut-trees,and Planes,namely after that the leaues be falne;and abideth vpon the tree in winter time. Theſe chats haue a kernel within like to thoſe of the Pine-nuts. It beginneth to grow in winter,& by the ſpring time al of it openeth and ſpreadeth to the proofe;but when the leaues begin to bud and put forth,it falleth off. Thus you ſee how fruitfull theſe okes be,and how many things beſides maſt,they do bring forth:and yet they ceaſe not nor giue ouer thus, for many times a man ſhall ſee certaine excreſcences growing forth about their roots,ſuch as toadſtools & muſhroms;the laſt deuiſes that our gluttons haue inuented to whet their appetite and ſtomacke,and to maintaine gourmandize. The common Oke breedeth the beſt of this kind : as for thoſe that grow about the Oke Robur, the M
Cypreſſe,and Pine-tree,they are hurtfull to be eaten,and venomous. Moreouer, *Heſiodus* ſaith, that the Okes Robora do beare Miſelto,and yeeld hony. True it is indeed, that the hony-dewes called Manna,falling from heauen(whereof we haue ſpoken before) light not vpon any other

leaues

20030
copy 1

A leaues more than of thoſe okes. Moreouer, this is known for certain, that the aſhes of this Oke when it is burnt, hath a quality or taſte of nitre or ſalt-peter.

Howbeit for all the riches and fruit that the Oke affourdeth, the Scarlet grain alone which commeth of the Ilex, challengeth yea and ouermatcheth it. This graine is no other than a very excrement or ſuperfluity ariſing about the ſtem of the ſmall ſhrub called Ilex Aquifolia, ſcraped and pared off from it, like ſuch refuſe as they Cuſculium or Quiſquilium: but of ſuch price it is, that the poore people of Spaine gather it, & make a good part of their reuenew thereby, euen as much as will pay halfe their tribute. As touching the commendable vſe thereof in dying, we haue ſufficiently ſpoken in the diſcourſe of the purple tincture. This ſcarlet grain is ingendred alſo in Galatia, Africa, Piſidia, and Cicilia. But the worſt of all other is that which
B commeth out of Sardinia.

As for Agaricke, it groweth in France principally vpon trees that beare maſt, in manner of a white muſhrom: of a ſweet ſauor, very effectuall in Phyſicke, and vſed in many Antidotes and ſoueraigne confections. It groweth vpon the head and top of trees: it ſhineth in the night, and by the light that it giueth in the darke, men know where and how to gather it.

Of all Maſt-trees, the Oke called by the Greeks Ægylops, beare certaine drie excreſcences ſwelling out like Touch-wood, couered all ouer with a hoary & hairy moſſe, and theſe not only beare out from the bark of the fruit, but alſo hang downe from the boughes a cubit in length: and odoriferous they are, as we haue ſhewed in our treatiſe of Ointments.

Now concerning Corke, the wooddy ſubſtance of the tree is very ſmall, the maſt as bad, hol-
C low, ſpungeous, and good for nothing. The barke only ſerueth for many purpoſes, which will grow again when the tree is barked, & that of ſuch a thicknes, that it will beare 10 foot ſquare. Much vſe there is of it in ſhips, & namely for boys to anere cables; alſo for flotes to trainels or dragnets that fiſhers do occupy: moreouer in bungs & ſtoppels of barrels, bottles, and ſuch like veſſels. Finally, our gentlewomen and dainty dames haue the ſoles of their pantofles & winter-ſhooes vnderlaid therewith. In regard of which barke, the Greeks call it by a pretty name, and not improperly, The bark tree, or the tree all barke. Howbeit ſome would haue it to be the female Ilex or Maſt-Holm, and ſo they name it: and where there groweth no Ilex, in ſtead thereof they take Corke, eſpecially in Carpentry, and cart-wrights worke, as about Elis and Lacedæmon. Neither groweth it in all parts of Italy, ne yet in any one quarter of France.
D

Chap. IX.

¶ *What trees they be that carry barke good for any vſe.*

THe peiſants of the countrey and the ruſticall people employ much, the barke alſo of Beeches, Lindens or Tillets, Firs, and Pitch trees; for thereof they make ſundry veſſells, as paniers, baskets, and certain broad and wide hampers for to carry their corn and grapes in time of harueſt and vintage, yea and otherwhiles they couer their cottages therewith. Moreouer, ſpies vſe to write in barks (when they be freſh and greene) intelligences to their captaines, grauing and drawing their letters ſo, as that the ſap and iuice thereof couereth them. To con-
E clude, the bark of the Beech tree is vſed in certain religious ceremonies of ſacrifice: but when the tree is ſpoiled of the bark, it ſoone fadeth and dieth.

Chap. X.

¶ *Of Shindles: of the Pine tree, the wilde Pine, the Fir, Pitch tree, Larch tree, Torch tree, and the Yew.*

THe bourds or ſhindles of the wild Oke called Robur, be of all others ſimply the beſt: and next to them, thoſe which are made of other maſt-trees, and eſpecially of the Beech. The ſhindles are moſt eaſily rent or clouen out of all thoſe trees which yeeld Roſin, but ſetting
F aſide the Pine-wood only, none of them are laſting. *Cornelius Nepos* writeth, that the houſen in Rome were no otherwiſe couered ouer head but with ſhindles, vntil the war with K. *Pyrrhus*, to wit, for the ſpace of 470 yeres after the foundation of the city: and of a truth, the chiefe quarters of Rome were diuided & diſtinctly named by certain woods and groues neere adioining. And euen at this day there remaineth the quarter of *Iupiter Fagutalis*, where ſometime ſtood a tuft or

groue of Beeches: also the gate Querquetulana, bearing the name of an Oke row: likewise the G
hill Viminalis, from whence they vsed to fetch windings and bands of Osiers: and many other groues, whereof some were set double, and were two of a name. We reade in the Chronicles, that *Q. Hortensius*, Dictator for the time being, (when as the commons arose, and in that mutinie or insurrection forsooke the city and withdrew themselues to the fort Ianiculum) made a law & published it within a certain groue hard by, called Esculetum, where there grew a number of trees named Esculi: and the said statute ran in this forme, That whatsoeuer ordinance should be enacted by the said Commonaltie, it should bind all Citisens of Rome whomsoeuer to obserue and keepe.

In those daies the Pine and Fir, and generally all trees that yeeld pitch, were held for strangers and aliéns, because none of them were knowne to grow neere vnto the city of Rome: wher- H
of now we will speak, the rather because the beginning & whole maner of confecting and preseruing wines might be thereby throughly knowne. First and formost, some of the trees aforesaid in Asia or in the East parts do bring forth pitch. In Europe there be six sorts of trees, seeming all of one race, which yeeld the same. Of which, the Pine and the Pinaster cary leaues thin and slender in manner of haires, long also and sharp pointed at the end. The Pine beareth least rosin of all others, howbeit otherwise some it hath in the very fruit thereof, which we call Pine nuts or apples (wherof we haue already written) yet so little it is, that hardly a man would reckon the Pine among those kinde of trees that yeeld rosin. The Pinaster is nothing els but the wild Pine: it growes wonderful tall, putting forth arms from the mids of the trunk or body vpward; wheras the other Pine brancheth only in the head. This of the twain is more plentifull I
in rosin, whereof we will speake more anon. These wild Pines grow also vpon plains. There be trees vpon the coast of Italy, which men cal Tibuli, and many think they be the same, although they carry another name: slender they are and shorter, altogether without knots, and little Rosin they haue in them or none: but they serue well for shipwrights, to build frigats & brigandines.

The Pitch tree loueth the mountains and cold grounds, a deadly and mournful tree it is, for they vsed in old time to sticke vp a branch thereof at the dores of those houses where a dead corps was, to giue knowledge therof abroad: and commonly it grew green in churchyards and such places, where the maner was to burn the bodies of the dead in funeral fires: but now adays it is planted in courtyards and gardens neer our houses, because it may be easily kept with cutting and shredding, it brancheth so well. This tree puts forth great aboundance of rosin, with K
white grains or kernels comming between, so like vnto frankincense, that if it be mixt therwith, vnneth or hardly a man may discern the one from the other by the eye. And hereupon it commeth, that Druggists and Apothecaries do sophisticate frankincense, and deceiue folk with it. All the sort of these trees are leaued with short thick and hard pricky bristles in manner of the Cypres. The Pitch tree beginneth to shoot forth branches euen from the very root almost, and those be but small, bearing out like armes, and sticking one against another in the sides. Semblably do the Fir trees, which are so much sought for to serue shipping: and yet this tree delighteth in the highest mountains, as if it fled from the sea of purpose, and could not away with it: and surely the form and maner of growing is all one with the pitch tree. The wood thereof is principal good timber for beams, and fitteth our turn for many other necessaries of this life. L
Rosin if it be found in the Fir is thought a fault in the wood, whereas the only commoditie of the pitch tree is her rosin; and yet somtime there frieth and sweateth out a little thereof in the extreme heate of the sun. The timber of them both is not alike, for that of the Fir is most faire and beautifull; the pitch tree wood serueth only for clouen lath or rent shindles, for coopers to make tubs and barrels, and for some few other thin boords and painels.

As for the Larch tree, which is the fift kind of those that beare rosin, like it is to the rest, and loueth to grow in the same places: but the timber is better by ods, for it rots not, but will last and endure a long time: the tree wil hardly be killed: besides, it is red of colour, & caries an hoter and stronger smel than the other. There issueth forth of the tree as it growes, good store of liquid rosin, in colour like hony, somwhat more clammy, which will neuer grow to be hard. M

A sixt sort there is of these trees, and it is properly called Teda [*i.* the Torch tree:] the same yeelds more plenty of moisture and liquor than the rest: lower it is of growth than the Pitch-tree, but more liquid and thin: very commendable also to maintain fire at sacrifices, & to burn in torches for to giue light. These trees, I mean the male only, bring forth that strong and stinking

20030
copy 1

A king roſin,which the Greeks call Syce. Now if it happen that the Larch tree proue Teda, [i. to be Torch-wood] it is a ſigne that it doth putrifie and is in the way of dying.

The wood of all theſe kinds before named,if it be ſet a fire,maketh an exceeding groſſe and thick ſmoke,and preſently turneth into a cole,ſpitting and ſparkling a far off; except that only of the Larch tree,which neither burneth in light flame,nor maketh cole,ne yet conſumeth in the fire otherwiſe than a very ſtone.

All theſe trees whereof we ſpeake continue greene all the yeare long: and very like they are in leafe,that men otherwiſe of cunning and good experience, haue enough to do to diſcern one from the other by it,ſo neere of kin they be,and their race ſo much intermingled. But the pitch tree is not ſo tall as the Larch: for the Larch is thicker in body, of a thinner and lighter barke, more ſhag leaued,and the ſaid leaues fattier,growing thicker,more pliable, and eaſier to wind
B and bend: whereas the leaues of the pitch tree hang thinner, they be of a drier ſubſtance,more ſlender and ſubiect to cold: and in one word, the whole tree is more rough and hideous to ſee to,and withall,full of roſin: the wood alſo reſembleth the Firre,rather than the Larch.

The Larch tree, if it be burnt to the very ſtumpe of the root, will not ſpring againe and put forth new ſhoots: whereas the pitch tree liueth ſtil for all the fire,and wil grow afreſh: the experience whereof was ſeen in the Iſland Lesbos, at what time as the Forreſt Pyrrhæum was ſet on fire,and clean burnt to the ground.

Moreouer,euery one of theſe kinds differ in the very ſex: for the male of each kind is ſhorter and harder: the female taller,hauing fattier leaues,and the ſame ſoft and plain, & nothing ſtif and rugged. The wood of the male is tough,and when it is wrought keepeth not a dire & grain,
C but windeth and turneth,ſo as the carpenter muſt goe euery way about it with axe and plaine: contrariwiſe that of the female is more frim and gentle. And commonly the axe or the hatchet wil tell the difference of male and female in any tree; for what wood ſoeuer it be,it will ſoone find and feele the male: for hardly is it able to enter,but either turnes edge,or rebounds again: and whether a man hew or cleaue withall, it maketh more craſhing and a greater noiſe where it ſetleth and taketh hold; it ſticketh alſo faſter,and with more ado is plucked forth. Moreouer, the very wood of any male tree is of a more brown and burnt colour,yea,and the root of a blacker hew.

About the forreſt Ida within the territory of Troas, there is another diſtinction of trees in the ſame kind: for ſome grow vpon the mountaines,others toward the coaſt on the ſea ſide. In
D Macedony,Arcadia,and about Elis,theſe trees eftſoons change their names, ſo that the Greek writers are not agreed how to diſtinguiſh their ſeueral ſorts,and range them in their due kind. I therefore haue expreſt them according to the iudgment of Roman and Latine Authors.

Of al the trees aboue named,the Firs ſurpaſſe for bigneſſe,and the femals are the taller. The timber alſo is more frim and ſoft,more profitable alſo,and eaſier to be wrought: the tree it ſelf rounder, and ſo it brancheth archiwiſe: the boughes as they reſemble wings ſtretched out and diſplaied,ſo they ſtand ſo thicke with leaues,that they will beare off a good ſhower, inſomuch as no rain is able to pierce through. In ſum, the female Firre is far more louely and beautifull euery way than the male.

All the ſort of theſe foreſaid trees,ſaue onely the Larch,beare certain knobs like Catkins or
E Chats,compoſed (as it were) of many ſcales wrought one ouer another, and thoſe hang downe dangling at the branches. Theſe knobs or clogs in the male Firre haue in the vpper end a kernel within: but thoſe of the femal haue no ſuch thing. Moreouer,the pitch tree as it hath ſuch catkins leſſe and ſlenderer; ſo all within,from one end to the other,the kernels be paſſing little and black withall,like to lice or fleas,which is the reaſon that the Greekes call it Phthiropho-ros. The ſaid catkins of the male pitch trees are more flat,and nothing ſo round as thoſe of the females,leſſe gummie alſo,and not ſo moiſt of the roſin.

To come now to the Yugh,becauſe we would ouerpaſſe none: it is to ſee to like the reſt,but that it is not ſo green; more ſlender alſo and ſmaller, vnpleaſant and fearefull to looke vpon,as a curſed tree,without any liquid ſubſtance at all: and of theſe kind of trees,it alone beares ber-
F ries. The fruit of the male is hurtful: for the berries in Spain eſpecially haue in them a deadly poiſon. And found it hath bin by experience, that in France the wine bottles made thereof for wayfaring men and trauellers,haue poiſoned and killed thoſe that drunke out of them. *Seſtius* ſaith, That the Greekes call it Smilax: and that in Arcadia it is ſo venomous, that whoſoeuer

take

take either repose or tepast vnder it, are sure to die presently. And hereupon it commeth, that those poisons wherewith arrow heads be invenomed, after some were called in times past Taxica, which wee now name Toxica. But to conclude, it is seen by good proose, that if a brasen wedge or spike be driuen into the very body of the tree, it loseth all the venomous nature, and becommeth harmlesse. G

Chap. XI.

¶ *How to make all kinds of Pitch. The maner how Cedrium is made. Also, of thicke Pitch, how it is made; and in what sort Rosin is boiled.*

THe liquid Pitch or Tar throughout all Europe is boiled out of the Torch tree: and this kind of pitch serueth to calke ships withall, and for many other vses. Now the manner of drawing Tarre out of this tree, is, to cut the wood thereof into pieces, and when they are piled vp hollow into an heape, to make a great fire within, as it were vnder a furnace, being claied without-forth: thus with the heate of the fire it doth fry and seeth again. The first liquour that sweateth and issueth forth runneth cleare as water, in a channell or pipe made for the purpose, and this the Syrians cal Cedrium: which is of such force and efficacy, that in Egypt they vse to embalme the dead bodies of men and women departed, and keep them from putrefaction. At the next running it is thicker, and this second liquor is very pitch. Howbeit this is cast again into certaine coppers or cauldrons of brasse, and together with vineger sodden a second time, vntill it come to a thick * consistence: and when it is thus thickened, it taketh the name of Brutian pitch, good only for tuns, barrells, and other such vessels. Much like it is to the former pitch, but that it is more glutinous and clammy, redder also of colour, and more fatty. And thus much concerning the pitch made of the Torch tree. H I

* *Palimpissa, i.* Stone-pitch.

As for that which comes of the pitch tree, the rosin thereof is drawne with red hot stones in certain vessels made of strong and thick oken planks: or in default thereof, the wood is clouen into pieces, and piled together after the order of a charcole hearth, & so the pitch boiles forth. The vse hereof when it is beaten into a kind of meale or pouder, is to be put into wine, and it is of a blacker colour than the rest. The same pitch-rosin, if it be boiled more lightly with water, and be let to run through a strainer, comes to a reddish colour, and is glewie: and thereupon it is called stilled Pitch. And for this purpose lightly, is set by the more grosse and faultie substance of the rosin, together with the bark of the tree. But there is another composition and maner of making of pitch, that serueth for heady wine, called Crapula. For the floure of the Rosin is taken green and fresh, as it distilleth from the tree, together with a good quantitie of small, thin, and short spils or chips of the tree plucked away with the same: the same are minced or shred so small, as they may passe through a sieue or a riddle: which don, all is put into scalding water, and there boileth vntill it be incorporate with the water. The fat substance that is strained and pressed from hence, is the excellent pitch Rosin, hard to come by, and not to be found in Italy, vnlesse it be in few places vnder the Alps, and very good it is in physick. Now to make it passing white, there must be taken one galon of the rosin, & sodden in two gallons of rain water. But some think it the better way to seeth it a whole day together at a soft fire, without any matter at all, in a pan or vessell of Latton. Others there be likewise that boile Turpentine in a hot frying pan, and are of opinion, that this is the best of all others. And the next to it in goodnesse is the Lentiske rosin, called Mastich. K L

Chap. XII.

¶ *Of the Pitch Zopissa, which is scraped from ships: and of Sapium. Also what trees are in request for their timber.*

IT would not be forgotten, that the Greeks haue a certaine Pitch, scraped together with wax from the ships that haue lien at sea, which they Zopissa (so curious are men to make experiments and try conclusions in euery thing:) and this is thought to be much more effectuall for all matters that pitch and rosin are good for, by reason of the fast temperature that it hath gotten by the salt water. M

For

20030
copy 1

A For to draw roſin out of the * Pitch-tree, it muſt be opened on the Sun ſide, not by giuing a ſlit or gaſh in the bark, but by cutting out a peece therof, ſo that the tree may gape and lie bare two foot at the moſt: and from the earth, this wound to be at leaſt a cubite. Neither doe they ſpare the entire bodie and wound of the tree, as they do in the reſt: for there is no danger therof, conſidering that the very chips of the wood being cut out, are ful of liquor, and do ſerue to make pitch. But the nearer that the ſaid ouerture or hole is made to the earth, the better is the roſin that iſſues forth: for if it be higher it is better. When this is don, all the humor afterwards runneth to the vlcer or inciſion aforſaid, from euery part of the tree. The like it doth in the Torch pine. When it hath left running to the firſt hole, there is a ſecond likewiſe made on another ſide, and ſo ſtill is the tree opened euery way: vntill at length tree and all is hewn downe, and the
B very pith and marrow thereof ſerueth for Torch wood to burne. Semblably, in Syria they vſe to plucke the barke from the Terebinth: yea, and they pill the boughes and roots too for Terpentine, howſoeuer in other trees the roſin iſſuing out of thoſe parts, is not counted good, in Macedonie the manner is to burne the male Larch, but the roots onely of the female for to draw out pitch. *Theopompus* wrate, that there is found in the territorie of the Apolloniats, a kind of minerall pitch, called Piſſaſphaltum, nothing inferiour in goodneſſe to the Macedonian.

The beſt pitch in all countries, is that which is gathered from trees, ſtanding vpon the North wind, and in places expoſed to the Sunne-ſhine. As for that which commeth from ſhadowie places, it is more vnpleaſant to the eie, and carieth beſides a ſtrong and ſtinking ſauor. If it bee a cold and hard winter, the pitch then made is the worſe, there is alſo leſſe ſtore of it, & nothing
C is it ſo well coloured. Some are of opinion, That the pitch iſſueth in more abundance out of trees in the mountaines, alſo that it is better colored, ſweeter in taſt, more pleaſant alſo in ſmell; namely, while it is raw pitch-roſin, and as it runneth from the tree: but if it be boiled, it yeelds leſſe plentie of pitch than that which commeth of trees in the plain, and runneth all into a thin liquor in manner of whey, yea, and the very trees themſelues are ſmaller. But both the one and the other, as wel the mountain pines and pitch-trees, as thoſe of the plaines, yeeld not ſo much pitch in a faire and drie ſeaſon, as when the weather is rainy and full of clouds. Moreouer, ſome there be of theſe trees that yeeld forth fruit (which is their roſin) the very ſame yere that immediately followeth their inciſion; others, two yeares after; yea, and ſome again in the third yeare. As for the inciſion or open wound that is made, it filleth vp with roſin: for neither doth it ſou-
D der or vnite in manner of a skar, ne yet cloſeth the barke againe: for in this tree, being once diuided it will neuer come together and meet.

Among theſe trees, ſome haue reckoned one kind by it ſelfe named Sapium, becauſe it is replanted and groweth of ſome of the ſions or imps of the ſaid trees, in maner as hath been ſhewed before in our treatiſe of nut-kernells. The neather parts of which tree they call Teda [*i.* Torch-wood:] whereas indeed this tree is no other than the Pitch-tree, brought to a more mild and gentle nature by tranſplanting. As for that which the Latines call Sapinus, it is nothing elſe but the wood or timber of theſe kinde of trees, being hewed or cut downe, as well * herafter declare in place conuenient. * Chap 39. of his booke.

E

Chap. XIII.

¶ *Of the Aſh, foure kinds thereof.*

THere be many trees beſides that Nature hath brought forth, only for their wood and timber: and among them the Aſh, which of all others, growes moſt plentifully in euery place. A tall tree this is & grows round, bearing leaues ſet in maner of feathers or wings; much ennobled by the praiſe and commendation that the Poet *Homer* giueth it, as alſo for the ſpeare or launce of *Achilles*, made thereof. And in very truth, the wood ſerueth right well for many vſes. As for the timber of the aſh, growing vpon the forreſt Ida in Troas, it is ſo like the citron-wood, that when the barke is off, a man may hardly diſcerne the one from the other, inſomuch, as the merchants and chapmen are deceiued therewith.

F The Greekes haue made two kinds of the Aſh: the one runneth vp tall and euen without a knot: the other is lower, more tough and hard, and withall, of a more browne and duskiſh color: and the leaues reſemble the Lawrell. In Macedony they haue an Aſh, which they cal Bumelia, which of all other is the talleſt and biggeſt, the wood thereof is moſt pliable and bending. Others

thers haue put a difference betweene Asshes, according to the places: for that of the plaine and champion countrey, hath a more curled or frisled graine than the other of the mountaines, but contrariwise, the wood of this is more compact and harder than the other. The leaues of this tree, according to the Greeks, are hurtfull, venomous and deadly to Horses, Mules, and such laboring garrons; but otherwise to beasts that chew the cud, they be harmlesse. Howbeit, in Italy if horses, &c. do brouse of the leaues, they take no harme thereby. Moreouer, they be excellent good, and nothing so soueraigne can be found against the poison of serpents, if the juice therof be pressed forth and giuen to drinke; or to cure old vlcers, if they be applied and laid thereto in manner of a Cataplasme: nay, so forcible is their vertue, that a serpent dareth not come neare vnto the shadow of that tree, either morning or euening, notwithstanding at those times it reacheth fartheſt; you may be sure then they will not approch the tree it selfe, by a great way. And this am I able to deliuer by the experience which I haue seene, that if a man doe make a round circle with the leaues thereof, and enuiron therwith a serpent and fire together within, the serpent will chuse rather to go into the fire, than to flie from it to the leaues of the Ash. A wonderfull goodnesse of dame Nature, that the Ash bloometh and flourisheth alwaies before that serpents come abroad; and neuer sheddeth leaues, but continueth greene, vntill they be retired into their holes, and hidden within the ground.

G H

Chap. XIIII.

¶ *Of the Line or Linden tree, two sorts thereof.*

I

GReat difference there is euery way between the male & female Linden tree: for, the wood of the male is hard and knottie, of a redder colour also, and more odoriferous than the female. The barke moreouer is thicker, and when it is plucked from the tree, it is stiffe, and will not bend. It beareth neither seed nor floure, as the female doth: which also is rounder and bigger in bodie, and the wood is whiter, more faire and beautifull by farre than is the male. A strange thing it is to consider, that there is no liuing creature in the world will touch the fruit of the Linden tree, and yet the juice both of leaf and barke is sweet ynough. Between the bark and the wood of this tree there be thin pellicles or skins lying in many folds together, whereof are made bands & cords called Brazen ropes. The finest of these pellicanes or membrans serued in old time for to make labels and ribbands belonging to chaplets, and it was reputed a great honor to weare such. The timber of the Linden or Tillet tree will neuer be worm-eaten.* The tree it selfe is nothing tall, but of a meane height, howbeit the wood is very commodious.

K

* *Pliny* herin is deceiued. For the Line Tree with vs is cõparable to the highest Okes in talnesse.

Chap. XV.

¶ *Ten kinds of the Maple tree.*

THe Maple in bignesse is much about the Linden tree: the wood of it is very fine and beautifull, in which regard, it may be raunged in the second place, and next to the very Citron tree. Of Maples there be many kinds: to wit, the white, and that is exceeding faire and bright indeed, growing about Piemont in Italie, beyond the riuer Po, & also beyond the Alps, and this is called the French Maple. A second kind there is, which hath a curled graine running too and fro with diuers spots; the more excellent worke whereof, resembling the eies in the Peacockes taile, thereupon took also the name. And for this rare and singular wood, the countries of Istria and Rhætia be chiefe. As for that which hath a thicke and great graine, it is called Crassiuenium of the Latines, and is counted to be of a baser kind. The Greekes distinguish Maples by the diuerse places where they grow. For that of the champion or plaine countrey (which they name Glinon) is white, and nothing crisped: contrariwise, the wood of the mountaine Maple is harder and more curled, and namely, the male of that sort, and therefore it is in great request for most exquisite and sumptuous workes. A third sort they name Zygia, which hath a reddish wood, and the same easie to cleaue: with a barke of a swert colour, and rough in handling. Others would haue it to be no Maple, but rather a tree by it selfe, and in Latine they call it Carpinus.

L M

Chap.

A

Chap. XVI.

¶ *Of the Boſſes, Wennes, and Nodoſities, called Bruſcum and Molluſcum: Of the wild Fiſticke or Bladder nut-tree called Staphylodendron: alſo three kinds of the Box tree.*

THe bunch or knurre in the Maple, called Bruſcum, is paſſing faire, but yet that wich is named Molluſcum, excelleth it. Both the one and the other ſwell like a wen out of the Maple. As for the Bruſcum, it is curled and twined after a more crawling and winding manner; whereas the Molluſcum is ſpread with a more direct and ſtrait courſe of the grain. And
B certes, if there might be plankes hereof found broad enough to make tables, doubtleſſe they would be eſteemed and preferred before thoſe of the Citron wood. But now it ſerueth only for writing tables, for painels alſo and thin bords in wainſcote work, to ſet out beds heads and ſeelings, and ſuch are ſeldome ſeen. As for Bruſcum, there be tables made of it inclining to a blackiſh color. Moreouer, there be found in Alder trees ſuch nodoſities; but not ſo good as thoſe, by how much the wood of the Alder it ſelfe is inferior to the Maple, for beauty and coſtlines. The male Maples do put forth leaues and flouriſh before the female. Yea, and thoſe that grow vpon dry grounds are ordinarily better eſteemed than thoſe of moiſt and wateriſh places, in like ſort as the aſhes.

Beyond the Alps there is a kind of bladder Nut-tree; whereof the wood is very like to the
C white white Maple, and the name of it is Staphylodendron. It beareth certain cods, and within the ſame, kernels in taſt like the Filberd or Hazell-nut.

Now for the Box tree, the wood thereof is in as great requeſt as the very beſt: ſeldom hath it any grain criſped damask-wiſe, and neuer but about the root, the which is dudgin and ful of work. For otherwiſe the grain runneth ſtreight and euen without any wauing: the wood is ſad enough and weighty: for the hardneſſe thereof and pale yellow colour much ſet by and right commendable. As for the tree it ſelfe, gardeners vſe to make arbors, borders, and curious works thereof. Three ſorts there be of the Box tree: the firſt is called the French Box, it groweth taper-wiſe, ſharp pointed in the top, and runneth vp to more than ordinarie height. The ſecond is altogether wild, and they name it Oleaſtrum, good for no vſe at all, and beſides carieth a ſtrong
D and ſtinking ſauor with it. The third is our Italian box, and ſo called. Of a ſauage kind I take this to be alſo: howbeit by ſetting and replanting brought to a gentle nature. This ſpreadeth and brancheth more broad, and herewith a man ſhall ſee the borders and partitions of quarters in a garden, growing thick and green all the yeare long, and kept orderly with cutting and clipping. Great ſtore of box trees are to be ſeen vpon the Pyrenæan hils, the Cytorian mountains, and the whole Berecynthian tract. The thickeſt and biggeſt Box trees be in Corſica, and they beare a louely and amiable floure, which is the cauſe that the hony of that Iſland is ſo bitter. there is not a beaſt that will eat the fruit or grain thereof. The Boxes of Olympus in Macedonie are more ſlender than the reſt, and but low of growth. This tree loueth cold grounds, yet lying vpon the Sun. The wood is as hard to burn as iron: it will neither flame nor burn cleare
E it ſelfe, nor ſerue to make charcole of.

Chap. XVII.

¶ *Of the Elme foure kinds.*

BEtween theſe wild trees aboueſaid, and thoſe that bear fruit, the Elm is reckoned of a middle nature, in regard of the wood and timber that it affords, as alſo of the friendſhip & acquaintance that it hath with vines. The Greekes acknowledge two ſorts thereof, namely, one of the mountains, which is the taller and the bigger; and the other of the plaines & champion, which is rather more like a ſhrub, the branches that it ſhooteth forth are ſo ſmal and ſlen-
F der. In Italy men hold the Elmes about Atinum to be the talleſt, and of thoſe they prefer them which grow in dry grounds, and haue no water comming to them, before thoſe by riuers ſides. A ſecond ſort of them, which are not all out ſo great, they call the French Elmes. The third kinde be the Italian Elmes, thicker growne with leaues than the reſt, and thoſe proceeding in greater number from one ſtem. In the fourth place be ranged the wilde Elmes. The Atinian

Elmes

Elmes aboueſaid beare no Samara (for ſo they cal the ſeed or grain of the Elme.) All the kind of them are planted of ſets taken from the roots, whereas others come of ſeeds. G

Chap. XVIII.

¶ *The nature of trees as touching the place where they grow.*

HAuing thus diſcourſed in particular of the moſt famous and noble trees that are, I think it not amiſſe to ſay ſomewhat of their natures in generall. And firſt to beginne with the mountain high countries: the Cedar, the Larch, and the Torch-tree loue to grow among the hills; like as all the reſt that ingender roſin: ſemblably, the Holly, the Box tree, the Maſt-Holme, the Iuniper, the Terebinth, the Poplar, the wilde Aſh Ornus, the Cornell tree, and the Carpin. Vpon the great hill Apennine there is a ſhrub named Cotinus, with a red or purple wood, moſt excellent for in-laid works in Marquetry. As for Firs, the wild hard okes (Robora) Cheſtnut trees, Lindens, Maſt-holmes, and Cornell trees, they can away with hills and vallies indifferently. The Maple, the Aſh, the Seruis tree, the Linden, and the cherry tree, delight in the mountains neere to waters. Lightly a man ſhall not ſee vpon any hills, Plum trees, Pomegranat trees, wild Oliues, Walnut trees, Mulberry trees, and Elders. And yet the Cornel tree, the Haſel, the common Oke, the wild Aſh, the Maple, the ordinary Aſh, the Beech, and the Carpin, are many times found to come downe into the plaines: like as the Elme, the Apple tree, the Peare tree, the Bay tree, the Myrtle, the Bloud ſhrubs, the Holme, and the Broome (which naturally is ſo good for to dry clothes) do as often climbe vp the mountains. The Servis tree gladly groweth in cold places, ſo doth the Birch, and more willingly of the twaine. This is a tree which is meere French, and came firſt out of France: it ſheweth wonderfull white, and hath as fine and ſmall branches or twigs, which are ſo terrible to the offenders, as wherewith the Magiſtrates rods are made for to execute juſtice. And yet the wood of this tree is paſſing good for hoopes, ſo pliable it is and eaſie to bend: the twigs thereof ſerue alſo for to make paniers and baskets. In France they vſe to boile the wood, and thereof draw a glutinous and clammy ſlime in maner of Bitumen. In the ſame quarters there loueth to grow for company the white thorn, which in old time they were wont to burne for torches at weddings, and it was thought to be the moſt fortunate and lucky light that could be deuiſed, becauſe (as *Maſſurius* reporteth) the Romane ſhepheards and heardmen who rauiſhed the Sabine maidens, were furniſhed euery one with a branch thereof to make them torches. But now adaies the Carpine and Hazel are commonly vſed for ſuch nuptial lights. The Cypres, walnut, Cheſtnut trees, and the Laburnum, cannot in any wiſe abide waters. This laſt named is a tree proper to the Alps, not commonly known: the wood thereof is hard and white: it beares a bloſſom of a cubit long, but Bees will not ſettle vpon it. The plant likewiſe called Iouis Barba, ſo handſom to be cut in arbors and garden works, which groweth ſo thicke and round withall, full of leaues, and thoſe of a ſiluer colour, hates waterie places. Contrariwiſe, Willows, Alders, Poplars, and Oſiars, & the Privet which is ſo good for to make dice, will not grow well and proſper but in moiſt grounds. Alſo the Vacinia or Whortles, ſet and ſowed in Italy for the Fowlers to catch birds withall; but in France for the purple colour, wherewith they vſe to die clothes for their ſeruants and ſlaues. H I K

To conclude, this is a generall rule, What trees ſoeuer will grow indifferently as well vpon hills as plaines, ariſe to be taller, bigger, and carry a fairer head to ſee to in the low champion grounds: but timber is better, and caries a more beautifull grain vpon the mountaines, except only Apple trees and Pyrries. L

Chap. XIX.

¶ *A diuiſion of Trees according to their generall kinds.*

MOreouer, ſome trees loſe their leaues, others continue alwaies green. And yet there is another difference of trees before this, and whereupon this dependeth. For trees there be which are altogether wild and ſauage: there be again which are more gentle and ciuil: and theſe names me thinks are very apt to diſtinguiſh them. Thoſe trees therefore which are ſo kind and familiar vnto vs, as to ſerue our turns either with their fruit which they bear, or ſhade which they yeeld, or any other vertue or property that they haue, may be very aptly and fitly be called ciuill and domeſticall. M

Chap.

20030

Chap. XX.

¶ *Of Trees that neuer ſhed their leaues: alſo of Rhododendron.*

AMong theſe trees and plants which are of the gentle kind, the Olive, the Lawrel, the Date tree, Myrtle, Cypres, Pines, Ivy, and the Oleander, loſe not their leaues. As for the Oleander, although it be called the Sabine herb, yet it commeth from the Greeks, as may appeare by the name Rhododendron. Some haue called it Nerion; others Rhododaphne: it continueth alwaies green leafed, beareth floures like roſes, and brancheth very thicke. Hurtfull it is and no better than poiſon, to Horſes, Aſſes, Mules, Goats, and Sheepe; and yet vnto man it ſerueth for a countrepoyſon, and cureth the venom of ſerpents.

B

Chap. XXI.

¶ *What trees ſhed not their leaues at all: which they be that loſe them but in part: and in what countries all trees are euer greene.*

OF the wild ſort, the Fir, the Larch, the wilde Pine, the Iuniper, the Cedar, the Terebinth, the Box tree, the Maſt-holme, the Holly, the Cork tree, the Yew, and the Tamariske, be green all the yeare long. Of a middle nature betweene theſe two kinds aboue named, are the Adrachne in Greece, and the Arbut or Strawberry tree in all countries: for theſe loſe the leaues of their waterboughs, but are euer green in the head. Among the ſhrubs kind alſo there
C is a certain bramble and Cane or Reed, which is neuer without leaues. In the territorie of Thurium in Calabria, where ſomtime ſtood the city Sybaris, within the proſpect from the ſaid Citie, there was an Oke aboue the reſt to be ſeen, alwaies green and ful of leaues, and neuer began to bud new before Midſummer: where by the way I maruel not a little, that the Greek writers deliuered thus much of that tree in writing, and our countrymen afterwards haue not written a word thereof. But true it is, that great power there is in the clymat, inſomuch as about Memphis in Egypt, and Elephantine in the territorie of Thebais, there is not a tree, not ſo much as the very Vine, that ſheddeth leaues.

Chap. XXII.

D

¶ *The nature of ſuch leaues as fall from trees: and what leaues they be that change colour.*

ALl trees without the range of thoſe before rehearſed (for to reckon them vp by name particularly were a long and tedious piece of work) do loſe their leaues in winter. And verily this hath bin found and obſerued by experience, that no leaues doe fade and wither, but ſuch as be thinne, broad, and ſoft. As for ſuch as fall not from the tree, they be commonly thick skinned, hard, and narrow: and therefore it is a falſe principle and poſition held by ſome, That no trees ſhed their leaues which haue in them a fatty ſap or oleous humiditie: for who could euer perceiue any ſuch thing in the Maſt-holme? a drier tree there is not, and yet it hol-
E deth alwaies green. *Timæus* (the great Aſtrologer and Mathematician) is of opinion, that the Sun being in the ſigne Scorpio, he cauſeth leaues to fall, by a certain venomous and poyſoned infection of the aire, proceeding from the influence of that maligne conſtellation. But if that were true, we may wel and iuſtly maruell, why the ſame cauſe ſhould not be effectuall likewiſe in all other trees. Moreouer, we ſee that moſt trees do let fall their leaues in Autumne: & ſome are longer ere they ſhed, continuing green vntill winter be come. Neither is the timely or ſlow fall of the leafe long of the early or late budding: for wee ſee ſome that burgen and ſhoot out their ſpring with the firſt, and yet with the laſt ſhed their leaues and become naked: as namely the Almond trees, Aſhes, and Elders. And contrariwiſe the Mulberry tree putteth forth leaues with the lateſt, and is one of them that ſooneſt ſheddeth them again. But the cauſe hereof lies
F much in the nature of the ſoile: for the trees that grow vpon a leane, dry, and hungry ground, do ſooner caſt leafe than others: alſo old trees become bare before yonger; and many of them alſo loſe their leaues before their fruit be fully ripe: for in the Fig tree, that commeth and beareth late, in the winter Pyrry, and Pomegranate, a man ſhall ſee in the later end of the yere fruit

only,and no leaues vpon the tree. Now as touching thoſe trees that continue euer greene, you must not think that they keep ſtill the ſame leaues,for as new come,the old wither & fal away: which hapneth commonly in mid-Iune about the Summer Sunne-ſtead. For the moſt part,the leaues in euery kind of tree do hold one and the ſame colour,and continue vniform, ſaue thoſe of the Poplar, Ivy, and Croton,which wee ſaid was called alſo Cici [*id eſt*, Ricinus, or Palma Chriſti.] G

Chap. XXIII.

¶ *Three ſorts of Poplar: and what leaues they be that change their ſhape and figure.*

H

OF Poplars there be found three ſundry kinds,to wit,the white,the blacke,and that which is named * Lybica, or the Poplar of Guynee: this hath leaſt leaues, and thoſe of all other blackeſt: but mow commendable they are for the fungous meazles (as it were) that come forth thereof. As for the white Poplar leafe,the leaues when they be yong,are as round as if they were drawn with a paire of compaſſes, like vnto thoſe of Citron before named: but as they grow elder,they run out into certain angles or corners. Contrariwiſe,the Ivy leaues at the firſt be cornered,and afterwards become round. All Poplar leaues are full of downe: as for the white Poplar (which is fuller of leaues than the reſt) the ſaid downe flieth away in the aire like to moſſie chats or Thiſtle-downe. The leaues of Pomegranats and Almond trees ſtand much vpon the red colour. But very ſtrange it is and wonderfull which hapneth to the Elme,Tillet,or Linden,the Oliue tree,Aſpe,and Sallow or Willow: for their leaues after Midſummer turn about vpſide downe,in ſuch ſort,as there is not a more certaine argument that the Sun is entred Cancer,and returneth from the South point or Summer Tropicke, than to ſee thoſe leaues ſo turned. I

* Taken by ſome to be our Aſpe.

Chap. XXIIII.

¶ *What leaues they be that vſe to turne euery yeare. Of Palme or Date tree leaues, how they are to be ordered and vſed. Alſo certain wonderfull obſeruations about leaues.*

K

THere is a certain general and vniuerſal diuerſitie & difference obſerued in the very leaf: for commonly the vpper ſide which is from the ground,is of greene graſſe colour, more ſmooth alſo & poliſhed. The outſide or nether part of the leaf hath in it certain ſtrings, ſinues or veins,brawns and ioynts,bearing out like as in the back part of a mans hand: but the inſide cuts or lines in maner of the palme of ones hand. The leaues of the oliue are on the vpper part whiter and leſſe ſmooth; and likewiſe of the Ivy. But the leaues of all trees for moſt part,euery day do turn and open to the Sunne, as deſirous to haue the inner ſide warmed therewith. The outward or nether ſide toward the ground of all leaues, hath a certaine hoary downe more or leſſe here in Italy,but in other countries ſo much there is of it, that it ſerueth the turn for wooll and cotton. In the Eaſt parts of the world they make good cordage and ſtrong ropes of date tree leaues (as we haue ſaid before) and the ſame are better, & ſerue longer within than without. With vs theſe Date leaues are pulled from the tree in the Spring, whiles they are whole and entire; for the better be they which are not clouen or diuided. Being thus plucked, they are laid a drying within houſe foure daies together. After that,they be ſpred abroad and diſplaied open to the Sun,and left without dores to take all weathers both day and night, and to be bleached,vntil they be dry and white: which done,they be ſliued and ſlit for cord-work. But to come again to other leaues,the broadeſt are vpon the Fig-tree, the Vine,and the Plane; the narroweſt vpon the Myrtle,Pomegranat,and oliue: as for thoſe of the Pine and cedar,they be hairy: the Holly leaues and all the kindes of Holme be ſet with ſharpe prickes. As for the Iuniper,in ſtead of leafe it hath a very pointed thorne. The Cypreſſe and Tamariske carrie fleſhie leaues: thoſe of the Alder be moſt thick of all other. The Reed and the Willow haue long leaues: the Date tree hath them double. The leaues of the Peare tree are round, but thoſe of the Apple tree are pointed; of the Ivie cornered: of the Plane tree diuided into certaine inciſions; of the Pitch tree and the Fir cut in,after the maner of comb-teeth; of the wild L M

hard

20030
copy 1

A hard Oke, waued and indented round about the edges; of the brier and bramble, ſharpe like thornes all the skin ouer. Of ſome, they be ſtinging and biting, as of Nettles: of others ready to pricke like pins or needles, as of the Pine, the Pitch tree, the Larch, the Firre, the Cedar, and all the ſorts of Holly. The leaues of the Oliue tree, and the Maſt-Holme, hang by a ſhort ſtele, the Vine leaues by a long. The Poplar or Aſpen leaues doe ſhake and tremble, and they alone keep a whiſtling and ruſtling noiſe one with another. Moreouer, in the very fruit it ſelfe, and namely in a certain kind of Apples, ye ſhall haue ſmall leaues breake out of the very ſides in the mids; in ſome ſingle, in others double and two together. Furthermore, there be trees that haue their leaues comming forth about their boughs and branches, others at the very end and ſhoot of the twig: as for the wild Oke Robur, it putteth leaues forth of the trunk and maine ſtock. Ouer
B and beſides, the leaues grow thicker or thinner in ſome than in others; but alwaies the broad and large leaues, are more thinne than others. In the Myrtle tree, the leaues grow in order by ranks; thoſe of the Box tree turn hollow; but in the Apple trees they are ſet in no order at al. In Pyrries & Apple trees both, ye ſhal ſee ordinarily many leaues put forth at one bud, hanging at one and the ſame taile. The Elme, and the Tree-trifolie, are full of ſmall and little branches. *Cato* addeth moreouer and ſaith, That ſuch as fall from the Poplar or the Oke, may bee giuen as fodder to beaſts, but he wils that they be not ouer drie: and he ſaith expreſſely, that for kine and oxen, Fig-leaues, maſt Holm leaues, and Iuie, are good fodder: yea and ſuch kind of beaſts may well brouſe and feed of Reed leaues and Bay leaues. Finally, the Seruiſe tree looſeth her leaues al at once, others ſhed them by little and little one after another. And thus much for the leaues
C of trees.

Chap. XXV.

The order and courſe obſerued in Nature as touching plants and trees, in their conception, flouring, budding, knotting, and fructifying. Alſo in what order they put forth their bloſſomes.

THe manner and order of Nature yeare by yeare, holdeth in this wiſe: firſt, trees and plants do conceiue by the meanes of the Weſterne wind Fauonius, which commonly beginneth to blow about ſixe daies before the Ides of Februarie: for this wind is in ſtead of an huſ-
D band to all things that grow out of the earth, and of it they deſire naturally to be conceiued, like as the Mares in Spaine, of which we haue written heretofore. This wind is that ſpirit of generation which breathes life into all the world; which the Latines call thereupon Fauonius, *à fauendo*, [*i.* of cheriſhing and nouriſhing euery thing] as ſome haue thought. It blowes directly from the Æquinoctiall Sun-ſetting, and euermore beginneth the Spring. This time, our ruſti-call peaſants call the Seaſoning, when as Nature ſeemeth to goe proud or aſſaut, and is in the rut and furious rage of loue, deſirous to conceiue by this wind, which indeed doth viuifie and quicken all plants and ſeeds ſowne in the ground. Now of all them conceiue not at once, but in ſundry daies: for ſome are preſently ſped in a moment, like as liuing creatures: others are not ſo haſtie to conceiue, but long it is firſt ere they retaine, and as long againe before their vitall ſeed
E putteth forth; and this is therupon called their budding time. Now are they ſaid to bring forth and be deliuered, when in the Spring they bloome, and that bloſſome breaketh forth of certain matrices or ventricles. After this, they become nources all the while they cheriſh and bring vp the fruit: and this time alſo the Latines call Germinatio, [*i.* the breeding ſeaſon.] When trees are full of bloſſomes, it is a ſigne that the Spring is at the height, and the yeare become new againe. The bloſſom is the very ioy of trees, and therein ſtandeth their chiefe felicitie: then they ſhew themſelues freſh and new, as if they were not the ſame; then be they in their gay coats; then it ſeemeth they ſtriue avie one with another in varietie of colours, which of them ſhould excell and exceed in beautifull hew. But this is not generall, for many of them are denied this pleaſure, and enjoy not this delight; for all trees bloſſome not: ſome are of an heauie and ſad
F countenance, neither cheare they at the comming of this new ſeaſon and gladſome Spring: for the maſt-Holme, the Pitch tree, the Larch, and the Pine doe not bloome at all, they are not arrayed in their robes, they haue not their liueries of diuers colors to fore-ſignifie (as meſſengers and vantcourriers) the arriuall of the new yeare, or to welcome and ſolemnize the birth of new fruits. The Figge trees likewiſe both tame and wild, make no ſhew of floures: for they are not

too ſoon bloomed (if they bloom at all) but they bring forth their fruit. And a wonderful thing G
it is to ſee what abortiue fruit theſe Figge-trees haue, and how it neuer commeth to ripeneſſe.
Neither doe the Iunipers bloome at all. And yet ſome writers there be who make two kinds
thereof: and they ſay, that the one flowreth, and bears no fruit, as for the other which doth not
bloſſome, it brings forth fruit vpon fruit, and berrie vpon berrie, which hang two yeres vpon the
tree before they come to maturitie. But this is falſe, for in very truth all Iunipers without ex-
ception, haue euermore a ſad looke, and at no time ſhew merie. And this is the caſe and condi-
tion verily of many a man, whoſe fortune is neuer in the floure nor maketh any outward ſhew
to the world. Howbeit there is not a tree but it buddeth, euen thoſe that neuer bloſſome: And
herein the diuerſitie of the ſoile is of great power: for in one and the ſame kind, ſuch as grow in
mariſh grounds, do ſhoot and ſpring firſt; next to them, thoſe of the plaines; and laſt of all they H
of the woods and forreſts. And generally the wilde Pyrries growing in woods doe bud later
than any other. At the firſt comming of the weſtern wind Fauonius, the Corneil tree buddeth;
next to it, the Bay; and ſomewhat before mid-march or the ſpring Æquinoctiall, the Tillet or
Linden, and the Maple, the Poplar, Elme, Willow, Alder, and Filberds or Hazell nut trees, bud
with the firſt. The Palme alſo maketh haſt and is loth to come behind. All the reſt at the point
Ex Theophr. and prime of the ſpring, namely the Holly, the Terebinth, the Paliurus, the Cheſton, and the
Walnut-trees, or Maſt-trees. Apple trees are late ere they bud, but the Corke tree longeſt of
any other. Trees there be that put forth bud vpon bud, by reaſon that either the ſoile is exceed-
ing battill and fat, or elſe the weather faire and pleaſant: and this happeneth more to be ſeene
in the blades of corne. But trees if they happen to be ouer rancke in new ſhoots and buds, they I
waxe wearie and grow out of heart.

Moreouer, ſome trees there be that naturally do ſprout at other ſeaſons beſides the ſpring,
according to the influence of certaine ſtarres, whereof the reaſon ſhall be rendred more conue-
niently, in the third booke next enſuing after this. Meane time this would be obſerued, That
the winter ſpring of trees is about the riſing of the Ægle-ſtar: the Summer budding at the riſing
of the Dog-ſtar: and a third, when the ſtar Arcturus is vp. And for the two later, ſome would
haue them verily to be common to all trees, but moſt euidently ſeen, in Fig-trees, Vines, Pome-
granate trees: and they yeeld a cauſe, For that in Theſſalie and Macedonie the Fig tree about
theſe times putteth forth moſt plenteouſly: and in Ægypt this reaſon is to be ſeene moſt appa-
rantly. As for all other trees, certaine it is, that when they begin once to bud, they hold on and K
ſhoot forward continually without intermiſſion. The wild Oke, the Fir, and the Larch tree, haue
their ſeuerall ſhoots in one yere, and ſpring at three ſundrie times, giuing ouer between whiles;
and therefore they put forth the ſprouts between the skales of their barks: a thing vſually hap-
ning to all trees in their budding & breeding time: for after they be once conceiued, their rind
or bark burſteth withall. Now their firſt budding is in the prime & beginning of the ſpring, and
continueth much about 15 daies. They bud a ſecond time in the moneth of May when the ſun
paſſes thorough the ſigne Gemini: by which time it is euidently to be ſeen, how the bud heads
that came firſt, are driuen and thruſt vp higher by thoſe that follow after; & that appeares more
plainly by the encreaſe of the knots & joynts. As for the third budding, it is very ſhort, name-
* Solſtitium. ly at * midſummer, and laſteth not aboue a ſeuen-night: and euen then alſo may a man perceiue L
manifeſtly by the knots and joynts of the ſhoots how much they are put forth and grown. The
Vine alone ſhooteth twice, to wit, when ſhe firſt beginneth to burgen & put forth a grape; and
a ſecond time, when ſhe formeth and digeſteth or concocteth the ſame. As for thoſe trees that
bloſſome not, they haue no more to doe but only to bring forth their fruit, and ſo proceed to ri-
pen it. Now there are ſome trees, which no ſooner bud, but they ſhew alſo a bloſſom; and yet as
haſty as they be that way, they take their leiſure afterwards, and long it is ere their fruit come
to be ripe: and ſuch are the Vines. Others again be as backward and ſlow both to bud and bloſ-
ſome; but they make ſpeed to ripen their fruit, as the Mulberry tree, which of ciuile and dome-
ſticall trees, is the laſt that buds, and neuer before all the cold weather is paſt; and therfore ſhe
is called the wiſeſt tree of all others: but after that ſhe begins once to put forth buds, ſhe di- M
ſpatches her buſines out of hand, inſomuch as in one night ſhe hath done; and that with ſuch a
force, that in the breaking forth a man may euidently heare a noiſe. Of thoſe trees that conceiue
in winter, about the riſing of the Ægle-ſtar, (as we haue before ſaid) the Almond tree is the firſt
that bloſſometh in the moneth of Ianuarie, and by March the Almond is ripe. The next that
bloſſome

20030
copy 1

A bloſſome after it, be the Peach Plum-trees of Armenia, then the Iujube trees called Tuberes, and the Abricots. As touching the former, they be meere ſtrangers, but theſe Abricots are forced by Art and induſtrie of man. As for wild and ſauage trees, by courſe of nature the Elder floures firſt, and hath of all other moſt plentie of pith or marrow within, wheras the male Corneil hath none at all. But of domeſticall and ciuile trees, the Apple tree beginneth to bloſſome, and ſoone after the Pyrry, Cherrie tree, and Plum tree, inſomuch as they ſeeme all to floure together. Next to them, is the Lawrell; anon after it, the Cypreſſe; and then the Pomegranat, and the Fig tree: Vines and Oliue trees do but then burgen and bud, when thoſe other be in their floure: for in truth they conceiue late, namely, at the riſing of the Vergiliæ or Brood-hen; for this is the proper ſtar to the influence whereof theſe trees be ſubject: and it is Iune firſt and
B the ſummer Sun-ſtead, before the vine bloomes; and ſo it is with the Oliue tree, but that it commeth ſomewhat later. All trees be ſeuen daies at the leaſt in their bloſſoming; and ſome be longer ere they giue ouer, but none paſſe a fortnight: and done they haue euer by the eight day before the Ides of Iuly; which are forerunners of the Eteſian winds. Finally, ſome trees there are which doe not knit nor ſhew their fruit immediatly vpon their blooming.

Chap. XXVI.

¶ *Of the Corneil tree. Alſo, what is the proper time wherein euery tree beareth: which trees be they that beare not, and which be reputed vnluckie. Alſo of thoſe trees which ſooneſt loſe their fruit. Laſt of*
C *all, what trees ſhew fruit before leafe.*

AS for the Corneil tree, it is about midſummer or the ſummer Sun-ſtead, before it putteth forth any fruit, which at firſt is white, afterwards red as bloud. But the female of this kind beareth after Autumne, ſowre berries, and ſuch as no beaſt will abide to taſt. The wood thereof alſo is ſpungeous, hollow, and good for nothing; whereas that of the male is counted among the hardeſt that be: ſo great difference there is in trees of one and the ſame kind. Moreouer, the Terebinth, Maple, and Aſh, yeeld their fruit or ſeed in harueſt time: Walnuts, Apples, and Peares (vnleſſe they be ſome winter fruits, or of the haſtie kind) ordinarily are readie to be gathered in the Autumn. All maſt trees be later ere they render their fruit, to wit, about the go-
D ing downe of the Vergiliæ or beginning of the winter, ſaue only the Æſculus, which paſſeth not the Autumne. As for certain Apple trees and Peare trees both, as alſo the Corke tree, their fruit is not to be gathered before winter begin. The Firre putteth forth a bloſſome of a yellow color like Saffron, about mid-Iune or the ſummer ſun-ſtead; but the Brood-hen ſtar is downe before the fruit be ripe. The Pine, and Pitch tree, do bud before the Firre ſome fifteen daies, or thereabout; and it is winter firſt, and the foreſaid Vergiliæ or Brood-hen is likewiſe ſet, before their fruit is ripe. Citron trees, Iunipers, and maſt-Holmes, are counted trees that beare all the yeare long, and the old fruits of the former yeare tarieth on the tree vntill new come, and they hang both together. But aboue all other trees, the Pine is a wonder in nature; for a man ſhall euer find vpon it ſome of the fruit readie to be ripe; and ſome againe that will remaine vnto the
E next yeare, and the third yere before it will be readie: and there is not another tree that is more forward and greedie (as it were) to put forth it ſelfe, and giue greater hope of increaſe, than it doth: for look in what month ſoeuer the Pine-nuts are gathered from the tree, in the very ſame others are in good forwardneſſe of ripening; and in ſuch ſort ſhe ordereth the matter, that euery month a man ſhall haue ripe fruit on her. Thoſe Pine-apples or nuts which cleaue and open vpon the tree, bee called Zamiæ; and well may they be ſo named, for vnleſſe they be plucked, they hurt and corrupt the reſt. The only trees that bear no fruit at all, that is to ſay, not ſo much as ſeed, are theſe; the Tamariske, good for nothing but to make Beeſoms of; the Poplar, Alder, Atinian Elme, and the Alaternus, which hath leaues reſembling the Holme, and partly the Oliue. As for ſuch trees which neither at any time are ſet or planted, nor yet beare fruit, they bee
F holden for vnfortunate, accurſed, and condemned, in ſuch ſort, as there is no vſe of them in any ſacrifice or religious ſeruice. *Cremutius* writeth, That the (Almond) tree whereon ladie *Phyllis* hanged her ſelfe, had neuer (after) greene leaues on it. Such trees as yeeld gum, after they haue put forth their bud, do cleaue and open: howbeit the gum that iſſueth out, neuer commeth to any thickneſſe, vntill the fruit thereof be gathered. Yong trees commonly beare not ſo long as

they ſhoot and grow. The Date tree, the fig tree, the Almond tree, the Apple tree, and the Pyrie, do ſooneſt of all other let their fruit fall before it be fully ripe. Semblably, the Pomegranat tree, which is ſo tender beſides, that with euery thicke and heauie dew, white froſt, and foggie time, ſhe wil be bitten & ſhed the bloſſom: which is the cauſe that folk vſe to bend the boughs thereof downeward to the ground, that both dew and rime may ſooner fall off which lights vpon them, and otherwiſe would ouer-load and hurt them. The Pyrrie and the Almond tree cannot abide cloſe and cloudie weather, eſpecially if the wind be Southerly, although no raine do fall: for in ſuch daies, if they chance to bloſſom, they not only ſhed their flowre, but loſe their fruit new knit. But the Sallow or Withie tree, is of all others moſt tickliſh, and ſooneſt forgoes the ſeed or chats that it beareth before it commeth to any ripenes: for which cauſe, called it is of *Homer* * Looſe-fruit, or Spill-fruit. Howbeit the age enſuing (naught as it was) hath interpreted that Epithet of his, in another ſenſe, according to the wicked experience they had of it, whereby it was found, that the ſeed therof cauſeth barraineſſe in women, and hindreth conception. But in this regard, Nature hath well done alſo to preuent this miſchiefe and inconuenience, in that ſhe hath not been very carefull to preſerue the ſeed: and yet for the maintenance of the whole kind, ſhe hath endued it with this gift, To grow very quickly, if a man do pricke into the ground but a cutting or twig thereof. And yet (by report) there is one Willow in Candie, and namely about the very deſcent of *Iupiters* caue, which is wont ordinarily to carie the graine or ſeed thereof vntill it be full ripe, and then is it of a rough and writhen ſhape, of a wooden and hard ſubſtance, and withall, of the bigneſſe of a cich peaſe.

* Ὀλιγοκάρπους, *Frugiperda.*

Moreouer, ſome trees there be that proue barraine and fruitleſſe by the occaſion of the imperfection of the ſoile and territorie where they grow: and namely in the Iſle Paros, there is a whole wood or coppiſe that vſually is lopt and cut, but it neuer beareth any fruit. The Peach trees in the Iſland Rhodos bloſſome only, and otherwiſe are fruitleſſe. Ouer and beſides, this difference of trees (that ſome be fruitfull and others barraine) ariſeth of the ſexe alſo; for commonly the males beare not: how ſoeuer ſome affirme cleane contrary, and ſay, They are the male only that be fruitfull, and the female barren. Furthermore, it falleth out many times that trees be fruitleſſe, either becauſe they grow too thick one by another, or elſe are ouercharged and too ranke with boughes and branches: but of ſuch as do beare, ſome bring forth their fruit both at the ſides, and alſo at the very tips and ends of their branches; as the Peare tree, Pomegranate tree, Figge tree, and Myrtle. As for others, they are of the nature of corne and pulſe; for the one grows in the eare or ſpike alone, the other by the ſides, & not otherwiſe. The Date tree onely (as hath been ſaid before) containeth fruit within certain pellicles, and the ſame hangeth down in cluſters after the manner of grapes. Other trees beare their fruit vnder the leafe for their ſafeguard and defence, except the Fig tree, which hath her Figs aboue the leaf, becauſe it is ſo large and ouerſhadowie. Moreouer, the leafe of the fig tree commeth forth after the Figge. One notable thing is reported of a kind of figge-trees in Cilicia, Cyprus, and Hellas, to wit, that they haue this propertie ſingular by themſelues, To bring forth their perfect Figs vnder leafe, and their greene abortiue Figs that come to no proofe, after the leafe. The Fig tree beareth moreouer certain haſtie Figs, which the Athenians call Prodromos, *i.* vant-courriers or forerunners, becauſe they be long ripe before others. The Laconian Figge trees bring the faireſt and greateſt Figs.

Chap. XXVII.

¶ *Of trees that beare twice and thrice in one yeare. Alſo what trees ſooneſt wax old: and of their ages.*

IN the ſame countries aboue-named, there be Figge trees alſo that beare Figges twice in one yeare. And in the Iſland Cea, the wild Figge trees beare thrice in the ſame yeare: for the ſecond increaſe is put forth on the firſt, and the third vpon the ſecond: and by this third fruit, the Figges of the tame Figge tree receiue their maturitie by way of caprification: and thoſe wild greene Figges of theirs come forth aboue the leafe. Moreouer, there be ſome Pyrries and Apple trees that bring forth fruit twice a yeare: as alſo there be others of the haſtie kind, which do beare both Peares and Apples betimes in the yeare. There is a kinde of Crab tree alſo or Wilding, that in like manner beareth twice a yeare; and the later fruit is ripe preſently after

20030
copy 1

A after the midſt of September, eſpecially in places lying well vpon the Sun. As touching Vines, there be of them alſo, that after a ſort beare three times in the yeare, which thereupon men call Inſanas, [*i.* The mad or fooliſh vines:] for whiles ſome of the grapes be ripe, others begin to ſwel and wax big, and a third ſort againe are but then in the flower. *M. Varro* writeth, That in Smyrna by the ſea ſide there was a vine that bare fruit twice a yeare, as alſo an Apple tree in the territorie of Conſentia. But this is an ordinary thing throughout all the countrey about Tacapa in Africa, and neuer is it ſeen otherwiſe there, ſo fertile is the ſoile; but thereof will wee write more at large hereafter in another place. As for the Cypreſſe trees, they faile not but come with fruit thrice in one yeare: and their berries be gathered in Ianuarie, May, and September, and all of a diuers bigneſſe, one from the other. Ouer and beſides, the very trees themſelues are not laden with fruit after one and the ſame manner: for the Arbut or Strawberry tree is more plen-
B teous in the head, and toward the top: the Oke, the Wal-nut-tree, Fig-tree (and namely that which beareth the vnſauorie great figs Mariſcæ) are more fruitfull beneath. Generally, all trees the elder they are, the ſooner they beare and make more haſt to ripen their fruit; the rather alſo if they grow in a ground leane, and expoſed to the Sun. Contrariwiſe, trees that be wild are later in bearing than other: and ſome of them neuer yeeld fruit fully ripe. Moreouer, ſuch trees vnder which the ground is tilled & laid hollow, haue their fruit ſooner ripe, & are more fruitful withall, than thoſe that are neglected and not looked vnto. Beſides all this, there is a difference in trees as touching bearing their fruit, according to the age: for the Almond tree & the Pyrrie are, moſt fertile when they be old, as alſo maſt trees, and a certain kind of fig-trees. Al others, the yonger they are, the more fruitfull they be, howbeit, later it is, ere their fruit be ripe: a thing
C moſt plainly to be obſerued in Vines. For the better wine commeth from the elder Vines: but more plenty from the yonger. As for the Apple-tree, it becommeth of all other ſooneſt old, and in that age the fruit is nothing ſo good as in youth: for both leſſer be the Apples, and alſo more worm-eaten, inſomuch as the very wormes will breed in them vpon the tree. The Fig is the fruit alone of all trees, that needeth ſome help of * Phyſicke to ripen. And this may be noted for a ſtrange and miraculous thing in them, That the later figs bee in more price than the haſty and early ripe, and that there ſhould be more reckoning made of prepoſterous and artificiall things beſide the courſe of kind, than of the naturall. Alſo this is a generall rule, Whatſoeuer tree is exceeding fruitful, and beareth moſt, the ſame continueth leaſt while, and ſoon waxeth old. Yea
D and ſome of them are to be ſeen to die out right, and that very quickely, becauſe they inioyed ſo fauorable a ſeaſon, to cauſe them ſo to ſpend themſelues with bearing; as wee may marke moſt eaſily in Vines.

* To wit, by caprification.

Chap. XXVIII.

¶ *Of the Mulberrie tree.*

COntrariwiſe, the Mulberry tree laſteth long, and is very late ere it ſeemeth old. For why? it is not giuen greatly to beare fruit, neither is ouerloden with Mulberries. To conclude, look what trees haue a curled graine in the wood, as the Maple, Date-tree, and Poplar, they continue a long time before they decay. And in one word, ſuch as haue their roots digged or delued
E often and laid bare about, are not long liued, but ſoone age and decay.

Chap. XXIX.

¶ *Of wilde trees.*

AS for wilde trees, they indure longeſt of all others. And generally, as carefull tending and looking to trees, maketh them more fertile: ſo there is nothing ſooner bringeth age vpon them, than fruitfulneſſe and much bearing. Hereupon it is likewiſe, that ſuch trees both bud and alſo bloſſome ſooner than others, yea, and ordinarily their fruit is ripe before the reſt: in regard wherof, they are more ſubiect to the iniury of the time & the weather, which cauſeth alſo diuers and ſundry infirmities. Moreouer, as we haue ſaid already in the chapter of maſt
F trees, there be many that bring forth fruits of different ſorts: among which may be reckoned the Lawrell, with her variable floures and berries growing ſo thicke, and principally the barren of that kind which beareth nothing els, and therfore is eſteemed of ſome the male. The Hazels al-

ſo

so and Hilbard trees, besides, their nuts do carry certain chats with a callous substance of skales joined one within another, but good for nothing. G

Chap. XXX.

¶ *Of the Box-tree: the Greeke Beane or the Lotus.*

All this *Theophrastus* reporteth of Ilex, and not of Buxus.

AMong these is to be ranged the Box-tree, which bringeth forth the most varietie of all others. For it putteth forth a seed of her owne, also, a graine which they call Carthegon: besides, on the North side Misselto, and on the South Hyphear: whereof wee will write anone more at large: so that otherwhiles a man shall find foure diuers things vpon the Box all together.

Moreouer of trees, some be simple or single, to wit, such as from the root haue one trunke or body, and no more, and yet many boughes and branches; as the Oliue, Fig-tree, and the Vine: others be of a shrubs kind, and put forth many shoots from the root besides the main trunk, as the Rhamne-thorn Paliurus, and the Myrtle. In like maner the Hazell nut-tree. Howbeit, the better is the tree and more plenteous in fruit, when it is well branched from the body, and hath not those suckers from the root: ye shall find some again haue no principall stock at all, as wee may see in a kind of Box, and a certain Lotus beyond sea. Others be forked in twain, yea in fiue, immediatly from the root: and ye shall meet with those that put vp many trunks out of the earth, but branch not into boughes, as namely, the Elders; as also with others that forke not, nor are diuided at all, howbeit, they be ful of arms & boughs, as the Pitch-trees. Moreouer, some there be which haue their boughes disposed in good order, as the Pitch-tree, Firre, or Deale: others again be as disorderly, as the Oke, Apple-tree, and Pyrrie. As for the Fir verily, where it is diuided into boughs, they grow directly vpright vnto heauen, and spread not in breadth about the sides. But a strange and wondrous thing it is of this tree, that if it be headed, or the tops only of those arms cut off, the whole dieth thereupon: but if they be lopped off close to the body, it continueth still aliue. Nay, in case it be cut vnder the place where the branches put forth, the stock or stump that is left, will take no harme by it, but remaine and liue: crop the head onely thereof, and the whole tree dieth. To proceed, some trees spread into arms immediatly from the root, as the Elme: others branch only toward the top, as the Pine, and the Greek Bean, which at Rome for the pleasant taste of the fruit, resembling cherries very much, although it be of a wild nature, they call Lotus. This tree is much planted about faire houses, in the court yards, especially because the boughs spread so large; for albeit the stock or body it selfe be but very short and small, yet it brancheth so, as that it yeeldeth much shade: yea, and often times the boughes reach to the neighbor housen. But there is not a tree againe that maintaineth this shade a lesse while; for when Winter is once come, the leaues shed, and then it admitteth the warm Sun for it. Moreouer, there is not another tree that beareth a fairer barke, nor more pleasant to the eie, nor that carieth either longer boughes, and more in number than it, or stronger: a man that seeth them, would say they were so many trees by themselues. As touching the vse and commodities of this tree, the barke serueth to colour skins and leather: the root to die wooll. And as for the fruit or Apples that it beareth, they are a speciall kind by themselues: for all the world they resemble the snouts or muzles of wild beasts, and many of the smaller sort seeme to hang to one that is bigger than the rest. H I K L

As concerning boughs of trees, some are termed blind, because they put not forth certaine eies or chits where they should bud: which happeneth somtime by a naturall defect, when they are not of validity to thrust out a bud; otherwhiles it is occasioned by some wrong and iniurie done, namely, when they be cut off, and in the place of the cut, there groweth as it were a callous skar that dulleth the vertue of the tree. Furthermore, looke what is the nature that forked trees haue in their boughes, the same hath the Vine in her eies and burgeons; the same also haue canes and reeds in their joints and knots. Ouer and besides, all trees toward their root, and the neareſt to the ground, are thicker than else where. Some run vp altogether in height, and therein shew thrir growth, as the Firre or Deale tree, the Larch, Date-tree, Cypresse, Elme, and generally all that rise vp in an entire stocke, and are not diuided. Of those also that branch and put out many boughes, there is a kind of Cherry-tree that is found to beare armes like beames forty cubites long, and two foot in thicknesse square throughout the whole length. M

A

Chap. XXXI.

¶ *Of the Boughes, Barke, and Roots of trees.*

THere are trees, that immediatly from the root thruſt out boughes and branches, as do the Apple-trees. Some be couered with a thin rind, as the Lawrell and I ..e tree: others with a thicke barke, as the Okes. In ſome a man ſhall find the barke euen and ſmooth, as in the Apple-tree, and fig-tree: the ſame in others is rough and rugged, as is to be ſeene in Okes and Date-trees. And ordinarily, all old trees haue more riueled barks and furrowed, than the younger. In many trees the bark naturally doth breake and cleaue of the own accord, and namely in the Vine. From ſome it ſhaleth and falleth off, as from the Apple tree and the Arbut. The cork
B and the Poplar haue a fleſhie and pulpous barke: the rind of the Vine and the Reed, is made in manner of a membrane or thin skin. In Cherry trees it is as ſlender as paper, and runneth into rolls: but Vines, Lindens, and Firs, are clad with tunicles and coats of many folds. In ſome again the rind is but ſingle, as in the Fig-tree, and the Cane or Reed. And thus much of Barke.

There is as great difference in the root. For the fig-tree, the Oke, and the Plane, haue great ſtore of roots and large ſpurns: contrariwiſe, in the Apple tree they are ſhort and ſmall: the firre and Larch haue one tap root and no more: for vpon that one main maſter-root they reſt and are founded; howbeit, many ſmall ſtrings and petie ſpurns ſhoot out of the ſides. In the Bay-tree the roots be more groſſe and vnequally emboſſed, and likewiſe in the oliue, which alſo ſpredeth out into many branches. But thoſe of the oke be of a carnous ſubſtance: and verily, all the kind
C of okes do root deep into the ground. Certes, if we giue credit to *Virgil*, that ſort of them which are called Eſculi, go down as deep into the earth with their roots, as they ariſe & mount aboue ground with their heads. The roots of the Apple-tree, Oliue, and Cypreſſe, lie very ebbe, and creep hard vnder the ſourd of the ground. Moreouer, there be roots that run direct and ſtreight, as thoſe of the Bay and Oliue: there be againe that wind and turne as they go, as thoſe of the fig-tree. Some are all ouergrowne and full of hairy ſtrings, as the firre-root, and many others of wild trees that grow in forreſts: from which the mountains vſe to pluck thoſe fine fibers & ſmal threds, wherewith they twiſt goodly faire paniers, couers for flaggons and bottels, and work many other veſſels & prety deuiſes. Some writers [as namely *Theophraſtus*] hold opinion and haue put down in their books, that no roots goe lower into the earth, than that the Sunnes heat may
D pierce vnto them and giue them a kind warmth; the which is more or leſſe, ſay they, according to the nature of the ſoile, as it is either lighter or lean, or maſſier, richer, and faſter compact. But I take this to be a meere vntruth. This is certain, that we find in antient writers, that a yong Fir, when it was to be tranſplanted and ſet again, had a root that went eight cubits within the earth; and yet it was not digged vp all whole, but broken in the taking vp, and left ſomewhat behind. The roots of Citron trees are biggeſt of all other, and ſpread moſt. Next to them are thoſe of the Planes, Okes, and other Maſt-trees. Some trees there be, the roots wherof like better & liue longer, the more ebbe that they lie within the vpper face of the ground, and namely, Lawrels; and therefore they ſpring freſh againe, and put forth better, when the old ſtock is withered and cut away. Others hold, that trees which haue ſhort ſtumped roots, do ſooner decay, & liue leſſe
E while. But deceiued they are, and may be reproued by the inſtance of fig-trees, which liue leaſt while, and yet their roots are longeſt of any other. I ſuppoſe this alſo to be as falſe, which ſome haue held and deliuered in writing, That the roots do diminiſh and decay, as the trees do waxe old; for the contrary hath bin ſeen by an aged oke, which by the violent force of a tempeſt was ouerthrowne, the root whereof tooke vp a good acre of ground in compaſſe.

Moreouer, a common thing it is and ordinary, to replant and recouer many trees that haue bin blown down and laid along; for they will reioine, knit againe, and reuiue, by meanes of the earth, euen as a wound doth vnite by the ſolder of a callous cicatrice. And this is a moſt vſuall and familiar practice obſerued in the Planes, which by reaſon of their great heads ſo thicke of boughes, gather windes moſt, and are ſooneſt ſubiect to their rage: if any one of them by that
F means be fallen, they lop their boughes, and diſcharge them of their weightie load, and then ſet them vpright again in their owne place, as it were in a ſocket, and they will take root and proſper. And in good faith, this hath bin done heretofore already in Walnut trees, Oliues, and many other, to the like proofe.

CHAP.

Chap. XXXII.

¶ *Of certaine prodigious trees, and presages obserued by them. By what meanes trees grow of their owne accord. That all plants grow not euery where: and what trees they be that are appropriate to certaine regions, and are not elsewhere to be found.*

WE reade in Chronicles and records, that many trees haue fallen without wind and tempest, or any other apparent cause, but only by way of prodigie and presage of some future euent: and the same haue risen againe of themselues without mans helpe. This happened during the wars against the Cymbrians, to the great astonishment of the people of Rome, who thereupon gathered a fore-tokening of great consequence: for at Nuceria in the groue of *Iuno*, there was an old Elme fell, and after the head was lopped off, because it light vpon the very altar of *Iuno*, it arose of it own accord; and that which more is, immediatly vpon it put forth blossoms and flourished. And this was obserued, That from that very instant, the majesty of the people of Rome began to take heart, reuiue, and rise again, which had bin decaied and infeebled by so many and so great losses that the Romans hed receiued. The like chanced (by report) neer the city Philippi, vnto a Willow tree which was fallen downe, and the head of it cut off clean: semblably, to an Aspen tree at Stagyræ, neere vnto the colledge or publik place of Exercise there. And all these were fortunate presages of good luck. But the greatest wonder of all other was this, of a Plane tree in the Isle Antandros, which was not only fallen, but also hewed and squared on all sides by the Carpenter; and yet it rose againe by it selfe, and recouered the former greenneſſe and liued, notwithstanding it bare 15 cubits in length, & foure elnes in thickneſſe and compasse.

All trees that we are beholden vnto the goodneſſe of Nature for, we haue by 3 means: for either they grow of their owne accord, or come of seed, or else by some shoot springing from the root. As for such as we inioy by the art and industry of men, there be a great number more of deuises to that effect: whereof we will speake apart in a seuerall booke for that purpose. For the present our treatise is of trees that grow in Natures garden onely, wherein she hath shewed her selfe many waies after a wonderfull manner, right memorable.

First and formost, as we haue shewed and declared before, euery thing will not grow in euery place indifferently: neither if they be transplanted, will they liue. This happeneth sometimes vpon a disdaine, otherwhiles vpon a peeuish forwardneſſe and contumacie, but oftner by occasion of imbecility and feebleneſſe of the very things that are remoued and translated; nay, one while the climate is against it, & enuious; otherwhiles the soile is contrary therunto. The balm tree can abide no other place but Iury. The Assyrian Pome-citron tree will not beare elswhere than in Syria. As for the Date-tree, it scornes to grow vnder all climats; or if it be brought to that passe by transplanting, it refuseth to beare fruit. But say, that it fortune by some meanes, that she giueth some shew and apparance of fruit, she is not so kind as to nourish and reare vp to perfection, that which she brought forth, forced against her will. The Cinnamon shrub hath no power and strength to indure either the aire or earth of Syria, notwithstanding it be a neere neighbor to the naturall region of her natiuity. The daintie plants of Amomum or Spikenard, may not away with Arabia, howbeit they be brought out of India thither by sea: for king *Seleucus* made triall therof: so strange they are to liue in any other country but their own. Certainly, this is a most wonderful thing to be noted, That many times the trees for their part may be intreated to remoue into a forrain country, and there to liue; yea, and otherwhiles the ground and soile may be persuaded and brought to accord so wel with plants (be they neuer such strangers) that it will feed and nourish them; but vnpossible it is to bring the temperature of the aire and the climat to condiscend thereto and be fauourable vnto them. The Pepper-trees liue in Italy; the shrub of Casia or the Canell likewise in the Northerly regions; the Frankincense tree also hath been knowne to liue in Lydia: but where were the hot gleames of the Sunne to bee found in those regions, either to dry vp the waterish humor of the one, or to concoct and thicken the gumme and Rosine of the other? Moreouer, there is another maruell in Nature, welneare as great as that, namely, that shee should so change and alter in those same places, and yet exercise her vertues and operations otherwhiles againe, as if there were no change nor alteration

20030
copy 1

A ration in her. She hath aſſigned the Cedar tree vnto hot countries: and yet wee ſet it to grow in the mountaines of Lycia and Phrygia both. She hath ſo appointed and ordained, that cold places ſhould be hurtfull and contrary to Bay-trees, howbeit, there is not a tree proſpereth better, nor groweth in more plenty vpon the cold hill Olympus, than it. About the ſtreights of the Cimmerian Boſphorus, and namely, in the city Panticapæum, both K. *Mithridates*, and alſo the inhabitants of thoſe quarters, vſed all meanes poſſible to haue the Lawrel and the Myrtle there to grow, only to ſerue their turns when they ſhould ſacrifice to the gods: it would neuer be, did they what they could: and yet euen then, there were good ſtore of trees there growing of a warm temperature; there were Pomegranates and Fig-trees plenty; and now adaies there be Apple-trees and Pyrries in thoſe parts, of the beſt and daintieſt ſort. Contrariwiſe, ye ſhall not find in
B all that tract any trees of a cold nature, as Pines, Pitch-trees, and Firres. But what need I to goe as farre as to Pontus for to auerre and make good my word? Goe no farther than Rome, hardly and with much adoe will any Cheſtnut or Cherrie trees grow neere vnto it, no more than Peach-trees about the territory of Thuſculum. And worke enough there is to make hazels and filbards to like there: turne but to Tarracina thereby, ye ſhall meet with whole woods full of Nut-trees.

Chap. XXXIII.

¶ *Of the Cypreſſe tree. That oftentimes ſome new plants do grow out of the ground, which were neuer knowne to be there beforetime.*

C THe Cypreſſe hath bin counted a meere ſtranger in Italy, & moſt vnwilling there to grow; as we may ſee in the works of *Cato*, who hath ſpent more words, and made oftner mention of the Cypreſſe alone, than of all other trees whatſoeuer. Much ado there is with it before it come vp; and as hard it is to grow, and when all is done, the fruit is good for nothing. The berries that it beareth, be wrinckled, and nothing louely to the eie; the leaues wherewith it is clad, bitter in taſt; a ſtrong and violent ſmell it hath with it; not ſo much as the very ſhade thereof is delectable and pleaſant; and the wood but ſmall & not ſolide, but of an hollow ſubſtance, inſomuch, as a man may range it among the kinds of ſhrubs. Conſecrated is this tree to *Pluto*, & therefore men vſe to ſet a bough thereof as a ſigne, before thoſe houſes wherein a dead corpes
D lieth vnder bourd. As touching the female Cypreſſe, it is long ere ſhee beareth. The Cypreſſe tree for all this, in the end growing vp to a pyramidall forme ſharp pointed, is not rejected but much ſet by, if it were for nothing els but to ſtand between euery row and ranke of Pine-trees: howbeit, now adaies it is ordered with cutting and clipping for to grow thick in borders about garden quarters along the allies, alſo to climbe vpon walls in manner of ſeeling: and being thus kept down, it is by this means alwaies ſmall and tender. Moreouer, thereof are drawne many vinets and borders about ſtory-works in colours: for ſo fine is the leafe, ſo ſhort and green withal, that it may be brought in a traile to winde about pictures either of hounds and hunters, or of ſhips and ſailers, or any counterfeits and images whatſoeuer moſt daintily.

Two ſorts there are of the Cypreſſe tree. Firſt that which runneth vp into a pyramidal point, winding vpward as a round ſpire, which alſo is called the female. A sfor the male, it ſendeth out
E branches, and ſpreadeth broad: it is lopped alſo, and ſerueth in frames to beare vp vines. Both the one and the other is ſuffered to grow for perches, railes, and plankes, to be made of their boughes when they are cut. Once in thirteen yeares there is made a fall, and not one of thoſe but are ſold for a Roman denier apiece. A wood thereof planted in this manner, is of all others moſt gainfull, and yeeldeth greateſt profit: inſomuch, as in old time they were wont commonly to ſay, That one fall of ſuch Cypreſſe poles would yeeld a man a portion ſufficient to giue with his daughter in mariage.

The Iſland Candie is the naturall countrey of the Cypreſſe tree, howſoeuer *Cato* hath called it a Tarentine tree: haply, becauſe it came thither firſt. In the Iſle Ænaria, the Cypreſſe trees
F ſpring againe after they be cut downe to the roots. But in Candie, looke what ground ſoeuer a man doth breake vp and plough, vnleſſe he ſow or ſet it with ſome other thing, Cypreſſes will come vp, and preſently ſhew aboue ground. In many places alſo of that Iſle, they ſpring and grow of themſelues, euen in ground otherwiſe vntilled; and principally in the mountaines of Ida, and thoſe which they cal the white Hils: vpon the very creſts and tops wherof, which are

alwaies

alwaies couered with snow, they are to be seen in greatest plenty. A wonderfull thing, consideting that in all other places they loue warmth, and without it, will not grow: and besides, when they haue met with a familiar ground vnto them, yet they care not much for it, but disdaine so kind a nource: whereby a man may see, that not onely the nature of the soile, and the ordinarie power of the climat serueth much for these plants, but also certain sudden and temporarie impressions of the aire do wonderfully worke in this case: for some showers there be, that oftentimes do bring seeds with them and ingender plants. The same rains do fall somtime after one certain manner, otherwhiles also in such strange sort, as men are able to giue no reason thereof: A thing that befell the country about Cyrene in Barbary, at what time as the herbe Laserpitium (which beareth ihe gum Benjoine) grew there first: as hereafter we will write more at large in our treatise of herbes. Moreouer, about the 430 yere after the foundation of Rome city, there sprung vp a very forest or wood neere vnto the same city, by reason of a certaine thick and glutinous shoure like to Pitch, that then fell.

Chap. XXXIIII.

¶ *Of Ivie.*

IT is said, that now the Iuie tree groweth also in Asia: and yet *Theophrastus* in his time deliuered the contrary, and affirmed, that neither it was to be found there, nor yet throughout all India, but only vpon the mount Merus. Ouer and besides, it is reported, that *Harpalus* did what he could to store the country of Media therewith, but all in vaine. And as for *Alexander* the Great, when he returned from out of India with victory, for the rareneſſe thereof he would haue all his soldiers go in a sumptuous shew, wearing chaplets therof vpon their heads; resembling herein prince *Bacchus*, in solemnities and high feasts of which god, the people of Thracia euen at this day are furnished from this tree, and do with Ivie set out and garnish the heads of their launces, pikes, and iauelins, their mourrons also and targuets.

An enemy is Ivie doubtlesse to trees, and generally to all plants and sets what soeuer: it cleaveth and breaketh sepulchres built of stone, it vndermineth city walls; good onely to harbour serpents, and most comfortable for their cold complexions: so that I cannot chuse but maruell much that it should be honored at all, and accounted of any worth. But to enter into a more particular consideration and discourse of Iuie, two principall kinds are found therof, like as of all other trees, to wit, the male and the female. The male is described to be a more massiue and greater body, to be clad with a harder and fattier leafe, and to shew a flower inclining to purple: and yet the flower of them both, the male as well as the female, doth resemble that of the wild Rose or Eglantine, saue that it hath no smell at all. These generall kinds containe each of them three particular sorts: for there is the black and the white Iuie, and a third besides named Helix: and yet we must admit other subdiuisions of these also: for of the white, there is one sort that beareth white fruit only, and another that hath white leaues withall: moreouer, of such as carry only white fruit, one kind hath big berries growing thick together, and bunching round in maner of grapes, which clusters be called of the Greeks and Latines Corymbi. A second sort there is of the white Iuie named Selenitium, which beareth smaller beries, and those not so close set and thick couched together. Semblably, it is to be said of the black: for there is an Iuy that beareth also a black grain or seed: another with a fruit of a Saffron colour; and hereof are the garlands made which Poets weare: some call it Nysia, others Bacchica: the leaues of it are not altogether so blacke, but it beareth the greatest bunches and biggest berries of all the black kind. And verily of this Iuie there be some Greeke writers that make two sorts, according to the diuers colors of the berries: for the one they call Erythranus [*i.* the red;] & the other Chrysocarpos, as one would say, the golden berry-Iuie. Now as touching the rampant or climbing Iuie, Helix, there be many and sundry sorts thereof, differing in their leafe especially: for first & formost the leaues of this Iuie are small, cornered, and better fashioned than the rest, which indeed are but of a plain and simple making. There is a difference likewise in the length between euery knot and ioint, but especially in this, that it is barren and beareth no fruit at all. And yet some there be, who attribute that to the age, and not to a seuerall kind of Iuie by it selfe; saying, that the same which at first was Helix, and clasped trees, in tract of time changed the leafe and became a very Iuie tree: but fouly they are deceiued, and disproued plainly they may be by this,

That

20030
copy 1

A That of the ſaid claſping Iuie Helix, there be many kinds, and three principall aboue the reſt. The firſt, of graſſe greene colour, which groweth moſt common: the ſecond, with a white leafe: and the third, called alſo the Thracian Iuie, which hath leaues of diuers colours. The foreſaid greene Iuie is fuller of leaues, and thoſe finer and ſet in better order than in others; whereas the contrary is to be ſeen in the white kind: alſo in the third ſort with variety of colours, ſome haue ſmaller and thinner leaues, couched likewiſe in good order, and thicker growing, whereas in the middle kind, no ſuch thing may be obſerued. Ouer and beſides, the leaues of Iuie are bigger or leſſe, ſpotted alſo and marked; in which regard one differeth from another. Among the white Iuies, ſome be whiter than other. The green Iuie groweth moſt of all others in length: the white killeth trees, for by ſucking and ſoking al the ſap and moiſture out of them, it feedeth and thri-
B ueth ſowel it ſelfe, that it becommeth in the end as big as a tree. A man may know an Iuie being come to his perfection by theſe ſignes: the leaues are very big and large withal; the tree putteth forth yong ſhoots ſtraight, whereas in others they be crooked and bend inward: the berries alſo ſtand in their cluſters directly vpright. Moreouer, whereas the branches of all other Iuies be made like vnto roots, this hath boughes ſtrong and ſturdy aboue the reſt; and next vnto it, the black kind: howbeit this property hath the white Iuie by it ſelf, that amid the leaues it putteth forth armes that claſp and embrace the tree round on euery ſide: which it doth vpon walls likewiſe, although it cannot ſo well compaſſe them. And hereupon it is, that although it be cut aſunder in many places, yet it continueth and liueth ſtil: and looke how many ſuch arms it hath ſo many heads likewiſe of roots are to be ſeen, whereby it maintaineth it ſelfe ſafe and ſound;
C and is beſides of that force, as to ſuck and choke the trees that it claſpeth. Furthermore, there is great diuerſity in the fruit, as well of the white as the black Iuie. As for the reſt, the berries of them are ſo exceeding bitter, as no bird wil touch them. And yet there is one kind more of Iuy, which is very ſtiffe and ſtandeth alone of it ſelfe without any prop to beare it vp: and this of all others only, is therupon called Ciſſos or Iuie indeed. Contrariwiſe, Chamæciſſos, [*i.* ground Iuie] is neuer knowne but to creep along the ground.

Chap. XXXV.

¶ *Of the Bind-weed or Iuie called Smilax.*

D LIke vnto Iuie, is that plant which they call Smilax, or rough Bind-weed. It came firſt out of Cilicia, howbeit more commonly it is to be ſeen in Greece: it putteth forth ſtalks ſet thicke with ioints or knots, and thoſe thruſt out many thornie branches. The leafe reſembleth Iuie, and the ſame is ſmall, and nothing cornered: from a little ſtele that it hath, it ſendeth forth certain pretty tendrils to claſp and wind about: the floure is white, and ſmelleth like to a Lilly; it beareth cluſters comming nearer to thoſe grapes of the wild vine Labruſca, than to the berries of Iuie; red of color, wherof the bigger contain within them 3 kernels or pepins apiece, the ſmaller but one, and thoſe be hard and black withall. This Smilax is not vſed in any ſacrifices or diuine ſeruice of the gods, nor ſerueth for garlands and chaplets: for that it is held to be dolefull and ominous, or of an vnlucky preſage, by occaſion of a certain yong lady or Damoſell of that name, who for the loue of the young gallant and knight *Crocus*, was turned into this
E ſhrub or plant, retaining ſtill her name: which the ignorant people not knowing, but taking it for a kind of Iuie, ſtick not to make coronets therof; profaning by that means many times their high feaſts and ſacred ſolemnities: and yet who woteth not with what chaplets Poets are crowned, and what garlands prince *Bacchus* or *Silenus* vſed to weare? Of this Smilax are made certain manuell writing tables. And this property moreouer hath the wood thereof, That if a man hold it cloſe to his eare, he ſhall heare it to giue a pretty ſound.

But to return againe to the Iuie indeed, it hath (by report) a ſtrange and wonderful vertue to trie wines, whether they be delaied with water or no: for make a cup of Iuie wood, and put wine thereinto, all the wine will ſoke and run through, but the water (if any be mingled therewith)
F will tarry behind.

Chap. XXXVI.

¶ *Of Reeds, Canes, and other water ſhrubs.*

IN this diſcourſe touching plants that loue cold places, it wil not be amiſſe to treat of thoſe that grow in waters. Among which, the Reeds and Canes may be raunged in the firſt place:

*For Arrowes and Darts: * For writing pens. *For Flutes and Pipes.

for necessarie they be in time both of * warand * peace: they haue their vse besides, and are G
accepted among the * delightsom pleasures of this world. Moreouer, in the Northern regions,
the people vse therewith to couer and thatch their houses: and this kind of roofe will last many
ages, if it be laid with a thick coat, euen vpon high and stately houses. In other parts also of the
world, they are woont with it to make their arch-roufes, and hanging floores of most sleight
worke. As for Canes particularly, and those of Ægypt by name, which haue a certaine resem-
blance of the Papyr-reed in Nilus, they serue for writing Paper. Howbeit those of Gnidos, and
which grow in Asia along the lake or meere of Anaia, be held for the best. As for ours heere in
Italy, they are of a more spungeous substance and gristly matter, apt to sucke and drinke vp any
liquour. The same within-forth is full of holes and concauities, but conuerted aloft into a fine
wooddy rind, and in time becommeth drie, fast, and hard. Apt it is to cleaue, and the clifts euer- H
more carry with them a very sharp edge; and besides, it is full of ioints. Now this woodie sub-
stance being thus distinctly parted by knots, runneth alwaies euen and smooth, growing smaller
and smaller vntill it proue sharpe pointed in the top: with a head consisting of a good thicke
downe or plume, which serueth also to right good purposes: for either in stead of feathers they
vse to stuffe beds therewith in common Innes; or when it is growne hard and hath a slimie cal-
lositie about it, they in Picardie and those Nether-lands do stampe it, and therewith calfret or
calke the ioints of their ships, betweene the ribs and plankes: and herein it hath no fellow, for
it taketh faster hold than any glue, and for filling vp any rifts and chinks, no solder so strong, no
pitch so sure and trustie. Of Reeds, the Easterlings make their shafts; and archers they be that
fight their battels and determine all quarrels. These shafts they arme with sharpe barbed arrow I
heads in manner of fish-hooks, which wound with a mischiefe, becausethey cannot be drawne
out of the body againe: and to make these arrowes flie the faster and kill more presently, they
set feathers vnto them. Now say that a shaft be broken as it is set fast in the body, that end with-
out the flesh wil serue againe to be shot: & so inured are the people in those parts to these kind
of weapons, so practised withall in discharging of them so nimbly, that a man seeing how thick
the shafts flie in the aire, would say they were a cloud of arrowes that shadowed the very Sun.
And therefore when they goe to battell, they wish euer for faire weather and Sunne-shine
daies. Windes and raine, as most aduerse vnto their warres, they cannot abide: then are they
quiet and rest in peace, ful sore against their wils, becausetheir weapons at such a time wil not
serue their turne. Certes if a man would fall to an exact reckoning and æstimate of Æthyopi- K
ans, Egyptians, Arabians, Indians, Scythians, and Bactrians, of so many nations also of the Sar-
matians, and other East-countries, together with all the kingdomes of the Parthians, hee
should finde, that the one moietie or halfe of the world hath been vanquished and conquered
by the meanes of arrowes and darts, made of Reedes. The Candiots aboue all others, were so
readie and perfect in this kinde of feat, that the ouerweening of their owne skill, and the con-
fidence which they had in this manner of seruice, made them too bold, and was in the end their
owne ouerthrow. But herein also, as in all other things else whatsoeuer, Italie hath carried the
name, and woon the prize: for there is not a better Reed growing for to make shafts, than that
which is found about the Rhene, a little riuer running vnder Bononia: very full of marrow or
pith; stiffe also it is and weightie withall; it cutteth the aire, it flyeth away most swiftly: and last L
of all, it will hold the owne and stand in the weather so counterpoised, that no winde hath any
power on it. And those Reeds in Picardie and the Low-countries, are nothing comparable: ne
yet of Candie, how highly soeuer they be commended for warre-seruice. And yet the Reeds
that grow in India be preferred before them, and beare the name, which indeed some thinke to
be of another nature, considering they bee so firme and bigge withall, that beeing well headed
with yron, they serue in stead of Speares and Iauelins. In very truth, the Indian Canes for the
most part, grow to the bignesse of Trees, such as we see commonly in Temples, standing there
for a shew. The Indians doe affirme, that there is a difference amongst them also, in regard of
sexe: and namely, That the substance and matter of the male, is more fast and massie: but that
of the female, larger and of greater capacitie within. Moreouer, (if wee may beleeue their M
words) the verie Cane betweene euery ioint, is sufficient to make a boat. These great Canes do
grow principally along the riuer Acesine. All Reeds in generall, doe shoot and spring in great
number from one root and principall stocke: and the more they bee cut, the better they come
againe. The root liueth long, and without great iniurie offered vnto it, will not die: it also is di-

uided

20030
copy 1

A vided into many knottie ioints. Thoſe onely of India, haue ſhort leaues. But in all of them, the leaſe ſpringeth out of the ioint, which embracing the Cane, doth clad it round about with certaine thin membranes or tunicles, as far as to the middle ſpace between the ioints; and then for the moſt part they giue ouer to claſpe the Cane, and hang downeward to the ground. As well Reeds as Canes, ſpread their leaues like wings round one after another, on either ſide vpon the very ioints, and that in alternatiue courſe alwaies very orderly; ſo as if the one ſheath come forth of the right ſide, the other at the next ioint or knot aboue it, putteth out on the left, and thus it doth throughout by turnes. From theſe nodoſities, otherwhiles a man ſhall perceiue as it were certaine little branches to breake foorth, and thoſe bee no other but ſmall and ſlender Reeds.

B Moreouer there be many kindes of Reedes and Canes: for ſome of them ſtand thicker with ioints, and thoſe are more faſt and ſolid than others, & ſmall diſtance there is between the ſame: there be again that haue not ſo many of them, and greater ſpace there is from the one to the other, and ſuch Canes for the moſt part are of a thinner ſubſtance. Yee ſhall haue a Cane all full of holes within, called therupon Syringias; and ſuch are very good to make whiſtles or ſmal flutes, becauſe they haue within them neither griſtly nor fleſhy ſubſtance. The Orchomenian Cane is hollow throughout from one end to the other, and this they call Auleticus, or the pipe Cane; for as the former was fit for flutes, ſo is this better for great pipes. Now you ſhall meet with Canes alſo that ſtand more of the wood, & haue but a narrow hole and concauity within, and this is full of a ſpungeous pith or marow within-forth. Some be ſhorter, ſome longer than
C other: and where you haue one that is thin and ſlender, you ſhall ſpie a fellow to it more groſſe and thicker. That which brancheth moſt, & putteth forth greateſt ſtore of ſhoots, is called Donax, and is neuer known to grow but in mariſhes and watery places (for herein alſo lieth a difference) and preferred it is far before the Reed that commeth vp in dry ground. The archers reed is a ſeuerall kind by it ſelfe (as we haue ſhewed before;) but of this ſort, thoſe in Candy haue the greateſt ſpaces betweene euery ioint; and if they be made hot, they are very pliable, and will bend and follow which way ſoeuer a man would haue them.

Moreouer, Reeds are diſtinguiſhed one from another by the leafe, not for the number, but the ſtrength and colour. The leaues of thoſe about Lacedæmon, * are ſtiffe and ſtrong, growing thicker of the one ſide than of the other. And ſuch as theſe are thought generally to grow a-
D long ſtanding pooles and dead waters, far vnlike to thoſe about running riuers: and beſides, to be clad with long pellicles, which claſpe and climbe about the Cane higher aboue the ioint, than the reſt doe. Furthermore, there is another kind of Reeds that groweth crooked and winding trauers, and not vpright vnto any height, but creeping low toward the ground, and ſpreading it ſelfe in manner of a ſhrub. Beaſts take exceeding great delight to feed thereof, and namely, when it is young and tender, for the ſweet and pleaſant taſte that it hath. Some cal this Reed, Elegia.

* *Varia, or Verſicolor, μαλακὴ, Theoph. i.* of diuers colours.

Ouer and beſides, there breedeth in Italy alſo among the fens, a certain ſalt ſome, named * Adarca, ſticking to the rind or vtmoſt barke of Reedes and Canes, onely vnder the verie tuft and head: paſſing good it is for the tooth-ach, by reaſon of the hot and cauſtick quality that it hath
E like to Senuie or Muſtard-ſeed. As touching the Reed-plots about the Orchomenian lake, I muſt needs write more exactly, conſidering in what admiration they were in times paſt: for in the firſt place, they called that Cane which was the thicker and more ſtrong, Characias; but the thinner and more ſlender, Plotia. And this verily was wont to be found ſwimming in the Iſlands that floted in the ſaid lake; whereas the other grew alwaies firme vpon the bankes and edges thereof, how farre ſoeuer it ſpred and flowed abroad. A third ſort alſo there is of Canes, which they called Auleticon, for that it ſerueth to make flutes and pipes of: but this commonly grew but euery ninth yeare: for the ſaid lake alſo kept that time juſt, and increaſed not aboue that terme; but if at any time it chanced to paſſe that time and to continue full two yeres together more than ordinary, it was holden for a prodigious and fearfull ſigne. The which
F was noted at Chæronia, in that vnfortunate battell wherein the Athenians were ouerthrowne and defeated: and many times elſe is obſerued to happen about Lebadia, namely when the Riuer Cephiſus ariſeth ſo high, that he ſwelleth ouer his bankes, and is diſcharged into the ſaid lake. Now during that ninth yeare (whiles the inundation of the lake continueth) theſe Canes prooue ſo bigge and ſtrong withall, that they ſerue for hawking poles, and fowlers pearches:

* *Calamachnē.*

and then the Greeks call them Zeugitæ. Contrariwiſe, if the water hold not ſo long, but do fal G
and return back within the yere, then the Reeds be ſmall and ſlender, named Bombyciæ. How-
beit the femals of this kind, haue a broader and whiter leafe, little or no down at all vpon them,
and then they are known by a pretty name and called Spadones, as one would ſay guelded. Of
theſe Reeds were made the inſtruments for the excellent cloſe muſick within-houſe: wherein, I
cannot paſſe with ſilence, what a wonderfull deale of paines and care they tooke to fit them for
their tune, and make them to accord: inſomuch, as we are not to be blamed but born withall, if
now adaies we chuſe rather to haue our pipes and hautboies of ſiluer. And in truth, to the time
of *Antigenes* (that excellent minſtrell and plaier vpon the pipe) all the while that there was no
vſe but of the plain muſick and ſingle inſtrument; the right time of cutting down & gathering
theſe Reeds for this purpoſe, was about September, when the ſigne Arcturus is in force: then
were they to haue a ſeaſoning and preparation for certaine yeares, before they would ſerue the H
turne; yea and then alſo much ado there was with them, and long practiſe and exerciſe they aſ-
ked, before they could be brought into frame and good tune: ſo as a man might wel ſay, that the
very pipes were to be taught their ſound and note, by meanes of certaine tongues or quills that
ſtruck and preſſed one vpon another; and all to giue contentment and ſhew pleaſure vnto the
people aſſembled at Theatres, according as thoſe times required. But after that muſicke came
once to be compound, and that men ſung and plaied in parts with more varietie and delight,
they began to gather theſe Reeds before mid-Iune, and in three yeares ſpace they had their per-
fection and grew to their proofe; then were thoſe tongues or holes made more wide and open,
for to quauer and change the note the better: and of ſuch are the flutes and pipes made, which
be vſed at this day. But in thoſe times men were perſuaded, that there was a great difference in I
the parts of any Reeds for to ſerue theſe or thoſe inſtruments: in ſuch ſort, as that ioint which
was next vnto the root, they held to be meeter for the Baſe pipe that was fitted for the left hand;
and contrariwiſe for the Treble of the right hand, thoſe knots that were toward the head & top
of the Reed. Howbeit of all others, by many degrees were thoſe preferred which grew in the ri-
uer Cephiſus. Now adaies, the hautboies that the Tuſcans play vpon at their ſacrifices, be of
Box-wood; but the pipes vſed in plaies for pleaſure only, are made of the Lotos, of Aſſes ſhank-
bones, and of ſiluer. The beſt Faulconers Reeds wherewith they vſe to chaſe foules, came from
Panhormus: but the Canes for angle-rods that fiſhers occupie, are brought out of Africk from
Abaris. The Italian Reeds & Canes be fitteſt for to make perches to lay ouer frames, & props
for to beare vp vines. Finally, as touching the ſetting of Reedes, *Cato* would haue them to bee K
planted in moiſt grounds, after they haue bin firſt delued & laid hollow with a ſpade; prouided
alwaies that the œlets ſtand 3 foot aſunder, and that there be wilde Sparages among, whereof
come the tender crops for ſallads; for thoſe like well and ſort together with the Canes.

Chap. XXXVII.

¶ *Of the Willow or Sallow, eight kinds thereof: and what trees beſides the Willow are good for bindings. Alſo of Briers and Brambles.*

MOreouer (after the opinion of the ſaid *Cato*) it is good to plant Withies alſo about riuer
ſides, and neere to Reeds: for ſurely there is not more profit ariſing from any other tree of L
the waters, than from it; howſoeuer the Poplars are well liked and loued of the vines, and
do nouriſh the good wines of Cæcubum: howſoeuer the Alders ſerue in ſtead of rampiers and
ſtrong fences againſt the inundation and ouerflowing of riuers, withſtanding their forcible e-
ruptions; howſoeuer they ſtand in the waters as mures and wals to fortifie the banks, or rather
as ſentinels to watch and ward in the borders of country farms; and being cut down to the root,
do multiply the rather, and put forth many ſhoots and imps as heires to ſucceed. And to bigin
withall, of Sallowes there be many kinds: for ſome there be, that in the head beare perches of a
great length to prop and make trails for vines to run vpon: and the rind or skin as it were pilled
from the wood, is as good as a belt or thong to binde or gird any thing withall. Others againe
there are, and namely the red Willowes, which carry twigs and rods that are pliable and gentle M
to wind as a man would haue them; fit alſo for buildings. Ye ſhal haue of theſe Oſiers, ſome that
are very fine & paſſing ſlender, wherof are wrought prety baskets, and many other dainty deui-
ſes; others alſo that are more tough and ſtrong, good to make paniers, hampers, and a thouſand
other

20030
copy 1

A other neceſſary implements for country houſes,and to fit the husbandmen. Being pilled, they are the fairer and whiter,more ſmooth alſo and gentle in hand,whereby they are excellent good for the more delicate ſort of ſuch wicker ware,and better far than ſtubborn leather; but principally for leaning chairs,wherein a man or woman may gently take a nap, ſitting at eaſe and repoſe moſt ſweetly. A willow,the more that it is cut or lopt, the better ſpring will it ſhoot at root,and beare the fairer head. Let that which you cut or ſhred,be ſo little & ſhort withal, that it reſemble a mans fiſt,rather than a bough,the thicker will it come again: a tree no doubt that would not be ſet in the loweſt rank,but be wel regarded,how ſoeuer we make but baſe reckoning thereof:for ſurely there is not a tree for reuenue and profit,more ſafe and certain; for coſt, leſſe chargeable;and for iniury of weather,in better ſecurity. Certes,*Cato*, among the commodities that commend a good ferm or manor,eſteemeth it in the third place,and preferreth the increaſe
B and benefit thereby,before the gain that groweth from oliue rows,corn fields,& good medows. Yet hereof we muſt not infer,that we are not furniſhed with many other things which wil ſerue for bands to bind withal;for we haue certain ſorts of Spart or Spaniſh broom,we haue Poplars, Elmes,the Sanguine-ſhrubs,Birch,clouen Reeds,leaues of Cane; as for example in Liguria: the cuttings alſo of the very Vine,and Briars,ſo their ſharp pricks be cut away, to tie withall; yea and the Hazell wands alſo,ſo they be writhen and twined:wherein a man may ſee a wonderful property,That a wood ſhould be ſtronger for to bind withal,when it is cruſhed and bruiſed, than whiles it was entire and ſound. All theſe(I ſay)are good for bands,and yet the willow hath a gift therein beyond all the reſt. The Greek willow is red,and commonly is ſliuen for to make withs. The Amerian Oſier is the whiter,but more brittle,and ſoon wil crack,& therfore it is put
C to that vſe of binding ſound and whole as it groweth, and not clouen through. In Aſia,they make account of three ſorts of willows:the black,which they imploy to wind and bind withal, ſo tough and pliant it is:the white,wherewith husbandmen make their wicker paniers and baskets,with other ſuch veſſels for their vſe;as for the third,it is the ſhorteſt of all other,and they cal it Helix or Helice. With vs alſo here in Italy,there be as many kinds,& thoſe diſtinguiſhed by their ſeuerall names;the firſt,which is of a deep purple colour,they call the free oſier or willow;and that is ſo good for bands: the ſecond,which is more thin and ſlender,is named Vitelina,[or *Vitellinam* rather,for the yellow colour of the yolke of egges,] for the bright hew that it hath: the third that is ſmalleſt of all three,is the French willow.

D To come now to the brittle Ruſhes that grow in mariſh grounds,which ſerue to thatch houſes and to make mats; and the pith whereof when the rind is pilled, maketh wicke for watch-candles,and funerall lights to burne by a dead corps whiles it lieth aboue ground, they cannot iuſtly be reckoned in the ranke either of ſhrubbes,or Brier-buſhes,and Brambles, ne yet of tall plants growing vp with ſtems and ſtalks,no more than among Hearbes and Weeds creeping along the ground;but are to be counted a ſeuerall kind by it ſelfe. True it is,that in ſome places there are to be found ruſhes more ſtiffe,hard,and ſtrong,than in others. For not onely mariners and watermen in the riuer Po do make ſailes thereof,but fiſhermen alſo of Affrick in the maine ſea:howbeit they hang their ſailes betweene the maſts, from maſt to maſt, after a prepoſterous manner contrary to all other. The Mores alſo do couer their cottages with Bulruſhes:and ſurely if a man looke neerly to the nature of them, they may ſeeme to ſerue for that vſe which the
E Papyr-reeds in the netherland of Ægypt are put vnto, about the deſcent and fall of the riuer Nilus.

As touching Brambles,they may go among the ſhrubs of the water:ſo may the Elders alſo, which conſiſt of a ſpungeous kind of matter,& yet cannot wel be counted among thoſe plants which bee termed Fenels-gyant: for ſurely the Elder ſtandeth more vpon the wood than they do. The ſhepherds are verily perſuaded, that the Elder tree growing in a by-place farre out of the way,and from whence a man cannot heare a cock crow out of any town,maketh more ſhrill pipes and louder trumpes than any other. The Brambles beare certaine berries like the Mulberries,euen as the ſweet Brier of another kind,which they call Cynosbatos or the Eglantine, carieth the reſemblance of a Roſe. A third ſort there is of brambles,which the Greeks cal Idea,
F of the mountaine Ida. This is the Raſpis:ſmaller it is and more ſlender than the reſt,with leſſe pricks vpon it,and nothing ſo ſharpe and hooked. The floure of this Raſpis beeing tempered with hony,is good to be laied to bleared and bloud-ſhotten eies;as alſo to the wild-fire,or diſeaſe called Saint Anthonies fire. Being taken inwardly,and namely drunk with water,it is very

comfortable to a weake ſtomacke. The Elder beareth certain blacke and ſmall berries, full of a G
groſſe and viſcous humor, vſed eſpecially to die the haire of the head black. If they be boiled in water they are good and wholſome to be eaten as other pot-herbs.

CHAP. XXXVIII.

¶ *Of the iuice or humor in trees. The nature of their wood and timber. The time and manner of felling and cutting downe trees.*

TRees haue a certaine moiſture in their barkes, which we muſt vnderſtand to be their very bloud, yet is it not the ſame nor alike in all: for that of the Fig trees is as white as milke, and as good as rendles to giue the forme to cheeſe. Cherry trees yeeld a glutinous and H
clammy humor, but Elmes a thin liquor in manner of ſpittle. In Apple trees the ſame is fattie and viſcous; in Vines and Pyrries wateriſh. And generally, thoſe trees continue and liue longeſt, that haue ſuch a glewy moiſture in them. In ſumme, there are to be conſidered in the ſubſtance and body of trees, like as of all other liuing creatures, their skin, their bloud, fleſh, ſinues, veins, bones, and marrow. For in lieu of their hide is the barke. And I aſſure you, a ſtrange and maruellous thing it is to be obſerued here in the Mulberry, that when Phyſitians ſeek to draw the foreſaid liquour out of it, at ſeuen or eight a clocke in a morning, if they ſcarifie or lightly cut the bark with a ſtone, it iſſueth forth, and they haue their deſire: but if they cruſh or cut it deeper in, they meet with no more moiſture than if it were ſtark dry. In moſt trees next to the skin lieth the fat: this is nought elſe but that white ſap which of the colour is called in Latin Alburnum. As it is ſoft in ſubſtance, ſo is it the worſt part of the wood; and euen in the ſtrong I
oke, as hard as otherwiſe it is, ye ſhal haue it ſoon to putrifie and rot, yea and quickly be worme-eaten. And therefore if a man would haue ſound and good timber, this white muſt be alwaies cut away in the ſquaring. After it followeth the fleſh of the tree; and ſo the bone, which is the very heart and beſt of the wood.

All trees whereof the wood is ouer dry, beare fruit but each other yeare, or at leaſtwiſe more in one yere than another, as namely the Oliue tree: a thing obſerued more in them than in thoſe that haue a pulpous and fleſhie ſubſtance, as the Cherry tree. Neither are all trees indifferently furniſhed with ſtore of the ſaid fat or fleſh, no more than the moſt fierce and furious beaſts. As for the Box, Cornel, and Oliue trees, they haue neither the one nor the other, ne yet any marrow at all, and but very little bloud. Semblably, the Servis tree hath no heart, the Alder no car- K
noſitie, (and yet both of them are ſtored wel enough with marow, which is their pith) no more than canes or reeds for the moſt part. In the fleſhy ſubſtance or wood of ſome trees there are to be found graine and veine both. And eaſie it is to diſtinguiſh the one from the other: for commonly the veins be larger and whiter; contrariwiſe the grain, which the Latines cal Pulpa, runneth ſtreit and direct in length, and is to be found ordinarily in trees that wil eaſily cleaue. And hereupon it commeth, that if a man lay his eare cloſe to one end of a beame or piece of timber, he ſhall heare the knocke or pricke that is made but with a pen-knife at the other end, be the piece neuer ſo long, by reaſon that the ſound goeth along the ſtreit grain of the wood. By this means alſo a man ſhall find when the timber doth twine, and whether it run not euen, but be interrupted with knots in the way. L

Some trees there be that haue certain hard bunches bearing out and ſwelling like to kernels in the fleſh of a Swines necke: and theſe knobs or calloſities haue not in them long grain and broad veine, as is aboue ſaid, but only a brawny fleſh (as it were) rolled round together: And to ſay a truth, when ſuch knurres and calloſities as theſe be, are found either in Citron or Maple trees, men make great account of them, and ſet no ſmall ſtore by that wood. All other ſorts of Tables, when the trees are clouen or ſawne into plankes, are brought into a round compaſſe with the grain: for otherwiſe, if it were ſlit ouerthwart to make them round againſt the grain, it would ſoon breake out. As touching the Beech, the graine of it runneth croſſe two contrary wayes like combe teeth; but in old time the veſſels made of that wood were highly eſteemed. As for example, *Manius Curius* hauing ſubdued his enemies, proteſted, and bound it with an M
oath, That of all the booty and pillage taken from them, hee had not reſerued any thing for himſelfe, but onely a cruet or little Ewer of Beech wood, wherein he might ſacrifice vnto the gods.

There

20030
copy 1

A There is no wood but floteth aloft the water, and waueth in length: like as that part which is next to the root is far more weighty, ſetleth faſter downe and ſinketh. Some wood hath no veins at all, but conſiſteth only of a meere grain, ſtreight and ſmall in maner of threds, & ſuch commonly is eaſie to be clouen. There is again wood that hath no ſuch direct graine, and that will ſooner breake out than cleaue; and of this nature is the Ollue and Vine-wood. Contrariwiſe, the whole body and wooddy ſubſtance of the Figge tree is nothing but fleſh. The Maſtholme, Cornel, Oke, Tretrifolie, Mulberry, Ebeny, and Lotus, which haue no pith and marrow within, as is beforeſaid, are all heart. All wood for the moſt part turneth to a blackiſh colour. The Cornel tree is of a deep yellow, wherof are made the faire Bore-ſpeare ſtaues, which ſhine again, and be ſtudded (as it were) with knots, and chamfered betweene both for decencie and
B handſomneſſe. The Cedar, Larch, and Iuniper wood is red.

Chap. XXXIX.

¶ *Of the Larch tree, the Firre, and the Sapine: the manner of cutting or falling ſuch like trees.*

THere is a female Larch tree which the Greeks call Ægis: the wood whereof is of a pleaſant colour, like to hony. Painters haue found by experience, that it is excellent good for their tables, both for that it is ſo euen and ſmooth, not apt beſides to chink and cleaue: as alſo becauſe it will endure and laſt for euer. And that part they chuſe which is the very heart
C of it, and next the pith, which in the Fir tree the Greekes call Leuſon. In like ſort the heart of the Cedar is hardeſt which lieth next to the pith or marrow aboue named (much after the maner of bones in the bodies of liuing creatures) when the muddy carnoſitie is ſcraped off and taken away. The inward part alſo of the Elder by report is wondrous hard & tough, and they that make thereof ſtaues for Bore-ſpeares prefer it before any wood whatſoeuer. For it ſtandeth only vpon skin and bone, that is to ſay, of the rind and heart.

Theophraſtus writeth this of the Cornell tree.

As touching the falling and cutting downe of trees, to ſerue either in temples or for other vſes, round and entire as they grow, without any ſquaring; as alſo for to barke them, the onely time and ſeaſon is, when the ſap runs, and that they begin to bud forth: otherwiſe you ſhal neuer be able to get off their bark: for bark them not, they wil rot and become worm-eaten vnder
D the ſaid barke, and the timber withall wax duskiſh and blacke. As for the other timber that is ſquared with the axe, and by that means rid from the barke, it would be fallen or cut downe between mid-winter and the time that the wind Fauonius bloweth: or, if we be forced to vſe the timber before, and to preuent that time, trees may be fallen at the ſetting of the ſtar Arcturus, or of the Harp-ſtar before it. Finally, the vtmoſt and laſt time thereof is at the ſummer Sunneſted. But foraſmuch as moſt men be ignorant of theſe ſeaſons, and know not when theſe ſtarres aboue named do either riſe or fall, I will hereafter ſhew the reaſon both of the one and other in place conuenient. For this preſent, as touching the time of felling trees, the common ſort make no more ſcruple, but thinke it ſufficient to obſerue, that no trees which are to be hewne ſquare for carpenters work be caſt down and laid along before they haue borne their fruit. As for the
E hard and ſauage Oke, if it be felled in the ſpring it will be ſubiect to the Worme: but cut it down in mid-winter, it will neither warp, ne yet cleaue and chink: being otherwiſe ſubiect vnto both, namely, as well to caſt and twine, as to rift and gape: a thing incident to the Cork wood, be it cut down in as good a ſeaſon as is poſſible. Moreouer, it paſſeth to ſee how much the age of the Moon auaileth in this caſe: for it is commonly thought that timber would not be fallen but in the wain and namely in the laſt quarter, from the 20 day of the Moon, till the thirtieth. And this is generally receiued among all good workmen, That the beſt time to cut downe any timber, is in the coniunction of the Moon with the Sun, euen in the very day of the change, before ſhe ſheweth new. Certes *Tiberius Cæſar* the Emperor gaue order to fel the Larch trees that came out of Rhœtia, to repaire and re-edifie the bridge that ſerued to repreſent the ſhew of a
F naual battell vpon the water (which fortuned to be conſumed with fire) iuſt at the change of the Moon. Some ſay, that we muſt preciſely obſerue the point of the conjunction, and that the Moon withall be vnder the earth, when ſuch trees ſhould be felled: which cannot be but in the night. But if it fall out beſides, that this conjunction or change of the Moone, and the laſt day of the Winter Sun-ſtead meet together at one inſtant; the timber then cut downe will laſt a world

world of yeares. Next vnto it is that timber which is fallen in the daies and ſignes aboue re- G
hearſed. Others affirme moreouer, that the riſing of the Dog-ſtar would be conſidered and choſen for this purpoſe: for at ſuch a time was that timber felled which ſerued for the ſtately hall or pallace of *Auguſtus*. Moreouer, for to haue good and profitable timber, the trees would be cut down that are of a middle age, for neither yong poles nor old runts are fit for durable building. Furthermore, there be that hold opinion, that for to haue the better timber, the trees ſhould haue a kerfe to the very heart and pith round about, and ſo let it ſtand an end ſtill, that all the humor by that means might run out, before they be ouerthrowne and laid along. And verily a wonderfull and miraculous thing is reported in old time, during the firſt Punicke war againſt the Carthaginians, namely, that all the ſhips of that fleet which was conducted by Generall *Duellius* the high Admiral, were ſhot into the ſea and vnder ſaile, within ſixty daies after H
the timber whereof they were built was cut downe in the wood. And *L. Piſo* hath left in writing, That againſt king *Hiero* there were 220 ſhips made & furniſhed in 45 daies after the timber grew. Alſo in the ſecond Punick war, the Armado which *Scipio* imploied, was ſet aflote and bare ſaile forty daies after the fall of the timber. See how forcible and effectuall in all things is the ſeaſon and opportunitie of time duly taken, eſpecially when need driueth to make ſpeed and haſten apace.

Cato the chiefe and only man of all others for experience and knowledge in euery thing, in his treatiſe of all kind of timber to be imploied in building, giues theſe rules following, Make
* *Sapino* or *Carpino.* » thy preſſing plank eſpecially of the black * Sapine or Horn-beam tree. *Item*, Whenſoeuer thou
» meaneſt to ſtorke vp either Elme, Pine, Walnut tree, or any other whatſoeuer for timber, ſee I
» thou dig it out of the ground, in the wane of the Moon, and that in the afternoon, and take heed
» in any wiſe that the wind be not South. *Item*, The right ſeaſon to fell a tree for timber, is when
» the fruit is ful ripe. *Item*, Beware in any caſe, that thou neither draw forth of the ground, nor yet
» ſquare a tree when the dew falleth. And a little after: Beware thou meddle not with timber
» trees but either at the change or full of the Moon. And in no hand, neither ſtork it vp then, nor
» hew it hard to the ground. But within foure daies after the full Moone, plucke vp trees hardly,
» for that is the beſt time. *Item*, Be well aduiſed, that thou neither fell, ſquare, nor touch with the
» ax, any timber that is black, vnleſſe it be dry. And meddle not with it, if either it be frozen or
full of dew. *Tiberius* the Emperor aboue named obſerued likewiſe the change of the Moon, for
cutting the haire both of head and beard. And yet *M. Varro* gaue a rule, That to preuent bald- K
neſſe and the ſhedding of haire, the Barber ſhould be ſent for alwaies after the full Moon.

But to come again vnto our timber trees: The Larch and Fir both (but the Fir eſpecially) if they be cut down, bleed a long time after, and yeeld abundance of moiſture. Indeed, theſe twain of all others be the talleſt, and grow moſt ſtreight and vpright. For Maſt-poles and croſſe ſaile-yards in ſhips, the Fir or Deale is commended and preferred before all other, for the ſmoothnes and lightneſſe withall. The Larch, the Fir, and the Pine haue this propertie common to them all, To ſhew the graine of their wood running either parted in foure, forked in twaine, or ſingle one by one. For fine carpentry and Ioiners ſeeling within houſe, the heart of the tree would be clouen or rent. The quarter timber, or that which runneth with foure grains, is ſimply the beſt, and more pleaſant to be wrought than the reſt. They that be skilfull woodmen, and haue expe- L
rience in timber, wil ſoon find at the firſt ſight the goodnes of the wood by the very bark. That part of the Fir tree which groweth next to the earth is without knots, euen and plain: the ſame is laid to ſoke and ſeaſon in the water, and afterwards the barke is taken off, and ſo it commeth to be called Sapinus. The vpper part is knotty, and harder than the nether, and the Latins name it Fuſterna. In ſum, what tree ſoeuer it be, that ſide which regardeth the North is more ſtrong and hard than the other. And generally, the wood of thoſe trees that grow in moiſt and ſhadie places is worſe: contrariwiſe, that which commeth from ground expoſed to the Sun-ſhine is more faſt and maſſie, and withall endureth a long time. And herupon it is, that at Rome the Fir trees that come from the nether ſea ſide out of Tuſcane, be in better requeſt than thoſe from Venice ſide, vpon the coaſt of the vpper ſea. M

Moreouer, there is great ods between Firre trees, in regard of diuers Countries and Nations where they grow. The beſt are thoſe of the Alps and the Apennine hills. Likewiſe in France there are excellent good Firs vpon the mountains Iura and Vogeſus: as alſo in Corſica, Bithinia, Pontus, and Macedonia. A worſe kind of them grow in Arcadia and about the mountaines

neere

20030
copy 1

A neare Ænea. The worſt be thoſe of Pernaſſus, & Eubœa: for in thoſe parts they be ful of boughs and grow twined, beſides, they ſoone doe putrifie and rot.

As for Cedars, the beſt ſimply be thoſe that grow in Candy, Affricke, and Syria. This vertue hath the oile of Cedar, That if any wood or timber be thoroughly anointed therewith, it is ſubject neither to worme nor moth, ne yet to rottenneſſe.

The Iuniper hath the ſame propertie that the Cedar. They proue in Spaine to be exceeding big and huge, the Berries alſo greateſt of all others. And whereſoeuer it grows, the heart thereof is more ſound than the Cedar.

A generall fault and imperfection there is common to all wood, When the graine, and the knots run into round balls; and ſuch they call in Latin Spiræ. Alſo in ſome kind of timber, like
B as in marble alſo there be found certaine knurs like kernils, as hard they be as naile heads, and they plague ſawes, whereſoeuer they light vpon them. Otherwhiles they fall out to be in trees, by ſome accidental occaſion, as namely, when a ſtone is got into the wood, and encloſed within it: or, in caſe the bough of ſome other tree be incorporat or vnited to the foreſaid wood. There ſtood a long time a wild Oliue in the market place of Megara, vpon which the hardie and valiant warriors of that citie vſed to hang and faſten their armor, after ſome worthy exploit performed: which in tract and continuance of time were ouergrown with the bark of the ſaid tree, and quite hid. Now was this a fatal tree vnto the ſame city and the inhabitants thereof, who by way of Oracle were forewarned of their wofull deſtiny and vtter ruin; which was to happen. When that a tree ſhould be with yong, and deliuered of harneis: which Oracle was fulfilled when this
C tree was cut downe, for within the wombe thereof were found the mourrions, jambriers, or grieues, of braue men in times paſt. To conclude, it is ſaid, That ſuch ſtones ſo found in trees be ſingular good for a woman with child, to carie about her, that ſhe may goe her full time.

Chap. XL.

¶ Of diuers ſorts of timber. Of ſome trees of extraordinarie bigneſſe. What trees they be that neuer be worme-eaten, nor decay and fall. What wood doth endure and continue alwaies good.

D THe greateſt tree that to this day had euer been knowne or ſeene at Rome, was that, which being brought with other timber for the rebuilding of the foreſaid bridge called Naumachiaria, *Tiberius Cæſar* commanded to be landed and laid abroad in view for a ſingular and miraculous monument to all poſteritie: and it remained entire and whole, vntill the time that *Nero* the Emperour built ſtis ſtately Amphitheatre. This peece of timber was of a Larch tree: it contained in length 120 foot, and caried in thickeneſſe euery way two foot, from one end to the other. Whereby a man may gueſſe and judge the incredible height of the whole tree beſides, to the very top. Such another tree there was to be ſeen in our daies, which *M. Agrippa* left for the like ſingularity and wonder of men, in thoſe ſtately porches and cloiſters that hee made in *Mars* field: and it continued ſtill after the building of the muſter place and treaſurers hall named Diribitorium. Shorter it was than the former by 20 foot, and caried a foot and half
E in thickeneſſe. As for the Fir tree, which ſerued for a maſt in that huge ſhip, which by the commandement and direction of *C. Caligula* the Emperour tranſported and brought out of Ægypt, that Obelisk which was erected and ſet vp in the Vatican hil, within the cirque there, together with the foure entire ſtones which bare vp the ſaid Obelisk as ſupporters; it was ſeen of a wonderfull and ineſtimable height aboue all others: and certaine it is, that there was neuer knowne to flote vpon the ſea a more wonderful ſhip than it was. She receiued 120000 Modij of Lentils for the very ballaiſt; ſhe tooke vp in length the greater part of the left ſide of Hoſtia harbour: for *Claudius* the Emperor cauſed it there to be ſunk, together with three mighty great piles or dams founded vpon it, and mounted to the height of towers, for which purpoſe there was brought a huge quantity of earth or ſand from Puteoli. The maine bodie of this maſt contai-
F ned in compaſſe 4 fadom full. And a common by-word it is, currant in euery mans mouth, that Fir maſt for that purpoſe, are vſually ſold for eight hundred Seſterces apeece, and more monie: whereas for the moſt part planks which are ſet together and ſerue in ſtead of boats, ordinarily coſt but forty. Howbeit, the kings of Egypt and Syria, for default and want of Fir (haue vſed by report) in ſtead thereof Cedar wood about their ſhipping. And verily, the voice goes of an exceeding

ceeding big one which grew in Cyprus, and was cut downe for a maſt to ſerue that mighty gal- G
leace of king *Demetrius*, that had eleuen bankes of oares to a ſide; a hundred and thirtie foot it was high, and three fatham thicke. And no maruell, ſince that the pyrats and rouers, who haunt the coaſts of Germanie, make their punts or troughs of one entire peece of wood and no more, wrought hollow in manner of a boat, and ſome one of them will hold thirtie men.

To proceed now vnto the ſundry natures of wood. The moſt maſſie and faſt wood, and therfore the weighteſt of all other, by judgment of men, is that of the Ebene and the Boxe: both ſmall trees by nature. Neither of them twaine ſwims aboue the water, no more will the Corke wood, if it be barked, nor the Larch. Of all the reſt, the ſaddeſt wood is that of Lotus, I meane that which at Rome is ſo called. Next to it, is the heart of Oke, namely, when it is rid of the white ſappie wood: the heart (I ſay) which comes neare to a black color: and yet the Cytiſus or H
Tetrifolie is blacker, and ſeemeth moſt to reſemble the Ebene. Howbeit, you ſhall haue ſome who affirme that the Terebinths of Syria be blacker than it. There was one *Thericles* a famous Turner, who was wont to make drinking cups, mazers, and bowles of the Terebinth; which is a ſufficient proofe, that the wood is fine and hard. This wood alone of all others, loueth to be oiled, and ſurely the better it is for the oile. But a maruellous prety deuice there is to ſet a paſſing faire blacke color, and a ſhining gloſſe vpon it; with Walnuts and wild Peares, namely, boiling theſe together, and making thereof a mixture and compoſition to giue the ſaid tincture. All theſe trees abouenamed haue a ſad and faſt wood. Next to them in that reſpect is the Cornell tree: and yet I cannot properly range it in the order of timber trees, ſo ſmall and ſlender it is. Neither is the wood thereof in manner good for nought elſe but for ſpokes in cartwheeles, alſo to make wedges to cleaue wood, and tough pins, that wil hold as faſt well neer as yron ſpikes. In I
like ſort, the Maſt-holm, the Oliue both wild and tame, the Cheſtnut tree, the Hornbeame, and the Poplar, be of an hard ſubſtance, and meet for this purpoſe. The wood hereof hath a curled graine like the Maple, and ſurely would be as good timber as any, but for often lopping the boughs, which gueldeth and deminiſheth the ſtrength. Moreouer, many of them there bee, and the Oke eſpecially, ſo hard, that vnleſſe they be ſoked firſt in water, it is impoſſible to bore a hole into them with an augoer, or to pluck forth a nail if it be once ſet faſt, water them as much as you will. Contrariwiſe, the Cedar will not hold a naile. The wood of the Linden tree ſeemes of all other to bee moſt ſoft, and hoteſt withal: for proofe whereof, this reaſon men doe alleadge, becauſe it ſooneſt turnes and dulles the axe edge. Of a hote nature alſo are the Mulberrie tree, the Lawrell, and the Yvie, and in one word, all thoſe that ſerue to ſtrike fire with. This experi- K
ment was firſt found out by ſpies, that goe between camp and camp, by ſheepheards alſo in the field: for hauing not flint euermore readie at hand to ſmite and kindle fire withall, they make ſhift for to rub and grate one wood againſt another, and by this attrition there fly out ſparkles, which lighting vpon ſome tinder, made either of drie rotten touchwood, or of bunts and withered leaues, very quickly catch fire, and burne not out. And for this intent, there is nothing better than to ſtrike the Yviewood, with the Bay. In this caſe alſo the wilde Vine (I mean not Labruſca) is much commended: and it climbeth and runneth vpon trees in manner of Yuie.

The trees that grow in waterie grounds be coldeſt of all others: but ſuch be tougheſt and therefore beſt to make bucklers & targuets, the wood whereof, if it be cut, comes quickly together, and cloſes vp the gaſh againe, and in that regard, much adoe there is to pierce it thorough L
with any weapon whatſoeuer. And of this ſort are Fig trees, Willowes, Lindens, Birch, Elder, Aſh, and Poplar. Of all theſe, the Fig tree and the Willow be lighteſt, and therefore fitteſt for that purpoſe. Theſe trees laſt rehearſed, be good for caskets and foſſers: wicker baskets alſo and prettie paniers, which be made of winding twigs. Their wood beſides is faire & white, ſtreight alſo and eaſie to be grauen. The plane wood is ſoft and gentle, but moiſt withall; and ſo is the Alder. Elme likewiſe, Aſh, Mulberry, and Cherry-tree wood, is pliable, but drier and more ponderous. The Elme, of all kinds of wood, will keep ſtreight and ſtiffe beſt, and not warp at all: & becauſe it twines and caſts not, it is paſſing good for hinges and hooks, for ſawne bords for ledges in dores and gates, ſo as this regard be had of exchange, that the vpper end of the bord that grew toward the head of the tree, be fitted to the nether hinge or hooke of the dore; and con- M
trariwiſe the butt end, ſerue the higher. The Date tree and the Corke, haue a ſoft and tender wood. The Apple tree, Peare tree, and Maple, haue as ſad and maſſie; but brittle it is, like as all wood that goeth with a croſſe and friſled grain. And look what tree ſoeuer is naturally hard

and

20030
copy 1

A and tough, the wild and the male of the ſame kind, haue their wood more churliſh than otherwiſe it is in the reſt. Semblably, thoſe that beare no fruit, are of a faſter and firmer wood than the fruitful: vnleſſe it be that that the males be bearers and the female barren, of which ſort are the Cypreſſe and Cornell trees. The wood of Cypreſſe, Cedar, Ebene, Lotus, Box, Yewgh, Iuniper, and the Oliue both ſauage and gentle, is neuer worme-eaten, ne yet rotteth for age. As for all other trees, long it is before theſe decay, to wit, the Larch, the Oke, the Corke tree, Cheſtnut and Walnut tree. The Cedar, Cypreſſe, and Oliue wood, neuer doth chinke or cleaue of it ſelf, vnleſſe it be by ſome accident.

It is commonly thought, that the Box, the Ebene, the Cypreſſe, and the Cedar wood, is euerlaſting and will neuer be done. An euident proofe thereof as touching all theſe ſorts of timber, by the judgment and choiſe of ſo many men, was to be ſeene in that famous temple of *Diana* in
B Epheſus: for al Aſia ſet to their helping hand and contributed toward that work, which in foure hundred yeres and not before, they brought to an end & finiſhed. The beames, rafters, and ſpars that went to the making of the rouſe, were by the generall voice of the whole world, of Cedar timber. As touching the ſtatue or image it ſelfe of the goddeſſe *Diana*, it is not certainly known of what wood it was: all writers, ſaue only *Mutianus*, report that it was of Ebene. As for him, a man who had been thrice Conſull of Rome, and one of the laſt who vpon their owne ſight of the ſaid thing, wrate therof, auoucheth that it was made of Vine wood; and that, howſoeuer the temple was ruined and rebuilt againe no leſſe than ſeuen times, yet the foreſaid image was neuer altered nor changed. Who ſaith moreouer, that *Canetias* choſe that wood for the beſt (for ſo he named the workman that cut and carued it.) And I much maruel therat, conſidering that
C by his ſaying this image was of greater antiquity than that of lady *Minerua*, much more than of prince *Bacchus*. He addes moreouer and ſaith, that this ſtatue was embaulmed within, by reaſon of the precious oile of Spiknard, which was diſtilled into it at many holes: by means of which medicinable liquor, the wood was nouriſhed, and the joints held cloſe and faſt together; whereat I canot chuſe but maruell again very much, that conſidering the ſtatue was ſo ſmall, it ſhould haue any peece or joint at all. Now as touching the leaues of the dores belonging to this temple, they were by his report, of Cypreſſe wood: and continued ſtill freſh and new to the eye, notwithſtanding it is foure hundred yeares well neare ſince they were made. Where, by the way this is to be noted, that theſe dores ſtood foure yeres glewed in the claue. And verily, this wood
D was choſen for that purpoſe, becauſe among other properties, the Cypreſſe alone hath the gift, to looke alwaies ſhining and poliſhed, and neuer loſeth the gloſſe and beauty. And for to proue this, we need not to goe farre? Looke but vpon the emage of * *Vejouis*, in the Capitol, made of Cypreſſe wood, doth it not endure ſtill faire and trim? and yet was it dedicated and conſecrated in that temple, in the yeare after the foundation of Rome, 551.

* Or, *Iupiter*.

A famous and memorable temple there is of *Apollo* at Vtica, where the beames and maine peeces of timber, made of Numidian Cedars, remaine as whole and entire as at the firſt day when they were ſet vp, which was when the citie was firſt founded: by which computation, they haue continued alreadie 1188 yeares. Moreouer, it is ſaid, that at Saguntum a citie of Spaine, there is a temple of *Diana* ſtill ſtanding, a little beneath the citie: and yet as king *Borchus* mine Author ſaith, 200 yeares before the ruine and deſtruction of Troy, the ſame men that brought
E the image of the ſaid *Diana* from the Iſland Zacynthus, founded the temple aboueſaid. For the antiquity and religion whereof, *Annibal* made ſome conſcience to demoliſh it, and would not once touch it: and therein are to be ſeen at this day the beames and rafters of Iuniper, ſound and good. But aboue all other, memorable is the temple of the ſaid goddeſſe *Diana* in Aulis, which was built many hundred yeres before the Trojane war: but what kind of timber was emploied about the Carpentrie thereof, is not well knowne. Howbeit, this we may boldly reſolue vpon, that the more odoriferous any wood is, the more durable alſo it is and euerlaſting.

Next to theſe trees aboue rehearſed, the wood of the Mulberrie tree is moſt commended, which in tract of time as it growes to be old, waxes alſo blacke. Moreouer, ſome kinds of wood
F as they be more laſting than other, ſo they continue better being emploied in one kind of work, than they do in another. The Elme timber will well abide the aire and the wind. The wild Oke Robur loueth to ſtand within the ground, and the common Oke is good in the water: let it bee vſed aboue ground to take the aire and the weather, it will caſt, warpe, and cleaue too bad. The Larch wood agreeth paſſing wel with water works, and ſo doth the black Alder. As for the Oke

Robur,

Robur, it will corrupt and rot in the sea. The Beech will doe well in water, and the Walnut tree likewise: but to stand within the earth, they are principall good, and haue no fellow. And for the Iuniper, it will hold the owne, being laid vnder ground, but for building aboue in the open aire, it is excellent good. The Beech and the Cerus wood rot quickly. The smal Oke called Esculus canot abide the water. The Cherrie tree wood is firme and fast: the Elme and the Ash are tough; howbeit, they will soone settle downward and sag, being charged with any weight, but bend they will before they break: and in case before they were fallen, they stood a while in the wood, after they had a kerfe round about, for their superfluous moisture to run out vntill they were well dried, they would be the better and sure in building. It is commonly said, that the Larch wood if it be put into ships at sea, is subject to wormes: like as al other kinds of wood, vnlesse it be the wild and tame Oliue. For to conclude, some timber is more readie to corrupt and be marred in the sea, and others againe vpon the land.

Chap. XLI.

¶ *Of wormes that breed in wood.*

Of vermine that eat into wood, there be 4 kinds. The first are called in Latine Teredines: a very great head they haue for the proportion of the body, and with their teeth they gnaw. These are found only in ships at sea, and indeed properly none other be Teredines. A second sort there be, and those are land wormes or mothes, named Tineæ. But a third kind resembling gnats, the Greeks tearme by the name of Thripes. In the fourth place bee the little wormes: whereof some are bred of the putrified humor and corruption in the very timber: like as others againe engender in trees, of a worme called Cerastes: for hauing gnawne and eaten so much, that he hath roume enough to turne him about within the hole which he first made, hee engendreth this other worm. Now, some wood there is so bitter, that none of these wermin will breed in it, as the Cypresse: others likewise so hard, that they cannot eat into it, as the Box. It is a generall opinion, that if the Firre be barked about the budding times, at such an age of the Moon as hath been beforesaid, it will neuer putrifie in the water. Reported it is by those that accompanied *Alexander* the great in his voiage into the East, that in the Isle Tylos lying within the red sea, there be certain trees that serue for timber to build ships, the which were known to continue two hundred yeares: and being drowned in the sea, were found with the wood nothing at all perished. They affirmed moreouer, that in the same Island there grew little plants or shrubs, no thicker than would wel serue for walking staues to cary in a mans hand, the wood whereof was massie and ponderous, striped also and spotted in manner of a Tygres skin; but so brittle withall, that if it chanced to fall vpon a thing harder than it selfe, it would breake into fitters like glasse.

Chap. XLII.

¶ *Of timber good for Architecture and Carpentrie: what wood will serue for this or that worke: and which is the strongest and surest timber for roufes of building.*

WEe haue here in Italie, wood and timber that will cleaue of it selfe. For which cause our Maister Carpenters giue order to besmeare them with beasts dung, and so to lie a drying, that the wind and piercing aire should not hurt them. The joists and plankes made of Firre and Larch, are very strong to beare a great weight, although they bee laid in length ouerthwart. Contrariwise, the Rafters made of the wild Oke Robur, and Oliue wood, wil bend, & yeeld vnder their load: whereas the other named before, do resist mainly & withstand, neither will they easily break, vnlesse they haue much wrong: nay sooner do they rot, than faile otherwise in strength. The Date-tree wood also is * tough and strong, for it yeeldeth not, but curbeth the contrarie way. The Poplar setteth and bendeth downeward: whereas the Date-tree contrariwise riseth vpward archwise. The Pine and the Cypres are not subject either to rottennesse or worme-eating. The Walnut tree wood soone bendeth, and is saddle-backt as it lieth, (for thereof also they often vse to make beames and rafters) but before that it breaketh, it will giue warning by a cracke, which saued many a mans life in the Island Antandros, at what time

* *Valida, ex Theophrast.*

20030
copy 1

A time as being within the common baines, they were skared with the crack that the floore gaue, and ran forth ſpeedily before all fell. Pines, Pitch trees, and Allar, are very good for to make pumps and conduit-pipes to conuey water: and for this purpoſe their wood is boared hollow: lying buried vnder the ground, they will continue many a yeare ſound and good: let them bee vncouered without any mould and lie aboue ground, they will quickly decay. But if water alſo ſtand aboue the wood, a wonder it is to ſee how they will harden therewith and endure. Firre or Deale wood, is of all other ſureſt and ſtrongeſt for rouſes aboue head: the ſame alſo is paſſing good for dore leaues, for bolts and barres: alſo in all ſeelings and wainſcot or whatſoeuer it bee, whether Greekiſh, Campaine, or Sicilian, it is beſt, and maketh very faire worke. A man ſhall ſee the fine ſhauings thereof run alwaies round and winding, like the tendrills of a vine, as the
B ioyner runneth ouer the painels and quarters with his plainer. Moreouer, the timber of it is commendable for coaches and chariots: and there is not a wood that makes a better and ſtronger joynt with glew, than it doth: inſomuch, as the ſound plank will ſooner cleaue in any other place, than in the joynt where it was glewed.

Chap. XLIII.

¶ *Of glewing timber: of rent, clouen, and ſawen painell.*

GReat cunning there is in making ſtrong glew, and in the feat of joyning with it, as well in regard of ſeelings and wainſcot made of thin bourd and painell, as of marquetry & other inlaid workes: and for this purpoſe, Ioyners doe chuſe the miſtreſſe threadie grain that is
C moſt ſtreight, which ſome call the Fertill veine, becauſe ordinarily it breedeth others, and yee ſhall ſee it branching and curled, as if it ſhed teares and thoſe trickling down. In euery kind of wood whatſoeuer, the criſped graine will not take glew and beare a joynt. Some wood it is impoſſible to glew and joyne, with peeces of their owne kind, much leſſe of other wood; as the hard Oke Robur. And lightly ye ſhall not haue peeces of a diuers nature, knit and vnite well in a joint, no more than if a man ſhould go about to glew & join ſtone & wood together. The Seruiſe tree wood canot in any wiſe ſort in a joynt with the Corneil wood; no more can the Hornbeame and the Box: after them, the Tillet or Linden wood may hardly away with his ſocietie. To ſpeak generally, whatſoeuer wood is gentle and apt to bend, (ſuch as we cal pliant) the ſame
D is good and eaſy to be wrought to any work that a man would haue: to which, you may put the Myrtle and wild Fig-tree. Durable and handſome withall, either to be cut, ſquared, clouen or ſawen, are all thoſe kinds of wood which be by nature moiſt. As for drie peeces of timber, they giue not way ſo faſt to the ſaw, as greene: and yet you muſt except the Oke and the Box wood, which although they be greene, do ſtiffely withſtand the ſaw-gate, choking and filling vp their teeth euen; by which meanes the ſlit is hindred, and the worke goeth not forward: which is the cauſe alſo that the ſawyers draw vp & let downe the ſaw twice, before the teeth ſend from them any duſt into the pit, As for the Aſh, it is moſt eaſie to be wrought, put it to what vſe you will, and makes the faireſt worke: and namely for horſemens ſtaues, better it is than Hazell, lighter than the Corneil, and more gentle and pliable than the Seruiſe wood. The French white Aſh, it
E will bend well for cart-thills and fellies. The Elme would be very like vine-wood, but that it is more ponderous and heauie. The Beech is eaſie to be wrought into any form, brittle though it be and tender: yet thereof are made fine trenchers, thin ſhindles, and ſuch like, as will wind and bend euery way: and therfore it is the only wood commendable for to make prettie caskets, paniers, and boxes. The maſt-Holme alſo may be cut into fine thin foile or leaues like plates, and thoſe alſo are of a daintie and pleaſant colour: but ſingular good is the wood thereof for ſuch things as fret and weare with rubbing, and namely, the axle trees in wheeles: and as the Holme is fit for this purpoſe in regard of the hard wood; ſo the Aſh likwiſe, becauſe it is ſo lyth & pliable: in which two reſpects, the Elm is choſen before them both. Moreouer, the wood of theſe trees before-named, are notable to make many prettie tooles that ſerue artizans in their daily
F worke: and therefore it is commonly ſaid, That the wood of the wild Oliue, Boxe, maſt-Holm, Elme, and Aſh, are excellent good for awgre-handles and wimble ſtockes. Of the ſame alſo are made mallets, but beetle heads of the bigger ſort, of the Pine and Holme. A great reaſon why theſe kinds of wood are the more tough and harder, is when the trees haue their right ſeaſon, and be cut down in their beſt time, rather than too ſoon and before they be come to maturity.

Thus it hath beene knowne that doore-hinges and hookes made of Oliue wood (which otherwiſe is moſt hard) if they haue reſted any long time, and not beene worne by ſhutting, and opening too and fro, haue put forth freſh buds, as if they had growne ſtill in the plant. As for the dore-barres and bolts, *Cato* would haue them made of Holly, Bay-tree, and Elme. The handles and helues of ruſticall tooles, mattocke ſteeles, and ſpade trees, *Hyginus* willeth they ſhould bee either of Hornebeame, Holme, or Cerrus. For fine painell in fret-worke, for ſeeling alſo and ouerlaying other wood, theſe are the chiefe, the Citron, Terebinth, Maple of all ſorts, Box, Date tree, Huluer, Holme, Elder root, and the Poplar. The Alder tree likewiſe (as hath beene ſaid) affordeth certain ſwelling bunches & hard knots, which may be cut and clouen into moſt daintie flakes and precious leaues, as faire and pleaſant to the eie for their damask branch, as either Citron or Maple: ſetting which three aſide, there be no knurs and nodoſities in any tree worth ought and of account.

Moreouer, yee ſhall haue trees ordinarily in the mids toward the heart, carie a more criſped and curled wood; and the neerer it is to the but or root end, the finer is the graine, more branching alſo, and the ſtreaks winding in and out. Loe, from whence firſt came the ſuperfluous expence to couer and ſeele one wood with another! See how thoſe trees which for their very wood were of no price, are become more coſtly and dearer, when they ſerue as a barke to clad others! that one tree forſooth by this means, ſhould be ſo ſold many & ſundry times at a ſeueral price. Thus haue been deuiſed (I would not els) thin leaues of wood, like gold or ſiluer-foile. And yet that is not all: for there is come vp of late a deuiſe, to paint and die in ſundrie colors the hornes of beaſts, to cut and ſaw their teeth into thin plates: and wheras at firſt there was fret-works only inlaid and ſet out with Ivorie here and there, ſoone after it came to paſſe, that the wood was couered all ouer therewith. Neither hath the ryot and waſtfull prodigality of the world ſtaied there, but proceeded farther, euen to ſearch into the deepe ſea for that, which might ſerue in ſtead of wood and timber. Thus the tortoiſe ſhel hath been cut into flakes and leaues, for want forſooth of wood vpon drie land. And now of late daies, certaine monſtrous ſpirits, during the Empire of *Nero*, haue found out a deuiſe to disfigure the Tortoiſe ſhel alſo with paintings, that it might be ſold the dearer when it lookt like wood. Thus means are wrought, that the price of beds ſhould be raiſed and ſet vp by this meanes: thus they would haue the Terebinth wood to bee exceſſiue deare and aboue the worth: thus muſt the Citron wood be enhaunſed to an higher rate: and thus the Maple is counterfeited, Tortoiſe ſhells are foiſted in the place and bought for it. To conclude, of late daies the curioſitie of men was ſuch, that they could not content themſelues with rich and coſtly wood; and now for to beautify and ſet out ther wood, Tortoiſe ſhels muſt needs be bought, there is no remedie.

Chap. XLIIII.

¶ *The age of trees: what kind of trees they be that are of leaſt continuance. Semblably, of Miſſelto, and the Prieſts called Druidæ.*

IF a man would conſider the hidden corners of the world, and the inacceſſable deſarts that be in it, he might by infallible arguments conclude and reſolue, that there be ſome trees that haue continued time out of mind, and liued infinitly. But to ſpeak of their age only that are known (euen by the teſtimonie of ancient records, and thoſe faithfully deliuered vnto vs) there are to be ſeen ſtanding or growing at this day, about Linternum (a towne in Campaine) certain Oliue trees, that *Scipio Africanus* (the firſt of that name) planted long ſince with his owne hand. In the ſame place alſo there is a Myrtle tree, of a rare and admirable greatneſſe; and vnder it, a caue or hole in the ground, wherein (by report) there lyeth a dragon that keepes the ghoſt and ſoule of the ſaid *Scipio*. And at Rome, in the court-yard belonging to the chappell of goddeſſe *Diana Lucina*, there is yet to be ſeen a Lote tree ſtanding before the ſaid chappell, built in the yeare of the Anarchie, what time as Rome ſtood deſolate of all magiſtrates, and that was 369 yeares after the foundation of the citie: but how much more auncient this tree is than the ſaid temple, God knoweth: for elder it is without all queſtion, conſidering that of the groue or tuft of trees there growing, which the Latines call Lucus, the ſaid goddeſſe *Diana* tooke her name * *Lucina*. Now it is 450 yeares or thereabout, ſince that time, and ſo old it is doubtleſſe. Another Lote tree there is and elder than that, but the age thereof is likewiſe vncertain: known it is

* *Gratia Lucinæ dedit hæc tibi nomina Lucus.* Ouid.

by

20030
copy 1

A by the name Capillata,[*i.* hairie:]ſo called, becauſe the haire of the veſtall Nuns heads is vſually thither brought,& there conſecrated:and yet is there a third Lotus at Rome in the court-yard and cloiſter about the temple of *Vulcan*, which *Romulus* built for a perpetuall monument and memoriall of a victorie,and defraied the charges out of the tenths of the pillage and ſpoile that he woone from his enimies;and this tree is at leaſt full as old as the citie of Rome, if it bee true that *Maſſurius* writeth. The roots thereof,paſſing along the ſtreet where the Burgeoiſes vſe to keep their reſidence, doe reach as farre as the ſtately market-place or Hall of *Cæſar*. There grew by it a Cypreſſe tree alſo of the ſame age,the which by an ouerſight and carleſſe neglect, fell downe no longer ſince then the laſt yeare of *Nero* the Emperour. But why ſtand wee long hereupon? there is an Holme growing in the Vatican,elder than Rome it ſelfe, with a plate of
B braſſe vpon it engrauen in Tuſcan letters, containing an inſcription or title: wherby it appeareth, that euen in thoſe daies the ſaid tree for antiquity,was worthy of peoples deuotion. Moreouer,it is well knowne, that the Tyburtines are more antient than the Romans, and their citie Tybur founded many a yeare before Rome:and yet certain it is,that there be yet three Holmes there remaining aliue,elder than *Tyburtus* himſelfe,their firſt founder:vpon which trees (as the voice goeth) he obſerued the flight of birds, and thereby tooke his auſpices and warrant from the gods to build the ſaid citie. And (by report) the ſonne he was of *Amphiaraus*, who died at Thebes an hundred yeares before the Trojane warre. Writers there be who affirme,that both that Plane tree which groweth before the temple of *Apollo* at Delphos,was ſet by king *Agamemnons* owne hand:as alſo another in the ſecond groue of Caphys in Arcadie. Furthermore,
C at this day, there be trees neere vnto the ſtreight of Callipolis,ſometime called Helleſpontus, ouer-againſt the citie of the Ilians, where old Troy ſtood, growing cloſe vnto the tombe or ſepulcre of *Proteſilaus*: which euery fourteene yeres ſo ſoon as they areſhot vp ſo tall only as they may ſeeme to diſcouer and ſee the citie Ilium,immediatly begin to wither and fade,and afterwards ſpring againe and grow anew vnto that age and height aforeſaid. Hard by the citie of Ilium,there be certain Okes alſo(as folke ſay)neer vnto the tomb of *Ilus*,which were then planted or ſet of acornes,when Troy began to be called Ilium. It is reported moreouer, that the Oliue tree remaines yet aliue at Argos, vnto which *Argus* tied lady *Io*, after ſhe was transformed or turned into an Heifer. About Heraclea in Pontus,there be certaine altars erected to the honor of *Iupiter* ſurnamed *Stratius*,ouer which there ſtand two Okes,both ſet by the hands of *Her-*
D *cules*. In the very ſame tract there is an hauen, ennobled and renowmed by the name of *Amycus* the K. of the Bebrycians there ſlaine. His tombe,from the very day of his ſepulture,hath been ouerſhadowed with a Bay tree (planted there and then for that purpoſe) which the people of that countrey do call The raging or mad Lawrell; for pluck but a branch or twig thereof be it neuer ſo ſmall, and carie it into a ſhip, all the marriners and paſſengers within, will fall a brawling,and neuer agree vntill it be caſt out and throwne away out of the veſſell, that was brought thither from the tree aforeſaid. Of a certain region we haue before written, called Aulocrene, lying in the way between Apamia and Phrygia;& there the paiſants of that countrey can ſhew you that very Plane tree,on which *Marſyas* the muſitian hung himſelfe in a melancholly mood for that he was ouermatched in his owne cunning and profeſſed skill,by *Apollo*: and ſurely like
E it is,that euen then he made choiſe of that tree for the bignes:ouer and beſides,in the Iſle Delos,there is a Date tree to be ſeen,which hath remained there euer ſince that the ſaid god *Apollo* was borne and reared there. The wild Oliue tree at Olympia (wherof *Hercules* ware the firſt coronet or guirland) is kept and tended ſtill with great deuotion. The very ſame Oliue tree alſo (by folks ſaying) continueth this day at Athens,which ſprung vp at the very time that *Minerua* and *Neptune* ſtroue together about giuing the name to the citie Athens. And thus much of long-liued trees.

Contrariwiſe,Pomgranat trees,Fig trees,and Apple trees,liue a very ſhort time:& of theſe, the haſtie kind or Ienitings,continue nothing ſo large as thoſe that bear and ripen later:neither yet thoſe that carie ſweet fruit,laſt ſo wel as they that bring forth ſower. The Pomgranat tree
F alſo with the more pleaſant fruit,is ſhorter liued than the other. The like is to be ſaid of Vines, and namely,ſuch as bear greater burden of grapes & veeld moſt wine. Howbeit *Gracinus* ſaith, That there haue been vine trees known to liue threeſcore yeres. It ſeems alſo, that trees which come vp in wateriſh and moiſt places, are not of any long continuance, but ſoone die. In deed Bay trees,Apple trees,and Pomgranat trees,do age & looke old quickly; howbeit they ſpring

freſh again from the root. Well then, the Oliue trees hold out life and liue very long: for after G
the common opinion and agreement of all writers, they continue ordinarily 200 yeares. There
is a little hil named Carne within the territory of Tuſculum, not far from Rome city ſide, clad
and beautified with a goodly groue and tuft of Beech trees, ſo euen and round in the head, as if
they were curiouſly kept, cut, and ſhorne artificially with garden ſheares: which groue was con-
ſecrated rn old time to *Diana*, by the common conſent of al Latium, which did their deuotions
there. In it there was one eſpeciall faire tree aboue the reſt, which *Paßienus Criſpus*, a man in our
daies of great authoritie (as hauing been twice Conſull in his time, & reputed an excellent O-
rator, who alſo afterward mounted to higher place of reputation by marrying *Agrippina* the
Empreſſe, by which match he became father in law to *Nero* the Emperor) caſt a fancie and ex-
traordinar ie liking vnto: inſomuch as he was wont not only to take his repoſe and lie vnder it,
to ſprinckle and caſt wine plentifully vpon it, but alſo to clip, embrace, and kiſſe it otherwhiles. H
Neere adioining as a neighbour to the ſaid groue, there is an Holme, which of it ſelfe alone is
much renowmed: it beareth in compaſſe about the butt therof 35 foot, and ſends out ten mon-
ſtrous big armes from the bodie, which may goe well enough for as many trees, and thoſe eue-
ry one ſo great as it is wonderfull. Surely this one tree alone (a man would ſay) reſembled a
whole wood.

Moreouer, there is nothing more certaine than this, that Iuie killeth trees. The like is to bee
ſaid (in ſome ſort) of the Miſſelto, although it is generally thought, that the harme thereby is
not ſo ſoon ſeen. And this you muſt thinke, that this Miſſelto is not to be taken for the fruit of
a tree, and therfore as great a wonder it is in nature, as any other: for ſome things there be, that
not willing to grow out of the earth, engender in trees; & hauing no proper place of their own I
habitation to ſeat themſelues in, ſojourn as it were & make their abode with others, and of this
nature is the Miſſelto. Alſo, in Syria there is a certain hearbe named * Cadytas; which windeth
about, not trees onely, but alſo very buſhes and thornes: likewiſe, all about the pleaſant vale
Tempe in Theſſalie, you ſhall haue a kind of Ferne ealled Polypodie, to doe the ſame: alſo, the
Pulſe named Dolychos, which is Faſels or Kidney beanes, and the wild running-laced Thyme,
Serpillum. Semblably, that which the Greeks cal Phaunos: the very ſame, that after a man hath
cut and proined the wild Oliue, engendreth thereupon. The like is to be ſaid of Hippopheſton
which groweth vpon the Fullers thorne or thyſtle: it beareth certaine little heads and hollow
knobs with nothing in them, ſmal leaues, and a white root; the juice wherof is ſingular good to K
euacuate and purge the bodie, for the diuerſion of ill humors, in the falling ſickneſſe. But to re-
turn againe to Miſſelto, there be three kinds thereof. For that which groweth on the Firre and
Larch tree, is called Stelis in Euboea, and Hyphear in Arcadia. And as for that which properly
is Miſſelto indeed, moſt men are of opinion, that it groweth faſt to the common Oke, the wild
Robur, the Holme, wild Plumtree, and the Terebinth, and not lightly on any other trees. How-
beit, in greateſt plenty it is ſeen vpon the Oke, and that is named Dryos Hyphear. A difference
there is in the Hyhpear and Miſſelto, on what tree ſoeuer they are found (except the Holm and
common Oke) in regard of the ſauor, which is ſtrong and ſtinking in the one more than the o-
ther. The leafe of them both hath no pleaſant ſmel, and in the Miſſelto it is bitter, clammy, and
viſcous beſides. Of the two, Hyphear yet is the better to feed ſheep and ſuch cattell fat: only at
the firſt it purgeth yll humors, and makes them to ſcoure apace, but afterwards it fatteth them; L
I mean ſuch as were able to bear the ſaid purgation. But in caſe any of them were deeply tackt
and infected with the rot, or other inward conſuming diſeaſe, they can neuer endure the taking
of the ſaid Hyphear, but they die vpon it. The only fit time for this kind of curing them, by the
way of purgiug, is in Summer, and that for 40 daies ſpace together, There is moreouer, by mens
ſaying, another difference in Miſſelto: for that which groweth vpon trees, ſhedding their leaues
in winter, loſeth alſo his owne leaues; but contrariwiſe, it continueth alwaies green vpon ſuch
trees as hold their leaues all the yeare long. Moreouer, ſet or ſow this Miſſelto what way ſoeuer
you will, it will neuer take and grow: it comes onely by the mewting of birds, eſpecially of the
Stockedoue or Quoiſt, and the Blackbird, which feed thereupon, and let it paſſe thorough their M
body. And this is the nature of it vnleſſe it bee mortified, altered and digeſted in the ſtomacke
and belly of birds, it will neuer grow. It exceedeth not at any time a cubit in heighth, notwith-
ſtanding it be alwaies greene and full of branches. The male beareth a certaine graine or berry:
the female is barren and fruitleſſe. But ſometimes neither the one nor the other beareth at all.

*Some take this for *Caſſu-tha*, or *Cuſcuta* ſ Doder.

Now

20030
copy 1

A Now as touching Birdlime, it is made of the berries of Miſſeltoe, gathered in harueſt time before they are ripe; for if they ſhould tarry ſtil to take ſhowres of rain, wel might they thriue and increaſe in bigneſſe, but their ſtrength and vertue would be gon clean, for euer making any ſuch glew or birdlime aforeſaid. Being ſo gathered, as is beforeſaid, they muſt be laid abroad a drying, and when they be once dry, they are braied or ſtamped, and ſo put in water to ſteepe, and let to putrifie for the ſpace of 12 daies or thereabout. This one thing yet in the whole world is the better for putrefaction, and ſerueth to good purpoſe. When this is done, the ſaid berries thus putrified and corrupt, are beaten or punned once again with mallets, in running water; by which means when they are husked and turned out of their skins, the fleſhy ſubſtance within, becommeth glutinous, and will ſtick too, in manner of glew. This is the way to make birdlime
B for to catch poore birds by their wings, entangled therewith; which foulers vſe to temper and incorporate with the oile of Walnuts, when they liſt to ſet limetwigs to take foule.

And forasmuch as we are entred into a diſcourſe as touching Meſſelto, I cannot ouerpaſſe one ſtrange thing thereof vſed in France: The Druidæ (for ſo they call their Diuinors, Wiſemen, & the ſtate of their Clergy) eſteeme nothing more ſacred in the world than Miſſelto, and the tree whereupon it breeds, ſo it be on Oke. Now this you muſt take by the way, Theſe prieſts or Clergy men choſe of purpoſe ſuch groues for their diuine ſeruice, as ſtood only vpon Okes; nay, they ſolemniſe no ſacrifice, nor perform any ſacred ceremonies without branches & leaues thereof, ſo as they may ſeem well enough to be named thereupon Dryidæ in Greek, which ſignifieth as much as the Oke prieſts. Certes, to ſay a truth, whatſoeuer they find growing vpon
C that tree ouer and beſides the own fruit, be it Miſſelto or any thing elſe, they eſteem it as a gift ſent from heauen, and a ſure ſigne by which that very god whom they ſerue giueth them to vnderſtand, that he hath choſen that peculiar tree. And no maruel, for in very deed Miſſelto is paſſing geaſon and hard to be found vpon the oke; but when they meet with it, they gather it very deuoutly and with many ceremonies: for firſt and formoſt, they obſerue principally, that the Moon be iuſt ſix daies old (for vpon that day they begin their months and new yeares, yea and their ſeueral ages, which haue their revolutions euery thirty yeres) becauſe ſhe is thought then to be of great power and force ſufficient, and is not yet come to her halfe light and the end of her firſt quarter. They call it in their language All-Heale, (for they haue an opinion of it, that it cureth all maladies whatſoeuer) and when they are about to gather it, after they haue well
D & duly prepared their ſacrifices and feſtiual cheare vnder the ſaid tree, they bring thither two
K yong bullocks milk white, ſuch as neuer drew in yoke at plough or wain, and whoſe heads were then and not before bound by the horn: which done, the prieſt araied in a ſurpleſſe or white veſture, climbeth vp into the tree, and with a golden hooke or bill cutteth it off, and they beneath receiue it in a white ſoldiers caſſock or coat of armes: then fall they to kil the beaſts aforeſaid for ſacrifice, mumbling many oraiſons & praying deuoutly: that it would pleaſe God to bleſſe this gift of his to the good and benefit of all thoſe to whom he had vouchſafed to giue it. Now this perſuaſion they haue of Miſſelto thus gathered, That what liuing creatures ſoeuer (otherwiſe barren) do drink of it, will preſently become fruitfull thereupon: alſo, that it is a ſoueraign countrepoiſon or ſingular remedie againſt all vermine. So vain and ſuperſtitious are many na-
E tions in the world, and oftentimes in ſuch friuolous and fooliſh things as theſe.

F

THE SEVENTEENTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

CHAP. I.

¶ *The wonderfull prices of some Trees.*

AS touching the nature of all those trees which of their owne accord doe grow, as well vpon the main land as the sea coast, we haue already treated sufficiently. It remaineth now to discourse of those which (to speake more properly) are made rather and forced by art and wit of man, than otherwise come by nature and of themselues. But before I enter into this treatise, I cannot chuse but maruel how it is come to passe, That those trees which for necessity & need we hauing taken from the wilde and brute beasts, and possessed in common with them (considering that men maintaine fight and scramble with them for the fruits that fall, yea and otherwhiles with the fowles of the aire, about those which hang vpon the tree) should grow to so excessiue a price, as to be esteemed among the principall delights of this world? And that this is so, appeareth by that most notable example (in mine opinion) of *L. Crassus* and *Cn. Domitius Ænobarbus*. This *L. Crassus* (a right renowmed Orator of Rome as any one of his time) had a stately and sumptuous dwelling vpon mount Palatine: howbeit that house of *Q. Catulus* (who defeated in battell the Cimbrians, together with *C. Marius*) went beyond it a faire deale in magnificence, and stood likewise within the pourprise of the same mount. But the goodliest and fairest Pallace knowne in that age, was that of *C. Aquilius* a Gentleman or Knight of Rome, scituate vpon the hill of Osiers, called Viminalis: in regard whereof there went a greater name of him, than for all the skill he had in the Ciuill Law, which was his profession. Yet of all those three, *Crassus* onely was challenged and reproched for that foresaid house of his. And in this manner is the storie deliuered: *Crassus* and *Domitius* (great personages both, and descended from most noble Houses in Rome) after they had beene Consuls, happened also to be chosen Censors together: and this fell out to be in the six hundred sixty two yeare after the foundation of the city: but during this Magistracie of theirs there passed many a foule day and bitter fit betweene them; so dissonant were their natures, and their conditions so farre vnlike. Now it fortuned vpon a time, that *Cn. Domitius* (as hee was hot and hasty man by nature, and carried an inward hatred besides in his heart, which soone is kindled and set on fire, yea and most insatiable, vpon emulation and enuy betweene Concurrents, such as they two were) reproued *Crassus* verie sharpely for his excesse in expence, and namely, That any Censor of Rome should dwell in so stately and sumptuous a Pallace as he did; and euer and anon made offer to buy the House, and pay him downe-right for it an * hundred Millions of Sesterces: whereat *Crassus* (being a man quicke of spirit, and of a prompt and present wit, finely conceited withall, and not to seeke for a ready answer) tooke him at his word, and accepted of the offer; reseruing only six trees that grew about his house. Tush (quoth *Domitius*, replying againe) take those Trees away, and take all; if they be gone, I will none of the house though I might haue it for a single denier. Then *Crassus* hauing gotten the vantage and start of him, rejoyned and came vpon him thus: Tell me now I pray you good *Domitius*, whether of vs twaine giueth a scandalous example to the world? Whether am I my selfe (I say) offensiue, and deserue to be taxed and noted by mine own Censorship, who can be contented to liue quietly and louingly among my neighbours in mine owne house, and that house which came to me by way of inheritance from my father;

* *Millies Sestertium.* An incredible price for a dwelling house: and therefore as *Budæus* thinketh, this place must be corrected, by conference with *Val. Max.* who for (*millies*) hath (*sexagies*) which amounts little more than to the 20 part of the other summe.

20030
copy 1

A father;or you rather,that for ſix trees bid 100 millions of Seſterces ? Now,if a man be deſirous to know,what theſe trees might be ? truly they were no other but ſix Lote trees, very faire and beautifull indeed,but there was nothing in them commendable, ſaue only their ſpreading and caſting a goodly ſhade. And verily,*Cæcina Largus*,a Nobleman and principal citizen of Rome, vſed many a time and often(I remember well)to ſhew me when I was a yong man, thoſe trees about his houſe. And ſince our ſpeech hath bin of ſuch trees as liue very long,theſe I wote wel, continued for the ſpace of 180 yeres after *Craſſus* death,to the great fire that *Nero* cauſed to bee made for to burne Rome;freſh and green they were with good keeping, and looked yong ſtill, like to haue liued many a faire day more,had not that prince haſtened the vntimely death euen of trees alſo[as well as of citizens.] Now leſt any man ſhould think,that all the ſumptuoſitie of *Craſſus* conſiſted only in thoſe trees,and that the furniture otherwiſe of his houſe was but mean
B and ſimple,and could miniſter vnto *Domitius* no matter of ſuch conteſting and reproofe,diſpoſed as he was to quarrel and find fault:know he thus much,That the ſaid *Craſſus* had before that time ſet vp in the open hall of that houſe,foure goodly pillars of Hymettian marble;which in the yere of his Edileſhip were brought abroad to rich and beautifie the Theatre,the Stage and Shew-place of the ſolemne plaies by him ſet out:for as yet there had not bin in publicke place at Rome any marble pillars ſeen:lo how lately is come vp this exceſſiue expence in rich & glorious building,ſo common in theſe daies. See(I ſay) how in thoſe times, faire trees beautified pallaces more than any thing els;inſomuch,as *Domitius* for the want of ſix trees only,would not ſtand to the price that himſelfe firſt made,no not to buy his very enemy out of houſe and home with it:but no maruel if trees were accounted of ſo highly,ſeeing that our anceſtors in old time
C thought not ſcorn to take otherwhiles their ſyrnames from them. Thus that braue and valiant ſouldier came to be named *Fronditius*,who(maugre the beard of *Annibal*) ſwum ouer the riuer Vulturnus,with a chaplet of green leaues(anſwerable to his name) ſet vpon his head, and performed many feats of arms and worthie exploits againſt him. Thus they of the noble *Licinian* family had for their addition *Stolons* (*i*.the vnprofitable water-ſhoots that puſt forth from the root or tree it ſelfe,and neuer proue or come to any good.) And why ſo? For that one of the ſaid houſe deuiſed the means to cleanſe trees & vines of ſuch ſuperfluous twigs (the practiſe & feat of cutting which a way,is called Pampinatio)and therupon was one *Licinius* firſt ſirnamed *Stolo*. Moreouer,our predeceſſors in antient time made good ſtatutes and ordinances for the main-
D tenance of trees : and expreſſely prouided it was by the laws of the 12 Tables at Rome,in theſe words,*That whoſoeuer made wilfull waſte,and cut downe any trees growing in another mans ground,ſhould be peined in the court for a treſpaſſe don;& forfeit for euery ſuch tree, 25 pound of braſſe money*. But what ſhould we thinke of this ? Did theſe law-makers trow ye, ſuppoſe or imagine that other wilde trees would euer haue growne to that high reckoning aboue named, and which now they are come vnto,who valued fruitfull trees at no greater price,and ſet the penalty for the treſpaſſe,ſo low ? But neuer maruell we any more hereat,conſidering to what a proportion Apple-trees,and ſuch like are riſen vnto. For there be many of them here about the city of Rome, in the villages neere adioining,which are ſet for a yearely rent of 2000 Seſterces ; and one of them yeeldeth more profit and reuenue by the yere to the owner, than a pretty ferm in times paſt of good domaine,to the land-lord. Hereupon came the inuention of graffing trees : for this purpoſe haue
E we ſuch baſtard fruits intermingled one with another, of ſundry kindes;as if Apples and other fruits were not for poore men to eat, but grew only for the rich. Hence forward now therefore will we ſhew the right,perfect,and abſolute manner how to order and cheriſh them, that it may appeare by what means eſpecially,ſuch annuall commodity can be made of them, as is beforeſaid. For the better performance of which diſcourſe,I meane to leaue the common and ordinary way;neither will I handle the vſuall and vulgar manner of that point in husbandry, wherein euery man is perfect,and whereof no man maketh queſtion : but deliuer ſuch matters onely, as be vncertaine and doubtfull,whereby oftentimes folke are deceiued and beguiled. For to break my head or buſie my brains in needleſſe trifles,and therein to affect a kinde of curioſitie , was neuer my manner yet,nor is it any part of my meaning and intention now. But before I doe en-
F ter into particulars,my purpoſe is to treat in generalitie of this matter, and touch briefely the conſideration of heauen and earth both, ſo farre forth as may concerne in common all kindes of trees whatſoeuer.

CHAP.

G

Chap. II.

¶ *Of the nature of the Skie reſpectiue vnto trees: and what quarter thereof they ſhould regard.*

TRees generally do like beſt that ſtand to the Northeaſt wind: for it nouriſheth them well, cauſeth them to ſpread thick and grow euery way in length and breadth, and withall maketh the timber more faſt and ſtrong. But in this rule moſt men do erre, and be much deceiued; for in vnderpropping vines, the forkes would not be ſet oppoſite againſt that wind to hinder the blaſt thereof; a point that is to be obſerued in regard of the North wind only. Moreouer we find by experience, that if trees haue a kindly winter and cold ſeaſon in their due time, their wood will be more firme, and ſo likewiſe will they bud and ſhoot out beſt: otherwiſe, if the H warm Southerne winds blow vpon them much, ye ſhall haue the trees proue ſoft and feeble, and their bloſſoms come to nothing, blooming as they do before time: for if it chance that preſently after their floures be fully out, and ready to ſhed, there fall any ſtore of raine, the fruit is quite gone for that yeare. And as for Almond trees and Peare-trees, if it be but cloſe and cloudy weather only, without any raine, or the wind ſtand South when they floure, ſure they be to loſe their fruit. Certes, a glut of rain in May, at what time as the Brood-hen ſtar called Virgiliæ doth ariſe, is exceeding hurtfull to Vines and Oliue-trees: for then is the very ſeaſon of their knitting or conception. Then be the foure decretorie or criticall daies, that giue the doome of Oliue trees, either to good or bad: this is the Southerly point of filthy, foule, and glowmie weather, I wereof wee haue ſpoken before. Moreouer, all manner of graine feeleth the inconuenience of Southern wind at the time of their ripening. Well may corne make haſt and ripen ſooner, but it ſhal neuer haue the kind maturity and perfection as it ought. As for the cold pinching black froſts and Northern winds, which blow out of ſeaſon, come the[illegible]rly or come they late, they be hurtfull all. But if the wind ſtand Northeaſt in winter, there is nothing ſo good generally for all fruits of the earth. And verily, a good ſhower now & then during that time, wil do no harm; and that men wiſh for rain then, the reaſon is euident: for why? trees with bearing of fruit, are drawne dry and haue loſt their naturall moiſture, with ſhedding their leaues they be poore and feeble; ſo that it is kind for them to be hungry then, and to haue a greedy appetite to new food, which is raine. Now if the winter be open and warm withal, that ſo ſoone as the trees haue don K bearing, they reſt not between, but conceiue again preſently vpon it (that is to ſay, bud & ſpurt anew, yea, and fall afreſh to bloſſome, whereby they haue another euacuation that way alſo, to ſpend their ſap and radicall moiſture) we find by experience, that there is nothing in the world ſo bad for them. Nay, if many ſuch yeres come together, immediatly one after another, the very trees themſelues will die; for who can looke for better, when they are thus pined and famiſhed? He then* whoſoeuer he was that ſaid, Husbandmen were to wiſh for faire winters: ſurely he was no friend therein to trees, nor neuer praied for them: neither are wet Mid-ſummers good for Vines. But in truth, That winter duſt ſhould cauſe plentiful harueſt, was a word ſpoken in a bravery, and proceeding from a pregnant wit and jolly ſpirit: for otherwiſe, who knoweth not, that euery man (wiſhing well to trees and corn indifferently) praieth, that ſnow might lie long vpon the ground? The reaſon is, for that not only it keepeth in & encloſeth the (vitall breath & ſoule L (if I may ſo ſay) of the earth, ready to exhale out and vaniſh away, yea, and drieth it back again into the blade and root of corn, redoubling therby the force and vigor thereof: but alſo becauſe it both yeeldeth moiſture and liquor thereunto gently by little and little, and the ſame withall fine, pure, and paſſing light: conſidering, that ſnow is nothing els but the fome or froth of rain-water from heauen. This humor therefore, not falling forcibly all at once to drown the root, ne yet waſhing away the earth from it (but diſtiling drop-meale a little at once, in that proportion and meaſure as thirſt requireth and calleth for it) nouriſheth all things, as from a teat or pap; nouriſheth (I ſay) and neither drencheth nor ouerfloweth them. The earth alſo for her part, by this means wel ſoked, ſwelleth and houeth as it were with a leauen, and lieth thereby more light and mellow: thus being full of juice and moiſture it ſelfe, & not barren, but well repleniſht with M ſeeds ſown, and plants ſuckled, thus continually in her womb; when the open time of the ſpring is once come to diſcharge her, ſhe ſheweth her ſelfe freſh and gay, and willingly entertaineth the warme weather of that ſeaſon.

* *Virgil.*

By

20030
copy 1

A By this meanes eſpecially, we ſee how corne liketh well vpon the ground, and thriueth apace euery where, vnleſſe it be in climates where the aire is alwaies hot, as in Ægypt. For continuance and ordinarie cuſtome alone effecteth the ſame there, which the ſeaſon of the time, & moderat temperature of the aire elſwhere. And in one word, be the place whatſoeuer, paſſing good it is to keep away the thing that is hurtfull. For in the moſt parts of the world it happeneth, That when either corn is winter-proud, or other plants put forth and bud too earely, by reaſon of the mild and warm aire; if there follow any cold weather vpon it, all is nipped, blaſted, and burnt away. Which is the cauſe, that late winters do harme vnto the wild trees alſo in the forreſt. The more paine and ſorrow likewiſe ſuch trees abide, by reaſon of their owne thicke branches ſhading one another, and not eaſily admitting the warme Sun; and deſtitute they are beſides of mans helping hand to cure them: for growing as they do in wild and deſart forreſts, im-
B poſſible it is to lap and wrap them about with wreaths and thumb-ropes of ſtraw, and ſo to cheriſh and defend them when they be yong and tender. Wel then, to conclude this matter, Winter raine principally is ſeaſonable and good for all plants: and next to it the dewes and ſhowers that fal immediatly before their ſprouting time: a third ſort alſo there be of ſhowers that come when fruits hang on the tree, and are in their growth, yet not too ſoon, namely, before they bee ſtrong and able to abide ſome hardneſſe.

As touching trees which be late-ward and keep their fruit long ere they ripen, ſuch alſo as require ſtore of nouriſhment and more food ſtill, as namely, the Vine, the Oliue, & Pomgranat trees; it is good for them to be watered with raine in the later end of the yeare. And to ſay a truth, euery kind of tree requireth a ſeuerall rain by it ſelfe, in due ſeaſon, for that ſome ripen
C their fruit at one time, and ſome at another: ſo as a man ſhall ſee ordinarily the ſelfeſame ſhowers, to hurt one ſort, and to help another; yea, and that diuers effect is to be ſeen in trees & fruits of the ſame kind, as for example, in Pyrries: for the late-ward of them call for raine at one time, and the haſty or forward at another, and yet indifferently all doe require alike the ſeaſonable ſhowers of winter, as alſo thoſe before budding time. In which regard, the winds Northeaſt are better than the Southern, and ſuch winters be moſt kindly. Semblably, by the ſame reaſon the Mediterranean or mid-land parts of any country are for this purpoſe preferred before the maritime or ſea-coaſts (as being for moſt part colder) the high & hilly regions before the plaines and vallies: and laſt of all, the night rains are held to be more profitable than thoſe that fall by
D day time: for lands new ſowne, and any yong plants, inioy more benefit by ſuch ſhoures in the night, for that the Sun commeth not ſo preſently vpon them againe to dry and drink vp all the moiſture.

Hereunto ought to be annexed the conſideration of Vine-yards, hort-yards, and Groues, as touching their ſcituation, and namely, what part of the heauen they ſhould regard. *Virgil* condemned altogether the planting of any trees, reſpectiue to the Weſt: ſome haue choſen that quarter before the Eaſt. And this haue I obſerued, that in moſt mens opinion, the South is beſt. But if I ſhould ſpeak what is mine own conceit indeed, there can no generall and infallible rule be giuen concerning this point, for to hold alwaies. All our skil and art herein muſt be directed by the nature of the ſoile, the diſpoſition of the climat and temperature of the aire. In Africke
E although it be nothing profitable for Vine-yards to be planted ſo as they look into the South, yet kind it is & wholeſome for the Vine-planter and husbandman, by reaſon that all Africke lieth vnder the Meridionall or South climat. And therefore he that ſhall ſet vines there, either into the Weſt or North (howſoeuer *Virgil* alloweth not of the Weſt) ſhall make an excellent, medley between the temperature of that aire and the nature of ſoile together. As for the North no man ſeemeth to make any doubt or queſtion, but that vines ſo planted, wil proue right well. And verily there are not found any vines to proſper better, or to beare more fruit in all Italy tha nin that tract which lieth on this ſide, and vnder the Alpes: and there for the moſt part the Vineyards are ſo planted.

Moreouer in this caſe the winds would be much conſidered; for in Languedoc or the prouince of Narbone, in Liguria and part of Tuſcane, they are reputed vnskilfull husbandmen that plant
F any vine-yards directly vpon the Northweſt wind: but it is counted contrariwiſe a ſpecial point of prouidence and good husbandry, to caſt it ſo, as the ſaid wind may flanke it on the ſide. For this is the wind, which in thoſe quarters qualifies and tempereth the exceſſiue heat of the ſummer: howbeit, many times, ſo violent and bluſterous he is, that hee beareth downe before him the

the roofe of many a house, and carrieth it cleane away. G

Chap. III.

¶ *The societie of the skie and aire with the earth, respective to trees.*

SOme men do force the skie for to be obedient & conformable to the earth: as namely, when planting in dry grounds, they haue regard to the East and North: and contariwise, when in moist places they respect the South. Moreouer, it falleth out, that they be driuen otherwhiles to follow the nature of the very Vines, and thereby to be ruled: wherupon, in cold ground they plant such as be of the hastie kind, and soone ripen their grapes; to the end that they may come to their maturity and perfection, before cold weather comes. As for such Vines and trees H bearing fruit, as canot abide dews, those they set in to the East, that the Sun may soon dispatch and consume the said dew: but looke what trees do loue dewes, and like well therewith, those they will be sure to plant against the West, or at leastwise toward the North, to the end they may inioy the full benefit thereof. All others againe (grounding in manner vpon natural reason only) haue giuen counsell to set as well Vines as Trees, into the Northeast. And *Democritus* verily is of this mind, that such fruits will bee more pleasant and odoriferous.

Chap. IIII.

¶ *The quality of sundrie regions.*

AS touching the proper seat of the Northeast wind, and of all other winds, we haue spoken already in the second booke: and our purpose is in the next following, to treat of the rising I and falling of signes and notable stars, of other Astronomical points also concerning heauen. Now in the mean time for this present, it is sufficient, that in the former rule of the North wind, we seem to rest and resolue vpon the apparent and euident argument of the wholesome and healthfull climate of the heauen: forasmuch as we see, that euermore all such trees as stand into the South, soonest shed their leaues: the same reason also is to be giuen of those that grow vpon the sea coasts: and albeit in some places the winds blowing from thence, and the very aire of the sea be hurtfull, yet in most parts the same are good and profitable. Certaine plants and trees there are, which take pleasure to be remot from the sea, and ioy to haue the sight of it only a farre off: set them neerer to the vapors and exhalations ascending from thence, they will take harm and mislike therewith. The like is to be said of great riuers, lakes, and standing pooles. As K for those which we haue spoken of, they either burn their fruit with such mists, or refresh and coole such as be hot with their shade, yea, & take joy and prosper in the frost and cold. And therfore to conclude this point, the surest way is, to beleeue & trust vpon experience: thus much for this present, concerning the heauen: our next discourse will be of the Earth and Soile, the consideration whereof is no lesse difficult to be handled than the other.

First and formost, all grounds are not alike good for trees and most kinds of corne. For neither the black mould (such as Campain standeth vpon much) as in all places best for Vines; or that which fumeth and sendeth vp small and thin mists: neither is the red veine of earth any better, how soeuer there be many that commend it. The white earth or chalkie marle, the clay also within the territory of Alba and Pompeij, for a vineyard, are generally preferred before all I other countries (although they be exceeding fat, which in that case is otherwise vsually reie-
*i Pauic. cted.) On the other side, the white sand about * Ticinum: likewise, the blacke mould or grit, in many places, as also the red sandy ground, although it be wel mingled & tempred with fat earth are all of them nothing to the purpose for increase & fruitfulnesse. And herein must men take heed, because oftentimes their judgement may faile when it goeth but by the eie: for wee must not streight waies conclude, that the ground is rich & battle, wheron we see goodly faire & tall trees to grow, vnlesse it be for those trees only: for where shal we meet with any, higher than the Firr? & is there a tree again that possibly can liue where it doth? No more is rank grasse & plentifull forrage a true token alwaies of a good ground: for there is no better pasture nor grasing to be found than in Almaine; and yet dig but vp the greene sourd and the thinnest coat of turfe M that may be, ye shal presently come to barren sand vnder it: ne yet is it by & by a moist ground, that hath vpon it deepe grasse and hearbes shooting vp in height: no more verily, than a fat

and

20030
copy 1

A and rich ſoile is knowne by ſticking to one fingers; as appeareth plainly in all ſorts of clay. And verily, no earth doth fill vp the trenches euen againe, out of which it was caſt, that therby a man might find out whether the ground be ſad, or hollow: and generally all ſorts thereof will cauſe yron to ruſt that ſhal be put into it. Moreouer, there is no weighing of earth in ballance, to know by that means which is lighter or heauier: for who could poſſibly euer ſet down the iuſt weight that earth ſhould haue? Againe, the ground that is caſt vp into banks by the ouerflow of great riuers is not alwaies commendable: ſeeing that ſome plants there be that decay, if they be ſet in water. And ſay that ſome ſuch bank were ground good enough, yet it continueth not ſo long; vnleſſe it be for Willowes and oiſiers onely. But if you would know a rich ground indeed, one of the beſt arguments and ſignes therof is this, when you ſee it to bring forth a thick & ſtrong haulme or ſtraw, ſuch as vſually groweth in that noble territorie Laborine within Campaine;
B which is of that bigneſſe, that the people of the country vſe it for fewell in ſtead of wood. Now, this ground, ſo good as it is, where & whenſoeuer we haue found it, is hard enough to be tilled, and requireth great labour and husbandry, putting the poore husbandman to more paines in manner with that goodneſſe of it, than poſſibly he could haue with any defects and imperfections thereof. For euen the hot earth, called by the name of Carbunculus, which vſeth to burn the corne ſown therupon, may be helped & remedied (as it is thought) by ſetting it with plants of poore & hungry vines. The rough grauell ſtone which naturally will crumble as grit, many writers there bee that allow and commend, for vines. As for *Virgil*, he findeth no fault with the ground that beareth fern and brake, for a Vineyard. The earth that is brackiſh, and ſtandeth much vpon ſaltpetre, is thought to be more ſound for many plants than others; and in regard of
C vermine that vſe to breed therein, much ſafer alſo. Neither do high banks and hils remaine vntilled and naked for want of good husbandry, if ſo be a man haue the caſt of it, to eare & breake them vp skilfully. As for the plaines, they are not all of them expoſed to the Sun or ſubiect to the wind more than need requireth. And to ſpeake of froſts, miſts and fogs, there be Vines (as we haue ſaid already) which are nouriſhed and fed with them. And to conclude, hereby we may ſee, that in euery thing there is ſome one deep ſecret or other, wherein it behoueth each man to employ his ſpirit and ſet his mind for to ſearch them throughly and find them out: what ſhall we ſay then to this, That oftentimes thoſe things which haue bin approoued by long experience and many obſeruations, become otherwiſe, and change their vſuall manner? In Theſſalie about Lariſſa, the whole region, by reaſon of a lake that was let out and drained drie, prooued
D much colder: and the Oliues which there grew before, left bearing and died all, vpon it. In like ſort, neer vnto Ænos, the Vines were all ſcorched and burnt, by occaſion, that the courſe of the riuer Ebrus was brought neere vnto them, an accident that beforetime neuer befell vnto them. Semblably, about the citie Philippi, the whole country being made drie by ſluces and trenches artificiall; altered withall the whole diſpoſition of the aire and weather, and changed the very habite of the heauen aboue their heads. But in the territory of Syracuſa, the forraine Coloners that thither came to inhabit and practiſe husbandry, by ridding the ground from all the ſtones, marred all the corn in the country; ſo mirie and durtie it was by that meanes, vntil ſuch time as they were driuen to lay the ſtones againe where they had them. In Syria, the husbandmen goe lightly ouer with their plough, & take no deep ſtitch in making their furrowes, for feare of the
E ſtony rocke lying ebbe vnder the good ground, which in Summer ſeaſon will burne all their graine and ſeed ſowne there. Now, there be certain parts of the world, where a man ſhall ſee one and the ſame effect to proceed both of extreame heat, and alſo of exceſſiue cold. Thracia is exceeding cold, and thereby plentifull in corne. Africke and Ægypt be as hot, and yet come not after it for fertilitie in that kind. In Chalcia, an Iſland belonging to the Rhodians, there is one place aboue the reſt ſo fruitful, that the Barly which was ſowed in the due time & ſeaſon of the yere, they mow once, and preſently put it into the ground againe; which will be ready to be cut downe the ſecond time, with other corne in harueſt. In the Venafrane tract within the realme of Naples, the grauellie ground is thought meeteſt for Oliue trees, & therin they bear moſt plentifully: contrariwiſe, about Bœtica in Spaine, the fatteſt ſoile is beſt for that purpoſe. The ex-
F cellent grape that makes the good Punicke wine, ripeneth ſoon vpon the very rockes: but the Cæcube Vines ſtand ſoaked & drenched (as it were) in the mariſh low grounds of Pomptinum. See what a difference and diuerſitie there is in cauſes, to make this variety in ſundry plots of ground! *Cæſar Vopiſcus* being conuented before the Cenſors, and there pleading his cauſe, affirmed

med openly, that the plaines of Roſea were the very fat of Italy, and reſembled the kell or leafe G
of a fed and franked ſwine: wherein (quoth he) if a man left forks or props to day, they will bee ouergrowne and couered with graſſe by to morrow. But ſurely, this ground is good for nothing but paſture. Yet notwithſtanding, Nature would haue vs ſtill to learne and grow skilfull euery day more than other: and for that intent ſhe hath laid open the defects and imperfections of the ground, euen there, whereas the commodities thereof be neither ſo certain, nor ſo well knowne. And therefore let vs in the firſt place ſpeake of thoſe faults for which the earth is blamed.

Chap. V.

¶ *Sundry ſorts of earth.*

IF a man would know which is a lean, hungry, & bitter ground, there is no better experiment H
and proofe thereof, than by the blackiſh, miſliking, and vnkind herbs growing thereupon: like as, when they come vp ſcorched and burnt, they ſhew a cold ſoile: alſo, when they ſeem ill fauored and vnpleaſant to the eie, the earth no doubt is ſoked and drowned in wet. As for red ſandy ground and clay, you need go no farther than to your owne eie-ſight. And ſuch ſoiles as theſe be, is of all other, hardeſt to be wrought and tilled; they ſo clog and load both the harrow teeth and the plow-ſhares, with huge and heauie clods. Howbeit, the ground that is thus churliſh to be eared and husbanded, is not alwaies bad and naught for increaſe. But it fareth cleane contrary with the pale and wan aſhie earth, as alſo with the white ſandy ſoile: for the barren ground is ſoon found by a thicke and callous cruſt that it hath, euen at the firſt dent of culter or I
ſtroke of mattocke.

Cato ſetteth down briefely, as his maner is, all the defects and faults of ground in theſe words: *Take heed* (quoth he) *of a rotten ground, and ſee that you ſtir it neither with cart, nor touch it with beaſt.* What ſhould we think was his meaning by this term of his, that he ſhould feare rotten ground ſo much, as to forbid in a manner to tread and goe thereupon? Let vs call to mind the rottenneſſe that is in wood: and thereby ſhall we find thoſe faults that he abhorreth and deteſteth ſo much in the earth. In good faith, by rotten earth hee vnderſtandeth dry, ſpungeous, and full of holes, rugged, hoary, eaten, old, and hollow. So as in that one ſignificant word (*Carioſa*) hee ſaid more than could be expreſſed poſſibly by any multip icity of language whatſoeuer: for if a man would rip vp to the quicke the imperfections that are in grounds, he ſhould find, that ſome pie- K
ces there be of it that may be termed truly old and ouerworne, not for any age (for who can ſay properly, that earth is ſubiect to old age) but by reaſon of their naturall defects: in regard wherof, a ground may be weake, feeble, barren, and no longer good for to bring forth any thing. The ſame *Cato* iudgeth, That ground to be principall which lieth at the foot of an hill, and runneth forth in manner of a plaine, into the South, which is the very ſcituation of all Italy: and by a blackiſh and ſwart earth, which he calleth [*Pulla*] he meaneth a gentle, tender, and mellow ſoile. And this we will determine to be the beſt ſimply both for worke or tillage, and alſo for gaine and increaſe: now let vs (if ye pleaſe) ſtand a little vpon this word *Tenera* [*i.* Tender] which he vſeth in this ſence: you ſhall find a maruellous ſignification thereof: and that he implieth thereby, as much as your heart can wiſh to be in a ground. That is it, which is ſo temperat in fertility, L
that is it which to be wrought is ſo gentle, ſoft, pliable, and mellow; neither wet, nor yet dry and thirſty. Now doth this ground ſhine againe after the plough-ſhare, reſembling that veine of earth, which *Homer*, the very fountaine and ſpring of all good wits, reported to haue bin engrauen by a * god, in the armour (of *Achilles*:) adding moreouer, that the ſaid earth looked black withall: wherein hee obſerued a wonderfull piece of workemanſhip, notwithſtanding it was wrought in gold. This is that ground, I ſay, which beeing new broken and turned vp with the plough, the ſhrewd and buſie birds ſeeke after, and goe vnder the plough-ſhare for it: this is it, that the very Rauens follow the plough-man hard at heeles for, yea, and are readie for greedineſſe to pecke and job vnder his very feet. And here, in this place I cannot chuſe but relate the opinion that is currant among our roiotous and delicate gallants: which ſome other thing M
alſo making for our purpoſe, in the diſcourſe of this argument which wee haue in hand. Certes *Cicero*, a man reputed (as he was no leſſe indeed) for a ſecond light of all good learning and literature. Better are eſteemed (quoth hee) the ſweet compoſitions and ointments which taſt of earth, than of ſaffron: where note by the way, that this great Clearke choſe to vſe the word

of

* *Vulcan.*

20030
copy 1

A of taſt rather than of ſmell, in ſuch odoriferous perfumes and mixtures. Well, to ſpeake at a word, ſurely that ground is beſt of all other, which hath an aromaticall ſmell and taſt with it. Now if we liſt moreouer to be better inſtructed, what kind of ſauour and odour that ſhould be, which we would ſo gladly find in the earth; we may oftentimes meet with that ſent, euen when ſhe is not ſtirred with the plough, but lieth ſtil and quiet, namely, a little before the ſun-ſetting, eſpecially where a rainbow ſeemeth to ſettle & pitch her tips in the Horizon: alſo, when after ſome long and continuall drought, it beginneth to rain; for then being wet and drenched therwith, the earth will ſend vp a vapor and exhalation (conceiued from the Sun) ſo heauenly and diuine, as no perfume (how pleaſant ſoeuer it be) is comparable vnto it. This ſmell there muſt be in it when you ere it vp with the plough: which if a man find once, he may be aſſured it is a
B right good ground; for this rule neuer faileth: ſo as (to ſay a truth) it is the very ſmel and nothing els, that will iudge beſt of the earth: and ſuch commonly are new broken grounds, where old woods were lately ſtocked vp: for all men by a generall conſent, do commend ſuch for excellent. Moreouer, the ſame ground for bearing is held to be far better, whenſoeuer it hath reſted betweene, and either lien ley or fallow; whereas for vineyards it is clean contrary: and therefore the more care and diligence is to be emploied in chuſing ſuch ground, leaſt wee approoue and verifie their opinion, who ſay, That the ſoile of all Italie is alreadie out of heart and weary with bearing fruit. This is certaine, that both there and elſewhere, the conſtitution of the aire and weather, both giueth and taketh away the opportunitie of good husbandrie, that a man cannot otherwhiles do what he would: for ſome kind of grounds there is ſo fat and ready to reſolue in-
C to mire and dirt, that it is impoſſible to plough them and make good worke, after a ſhower of raine. Contrariwiſe, in Byzacium a territory of Africke, it is far otherwiſe: for there is not a better and more fruitfull piece of ground lieth without dore than it is, yeelding ordinarily 150 fold; let the ſeaſon be dry, the ſtrongeſt teeme of oxen that is, cannot plough it: fall there once a good ground ſhower, one poore aſſe, with the help of a ſilly old woman drawing the ploughſhare at another ſide, will be able to go round away with it, as I my ſelfe haue ſeen many a time and often. And whereas ſome great husbands there be, that teach vs to inrich and mend one ground with another, to wit, by ſpreading fat earth vpon a lean and hungry ſoile; & likewiſe by caſting drie, light, and thirſtie mould, vpon that which is moiſt and ouer-fat; it is a meere follie and waſtfull expence both of time and trauaile: for what fruit can he euer looke to reape from
D ſuch a mingle mangle of ground?

Chap. VI.

¶ *Of the earth which Britaine and France loue ſo well.*

THe Britaines and Frenchmen haue deuiſed another meanes to manure their ground, by a kind of lime-ſtone or clay, which they call Marga [*i.* Marle.] And verily they haue a great opinion of the ſame, that it mightily inricheth it & maketh it more plentiful. This marle is a certaine fat of the ground, much like vnto the glandulous kernels growing in the bodies of beaſts, and it is thickned in manner of marrow or the kernell of fat about it.

E

Chap. VII.

¶ *The diſcourſe of theſe matters continued according to the Greekes.*

THe Greekes alſo haue not ouerpaſſed this in ſilence: for what is it that they haue not medled withall? The white clay or earth wherewith they vſe to marle their grounds in the territorie of Megara, thoſe onely I meane which are moiſt and cold, they call Leucargillæ. Theſe marles (all the kind of them) do greatly inrich France and Britaine both, and therefore it would not be amiſſe to ſpeak of them more exactly. In old time there were two ſorts therof, and no more: but of late daies (as mens wits are inuentiue euery day of one thing or other) they haue begun to find out more kindes, and to vſe the ſame: for there are now diuers marles, the
F white, the red, the Columbine, the clay ſoile, the ſtony, and the ſandy: and all theſe are but two in nature, to wit, either hard and churliſh, or elſe gentle and fat. The triall of both is knowne by the handling, and a twofold vſe they yeeld; either to beare corne onely, or els for graſſe and paſture alſo. The ſtonie or grauelly ſoile is good only for to nouriſh corne; which if it be white

withall, and the pit thereof found among ſprings or fountains, it wil cauſe the ground to be in- G
finite fruitfull; but it is rough in handling, and if it be laid too thick vpon the lands or leyes, it wil burn the very ground. The next to it is the red marle, called alſo Capnumargos, which hath intermingled in it a certaine ſmall ſtony grit full of ſand: This ſtony marle the manner is to break and bruiſe vpon the very lands; and for the firſt yeares, hardly can the ſtraw be mowne or cut downe for the ſaid ſtones. Lighter is this marle than the reſt by the one halfe, and therefore the cariage thereof into the field is leaſt chargeable. It ought to be ſpred and laid thin, & ſome thinke that it ſtandeth ſomewhat vpon ſalt. But both the one and the other will ſerue well for fifty yeares, and the ground inriched thereby, will (during that time) yeeld plenty as well of corne as graſſe.

CHAP. VIII. H

¶ *Sundry ſorts of Earth and Marle.*

OF thoſe marles which are found to be fat, the white is chiefe; and thereof be many ſorts. The moſt mordant and ſharpeſt of them all, is that whereof wee ſpake before. A ſecond kind there is of chalkiſh clay, which our gold-ſmiths vſe (called Tripela:) this lieth a great depth within the earth, inſomuch as many times men are driuen to ſinke pits 100 foot deep, for it; and thoſe haue a ſmall and narrow mouth aboue, but within-forth and vnder the ground they be digged wider, by reaſon that the veine thereof runneth many waies, in manner of other mettall mines. This is the marle ſo much vſed in Britain: the ſtrength therof being caſt vpon a land, will laſt 80 yeres; and neuer yet was the man known that herewith marled the ſame I
ground twice in all his life time. The third kind of white marle, is that which the Greekes call Gliſchromargon: it is no other than the Fullers chalkie clay mixed with a viſcous and fatty earth. The nature of it, is to breed graſſe better than to beare corne: for after one crop of corne is taken off the ground in harueſt, before ſeed time is come for winter grain, the graſſe wil be ſo high growne, that a man may cut it down and haue a plentiful after-math for hay: and yet al the while that it hath corn vpon it, you ſhall not ſee it to beare any graſſe beſides. This marle continueth good 30 yeres: if it be laid ouer-thick vpon a land, it choketh the ground in manner of
* Cumine. The Columbine marle, the Gauls call in their language, by a name borrowed of the Greeks, Pelias, (*i.* Doue or Pigeon marle:) it is fetched out of the ground in clots and lumpes, like as ſtones be hewed out of quarries: with Sunne and the froſt together, it will reſolue and K
cleaue into moſt thin ſlates or flakes. This marle is as good for corne as for herbage. As for ſandy marle, it will ſerue the turn for want of other: yea and if the ground be cold, moiſt, and weely, the husbandman will make choice thereof before other.

* *Cymini. Turneb.* reades *Signini*, & meaneth thereby ſhards of potters worke and ſuch like rubbiſh.

The Vbians, vpon my knowledge, vſe to inrich their ground and make it more battle (though their territory otherwiſe be moſt fertile) with any earth whatſoeuer; prouided alwaies that it be digged vp three foot deep at leaſt, and laid a foot thick; a deuiſe that no other country doth practiſe: howbeit this ſoile and manner of manuring, continueth good not aboue ten yeres: the Heduans and Pictones, haue forced their grounds and made them moſt plentifull, with limeſtone; which is found alſo by experience to be paſſing profitable for vines and oliues.

To come now to the ordering of this piece of husbandry: the ground ought to be ploughed L
firſt, before marle of any ſort be caſt vpon it; to the end that the medicinable vertue & ſubſtance thereof, might the ſooner and more greedily be receiued into it. Now foraſmuch as marle is at the firſt ouer-rough and hard, not ſo free in the beginning as to reſolue and turne into blade or graſſe, it had need of ſome compoſt or dung to be mingled with it: for otherwiſe, be it neuer ſo rich, it will rather do harm than good to the ground, by reaſon that it is yet ſtrange and not acquainted therewith: and yet help it this way as wel as you can, it will not bring forth any plenty the firſt yere after it is laid on. Laſt of all, it skilleth much to conſider the nature of the ground, which you mean to marle: for the dry marle, ſorteth well with a moiſt ſoile; and the fatty, hitteth that which is dry and lean. But when the ground is of a middle temperature between both, it mattereth not whether you vſe the white gold-ſmiths chalke, or the Columbine-marle, for M
either of them will ſerue well enough.

A

Chap. IX.

¶ *The vſe of aſhes vpon lands: of Dung: what graine or pulſe ſowne, doth make the ground more plentifull, and what burneth it.*

THe people dwelling beyond the Po, make ſuch account of aſhes for to inrich the grounds withall, that they prefer it before horſ-muck, and ſuch like: which dung (becauſe they take it to be very light) they burne alſo into aſhes for that purpoſe. Howbeit (as we haue ſaid before) in one and the ſame corn-land, they vſe not aſhes and mucke both at once: no more doe they caſt aſhes in hortyards for to nouriſh yong trees, nor in fields, for ſome kind of corn. Some are of iudgement, that grapes are fed with duſt: who alſo do caſt duſt vpon them when they be-
B gin to bloome, yea and beſtrew duſt vpon the roots as well of Vines as other trees. Certain it is, that in the prouince of Narbon they vſe ſo to do, and they are aſſuredly perſuaded, that grapes ripen better and the vintage commeth the ſooner thereby: becauſe in thoſe parts duſt doth more good than the Sun.

As for mucke, there be diuers ſorts thereof, and in old time much vſe there was of it: for in *Homer* we read, that long ago the good old king [*Laertes*] was found laying ſoile and dung vpon his land with his own hands. The firſt that deuiſed mucking of grounds, was (by report) *Augeas* a king in Greece: but *Hercules* divulged the practiſe thereof among the Italians, who in regard of that inuention immortalized their K. *Stercutius* the ſon of *Fauuus*. *M. Varro* eſteemeth the dung of Blackbirds (gathered out of their bartons where they be kept in mew) aboue al others.
C He highly magnifieth and extolleth it alſo, for that it bringeth forth ſo good forage to feed kine, oxen, and ſwine withall: auouching for certaine, that they will become fat beeſe and pork with no meat ſooner. We muſt thinke well therfore and hope the beſt of the world now adaies, ſince that our anceſtors and forefathers ſo long ago had ſo great bartons and pens, that the dung of fouls there kept, was ſufficient to help their hard and hungry grounds. In the ſecond degree of goodneſſe, *Columella* rangeth Pigeons dung gathered out of Doue-cotes: the third place hee giueth to that of Hens, and other land pullen, reiecting altogether the dung of water-foule. Howbeit all other Authors (ſetting theſe two aſide) attribute with one voice and conſent vnto the excrements of mans body, the greateſt praiſe for this purpoſe. Some of them prefer mans vrine, and namely, when the haires of beaſt-hides haue bin ſoked therewith and quicke-lime to-
D gether in the Tanners pits. Others vſe vrine alone by it ſelfe, only they mingle water with it againe, but in greater quantitie a good deale, than they (whoſe vrine it was) did put to the wine when they drank it: and good reaſon too; for more need there is now to correct and repreſſe the malice thereof, conſidering that beſides the natiue malignitie of the wine it ſelfe, mans bodie hath giuen and imprinted into it, a ſtrong and vnſauorie quality. Thus you may ſee how men labour, ſtriue, and try concluſions, to feed and inrich the very ground, the beſt way they can deuiſe. Next vnto the ordure and vrine of mans body, the filthy dung of ſwine is moſt commended: only *Columella* condemneth it. Some praiſe the mucke of any foure-footed beaſts whatſoeuer, ſo they were fed with Tree-trifolie, called Cytiſus. Others prefer the doung of Pigeons before any other; in the ſecond place that of Goats; thirdly of ſheepe; then of kine and oxen; and
E laſtly of cart-jades, mules, aſſes, and ſuch like. Thus you ſee as well what difference there was in times paſt, between this dung and that; as alſo what were the rules (ſo farre as I can gueſſe and learne) whereby they went, in the vſe and ordering thereof: for, to ſay a truth, the old way is beſt, euen herein as well as in other matters. Ouer and beſides, the practiſe hath bin already ſeen in ſome of our prouinces (where there is ſo great ſtore of cattell bred) to riddle and ſift their dung ouer their ground through ſieues, in manner of meale; and ſo in proceſſe of time it loſeth not only the ſtinking ſent and ill-fauored ſight that it had, but alſo turneth into a pleaſant ſmel, and looketh louely withall. Of late, found it hath been by experience, that Oliue trees doe like and proſper very well, if the aſhes of lime-kills eſpecially be laid to their roots. *Varro*, among many other precepts, addeth and ſaith, That corne grounds would be manured with horſ-dung,
F becauſe it is the lighteſt; but medowes require compoſt that is heauier, and namely, made by beaſts that haue barley for their prouender; for that ſuch ſoile bringeth plentie of graſſe. Some there bee alſo, that preferre the dung made by horſes, before the mucke of kine and Oxen; likewiſe ſheeps treddles, before Goats dung; but Aſſes mucke before all other, becauſe

they eat and chew their meat moſt leiſurely. But daily experience teacheth the contrary, and teſtifieth againſt the one and the other. And thus much as touching compoſt of mucke. G

Furthermore, all men are of opinion, that nothing is better for the ground, than to ſow Lupines therupon; prouided alwaies, that before it cod, it be turned into the ground by the plough, ſpade, or two-piked yron forke: alſo when it is cut down, to make it into wads or bottles, and ſo to bury them at the roots of trees, and vines eſpecially. In countries where there are no cattell to better the lands, it is thought good to manure the ſame in ſtead of beaſts dung, with very hawme, ſtraw, and ferne. *Cato* hath a deuiſe to make an artificiall mucke or compoſt of litter, lupine ſtraw, chaffe, beane ſtalks, leaues and branches both of Maſt-holm and oke. He ſaith moreouer to the ſame purpoſe: Weed out of the ſtanding corn * Walwort [otherwiſe called Danewort] and Hemlock; alſo from about oſier-plots, plucke vp ranke weeds, or ground Elder; alſo Reeke or Sea-graſſe, and dead leaues or branches lying rotten vnder trees: when thou haſte ſo done, ſtrew, and lay a courſe of them vnder ſheep where they be folded. *Item*, If the Vine begin to decay and wax leane, burne the ſhreads and cuttings of the owne, and turne the aſhes vnder ground hard to the roots thereof. *Item*, where thou meaneſt to ſow any wheat or ſuch like bread-corn, draw thy ſheep thither, and there fold them. He ſaith moreouer, that the ſowing of ſome graine is as good as a dunging to the ground: for theſe be his very words, The fruit it ſelfe of the earth is a batling to the earth; and namely, Lupines, Beans, and Vetches, for they muck the lands: like as on the contrary ſide, Chiches do burn the ground, both becauſe they are plucked, and alſo for that they ſtand vpon ſalt. Semblably doth Barley, Fœnigreeke, Eruile, and generally all kind of pulſe which are pulled and not mowne downe. *Item*, Take heed (quoth *Cato*) that you ſet no pepins or kernels, where you meane to ſow corne. As for *Virgil*, he is of opinion, that the ſowing of Line-ſeed for flax, likewiſe of Otes and Poppies, do burne corne-ground and pill it out of heart. He alſo giueth rules as touching mucke-hills, That they ſhould be made in the open aire, within ſome hollow place where it may gather water; that they be couered ouer with ſtraw and litter, for feare they ſhould dry in the Sun; and laſt of all, that they haue a good ſtrong ſtake of Oke pitched and driuen in about the mids thereof, for ſo there will no ſnakes nor ſuch like ſerpents breed and ingender therein. Moreouer, as touching the ſpreading of mucke, and mingling it with the mould of a land, it is exceeding good to do it when the winde ſetteth full Weſt, ſo that the Moon then be paſt the full and in the Waine. But this rule many haue miſtaken and not conſtrued aright, ſuppoſing that they ſhould ſo do when the Weſtern wind Fauonius beginneth to riſe, and namely in the moneth of Februarie only; whereas indeed moſt corn-lands require this point of husbandry in other moneths as wel. But looke what time ſoeuer you liſt to do it, be ſure in any hand that the wind do then blow from the Equinoctiall point of the Weſt, and that the moone then be in the waine, and drie withall. Haue regard to theſe rules and obſeruations, you will wonder to ſee the effects thereof, and what increaſe the earth thereby will yeeld.

* *Herba Allen.*

Chap. X.

¶ *The planting and ſetting of trees: the manner how trees do grow, by a Sion ſliued and plucked from the root.*

NOw that we haue already ſufficiently treated of the conſiderations as well of the aire and skie, as of the earth, belonging vnto plants and trees; me thinks it were to good purpoſe to diſcourſe of the induſtry and artificiall meanes that men haue vſed to make trees grow: and verily we ſhall find no fewer kinds of them that come by mans hand, than of ſuch as nature it ſelfe hath brought forth; ſo kind and thankfull we haue bin to her, as to make recompence in this behalfe. Firſt and formoſt therefore this is to be noted, That all trees do grow either of ſeed ſowne, or of branches growing to the tree and couched in the ground, or of an old ſtocke from whence new imps may ſprout: alſo, either of a ſlip or ſprig plucked from another tree, and ſo laid in the ground; or of a young ſhoot, twig, impe, or Sion, engraffed in the very trunk of a tree, ſlit and clouen for that purpoſe. For I cannot chuſe but maruell much at *Trogus*, who was verily perſuaded, That about Babylon the leaues onely of Date trees beeing ſet or ſowne, would prooue trees. Now whereas there be ſo many deuiſes aboueſaid for to nouriſh trees, this you muſt vnderſtand, that ſome trees there be which will grow by many of theſe waies before ſpecified,

L

20030
copy 1

A fied, and others by them all. And verily the moſt part of this knowledge hath beene taught by Nature her ſelfe: for firſt of all, we haue learned by her for to ſow ſeed, by occaſion that we haue ſeen ſome to fall from trees, which being receiued by the ground, haue chitted, taken root, and liued. And in very truth, ſome trees there be that grow no otherwiſe, as Cheſtnut, and Walnut-trees, excepting onely thoſe that being cut downe, doe ſpring new again from the root. Of ſeed alſo (although the ſame be farre vnlike to others) thoſe alſo will grow; that are vſually planted otherwiſe; as for example, Vines, Apple trees, and Pyrries: for in theſe the ſtone and pepin within, ſerueth in ſtead of the ſeed; and not the fruit it ſelfe, as in thoſe before rehearſed, the kernels whereof [*i.* the fruit] are ſowne. Medlars likewiſe may come vp of ſeed. But all the ſort of theſe that ſpring after this maner, be late ere they be come forward, and ſlow in growth: they turn alſo
B to a degenerat and baſtard nature, and had need to be graffed anew ere they be reſtored to their owne kind: which is the caſe of Cheſtnuts alſo otherwhiles. Howbeit there be others for them againe, which (ſow or ſet them what way you will) neuer grow out of their owne kind; and ſuch be Cypreſſes, Date trees, and Lawrels: for the Lawrell commeth vp by ſowing, by ſetting, and planting, after ſundry ſorts. The diuers kinds whereof, we haue deſcribed already. Of all which, the Lawrell Auguſta with the broad leaues, the common Bay tree alſo that beareth berries, as alſo the wild kind named Tinus, be ordered all three after one and the ſame ſort. The manner whereof is this: the Bayes or berries thereof, be gathered dry in the moneth of Ianuary when the Northeaſt wind bloweth: they are laid abroad thin to wither, one apart from another, & not in heaps, for feare they ſhould catch a heat. This done, ſome put them afterwards in dung; and
C being thus prepared and ready for to be ſowne, they ſteep them in wine. Others take and lay them within a large basket or twiggen panier, trample them vnder their feet in a brook of running water, vntill they be pilled and rid of their outward skins: for otherwiſe their skin is of ſo tough and moiſt a ſubſtance, that it would hardly or not at all ſuffer them to come vp & grow. After all this, in a plot of ground wel and throughly digged once or twice ouer, a trench or furrow muſt be made a handfull deepe, and therein the berries ought to be buried by heaps, to wit, twenty or thereabout together in one place: and all this would be done in the month of March. Lawrels alſo will grow, if their branches or boughes be bended from the ſtocke and laid within the ground: but the Triumphall Lawrell will come vp no other way but by ſetting a graffe or impe cut from it. As for the Myrtle, all the ſorts thereof within Campaine, come of berries
D ſown: but we at Rome vſe to interre only the boughes of the Tarentine Myrtle, growing ſtill to the body, and by that means come to haue Myrtle trees. *Democritus* ſheweth another deuiſe alſo to increaſe Myrtles, namely, to take the faireſt and biggeſt berries thereof, & lightly to bruiſe or bray them in a mortar, ſo that the grains or kernels within be not broken; & then to beſmere with the batter or ſtamped ſubſtance thereof, a courſe cord made of Spart or Spaniſh broome, or els hempen hurds, and ſo lay it along within the ground. Thus there wil ſpring therof, a maruellous thick hay or wall (as it were) of yong Myrtles: out of which, the ſmall twigs you may draw which way you will, yea, and plant them elſwhere. After the like manner, folke vſe to ſow thorns or brambles for to make hedges & mounds, namely, by annointing ſuch another hempen rope with bramble blacke-berries, and interring the ſame. As for Bayes thus ſowne, when they
E come once to beare a dark and blackiſh leafe: Myrtles alſo, when their leaues be of a wine color, to wit, of a deep red (which commonly happeneth when they be three yeres old) it wil be time to remoue and tranſplant.

Among thoſe plants and trees that are ſowne of ſeeds, *Mago* maketh much ado, and is foully troubled about thoſe trees that beare nuts, & ſuch like fruit in ſhels: for to begin with almonds firſt, he would haue them to be ſet in a ſoft clay ground that lieth into the South: & yet he ſaith again that Almond trees loue a hot and hard ſoile; for in a fat or moiſt ground, they will either die or els wax vnfruitful. But aboue all, he giueth a rule to chuſe Almonds for to ſet or ſow, that be moſt hooked, and eſpecially ſuch as were gathered from a young tree: alſo he ordaineth, that they ſhould be well ſoked or infuſed in ſoft beaſt ſherne or thin dung, for three daies together:
F or at leaſtwiſe in honied water, a day before they be put into the ground. *Item*, they ought (by his ſaying) to be ſet charily with the ſharp and pointed end pitched downward, and the edge of the one ſide to turne into the Northeaſt. Alſo that they muſt ſtand three and three together in a triangle, forſooth, ſo as there be a handbredth iuſt between euery one. Moreouer, that euerie tenth day they ought to be watered, till they be ſhot vp to a good bigneſſe. Now to come vnto

walnuts,they be laid along within the earth, with this regard,that they do ly vpon their ioints. G
As for pine nuts,there would be ſix or ſeuen of their kernels put together into pots that haue holes in them,and ſo buried in the ground: or elſe they ſhould be ordered after the manner of the Bay tree,which commeth of berries bruiſed,as hath been ſhewed before.

The Citron tree will grow of ſeed, and may be ſet alſo of ſprigges or twiggs drawne to the ground from the tree,and ſo couched. Servis trees come of the grains thereof ſowed of a quick-ſet plant alſo with the root,or of a ſlip plucked from it. But as the Citron trees liue in hot grounds,ſo theſe Serviſes loue cold and moiſt.

As concerning ſeminaries and nourſe-gardens,Nature hath ſhewed vs the reaſon and maner thereof, by certaine trees that put forth at the root a thick ſpring of yong ſhoots or ſions; but lightly the mother that beareth theſe imps, killeth them when ſhe hath done, with her ſhade H
and dropping together. And this is euident to be ſeene in Lawrels, Pomegranate trees,Planes, Cherry trees,and Plum trees: for ſtanding as theſe imps doe, a number of them without all order vnder their mother ſtocke,they be ouerſhadowed and kept downe ſo, that they miſlike and neuer come to proofe. Howbeit ſome few there be of this ſort, that are not ſo vnkinde to their yong breed,as to kill them with the ſhadow of their boughs,and namely Elmes & Date trees. This would be obſerued by the way,that no trees haue ſuch yong imps ſpringing at their feet, but they only whoſe roots for loue of the warm ſun and moiſt rain, ſpred aloft and ly eb within the ground. Moreouer,the manner is not to ſet theſe yong plants preſently in the place where they muſt remaine and continue for altogether, but firſt they are to be beſtowed in a piece of ground where they may take nouriſhment,to wit,in ſome nurſe-garden for the nones,vntil they are grown to a good ſtature; and then they are to be remoued a ſecond time to their due place. And a wonder it is to ſee,how this tranſplanting doth mitigate euen the ſauage nature of the I
wildeſt trees that are: whether it be that trees as well as men are deſirous of noueltie,and loue to be trauelling for change; or that as they go from a place,they leaue behind them their malicious qualitie,and being vſed to the land,become tame and gentle like the wild beaſts; eſpecially when ſuch yong plants are plucked and taken vp with the quicke root. Wee haue learned of Nature alſo another kinde of planting like to this: for we ſee that not only water ſhoots ſpringing out of the root, but other ſprigs ſlipped from the ſtocke, liue and doe full well: but in the practiſe of this feat they ought to be pulled away with a colts foot of their owne, ſo as they take a quicke parcell alſo of their mothers bodie with them, in manner of a fringe or border hanging thereto. After this manner they vſe to ſet Pomegranate, Filberd, Hazell, Apple, and Serviſe trees; Medlars alſo, Aſhes,and Figge trees; but Vines eſpecially: marie,a quince K
ordered and planted in that ſort, will degenerate and grow to a baſtard kinde. From hence came the inuention,to ſet into the ground yong ſprigs or twigs,cut off from the tree. This was at firſt practiſed with foot-ſets for a prick-hedge,namely,by pitching down into the earth, Elder,Quince-cuttings,& brambles; but afterwards men began to do the like by thoſe trees that are more ſet by,and nouriſhed for other purpoſes, as namely Poplars, Alders,and the Willow, which of all others may be pricked into the ground with any end of the cutting or ſprig downward,it makes no matter whether,for the ſmaller end will take as wel as the bigger. Now al the ſort of theſe are beſtowed and ranged in order at the firſt hand,euen as a man would haue them and where he liſt to ſee them grow, neither need they any remouing or tranſplantation at all. But before we proceed any further, to other ſorts of planting trees, it were good to declare the L
manner how to order ſeminaries, ſeed-plots,or nource-gardens.

For to make a good pepinnier or nource-garden, there would be choſen a principal and ſpecial peece of ground; for oftentimes it falleth out, yea and meet it is,that the nource which giueth ſucke ſhould be more tender ouer the infant, than the owne naturall mother that bare it. In the firſt place therefore, let it be ſound and drie ground, howbeit furniſhed with a good and ſucculent elemental moiſture, and the ſame broken vp and afterwel digged ouer and ouer with mattock and ſpade, and brought to temper and order, ſo as it be nothing coy but readie to receiue al manner of plants that ſhall come,and to entertain them as welcome gueſts; & withall, as like as may be to that ground vnto which they muſt be remoued at laſt. But before al things this would be looked to, that it be rid clean of all ſtones; ſurely fenced alſo and paled about,for M
to keep out cockes and hens and all pullen: it muſt not be full of chinkes and cranies,for feare that the heat of the ſunne enter in and burne vp the ſmall filaments or ſtrings and beard of the

new

20030
copy 1

A new roots : and laſt of all, theſe pepins or kernels ought to ſtand a foot and a halfe aſunder : for in caſe they meet together and touch one another, beſides other faults & inconueniences, they will be ſubiect to wormes : and therefore I ſay there would be ſome diſtance between, that the ground about them may be often harrowed and raked, to kill the vermin, and the weeds pluckt vp by the heeles that do breed them. Moreouer, it would not be forgotten to proin theſe yong plants when they are but new come vp : to cut away, I ſay, the ſuperfluous ſprigs vnderneath, and vſe them betimes to the hooke. *Cato* giueth counſel to ſticke forks about their beds a mans height, and lay hurdles ouer them, ſo as the Sun may be let in vnderneath : and thoſe hurdles to couer and thatch ouer with ſtraw or holme, for to keepe out the cold in winter. Thus are yong plants of Peare trees and Apple trees nouriſhed : thus Pine nut trees, thus Cypreſſes which do
B likewiſe come vp of ſeed, are cheriſhed.

As for the grains or ſeeds of the Cypres tree, they be exceeding ſmall, and ſo ſmall indeed, that ſome of them can ſcarce be diſcerned well by the eye. Wherein the admirable worke of Nature would be conſidered, to wit, that of ſo little ſeeds ſhould grow ſo great and mightie trees, conſidering how far bigger are the cornes of Wheat and Barley (to make no reckoning nor ſpeech of Beans) in compariſon of them. What ſhould we ſay to Peare trees and Apple trees ? what proportion or likeneſſe is there between them, and the pretty little pepins whereof they take their beginning ? Maruell we not, that of ſo ſlender and ſmall things at the firſt, they ſhould grow ſo hard, as to checke and turne again the very edge of ax and hatchet ? that frames and ſtocks of preſſes ſhould be made thereof ſo ſtrong and tough, as will not ſhrinke vnder the
C heauieſt poiſe and weights that be ? that Maſt-poles comming thereof ſhould be able to beare ſaile in wind and weather ? and finally, that they ſhould afford thoſe huge and mightie Rams and ſuch like engins of batterie, ſufficient to command towers and baſtils, yea, and beat downe ſtrong walls of ſtone before them ? Lo what the force of Nature is ! ſee how powerfull ſhee is in her works ! But it paſſeth and exceedeth all the reſt, that the very gum and liquour diſtilling out of a tree, ſhould bring forth new plants of the ſame kind, as we will more at large declare in time and place conuenient. To returne then againe to the female Cypres (for the male as hath bin ſaid already bringeth forth no fruit) after that the little balls or pills (which be the fruit thereof) be gathered, they are laid in the Sun to dry, during thoſe moneths, which we haue before ſhewed, and being thus dried, they will breake and cleaue in ſunder. Now, when they are
D thus opened, they yeeld forth a ſeed which Piſmires are very greedy of. Where another wonder of Nature offereth it ſelfe vnto vs, That ſo ſmall a creature as it ſhould eat and conſume the ſeed which giueth life and being to ſo great and tall trees as the Cypres. Well, when the ſaid ſeed is gotten, and the plot of ground laid euen and ſmooth, with cilinders or rollers, it muſt be ſowne of a good thickneſſe in the moneth of Aprill : and freſh mould ſifted and ſtrewed ouer with riddles an inch thicke and no more : for if this grain be buried ouer-deep and ſurcharged, it is not able to break through againſt the weight of the earth, but in ſtead of riſing vp, the new chit turneth and bendeth backward vnder the ground. And hereupon it is that folke forbeare either to go at all vpon it, or elſe they tread very lightly. Being thus ſowed, it muſt be gently watered for three daies following, after the Suns ſetting, (that the earth may drinke equally in
E all places) vntill the ſprouts appeare aboue ground. Now, after they haue had a yeares growth, they be tranſlated and re-planted againe in rewes : for by that time they are come to a ſpan or nine inches in height : but great care muſt be had that the time be temperat, that is to ſay, that the weather be freſh and faire without any wind. Certes a wonderfull thing it is to be ſpoken, that all the danger or ſecurity of this tree, ſtandeth vpon the choice of that only day wherein it is replanted : for let there fall neuer ſo ſmal a rain or dew, nay let the wind blow neuer ſo little, it is a great haſard whether it will die. For euer after it is wariſhed and ſafe enough, howbeit it cannot abide a glut of rain at any time following. Moreouer, as touching Iujubes, they are likewiſe ſet of their graines in the moneth of Aprill. But that kinde of Peaches or Abricots which be called Tuberes, loue better to be graffed either vpon a skeg or wilde Plum-ſtocke, or
F Quince, or elſe vpon the wild Hart-Rhamme, called Calabricum, [or Spina Cervina.] To knit vp this diſcourſe, the fruit Sebeſten and the Serviſes may be graffed and planted both vpon the ſame kind of ſtocke : and looke what will beare the one, is apt to receiue the other.

G

Chap. XI.

¶ *The manner of tranſlating or replanting out of one ſeminarie or nource-garden vnto another. How Elmes are to be planted. Alſo as touching trenches.*

SOme would haue vs to remoue plants out of one ſeminarie into another, before they be ſet indeed where they ſhould be for to continue: which me-thinkes is a matter of more toile and curioſitie than neceſſitie, howſoeuer they make promiſe, that by ſuch tranſplanting, the leaues will proue larger and broader.

i. The firſt of March.

Now for Elms, their ſeed or grain is to be gathered about the * Calends of March, when it beginneth to turn yellow, and before the leaues break forth. After it hath bin dried in the ſhadow for two daies, it is to be ſown thick in a plot of ground well broken vp and laid hollow beforehand, and then muſt there be mould ſearced ouer through a fine riddle, to the ſame thickeneſſe as we haue appointed for the Cypres. In caſe no raine do fall in due time, it ought to be watered by hand. After one yere, the plants that come herof muſt be taken vp out of the trenches and ranges wherein they came vp, and tranſlated directly into the Elme plots where they are to grow; with this care & good regard, that they ſtand a foot at leaſt euery way diſtant one from another. As for the male Elmes, vnto which Vines are wedded, becauſe they are without ſeed, it is better they were planted in the Autumne: and for that they want ſeed they would be ſet of plants. Here with vs about Rome ſide they vſe to replant them again in their groue-plots when they be fiue yeares old, or as ſome would haue it, ſo ſoon as they be come to 20 foot in height. The maner whereof is this, in a trench or ditch called * Novenarius, 3 foot deep in the ground, and as many broad, or rather more, they are ſet: which done, for three foot in height euery way about the foot of each tree from the ground as it ſtands, there muſt be banks raiſed of ſome earth, after the maner of thoſe ſeats which they cal Arulæ in Campanie. As for the ſpaces between tree and tree, they ought to be ſet out and diſpoſed according to the nature and ſcituation of the place, and as the ground wil giue leaue. In the champion and plain country, thoſe would be planted that are of a drier nature, and likewiſe in a thinner courſe. As for Aſhes and Poplars, becauſe they make haſt to ſpring, leafe, and bud out betimes, it is meet that their plants likewiſe were ſet and ranged with the firſt, that is to ſay, about the * Ides of Februarie; for they alſo grow of plants, and may well be replanted.

H

I

i. Nine foot diſtant euery way from another, for trees were planted ordinarily with that ſpace between: as may appeare in the next chapter.

i. The 13 day of Februarie.

K

Now for the order of ſetting trees either in groues, hort-yards, or vine-yards, wee ought to follow the vſuall maner of checquer row, called Quincuntial, which is not ſo common, but it is alſo as neceſſarie: not only good to admit all kindes of winde to paſſe betweene, but alſo faire and pleaſant to the eye, conſidering, that which way ſoeuer a man looks, there offer to his ſight both the allies, and rewes, directly rangedin order.

The Opiets or Wich-Hazels are ſown of ſeed after the ſame maner as Elme: in like ſort alſo are they to be remoued & tranſplanted out of their nource-plots, as if they were wild, drawn from the very forreſts.

Moreouer, aboue all things this would be conſidered, that a tree to be remoued ought to be tranſlated either into the like ground from whence it came, or elſe into a better. For we muſt take heed how we remoue plants out of warme grounds, & where the fruit is early ripe, into others that be colder or late in ripening. Semblably, out of cold & hard places, they would not be tranſlated into warm, mellow, and forward. *Item*, if it be poſſible, let the trenches be caſt and digged ſo long before, that a good thicke green ſourd be ouergrowne againſt the time that you mean to plant. *Mago* is of opinion, That the ſaid trenches ſhould ſtand made a yeare before at the leaſt, that they might be fully ſeaſoned with the Sun, and receiue all rain, winde, & weather throughly. But in caſe it fall out otherwiſe, that the opportunitie thereof be ouerſlipt, or our leiſure wil not ſerue, he would haue fires to be made in the midſt of them two moneths before, and in no caſe any trees to be ſet but after ſhowres of rain. And if the ground be tough or hard, and ſtanding vpon the cley, the ditches ought (according to *Mago*) for to be three cubits deepe euery way: and if they be to plant plum trees, he would haue them be a hand-bredth more, or ſpanne in deapth, and digged on euery ſide hollow, and vaulted in manner of a fournace, with a narrower mouth in the top. In a blacke veine of ground, by his direction, it is ſufficient that they be two cubites and a hand-breadth or ſpanne deepe, and made foure-ſquare in manner

L

M

20030
copy 1

A ner of a quadrangle. In the meaſure and proportion of theſe ditches, the Greeke writers doe accord in one, ſaying, that they ought not to be more than two foot and a halfe deepe, nor wider than two foot bare: alſo, that in no place it muſt be vnder a foot and a halfe deepe, for that in a moiſt ſoile, we ſhal come ordinarily neer to water about that skantlin, and not before. But *Cato* is of another judgment, If (quoth he) the place be wateriſh, let the trenches be three foot broad in the mouth, but in the bottome not aboue a foot and a hand-breadth, but ſee they bee foure foot deep: prouided alwaies, that they be * paued beneath with ſtone: and for want thereof, laid with green willow baſtons, and for default of them, with vine cuttings, or ſuch trouſſe, ſo that they lie halfe a foot thicke. But conſidering the nature of trees wherof we haue before written, I think it not amiſſe to adde ſomewhat of mine owne, namely, The more ebbe that any roots of
B trees creepe vnder the ground, the deeper they muſt be ſet into the earth, as for example, the Aſh and the Oliue tree: for they and ſuch other like ought to ſtand foure foot deepe. As for all the reſt, it skils not, if they goe no deeper than 3 foot, for that is thought ſufficient. [Stocke me vp this root here (quoth *Papyrius Curſor* a Roman in General, in a brauery, when he meant to terrifie the Pretor of the Prænestines.) Whereby it is plain that the more ſecure & ſafe way in his judgment was rather to cut the ſtocke and maiſter Root indeed, than ſlightly to pare away thoſe bare roots that appeare naked aboue ground; for that mought be done, and the tree neuer the worſe for it.] Some there be that would haue round peble ſtones laid in the bottom of ſuch ditches, which might as wel contain and keep water, as let it forth and giue iſſue therto: whereas broad flat ſtones would not ſo doe, but beſides, hinder the root that it ſhould not goe downe
C and take hold of the earth. For to keep therefore a meane betweene, it were good in mine opinion, to lay grauell vnder the root.

Moreouer, there be diuers men of this mind, that a tree ſhould not be remoued, either vnder two yeares old, or aboue three: wheras others make no queſtion to tranſplant them after the firſt yeare, without more adoe. *Cato* alloweth not of tranſlating a tree, vnleſſe it beare in thickneſſe more than 5 fingers. And verily, ſo exactly hath he written hereof, that he would not haue forgotten, to marke in the barke of trees the South ſide, before they were taken vp, in caſe, hee had thought that it was material to the replanting of them, that they ſhould ſtand juſt in the ſame poſition and accuſtomed coaſt of the heauen, as they did before; for feare leaſt that ſide which regarded the North, if now it ſhould be oppoſed againſt the South, might cleaue and rift with
D the heat of the Sunne, not vſed thereto: and contrariwiſe, the parts which looked Southward, might now by the Northern winds, be clunged and congealed withall. Now there be ſome that affect a cleane contrarie courſe, and namely, in the Fig tree, and the Vine; exchaunging the one ſide for the other: being fully perſuaded, that by that means they will beare leaues thicker, preſerue and defend their fruit better, and in the end ſhed fewer: more particularly, that the fig tree therby wil be the * more eaſie to climb. Moſt men take great heed of this only, that when they prune trees, and cut off the top ends of boughes, the cut may be toward the South; without any regard or conſideration, that in ſo doing they expoſe the boughs to the danger of cleauing, by reaſon of the hote Southern wind which lieth vnceſſantly beating vpon them. Yet hold I rather with them, that would haue branches cut Southeaſt or Southweſt, namely, toward the points
E where the Sun is, at the fift and eight houres of the day. Another ſecret there is beſides, wherof they are as ignorant, howbeit, not to be neglected, namely, to beware that the roots of ſuch trees as are to be replanted, ſtay not long aboue ground, and thereby wax drie: alſo, that trees bee not digged vp, either ſtanding into the North, or in any quarter between that point and the Southeaſt, where the Sunne riſeth in midwinter, in caſe the wind ſit in thoſe corners: or at leaſtwiſe, that the roots be not expoſed bare againſt any of thoſe winds: for ſurely, many a tree dies hereby, and husbandmen neuer know the cauſe thereof. *Cato* vtterly condemneth al maner of winds whatſoeuer, yea, and raine too, all the while that trees be in remooving. Moreouer, in this caſe it is ſingular good, that there hang to the roots of theſe trees, when they be tranſlated, as much of the old earth wherein they liued and grew before, as may bee, yea, and (if it were poſſible) to
F bring them away with the turfes whole and entire, lapped faſt about the roots. And therefore *Cato* prouided wel, that ſuch yong plants ſhould be caried in baskets, earth and altogether with the roots. Doubtleſſe, not without very great reaſon there is one Author ſaith, That it is ſufficient that the vppermoſt courſe of the old mouth that lay at the foot of the tree, ſhould be put vnder the root thereof now when it is replanted. Some write, that if the bottom of the hole or

graue

* It ſeems that *Cato* meant of trenches to drain water out of low grounds: and not as *Pliny* miſtaketh.

* *Scanſilem*, reading it *ἐξαυτμον*, happily for *ἐξαστμον*, out of *Theophraſtus*, (i.) more fertill and fruitfull.

graue be paued with ſtone where Pomegranate trees ſhould ſtand, the Apple or fruit that they G
bear, wil neuer burſt nor cleaue vpon the trees. Alſo, that the roots of trees when they are to be ſet, ſhould be laid bending atone ſide, and not ſtand direct and ſtreight. Moreouer, that the tree in any caſe be ſet juſt in the mids of the ditch or hole made for it. It is ſaid moreouer, that if a man plant a fig-tree, together with the ſea-onion, Scilla (that is a kind of the Bulbi) it wil make haſt to bear Figs, and thoſe wil not be ſubject to the worme: and yet other fruits will be worm-eaten neuertheleſſe, ſet them with the ſaid Scilla as well as you can. As for the roots of a tree who makes any doubt, that great care ſhould be had in the taking of them vp? ſo as they might ſeeme rather drawn forth gently, and not plucked vp violently. But my purpoſe is not to dwell in theſe matters, nor to ſtand much vpon ſuch points, which haue a manifeſt reaſon, and wherof no man is ignorant or doubtfull; to wit, that the earth is to be well driuen and beaten downe H
cloſe with a rammer, that it may lie faſt about the roots, which *Cato* judgeth to bee a principall point for to be obſerued in this buſineſſe: who alſo giueth a rule, that the place where a tree is cut in the body, ſhould be plaſtred ouer with dung, couered ouer alſo, and faſt tied with leaues.

Chap. XII.

¶ *Of the ſpaces and diſtances that ought to bee betweene trees planted: of their ſhaddowes and droppings: of the place where they ſhould be planted.*

IT belongeth to this place properly for to ſpeak of the diſtances between tree and tree, in the ſetting. Some writers are of opinion, That Pomgranat trees, Myrtle trees, & Lawrels, ſhould I
be planted thicker than ordinarie, howbeit, with this regard, that they be ſet 9 foot aſunder one from another. As for Apple trees, they may ſtand a little more at large, Peare trees ſomewhat wider than they, Almond trees, and Fig trees yet a little more than all the reſt. But herein muſt we be ruled & directed by the boughs ſpreading more or leſſe, by the room of the place it ſelfe, and according to the ſhadow that each tree caſteth. There is not (I ſay) any one of theſe conſiderations to be neglected, and the ſhade eſpecially of all others would be obſerued. For ſuch trees as branch round as it were in compaſſe, although they be otherwiſe great, as namely Apple trees, and Pyrries, yet they yeeld no great ſhadow: whereas a man ſhall ſee Cherry trees and Lawrels take vp an exceeding deale of ground with their ſhade. Now theſe ſhaddowes of trees haue their properties by themſelues, for that of the Walnut tree is noiſome and hurtfull K
euen to man, breeding heauineſſe in the head: and an ill neighbour it is beſides to all plants either vnder or neere vnto it. The Pine tree alſo with her ſhaddow nippeth and killeth the yong ſpring of all plants within the reach thereof. Howbeit, both it and alſo the Walnut tree reſiſt the force of winds notably, and therefore they ſerue in good ſteed to protect vineyards, and are projected againſt the winds to breake their violence. The dropping of the Pine, Oke, and Maſtholme, by reaſon of the raine water wherewith they are much charged, is very heauy and ponderous, and therefore hurtfull. As for the Cypreſſe tree, it droppeth little or nothing, by reaſon that it receiueth ſo ſmall a deale of rain: and in truth of all others the ſhade is leaſt, the boughs are knit and truſt ſo round, and run vp ſharpe pointed in the top. The Fig tree giueth no thicke ſhadow, howeuer the boughs ſpread large ynough; which is the cauſe, that no man forbiddeth L
the planting of them in Vineyards among Vines. And as for Elmes, their ſhade is ſo milde and thin, that it nouriſheth whatſoeuer it ouerſpreads vnder it. Howbeit, *Atticus* is of opinion, That the ſhaddow of Elmes is one of the thickeſt and moſt hurtfull: neither doe I make any doubt thereof, if they be let to ſpread into great armes and boughes at liberty: marie, if the branches thereof, or if any tree within-forth be ſhrigged, I thinke that the ſhade will doe no harme at all. The Plane tree carieth a heauie head, and therefore caſteth a thicke ſhade, howbeit, pleaſant it is, and refreſhes thoſe that ſit vnder it: ſafe reſting there is vpon the graſſe, rather than the bare ground: and there is not a tree againe where graſſe groweth thicker and longer, to couer the bankes and ſeats vnder it. As for the white Poplar or Aſpen tree, it maketh little or no ſhade at all, the leaues keep ſuch a wagging & trembling, and neuer hang ſtill: the ſhadow of the Alder M
tree is fat and battle, it feeds whatſoeuer is ſowne or ſet vnder it. The Vine hath ſhade ynough to ſerue her owne turne: the leaues are euer ſtirring, and by their motion and turning often too and fro, there is a good temperature of ſhade and Sunne by that meanes: they ſerue alſo in ſteed of a couert in time of raine, and beare off a good ſhower. Generally, all trees in manner that

haue

20030
copy 1

A haue their leaues hanging by a long taile, caſt but a light and ſlender ſhaddow. And truly the knowledge hereof would not be contemned, nor ſet in the laſt place of ſuch points as belong to husbandrie, conſidering there is not the ſhadow of any one tree, but either is a kind nource, or a ſhrewd and curſt ſtep-dame, that is to ſay, either profitable or incommodious to all the fruits of the earth. For without all queſtion, the ſhade of Walnut trees, Pine trees, Pitch trees, & firs is no better than poiſon to all that is within the compaſſe of it, and kils whatſoeuer it toucheth. And thus much of Shadowes.

As touching the dropping of trees, a man may conclude in one word all that belongs thereunto. For looke what trees ſoeuer be ſo defended and clad with thick leaued branches, that the raine canot paſſe readily through them, be ſure the dropping and diſtillation of ſuch is naught
B and dangerous. And therefore it skilleth very much in this matter and queſtion now in hand, to know the nature of the earth wherin we meane to plant, how many trees it may well bear and nouriſh. As for hills, they require of themſelues not ſo great diſtance betweene tree and tree, as the plaines beneath: beſides, in ſuch places expoſed to the wind, it is good that they be planted thicker. Howbeit, Oliues require the greateſt ſpace between of all others: and therfore *Cato* following the judgment of all Italie, ordaines in theſe words, That they ſhould ſtand aſunder fiue and twentie foot at the leaſt, and thirtie at the moſt: but this rule holdeth not alwaies; for herin guided we muſt bee by the nature and ſite of places, which varie and differ much. For in Bœtica, which is a part of Spaine, there is not another tree growing, bigger than the Oliue: and if we may giue credite to authors that haue written hereof, there bee in Affricke, by their report ma-
C ny of them called Milliariæ, for that euery yeare they yeeld a thouſand pound weight of oile; apeece. And therfore *Mago* allowed threeſcore and fifteen foot euery way, for diſtance between Oliue trees, or elſe fiue and forty at leaſt, euen in leane and hard grounds, and thoſe that were expoſed to the winds. And in Bœtica verily, the people vſe to reap great plenty of corn among Oliue trees.

Now of all other follies this is one, and bewraieth ſhamefull blindneſſe and ignorance, To be driuen to make glades between trees when they be grown to a good bignes: and namely, either by lopping their boughs too much for to let in light between, and ſo by this means to haſten their age and decay; or els to draw them by cutting them downe cleane: wherin oftentimes they that did ſet them at firſt, take themſelues in the manner, and blame their own want of skil.
D Conſidering therefore, that there is no greater ſhame can happen to husbandmen than to repent when a thing is done, and then goe about to vndoe it, much better it is of the twain in this caſe, to fault in ouerwide, than too ſtreight roume.

Chap. XIII.

¶ *What trees grow but ſlowly: and which they bee that ſoone come forward: alſo, of the Sauine.*

SOme trees by nature are ſlacke of growth, and principally thoſe that come of ſeed, and liue longeſt. But ſuch as ſoone decay and die, are quicke of growth, as the Fig tree, Pomegranat tree, Plumme-tree, Apple-tree, Peare-tree, Myrtle, and Willow: but they make amends for
E their ſhort life in this, that they goe before others in fruit, and enrich their maſters quickly, for they begin to beare well at three yeeres age, yea, and they make a ſhew thereof in their bloſſom before. Of all theſe the Pear-tree is the ſloweſt. But the Cypirus, as wel the true & legitimat as the baſtard (which is a ſhrub called Pſeudo-Cypirus) come faſteſt forward of any other, for they beare at firſt both bloſſome and fruit. This is a generall thing obſerued, That al trees will thriue and proſper better, yea, and grow ſooner to perfection, if the ſhoots and ſuckers that put out at the root, as alſo other water twigs, be rid away, ſo that al the nouriſhment may be turned to the principall ſtocke only.

The work of Nature in ſending out theſe ſprigs, taught vs the feat to couch and lay ſets in
F the ground by way of propagation: and euen after the ſame manner briers and brambles doe of themſelues put forth a new off-ſpring: for growing as they do, ſmal and ſlender, and withal running vp to be very tall, they cannot chuſe but bend and lean to the ground, where they lay their heads againe, and take freſh root of their owne accord without mans hands: and no doubt, ouergrow they would and couer the whole face of the earth, were they not repreſſed and withſtood

by

by good husbandrie. The conſideration whereof maketh me to enter into this conceit. That G
men were made by Nature for no other end but to tend and look vnto the earth. See yet what a commodious deuice we haue learned by ſo wicked and deteſtable a thing as this bramble is, namely, to lay ſlips in the ground, and quick-ſets with the root. Of the ſame nature is the Yuie alſo, euen to grow and get new root as it creepeth and climbeth. And by *Catoes* ſaying, not onely the Vine, but Fig trees & Oliues alſo, wil grow & increaſe of cuttings couched in the ground; likewiſe Pomegranate trees, all kinds of Apple-trees, Baies, Plum-trees, Myrtles, Filberds, Hazels of Præneſte, yea, & Plane-trees. Now be there two waies to increaſe trees by way of propagation or enterring their twigs. The firſt is, to force a branch of a tree as it grows, downe to the ground, & ſo to couch it within a trench foure foot ſquare euery way; & after two yeares to cut it atow, where it bent from the tree: and after three yeares end to tranſplant it. But if a man liſt H
to haue ſuch plants or young trees to beare longer, the beſt way were to burie the ſaid branches at the firſt within mould, either in paniers or earthen veſſels, that when they are once rooted, they might be remoued all whole and entire in them, and ſo replanted. The ſecond is a more curious and wanton deuiſe than this, namely, to procure roots to grow on the very tree, by carrying, and conueighing branches, either through earthen pots or oiſier baskets, full of earth, thruſt cloſe to the ſaid branches: and by this means, the branches feeling comfort of the warme earth encloſing them on euery ſide, are eaſily intreated to take root, euen among Apples and other fruits, in the head of the tree, (for ſurely by this meanes we deſire to haue roots to chuſe, growing vpon the very top.) So audacious are men and of ſuch monſtrous ſpirits, to make one tree grow vpon another, far from the ground beneath. Thus in like manner as before, at 2 yeares I
end, the ſaid impes or branches that haue taken root, be cut off and carried away in the foreſaid pots or paniers: thither where they ſhall grow. As for the Sauine, an hearb or plant it is that wil take if it bee in this ſort couched in the ground: alſo, a ſprig if it be ſlipped off cleane from the ſtocke, will come again and root. Folke ſay, that if a man take wine lees, or an old bricke out of the wal broken ſmall, and either pour the one, or lay the other about the root, it wil proſper and come forward wonderfully. In like manner may Roſemarie be ſet as the Sauine, either by couching it, or ſlipping off a branch from it; for neither of them both hath any ſeed. To conclude, the hearb or ſhrub Oleander, may be ſet of any impe, and ſo grow, or elſe come of ſeed.

Chap. XIIII.

¶ *Of encreaſing trees by ſeed: the manner of graffing one in another: how the fine deuiſe of inoculation by way of ſcutcheon and emplaiſter was deuiſed.* K

NAture not willing to conceal any thing from man, hath alſo taught him to engraffe trees with their ſeed and graine. For oftentimes it happeneth, that birds being hungrie, haue greedily gobled vp ſeed and fruit whole and ſound, which after they haue moiſtened in their gorge, and tempered it alſo with the warmth and natural heat of their ſtomack, they ſend forth and ſquirt out again when they meute, together with their dung, that giueth vnto it a vertue of fecunditie, and ſo lay it vpon the ſoft beds of tree leaues, which many a time the winds catch and driue into ſome clifts and cranies of the barke, by meanes whereof, wee haue ſeene a Cherrie tree vpon a Willow, a Plane tree vpon a Lawrell, a Lawrell vpon a Cherrie tree: and at L
one time Berries and fruits of diuerſe ſorts and ſundry colors hanging at one and the ſame tree. It is ſaid moreouer, that the Chough or Daw hath giuen occaſion herof, by laying vp for ſtore, ſeeds and other fruit in creuiſes and holes of trees, which afterwards ſprouted and grew. From hence came the manner of inoculation or graffing in the ſcutcheon, namely, to cut out a parcel of the barke of that tree which is to be graffed, with a ſharp knife made in manner of a ſhomakers nall blade, and then to encloſe within the ſaid concauity, the eie or ſeed taken out of another tree with the ſaid inſtrument. And in old time verily this was the only maner, of inoculation vſed in fig-trees and apple trees. *Virgil* teaches vs to open a concauity in the knot or joint of a bud that driueth out the barke, and within it to encloſe the gem or bud taken out of another tree. And thus much for the graffing that Nature hath ſhewed. M

But there is another way of graffing, which caſualtie and chance hath taught. And to ſay a truth, this Maiſter hath ſhewed well neer more experiments, now daily practiſed, than Nature her ſelfe. Now the manner of it came by this occaſion. A certain diligent & painfull husband-

man,

20030
copy 1

A man, minding to mound and empale his cottage round about with a fence of an hedge; to the end that the ſtakes ſhould nor rot, laid a ſill vnder them, of Iuie wood: but ſuch was the vitall force of the ſaid Iuie, that it took hold faſt of the ſtakes and claſped them hard, inſomuch as by the life therof, they alſo came to liue; and euident it was to the eye, that the log of Iuie vnderneath, was as good as the earth to giue life and nouriſhment vnto the ſtakes afore-ſaid.

To come then vnto our graffing, which we haue learned by this occaſion: firſt, the head or vpper part of the ſtock muſt be ſawed off very euen, and then pared ſmooth with a ſharp garden-hook or cutting-knife: which don, there offers vnto vs a two-fold way to perform the reſt of the worke: The firſt is, to ſet the graffe or Sion between the barke and the wood: for in old time truly, men were afraid at firſt to cleaue the ſtocke; but ſoon after they ventured to bore a hole into
B the very heart of the wood: and then they ſet faſt into the pith juſt in the mids thereof, but one Sion or graffe; for by this kind of graffing, impoſſible it was that the ſaid pith ſhould receiue or beare any more. But afterwards they deuiſed a finer and more ſubtile inuention to graffe, by cleauing the ſtocke gently thorough the mids; and after this manner they might well ſet into it ſix imps or Sions at once: as being perſuaded, that by ſuch a number they might ſupply the defect of any, if they chaunced to die or miſcarry any way. Now when the ſaid clift was made, they held it open with a wedge of wood put between, vntill ſuch time as the impe or graffe being thwitted thin and ſharp beneath were ſet handſomely cloſe within the rift. In the practiſe of which feat, many points are to be obſerued: firſt and foremoſt, it would be conſidered, what trees will thus ſort together and be vnited; namely, what ſtock will beare this maner of engraf-
C fing, and of what tree an impe or Sion will agree well to be ſet into it: for be ye ſure of this, all trees are not alike, neither haue they all their ſap in one and the ſame part. Vines aud Figtrees are drier in the mids of the tree, than in the head; and toward the top they are more apt to take and conceiue, and therfore from thence it is good to make choiſe of impes to be graffed. Contrariwiſe, the ſap of Oliues is moſt frim about the mids, and from thence they afford Sions; for the tops are drie. Moreouer, ſooneſt of all other doe thoſe trees incorporate one into another, if when the ſtock and graffe haue barks both of one nature, if they bloſſom together at one time, if they bud and put forth their ſpring at the ſame ſeaſon, and laſt of all, if their ſaps doe agree one with another. On the other ſide, long it wil be ere they take, when the ſtock is drie and the graffe moiſt; or when the barke of the one is tender, and of the other tough and hard. Ouer and
D beſides, carefull heed muſt be taken in this buſineſſe, That the ſtocke be not clouen in a knot; for the churliſh hardneſſe therof will not willingly receiue and entertaine a gueſt, that choiſe alſo be made of the ſmootheſt and faireſt place in the ſtocke, where the graffe would be ſet: *Item*, That the clift be not aboue 3 fingers deepe; that it be ſtreight and direct; and laſtly, that the impe ſtand ſo cloſe barke to barke in the ſocket, that a man may not ſee between it and the ſtocke. *Virgil* will in no wiſe haue a Sion or graffe to be taken from about the top of a tree, for ſuch are all naught. But this one thing is generally held for certain, That the good imps to bee graffed are thoſe, which be gathered from thoſe armes of the tree that regard the Sun-riſing in ſummer: *Item*, That all ſuch graffs come from the boughs that beare well: alſo that they be new tender ſhoots of the laſt yeare (vnleſſe they are to be graffed in the ſtock of an old tree, for then
E there ſhould bee choſen ſuch as are ſtronger:) moreouer, this is to be regarded, that they be well budded, yea and knotted too, making ſhew and giuing good hope euen then, that they would bear fruit the ſame yere, but in any wiſe the ſame ought to be of 2 yeres growth at leaſt, and not ſmaller beneath toward the ſtocke than a mans middle finger. As for the graffes, the manner is to ſet them in the ſtocke with the leſſer end downward, when our purpoſe is, that the tree ſhould ſpread rather in breadth, than run vp in hight. Aboue all, it would be looked wel to, that they be neat and bright, ſo as they ſhine againe; that no part of them be ſeene either ſcorched drie with the ſunne, or cicatrized (as it were) and bliſtered. Good hope there is that the graft will take, if the pith or marrow of the ſion do fall jump with the joynt, ſo as it joyne cloſe to the wood and inner barke of the mother ſtocke: for this is farre better than to let it meet juſt
F and euen with the bark without-forth. Moreouer, a carefull eie muſt be had in thwitting and ſharpning the graffe or imp, that the heart or woody ſubſtance be not ſtript all naked and left bare: howbeit gently and with a light hand a man muſt go ouer it with a fine and ſharp inſtrument, in ſuch ſort, as it may go downe into the clift wedgewiſe, no deeper than 3 fingers bredth: the which may right eaſily be don, if it be ſhauen and pared preſently after it hath bin dipped

in water. Moreouer, wee ought be well aduiſed, that wee ſharpen not the end of a graffe in the G
wind, and that the barke goe not either from it or the ſtock. As for the graffe it ſelfe, it muſt be
driuen downe into the clift, cloſe to the ſhoulder where the owne barke goeth round, and from
whence you began to ſharpen it: but take heed in thruſting and forcing therof, that it ſtand not
out of joynt, ne yet that the barke thereof turne vp in wrinkles: and therfore choſen they would
not be which are ouer moiſt, no more (I aſſure you) than thoſe that be too drie; for as the ex-
ceſſiue humiditie of the one looſeneth the rind, ſo the want of vitall moiſture in the other, will
not ſuffer it to vnite & concorporat. Ouer and beſides, in the working of this feat, men obſerue
a certain religious reuerence, namely, that the ſions be ſet into the ſtocke when the moone is
croiſſant (to wit, before the full) and with both hands forſooth, or els all is marred: and other-
wiſe in this buſinhſſe there is an opinion, that two hands together are put to ſmaller ſtreſſe, and H
haue better ſtay of themſelues than one alone; and therefore ſuch a moderation is right neceſ-
ſarie: for the more forcibly the graffes be ſet into the ſtocke, and the faſter that they are ſetled,
the longer it will be ere they take to bear; but ſurer they be, and continue the longer: contrari-
wiſe, if they ſtand ſlacke, the tree indeed will the ſooner beare, but laſt the leſſe while. Further-
more, regard would be had in this caſe, as well that the clift of the ſtocke gape not too much
(as being ouerwide for the graffe;) as that it be not too little and ouer-ſtreight, for feare that ei-
ther it ſlurt it out againe, or claſp it and gird it ſo hard that it kill it quite. This principally we
muſt take heede of at the firſt, that there be no ſpill or little chip left behind in the mids of the
clift, nor any thing beſides the graffe it ſelfe, to fill vp the place. Some there be, that enter the
clift firſt in the ſtock, with a bill, and with an oſier twig tie and bind vp the very brims or edges I
therof: which done, they driue the wedges in, to make ſuch an ouerture as is meet; for by reaſon
of the foreſaid bonds, they need not feare the gaping of it too wide. Some ſtocks there be that
the very ſame day that they be graffed in the nource-garden, are without any harme remooued
to the place where they muſt grow. If the ſtocke wherein you graffe be big and round, the beſt
way is to ſet the ſion between the barke and the wood therof, and to diuide the one from the o-
ther with a wedge of bone, leaſt in enlarging of the barke it chance to breake. In graffing of a
Cherry tree ſtocke, the ouer rind or barke would be taken away before the clift be made. [Now
theſe trees alone of all others may be graffed very well preſently after mid-winter.] When the
ſaid rind is gone, you ſhall ſee therein a certain down, that if it chance to claſp about the graft,
it rots the ſame incontinently. But to return again to our worke of graffing: After the wedge is
taken forth whole and ſound at the point (which is a token that no ſpill remaines within) you K
may be bold to bind the head of the ſtocke all about. Yet this would be conſidered by the way
(which I had like to haue forgotten) that the beſt & handſomeſt graffing, is as neer the ground
as may be, in caſe the knots wil giue leaue and the ſtock beare it: alſo that the grafts would not
conueniently ſtand without the ſtock aboue ſix fingers breadth. Now when al is done and ſure
work made (as hath been ſaid) *Cato* willeth vs to take cley, or the ſandie grit of chalk, mixed to-
gether with oxe or cow ſhearn, to worke and temper all theſe together in maner of a tough paſt
or cataplaſme, and then to lay the ſame within the clift, & round about to daube all. And verily
by this and other ſuch rules which he hath left in writing, it appears plainly, that in thoſe daies
the manner was to graffe betweene the barke and the tree, and not otherwiſe; as alſo to ſet the
ſions in the ſtocke, not aboue two fingers deepe. As for Apple trees and Pyrries, he preſcribeth L
that they ſhould be graffed in the Spring; alſo 50 daies after the ſummer Sun-ſtead, and again
after vintage: but Oliues and Fig-trees in the Spring only, obſeruing the age and diſpoſition of
the Moon, when ſhe is in the wane and thirſtie, that is to ſay, drie: moreouer, after noonetide,
and when no Southern wind doth blow. And I cannot chuſe but wonder much at the curioſitie
and double diligence of *Cato*, who not content to haue defended the graft with clay or paſt a-
foreſaid, yea and to preſerue it with turfe and moſſe againſt the injurie of rain and cold, to haue
bound it about alſo with little knitches of ſoft oſier twigs ſliued in twaine; muſt giue charge
beſides to couer it with Oxe-tongue (a kind of herb there is ſo called) *i.* Bugloſſe: and yet hee
hath not done, but the ſame muſt be bound with wiſpes and wreaths of ſtraw and litter aloft.
Now adaies men make no more adoe, but thinke it ſufficient to ſtop and cloſe vp barke and al, M
with earth or cley and chaffe tempered together, thinking it ſufficient, the graft beare out two
fingers breadth aboue. They that wait vpon the Spring ſeaſon for to graffe, are many times dri-
uen to their ſhifts for want of time, by reaſon that all trees make haſt then to bud, and do break

out

20030
copy 1

A out of a ſudden,vnleſſe it be the Oliue, the oilets or eies wherof be longeſt while in comming forth, as hauing leaſt ſap of all other, running vnder the barke; the which if it were ouermuch would ſtifle and choke the grafts. As for the Pomegranat and Fig tree, howſoeuer otherwiſe they ſeem to be dry,yet good it is not to defer and put off the graffing of them. The Peare tree may well enough be graffed with the bloſſom on the head,and it makes no matter if a man do ſtay and graffe it within the moneth of May. To be ſhort, if a man be conſtrained to fetch his ſions or imps of Apple trees, and ſuch like, far off, it is thought that they will keepe their ſap beſt,if they be ſtuck or ſet faſt in a Rape root. Alſo if one would preſerue them a certain time before they ſhould be occupied, it is paſſing good to lay them cloſe betweene two ereſt tiles, well ſtopped on euery ſide with earth,and that neere to ſome riuers or fiſh-ponds.

B

Chap. XV. ¶ *The manner how to graffe a Vine tree.*

AS for the cuttings or ſets of vines,they may be kept wel a long time, couered all ouer with ſtraw or litter in dry ditches; and afterwards they are to be laid within the earth, all hilled or couered,ſaue only that their heads be ſeen aboue ground. *Cato* graffeth a vine ſtock three maner of waies: Firſt,he willeth that the mother ſtock ſhould be cut ouerthwart,& then clouen through the very pith or heart in the mids,wherin he would haue the yong imps(thwitted and ſharpened as is beforeſaid) to be ſet and ingraffed ſo, as the marrow of the one and the other may ioyne and meet iuſt together. The ſecond maner is,when two vine ſtockes doe reach one to the other,for to cut byas or aſlaunt(after the manner of a goats foot) two twigs or branches,of either one,with this regard,that theſe cuts be of a contrarie ſide the one vnto the other,
C and withall ſo deep,as that they come vnto the pith or heart: then to fit one to the other, ioyning pith to pith,and then binding them faſt together ſo cloſe,that no aire may enter between, vntill ſuch time as the one hath adopted the other. The third deuiſe is,to bore holes in an old vine,not directly, but aſlope,as far as to the pith; and then to put into them yong imps 2 foot long,and to bind them faſt: which done,to make a certaine batter or morter [with clay, beaſts dung,and ſand together] and therewith to dawbe the place: but with this regard,that the graft ſtand halfe vpright,or ſomwhat leaning. This manner of graffing hath bin checked and corre-
ɛted of late daies by our countrymen,who leauing the hand-piercer,haue taken the French Vibrequin or breſt-wimble,which gently and quickely boreth a hole, and hurteth not the wood: for all chafing heate cauſed by the ſaid piercer,dulleth the vigor both of ſtock and imp. Alſo
D they haue deuiſed,that the ſaid imp to be ingraffed,be gathered from the tree when it begins to bud or burgen: and when it is ſet into the ſtocke, that it be left ſtanding out with no more than two eies or buds out of the graffing place; that it be well bound alſo with the winding rods of an Elme: moreouer, that on either ſide of it the mother ſtock be ſlit or cut in two places on both ſides,to the end that from thence rather than otherwiſe, the wateriſh humour may diſtill and drop forth,which of all things hurteth vines moſt. After all this, they would haue the ſaid graffe remain bound,vntill ſuch time as it haue put forth ſhoots two foot long; and then the foreſaid bands to be cut in ſunder,that they may burniſh in thicknes and at eaſe accordingly. The ſeaſon which they haue allowed for to graffe vines,is from the Equinoctial in Autumne,vnto the time that they begin to bud forth Generally all trees that are tame and gentle
E may wel be graffed into ſtocks and roots of the wild, which by nature are dryer: contrariwiſe, graffe the wild and ſauage kind vpon the other,you ſhal haue all degenerate and become wild. Touching other points belonging to the feat of graffing, all dependeth vpon the goodneſſe or malignitie of the ſky and weather. In ſum, a dry ſeaſon is good for all trees graffed in this maner: and ſay that the drought were exceſſiue,there is a good remedie for it,namely,to take certain earthen pots of aſhes,and to let water diſtill through them ſoftly,by little and little to the root of the ſtock. As for inoculation,it loueth ſmall dewes otherwhiles, to refreſh both ſtock, ſcutcheon,and Oilet.

Chap. XVI.

F

¶ *Of Emplaſtration or graffing with the Scutcheon.*

THe manner of graffing by way of emplaiſtre or ſcutcheon, may ſeeme alſo to haue come from inoculation: and this deuiſe agreeth beſt with thoſe trees that haue thick barks,as namely Fig trees. To goe therefore artificially to worke,the mother ſtocke or tree to be

graffed, muſt be well rid and clenſed from the branches all about the place where you mean to G
practiſe this feat, becauſe they ſhould not ſuck the ſap from thence; and chuſe the neateſt and frimmeſt part, which ſeems moſt freſh and liuely: then cut forth a ſcutcheon of the barke [but be careful that your inſtrument pierce no farther than the bark, nor enter into the quick wood] which done, take from another tree the like ſcutcheon of the bark, ſauing the eye or bud thereon, and ſet it in the place of the other; but ſo equall this muſt be to the place, and ſo cloſe ioyned and vnited to it, that a man may ſee no token at all or apparance in the ioynt, of any wound or skar made, to the end, that preſently they may concorporat, that no humor of the ſap may iſſue forth, nor ſo much as any wind get between: and yet to make ſure work, the better way is to lute it well and cloſe with clay, and then to bind it faſt. This deuice of graffing thus with the ſcutcheon was but lately found out, by their ſaying, that fauor all new and modern inuentions: howbeit I find that the antient Greeks haue written thereof: yea and *Cato* alſo our own Coun- H
tryman, who ordained to graffe both Oliue and Fig tree in that order: and (as he was a man verie diligent and curious in all things that he tooke in hand) he hath ſet downe the iuſt meaſure and proportion of the ſcutcheon; for he would haue the barks both the one and the other, to be cut out with a chiſell foure fingers long, and three in bredth, and ſo to cloſe vp all in manner aforeſaid, that they might grow together; and then to be dawbed ouer with that mortar of his making aforeſaid: after which maner Apple trees alſo may be graffed.

Some there be who haue intermingled and comprehended vnder this kinde of graffing with the ſcutcheon, that deuiſe of making in the ſide a cleft, and namely in vines; for they take forth a little ſquare piece with the bark, and then ſet in an impe very hard & cloſe, on that ſide where it is plain and euen, to the very marow or pith. Certes, neere to Thuliæ in the Tyburtines coun- I
try, I haue ſeen a tree graffed all theſe waies aboueſaid, and the ſame laden with all manner of fruits; one bough bearing Nuts, another berries, here hung Grapes, there Figs; in one part you ſhould ſee Peares, in another Pomegranats; and to conclude, no kind of Apple or other fruit, but there it was to be found: mary this tree liued not long. Howbeit, let vs vſe what diligence we can, yet neuer ſhal we able with all our experiments to attain vnto the depth of Natures ſecrets. For ſome Trees there be that come vp of themſelues, and by no art and induſtry of man wil be made to grow: ſuch alſo loue ordinarily to be in wild foreſts and in rough deſarts, where they proſper well; wheras the Plane tree wil beare all manner of graffing beſt of any other; and next vnto it the wild and hard Oke: but both the one and the other corrupt and mar the taſt of what fruit ſoeuer is graffed thereupon. Some trees there be that refuſe not to be ingraffed vpon K
any ſtock, and what way ſoeuer they be graffed it skils not, as fig trees and Pomgranat trees. As for the Vine it will not beare the ſcutcheon, neither any Tree beſides that hath a thin barke, or which doth pill and rift: no nor ſuch as be dry or haue ſmall ſtore of ſap within them can away with inoculation. Howbeit this maner of graffing is moſt fruitfull of all other; and next vnto it that which is done by way of ſcutcheon or emplaſtre: yet trees ſo graffed be of all others moſt tender and feeble: as alſo ſuch as reſt and ſtay vpon the bark only, are with the leaſt wind that is, ſooneſt diſplanted and laid along on the ground. The ſureſt and ſtrongeſt way therefore is, to graffe imps vpon the head of a ſtocke, yea, and more plentifull by far, than to ſow them of ſeed, or plant them otherwiſe.

L

Chap. XVII.

¶ *An hiſtorie ſhewing the example and proofe hereof.*

IN this diſcourſe and queſtion concerning grafts, I cannot paſſe ouer the rare obſeruation of one example, practiſed by *Corellius* a Knight of Rome, borne at Ateſte: This Gentleman of Rome, in a ferme that he had within the territorie of Naples, chanced to graffe a Cheſtnut with an imp cut from the ſame tree: This graft tooke and bare faire Cheſtnuts and pleaſant to the taſt, which of him took their name. After the deceaſe of this gentleman, his heire (who had bin ſomtime his bondſlaue, and by him infranchiſed) graffed the foreſaid Corellian Cheſtnut tree a ſecond time: and certainly between them both was this difference, The former Corelli- M
an bare the more plenty, but the nuts of the other twice graffed were the better. As for other ſorts of graffing or planting, mans wit hath deuiſed, by obſeruing that which hath fallen out by chance: thus are we taught to ſet broken boughs into the ground, when we ſaw how ſtakes pitched

20030
copy 1

A ched into the earth, tooke root. Many trees are planted after that maner, and eſpecially the Fig tree, which will grow any way, ſaue only of a little cutting: but beſt of all, if a man take a good big branch thereof, ſharpen it at the end in manner of a ſtake, and ſo thruſt it deepe into the ground, leauing a ſmall head aboue the ground, and the ſame couered ouer with ſand. The Pomegranate likewiſe and the Myrtles are ſet of branches, but the hole firſt ought to be made eaſie and large with a ſtrong ſtake or crow of iron. In ſum, all theſe boughs ought to be 3 foot long, ſmaller in compaſſe than a mans arme, ſharpned at the one end, and with the barke ſaued whole and ſound with great care. As for the Myrtle tree, it wil come alſo of a cutting; the Mulberry will not otherwiſe grow: for to couch and plant them with their branches, we are forbidden, for feare of the lightnings. And foraſmuch as we are fallen into the mention of ſuch cut-
B tings, I muſt now ſhew the manner of planting them alſo: aboue all things therefore regard would be had, that they be taken from ſuch trees as be fruitfull, that they be not crooked, rough and rugged, nor yet forked; ne yet ſlenderer than ſuch as would fil a mans hand, or ſhorter than a foot in length. *Item*, That the barke be not broken or raſed; that the nether end of the cut be ſet into the ground, and namely, that part alwaies which grew next the root; and laſt of al, that they be banked wel with earth about the place where they ſpring and bud forth, vntil ſuch time as the plant haue gotten ſtrength.

Chap. XVIII.

¶ *The manner of planting, ordering, and dreſſing Olive trees. Alſo which*
C *be the conuenient times for graffing.*

WHat rules (by the iudgment of *Cato*) are to be obſerued in the dreſſing and husbanding of Oliues, I think it beſt to ſet down here word for word, as he hath deliuered them. Thus he ſaith therefore: The trunches or ſets of Oliue trees which thou meaneſt to lay in trenches, make them 3 foot long; handle them gently and with great care, that in cutting, ſharpning, or ſquaring them, the bark take no harm nor pill from the wood. As for ſuch as thou doſt purpoſe to plant in a nourſe-garden, for to remoue again, ſee they be a foot in length, and in this manner ſet them: Let the place be firſt digged throughly with a ſpade vntill it be well wrought, lie light, and brought into temper: when thou putteſt the ſaid truncheon into
D the ground, beare it downe with thy foot; if it goe not willingly deepe enough by that means, driue it lower with a little beetle or mallet; but take heed withall, that thou riue not the barke in ſo doing. A better way there is, To make a hole firſt with a ſtake or crow, before thou fet it into the ground, and therein maiſt thou put it at eaſe, and ſo will it liue alſo and take root the ſooner: when they be three yeares old, haue then a carefull eye to them in any caſe, and marke where and when the bark turneth. If thou plant either in ditches or furrowes, lay three plants together in the earth, but ſo as their heads may ſtand a good way aſunder aboue the ground; alſo that there be no more ſeen of them than the bredth of foure fingers: or els, if thou thinke good, ſet the buds or eyes only of the Oliue. Moreouer, when thou art about to take vp an oliue plant for to ſet again, be wary and carefull that thou break not the root: get as many ſpurres or
E ſtrings [called the beard] as thou canſt, earth and all about them: and when thou haſt ſufficiently couered thoſe roots with mould in the replanting, be ſure thou tread it down cloſe with thy foot, that nothing hurt the ſame.

Now if a man demand and would gladly know what is the fitteſt time for planting oliues; in one word I will tell him, Let him chuſe a dry ground in ſeed time [*i.* in Autumne] and a fat or battle ground in the ſpring: furthermore, begin to prune thy Oliue tree 15 daies before the Æquinox in the ſpring, and from that time forward for the ſpace of forty daies, thou canſt not do amiſſe. The maner of pruning or disbranching them, ſhall be thus, Looke where thou ſeeſt a place fertile, if thou ſpy any dry or withered twigs, or broken boughs that the wind hath met withall, be ſure thou cut them away euerie one: but if the plot of ground be barren, eare it vp
F better with the plough, take pains (I ſay) to till it well, to breake all clots and make it euen, to cleanſe the trees likewiſe of knurs and knots, and to diſcharge them of all ſuperfluous wood: alſo about Autumne bate the earth from about the roots of Oliues, and lay them bare, but in ſtead thereof put good mucke thereto. Howbeit if a man do very often labor the ground of an olive plot, and take a deep ſtitch, he ſhall now and then plough vp the ſmalleſt roots thereof, ſo ebbe

they will run within the ground, which is not good for the trees; for in caſe they ſpread aloft, G
they will wax the thicker, and ſo by that means the ſtrength and vertue of the Oliue will turne all into the root.

As touching all the kinds of Olive trees, how may they be; alſo in what ground they ought to be ſet, and wherein they will like & liue beſt; likewiſe what coaſt of the heauen they ſhould regard; we haue ſhewed ſufficiently in our diſcourſe and treatiſe of Oile. *Mago* hath giuen order in his books of husbandry, that in planting them vpon high grounds, in dry places, and in a vein of clay, the ſeaſon ſhould be between Autumne and mid-Winter: but in caſe you haue a fat, moiſt, or wateriſh ſoile, he ſets down a longer time, namely from harueſt to mid-winter. But this rule of his you muſt take to be reſpectiue to the clymat of Africk only: for in Italy at this day verily men vſe to plant moſt in the Spring: howbeit if a man hath a mind to be doing alſo H
in Autumne, he may be bold to begin after the Equinox: for during the ſpace of 40 dayes to-
*Vergiliæ. gether, euen to the ſetting of the * Brood-hen ſtar, there are no more but 14 days ill for planting. In Barbarie the people haue this practiſe peculiar to themſelues, For to graffe in a wilde Oliue ſtock, whereby they continue a certain perpetuity: for euer as the boughs that were graffed, and (as I may ſay) adopted firſt, wax old and grow to decay, a ſecond quickly putteth forth afreſh, taken new from another tree, and in the ſame old ſtock ſheweth yong and liuely; and after it a third ſucceſſiuely, and as many as need; ſo as by this meanes they take order to eterniſe their Oliues; inſomuch as one Oliue plant hath bin known to haue proſpered in good eſtate a world of yeares. This wilde Oliue aforeſaid may be graffed either with ſions ſet in a cliffe, or els by way of inoculation with the ſcutcheon aforeſaid. But in planting of Oliues this heed I
muſt be taken, that they be not ſet in a hole where an Oke hath been ſtocked vp by the root: for there be certain canker-wormes, called Erucæ in Latine, or Raucæ, breeding in the root of an Oke, which eat the ſame, and no doubt will do as much by the Oliue tree. Moreouer, it is found by experience better for Oliue trees, that their ſets be not interred in the earth, nor yet dried, before they be planted. Alſo, the ſame experience hath taught, that for old Oliue trees, ouergrown with a kind of moſſie skurfe, it is paſſing good, ech other yeare to ſcrape and claw them well, between the Spring and Æquinox, and the riſing of the ſtarre Vergiliæ or the Brood-hen: likewiſe to beſtow moſſe round about the root: mary euery yere they would be digged round about the root and laid bare after the ſunſtead, with a trench made two cubits broad, and a foot deep: as alſo once in three yeres it were not amiſſe to cheriſh them with good dung. Ouer and beſides, the ſame *Mago* ſaith, that almond trees ought to be planted between the ſetting of Ar- K
cturus and the ſhorteſt day in the yeare. As for Peare trees, they are not to be ſet all at one and the ſame time, for they bloſſom not all alike. They that beare either the long or round peares, haue their ſeaſon from the occultation of the Brood-hen ſtarre, vntill mid-Winter. All other ſorts, and principally thoſe that regard either the Eaſt or the North, are to be planted in mid-winter, namely after the retreit of the ſtar called Sagitta [*i.* the Shaft.] The Lawrell would be put in the ground, from the Egle-ſtar, vnto the fall of the Shaft aforeſaid: for certainly the obſeruation of the time, pertinent to the planting of trees, agreeth much-what after this maner; and for the moſt part, men do accord and ordaine, That it ſhould be done in the ſpring and Autumne eſpecially. Another ſeaſon there is about the riſing of the Dog-ſtarre, which few men take knowledge of, becauſe it is not ſo generally practiſed, nor found alike profitable to all L
countries: howbeit I muſt not ouerpaſſe it in ſilence, conſidering that my purpoſe is not to ſpeake of this or that countries diſpoſition, but to ſearch into the nature of all things. In Cyrenaica therefore, a region in Africk, they vſe to ſet trees about the time that the Eteſian Northerne winds do blow: in Greece likewiſe they do the ſame, and namely in Laconia they ſuppoſe that to be the beſt time for the Oliue tree: & in the Iſland Cos the maner is then to plant Vines alſo. In all other parts of Greece they make no doubt to inoculate and to graffe in that ſeaſon; but in no wiſe will they plant whole trees then. But herein it skilleth much to conſider the nature of each tract and region: for in Egypt, they ſet, plant, and replant euery moneth of the yeare: in Æthiopia likewiſe, and India; and generally in all Countries whereſoeuer it raineth not in Summer. Setting theſe reſpects aſide, Trees require of neceſſitie to be planted in M
Autumne. Like as therefore there bee three ſeaſons of planting Trees, ſo there are as many wherein they bud and put forth new ſhoots; to wit, the Spring, the riſing of the Dog-ſtarre, and the apparition of Arcturus. And verily this is a thing worthy to be noted, that not onely

beaſts

20030
copy 1

A beaſts and other liuing creatures haue an appetite to engender, but the earth alſo, and all the plants thereupon, are much more luſty and hot that way. And therefore to make them to conceiue in due ſeaſon, the time would be well obſerued, when they be as it were in loue, and deſire the act of generation. And not onely in the earth and trees therein planted, is this to bee ſeene, but in grafts and ſtocks alſo particularly by themſelues, ſince that they haue a mutuall and reſpective appetite, one to ioine and incorporate with the other. They that make choiſe of the Spring for this purpoſe, begin to put them as it were together for to ingender, preſently after the Equinoctiall; giuing out in theſe plaine termes, that trees then are broody and ready to put forth ſprouts; which is the reaſon, that their barkes at ſuch a time will knit and ioine together eaſily. But ſuch as prefer the Autumne before the Spring, fall to this buſineſſe immediatly vp-
B on the riſing of the ſtar Arcturus; for then they ſuppoſe, that plants will take root forthwith, & by the time that the Spring is come, they will be better prepared to put forth luſtily; conſidering that their vertue is not ſtreightwaies ſpent in budding, but rather imploied in taking good root. Howbeit, ſome trees there be that haue their ſet times and ſeaſons of the yere limited, whether it be to plant or to graffe: and the ſame indifferently in all places; as namely, Cherry-trees and Almond trees about the mid-winter. But for the moſt part, the ſcituation of the place will be able to guid and order all this matter beſt: for cold and wateriſh grounds ought to bee planted in the Spring: but dry and hot in the Autumne. With our peaſants here in Italy, it is ordinary to diuide their times and ſeaſons for planting in this manner following, They ſet out for the Mulbery all the time from the Ides of February to the ſpring Æquinox: for the Peare-
C tree they allow the Autumne, and ſo forward till 15 daies before the point of mid-winter, and no longer; for Summer apples and quinces, for Seruiſes likewiſe and plums, they aſſigne the ſpace between the winter tropicke or Sun-ſtead, and the Ides of February. As for Carobes of Greece, and Peach-trees, they haue all the Autumne and the whole yere before them vntill mid-winter approch. All Nut-trees, as namely, Walnut-trees, Pine-trees, Filberds, Hazels, and Cheſtnut-trees, would be planted from between the firſt day of March, and the 15 thereof. To conclude, the only time for willowes and broom, is about the Calends or beginning of the ſame March. But of theſe two laſt named, the Broom loueth to be ſet of Nource-plants, comming of ſeed, in dry and light grounds: but contrariwiſe, the willow to be ſet of twigs in moiſt places, according as we haue before ſaid.

D

Chap. XIX.

¶ *What trees they be that loue to ſort and keepe companie together. The skill, and feat of baring the roots of trees, and alſo of hilling or banking them about.*

THere is beſides a new manner of grafting trees, which I will not ouerpaſſe: for my purpoſe is not willingly to omit ought, that I haue found in any booke as touching this argument. And *Columella*, as himſelfe affirmeth, was the firſt deuiſer thereof, namely, to conioin trees of diuers natures, and ſuch as otherwiſe cannot abide ſocietie and fellowſhip together, as for example, Fig-trees and Oliue trees. He, I ſay, would haue a Fig-tree to be planted neere vnto an
E Oliue, and ſo neere indeed, as that a bough or branch of the oliue may reach vnto the Fig-tree at eaſe, conſidering that it is very ſupple and pliable otherwiſe, and ready to follow and be led as a man would haue it: and yet as obedient as it is, hee would haue it it euer and anone to be handled and made gentle in the meane time, that by this meanes inured firſt, it may bee bent and bowed to the purpoſe when the time ſerues. Which done, after that the Figge tree hath gotten ſome ſtrength, and is growne to ſufficient bigneſſe for to beare a graffe (which ordinarily is at three yeares end, or at the vtmoſt when it is fiue yeares old) the head thereof muſt be cut or ſawed off, and then the branch or bough of the Oliue beforeſaid, being well clenſed and made neat, and the head end thereof (as is beforeſaid) thwited and ſcraped ſharpe, howbeit, not yet cut from the mother ſtocke, muſt bee ſet faſt in the ſhanke of the Figge-tree, where it muſt bee
F kept well and ſurely tied with bands, for feare, that thus beeing forced and graffed arch-wiſe, it ſtart and flurt not out againe, and returne vnto the owne. Thus beeing of a mixt and meane nature, betweene a branch or bough growing ſtill vnto the Tree, and yet laied in the ground to take new root, and an Impe or Sion graffed, for the ſpace of three yeares it is ſuffered to feed and grow indifferently betweene two mothers, or rather by the meanes thereof, two mother-

ſtockes

stocks are growne and vnited together. But in the fourth yeare it is cut wholly from the owne G
mother, and is become altogether an adopted child to the Fig-tree, wherein it is incorporat. A pretty deuise, I assure you, to make a Fig-tree beare Oliues, the secret whereof is not knowne to euery man: but I my selfe do conceiue and see the reason of it well enough.

Moreouer, the same regard and consideration aboue rehearsed, as touching the nature of grounds, whether they be hot, cold, moist, or dry, hath shewed vs also the manner of digging furrows and ditches. For in watery places it will not be good to make them either deep or large: whereas contrariwise, in a hot and dry soile they would be of great capacity, both to receiue and also to hold store of water. And verily, this is a good point of husbandry for to preserue not onely young plants, but old trees also: for in hot countries, men vse in Summer time to raise hillocks and banks about their roots, and couer them all therewith, for feare lest the extreme heat of the Sun should scorch and burne them. But in other parts the manner is to dig away the earth, and H
to lay the roots bare, and let in the wind to blow vpon them. The same men also in winter doe banke the roots about, and thereby preserue them from the frost. Contrariwise, others in the winter open the ground for to admit moisture, to quench their thirst. ¶ But in what ground soeuer it be where such husbandry is requisit, the way of clensing tree roots, and ridding the earth from them, is to dig a trench three foot round about. And yet this must not be don in medows, forasmuch as for the loue of the Sun, and of moisture, the roots of trees run ebbe vnder the face of the earth. And thus much verily may suffice in generall, for the planting and graffing of all those trees that are to beare fruit.

Chap. XX. I

¶ *Of Willow and Osier plots: of places where reeds and Canes are nourished: also of other trees that be vsually cut for poles, props, and stakes.*

IT remaineth now to speake of those trees which are planted and nourished for others, and for Vines especially: to which purpose, their wood is vsually lopped to serue the turne. Among which, Willowes and Oisiers are the chiefe, and to be placed in the formost rank: and ordinarily they loue to grow in moist and watery grounds. Now, for the better ordering of the Oisier, the place would be well digged before, and laid soft two foot and a halfe deep, and then planted with little twigs or cuttings of a foot and a halfe in length, and those prickt in: or else stored with good big sets, which, the fuller and rounder they be in hand, so much better they are for to K
grow, and sooner will they proue to be trees. Betweene the one and the other, there ought to be a space of six foot. When they are come to three yeares growth, the manner is to keepe them downe with cutting, that they stand not aboue ground more than two foot, to the end that they might spread the better in bredth, & when time serues be lopped & shred more easily, without the help of ladder: for the Withie or Osier is of this nature, that the nearer it groweth to the ground, the better head it beareth. These trees also, as wel as others, require (as men say) to haue the ground digged & laid light about them euery yere, in the month of April. And thus much for the planting and ordering of Oisier willowes, which must be emploied in binding and winding. As for the other willow, which affoordeth big boughs, for poles, perches, and props, those may be set likewise of twigs and cuttings, and trenched in the ground after the same manner. L
These lightly euery fourth yere will yeeld good poles or staues, & for that purpose would they then be ordinarily cut and lopped. If these trees become old, their boughs by propagation may still maintain and replenish the place; to wit, by couching them within the ground; & after they haue lien soone yeare, and taken root, by cutting them clean from the stocke-father. An Oisier plat of one acre stored thus, will yeeld twigs sufficient for windings and bindings, to serue a vineyard of fiue and twenty acres.

To the same purpose men are wont to plant the white poplar or Aspe, in manner following. First, a piece of ground, or a quarter, must be digged and made hollow two foot deep: and therin ought to be laid cuttings of a foot and a half in length, after they haue had two daies drying: but so, as they stand one from another, a foot and a handbreadth, & be couered ouer with mould M
two cubits thick.

As touching canes and reeds, they loue to grow in places more wet and waterish than either the Willows and Oisiers aboue said, or the Poplars. Men vse to plant their bulbous roots, which

some

20030
copy 1

A ſome call their oilets or eies, in a trench of a ſpan depth: and thoſe two foot and an halfe aſunder. Theſe reeds do multiplie and increaſe of themſelues (if a plot be once planted with them) after the old plants be extirped & deſtroied. And ſurely, this is found now adaies to be the better and the more profitable way, euen to commit all to Nature, rather than to gueld and weed them out where they ſeem to grow ouer thick, as the practiſe was in old time: for the maner of their roots is, to creepe one within another, and to be ſo interlaced continually, as if they were twiſted together. The fit and proper time to plant and ſet theſe canes or reeds is a little before the calends of March, to wit, before the oilets or eies abouesaid begin to ſwell. They grow vntill mid-winter, at which time they wax hard, which is a ſigne that they haue done growing: and this is the only ſeaſon alſo for to cut them. Likewiſe, the ground would be digged about them,
B as often as vines. The order of planting them is two manner of waies, for either the roots be laid ouertwhart or acroſſe, and but ſhallow within the ground (and look how many eies there be in the root, ſo many plants wil ſpring aboue the earth:) or els they be pitched down-right, within a graue or trench of a foot depth, ſo as there be two eies or buds vnder the ground, & the third aboue, but cloſe and meet with it: but this caueat is to be giuen, that the head thereof may bend forward toward the earth, for feare that it drinke in any dew, which might ſtand and ſettle vpon it. This alſo is obſerued, that they be cut euer in the wane of the Moone: as alſo, before that they are imploied about Vineyards for to beare vp vines, they would haue a whole yeares drying, for ſuch are more profitable than the greene.

The beſt ſtaies to beare vp Vines, are made of the Cheſtnut-tree: for why? the wood is gentle
C and tractable; tough withall, and induring long: beſides, it hath this property, that cut it when you liſt, it will ſpring againe more plentifully than any willowes. It loueth to grow in a gentle and ſandy ground, but principally, if the ſame ſtand vpon a moiſt grauell or a hot earth full of little pebbles, and namely, where there is good ſtore of ſuch ſoft ſtones, as will ſoone crumble into grit: neither makes it any matter how much the place be ſhadowed, nor how cold and expoſed to the Northern winds, for ſuch it liketh well enough, yea, although it be the ſide or hanging of an hill, as bleake and cold as may be. But contrariwiſe, it may not abide the red French earth, the chalkie or marle ground, nor in one word, any that is battle or fruitfull. Set it is of a Nut, as we haue beforeſaid: but it commeth not vp, vnleſſe there be fiue in a heape piled together, and thoſe of the faireſt & biggeſt ſort. Moreouer, the plot wherin you mean to haue Cheſt-
D nuts grow, muſt be ouvertly broken vp aloft, from between Nouember and Februarie: in which time the Nuts vſe to be looſe, and to fall of themſelues from the tree, and ſpring vnderneath, finding the ground light and hollow vnder them. Betwixt each heape ſet in manner aforeſaid, there ought to be a foot ſpace euery way, and the trench wherein they be ſet, of a ſpan depth: out of this plot, as out of a ſeminary and nource-garden, theſe yong plants are to be tranſlated into another, and then they muſt be ſet two foot aſunder. Howbeit, they ought to be aboue two yeres old firſt, before they be remoued and replanted. Moreouer, a man may increaſe Cheſtnut-trees by propagation; to wit, by couching and trenching the branches therof, as they grow to the mother: and there is not another tree againe that ſooner taketh that way, than it doth; for the root thereof being laid bare, the whole branch muſt bee interred along in the trench made for the
E purpoſe, leauing out the end only aboue ground. Thus ſhall you haue one tree ſpring from it, and another from the root. Howbeit, planted in this wiſe, it loueth not to be tranſplanted; it cannot lodge elſewhere, but dreadeth and hateth all change of ſoile: and therefore ſuch plots of ground as do affoord coppiſes of Cheſt-nut trees, are ſtored with plants comming of marrons or nut-kernels, rather than quicke-ſets or plants ſet with the root. For the ordering and dreſſing of them, there is no other labour required, than the others before rehearſed; namely, for the two firſt yeares inſuing to dig the ground looſe about their roots, and to proine or cut away the ſuperfluous twigs: for euer after they will ſhift well enough, & manure themſelues, by reaſon that their owne ſhade will kill thoſe ſuperfluous water-ſhoots that ſpring out either from the root or the ſides of the tree. A coppiſe of theſe trees is cut ordinarily within euery ſeuenth yere: and
F one acre of them will yeeld props enough for to ſerue a vineyard of twenty acres: for beſides that one pole of them will abide to be clouen and make two props apeece, they will laſt very well vntill the next fall of the wood or coppis be paſt.

Moreouer, the Maſt-tree called Eſculus, is planted and commeth vp in like ſort: howbeit, paſſing vntoward and vnwilling they are to grow, and therefore they ſtand ten yeres at leaſt before

they

they be cut and lopped. Set Acorns of this tree Eſculus wherſoeuer you pleaſe, they wil ſurely take and come vp: but the trench muſt be a ſpan deep, and the Acornes two foot aſunder. And foure times a yeare are they to be lightly *raked and clenſed from weeds. A forke or prop made of this wood, laſteth very well and rotteth not: and in very truth, the more that the tree it ſelfe is cut and mangled, the better it ſpringeth and putteth forth new ſhoots. G

Sarritis.

Ouer and beſides theſe trees abouenamed, there be others that vſe to be cut and lopped for Vine props and ſtaies; to wit, the Aſh, the Bay tree, the Peach and Hazell tree, yea, and the Apple tree: but theſe are all of them lateward and ſlow of growth: neither will they indure ſo well without rotting, if they ſtand any time in the ground, and much leſſe will they abide any wet. But on the othe ſide, the Elder tree of all others is moſt firme for to make poles and ſtakes of. It wil grow of ſions and imps euen as the Poplar. As for the Cypreſſe tree, we haue of it ſpoken ſufficiently already. H

Chap. XXI.

¶ *The maner and skill of husbanding and dreſſing Vineyards.*

NOw that we haue treated ſufficiently of the inſtruments, furniture, and tackling as it were belonging to Vineyards, it remaineth to ſpeake of the nature of vines, and to deliuer with eſpeciall regard the manuring and dreſſing them. According therefore as wee may ſee in Vines and ſome other trees, which haue within them a ſpungeous matter and light ſubſtance, their twigs and branches do containe a kind of marrow or pith incloſed between certain knots or ioints wherewith their ſtalkes are diuided and parted. As for the fiſtulous concauities, they are but ſhort all of them, and toward the top ſhorter and ſhorter, but euermore betweene two knots, they incloſe the ioints aforeſaid. Now this marow, this vegetatiue and vitall ſubſtance, I ſay (call it whether you wil) runneth forward ſtil on end al the length of the hollow kex or pipe ſo long as it findeth no reſiſtance by the way: but meeting once with a ioint or hard knot which maketh head vpon it, not ſuffering the ſame to paſſe forward, it beeing driuen backe, returneth downward: howbeit, in that reuerberation, breaketh out vnder thoſe knots, and putteth foorth certaine wings or pinnions like arme-pits, whereas the buds or leaues doe come; but alwaies in alternatiue courſe, one of this ſide, another of that; after the maner of reeds, canes, and fennell-geant, as hath bin ſhewed before; in ſuch wiſe, that if one wing riſe forth at the bottome of the lower knot on the right hand, another ſpringeth for it on the left hand in that next aboue it; and thus they keep order the whole length of the branch. Theſe ſprouts when they are come once to ſome bigneſſe, and do branch there, be called of the Latines by a prety name, Gemmæ, as it were precious ſtones: but ſo long as they are no other than buds ſprouting forth vnder the concauity or pit-hole of the foreſaid ioints, they term them Oculos [*i.* Oilets or Eies:] marie in the very top they be named by them Germina [*i.* Sprigs or Burgeons.] After this order are ingendered the maine branches, the ſmaller * ſprigs yearly cut away, the grapes, leaues, and yong tendrils of Vines. But hereat I wonder moſt, that the burgeons comming forth on the right ſide, be alwaies more tough and firm than thoſe of the left. To come now vnto the planting of theſe vines: the ſhoots or branches muſt be cut iuſt in the midſt between the foreſaid knots or ioints, ſo as the marrow in no wiſe run out. And if you would plant fig-ſets or ſions, they ought verily to be a ſpan long, and then to be prickt into the ground (but firſt there ſhould bee a hole made with a little ſtake) with the greater end that grew next to the body of the tree downward: prouided alwaies, that two oilets or buds ſtand aboue ground. Now theſe oilets are properly (in twigs or ſets of trees) thoſe buds called, where the new ſpring firſt ſhooteth forth. And herupon it is, that theſe ſions or cuttings being ſet in nource-gardens, beare the ſame yere that very fruit which they would haue borne vpon the tree, if they had not been cut off: and namely, if they be ſet in the right ſeaſon whiles they be plump and full: for hauing conceiued on the Tree, they do conſummat the ſad conception ſo begun, and are deliuered thereof elſwhere. And look what Fig-ſets be in this manner planted, may be eaſily and without danger remoued and tranſlated the third yere after. For certes, as this tree of all others ſoon ageth and indureth not long; ſo in recompence of ſhort life, this one gift it hath of Nature, That it comes forward apace, quickly groweth to the full bigneſſe, and beareth fruit. I K L M

Nepotes.

As for the Vine, there is not a tree that is planted more ſundrie waies, nor affourdeth greater

ſtore

20030
copy 1

A ſtore of ſions or ſets than it. For firſt and formoſt, nothing thereof is planted, but that which is vnprofitable, hurtfull, ſuperfluous, and of neceſſitie to be pruned and cut away. But in the pruning, this rule muſt be obſerued, that thoſe branches bee cut off which were portoirs, and bare grapes the yere before. The manner in old time was to plant or ſet a ſion, headed (as it were) and taking hold on both ſides of the old wood and hard ſtock: whereupon, becauſe it was faſhioned like a little mallet or hammer head, it was and is at this day called in Latine Malleolus. But afterwards they began to ſlip off a twig with a heele only of the old wood (as they vſe to doe in a Fig-tree:) & there is not a better way to make a Vine ſurely to take and liue than this. A third ſort there is beſides of ſions or ſets which are more readily gotten, without any ſuch heele of the hard wood, and therefore they be wreathed and twined when they be ſet into the ground:
B whereupon they be called in Latine Sagittæ [*i.* Shafts:] for the ſame ſions only cut off and not wreathed, are named Trigemmes, as a man would ſay, twigs with 3 buds or ſpurts: & therefore of one and the ſame vine-branch, a man may in this ſort make many kinds of ſions or ſets. Howbeit, that is to be noted, that if you ſet any yong ſprigs that neuer bare fruit but leafe onely, the Vines comming thereof will be euer barren: and therefore none ought to be planted but ſuch as are fruitfull. A vine-ſet or cutting, that hath ioints ſtanding thin, but here & there, is thought to be fruitleſſe: but contrariwiſe, if it be ſet thick with buds, by all likelihood it will beare plentifully. Some are of opinion, that no ſions ſhould be put into the ground, but thoſe that haue floured already: alſo, that to ſet ſuch cuttings as be called ſhafts, which haue no part of the old wood, is not ſo fit; for, that in remouing they are in danger to break whereas they were writhen.
C Now, when you haue gotten ſuch ſets as be meet for planting; let them be a foot long at the leaſt, and carry fiue or ſix knots, and at this length they cannot poſſibly haue fewer than three buds. Moreouer, the beſt way is preſently to ſet them the very ſame day that they be gathered. But in caſe a man be driuen to keep them long before they be put into the ground, great heed would be taken, according to the rule beforeſaid, that they be not laid aboue ground; that they dry not in the Sun; that they take no wind; nor looſe their freſh vigor by cold. And if it chance that they lie out any while in the dry aire, they would be laied to ſoke in water many daies together, vntill they be refreſhed and look green again, before they be ſet into the earth. The plot or quarter within the nource-garden or vineyard, ought to be wel expoſed to the Sun, of a good largeneſſe, and ſufficiently moulded: alſo, it muſt be well digged for 3 foot broad with a grub-
D bing double toothed forke: then muſt you goe deeper and caſt vp the earth with a broad ſpade or ſhouell, after that the ſame hath bin broken vp with a mattocke or yron toole, carying foure foot in the head, ſo as the ditch may go two foot directly deep into the ground. Which done, the ditch is to be clenſed, & the mould to be ſpread abroad, & not left lying raw in that maner, but to take a kind concoction in the weather. And herein muſt the labourer proceed and be ruled by meaſure, and trie his worke thereby: for if the earth be not well delued, it will be ſoone found out by the vneuen balks or beds. There would be a iuſt meaſure taken alſo of the allies that lie between the beds. All things being thus prepared, let vs come now to the planting of the ſets aforeſaid, which would be couched either in trenches made of purpoſe, or in long furrowes; and then the fineſt and moſt delicate mould that can be found, is to be caſt aloft. But all
E this preuaileth not in a leane and hungry ground, vnleſſe fatter earth be laied as a pallet vnderneath. Moreouer, this is to be looked vnto, that two ſets at the leaſt be moulded and laid within the earth together in one range: alſo they muſt be ſo couched, that they leane with their heads cloſe vpon the earth next about them; yea, and with one and the ſame ſtake the ſaid earth ought to be driuen cloſe and faſt about them. Ouer ane beſides, throughout the whole plot or quarter of this nource-garden, regard is to be had, that between euery two ſets there be a foot & an half one way; to wit, in breadth; and halfe a foot another way, to wit, forward in length. Theſe plants being thus ordered, after they haue growne to twelue moneths, they ſhould be then diſcharged of all their burgeons, euen to the nethermoſt knot, vnleſſe haply it bee ſpared and let alone: for
F ſome there be that cut it alſo: after theſe, commeth forth the matter of the oilets, & ſhew themſelues; and therewith at the third twelue month end the quick-ſet root and all is remoued to another place in the vineyard.

Beſides all this, there is another pretty and wanton deuiſe, more curious ywis than needfull, to plant Vines, and namely, after this manner. Take foure branches of foure vines growing together, and bearing ſundry kindes of grapes; bind them wel and ſtrongly together in that part

where

where they are moſt ranke and beſt nouriſhed: being thus bound faſt together, let them paſſe a- G
long either through the concauitie of an Oxe ſhanke and maribone, or els an earthen pipe or
tunnell made for the nonce. Thus couch them in the ground, and couer them with earth, ſo as
two ioints or buds be ſeen without. By this meanes they inioy the benefit of moiſture, and take
root together: andalthough they be cut from their owne ſtocke, yet they put out leaues & bran-
ches. After this, the pipe or bone aforeſaid is broken, that the root may haue libertie both to
ſpread and alſo to gather more ſtrength. And will you ſee the experience of a pretty ſecret? you
ſhall haue this one plant thus vnited of foure, to beare diuers and ſundry grapes, according to
the bodies or ſtocks from whence they came. Yet is there one fine caſt more to plant a Vine,
found out but of late, and this is the manner thereof: take a Vine-ſet or cutting, ſlit it along
through the midſt, and ſcrape out the marrow or pith very cleane; then ſet them together again H
wood to wood, as they were before, and bind them faſt: but take heed in any caſe that the buds
or oilets without-forth be not hurt, nor raſed at all. This done, put the ſame cutting into the
ground, interre it I ſay wel within earth and dung tempered together: when it begins to ſpread
yong branches, cut them off; and oftentimes remember to dig about it, & lay the earth light: &
certes, *Columella* holdeth it for certain, and aſſureth vs vpon his word, That the grapes comming
of ſuch a vine wil haue no ſtones or kernels at all within them. A ſtrange thing and paſſing won-
derfull, that the very ſet it ſelfe ſhould liue; and that which more is, grow and beare, notwith-
ſtanding the pith or marrow is taken quite away.

Furthermore, ſince we are entred thus far into this diſcourſe and argument, I cannot paſſe by
but I muſt needs ſpeake of ſuch twigs and branches of trees as wil knit and grow together euen I
to a tree. For, certain it is, that if you take fiue or ſix of the ſmalleſt ſprigs of box, binde them
together, and ſo prick them into the ground, they will proue and grow to one entire tree. How-
beit, in old time men obſerued, that theſe twigs ſhould be broken off from a Box tree, which ne-
uer had bin cut or disbranched, for otherwiſe it was thought verily they would neuer liue: but
afterwards this was checked by experience, and the contrary knowne. Thus much as touching
the order of Vine-plants, and their nource-garden for ſtore.

It remaineth now to ſpeak of the manner of Vineyards and Vines themſelues. Where in the
firſt place, there offer vnto vs fiue ſorts thereof. For ſome traine and run along vpon the ground
ſpreading euery way with their branches: others grow vpright and beare vp themſelues with-
out any ſtaies. Some reſt vpon props, without any traile or frame at all: others be born vp with K
forkes and one ſingle raile lying ouer in a long range: and laſt of all, there be vines that run vpon
trailes and frames laid ouer croſſe-wiſe with foure courſes of railes, in manner of a croſſe dor-
mant. The ſame manner of husbandry that ſerues thoſe Vines which beare vpon props without
any other frame at all, will agree well enough to that which ſtandeth of it ſelfe without any
ſtaies. For ſurely it groweth ſo, for default onely and want of perches and props. As for the vine
that is led vpon a ſingle range as it were in one direct line, which they call Canterius, it is
thought better than the other, for plenty of liquor: for beſides that it ſhadoweth not it ſelfe, it
hath the furtherance and help of the Sun-ſhine continually to ripen the grapes: it hath the be-
nefit alſo of the wind blowing through it, by which means the dew will not long ſtand vpon it.
Moreouer, it lieth more handſome to the hand for the leaues to be plucked away, and for the L
clods to be broken vnder it: & in one word, is readieſt for all kind of good husbandry to be don
about it. But aboue all other commodities it hath this, that it is not long in the floure, but bloo-
meth moſt kindly. As for the frame aforeſaid, that is ranged in one line a length, it is made of
perches or poles, reeds and canes, cords and ropes, or els lines of haire, as in Spaine and about
Brindis. The other kind of frame with railes and ſpars ouerthwart, beareth a vine more free, for
plenty of wine than the reſt, and called this is *Compluviata vitis*, becauſe it reſembleth the hol-
low courſe of gutter tiles, that in houſes receiue all raine water and caſt it off. For as the croſſe
dormant in building ſhutteth off the raine by foure gutters, euen ſo is this Vine led and caried
foure waies, vpon as many trailes. Of this Vine and the maner of planting it, we will only ſpeak,
for that the ſame ordering will ſerue well enough in euery kind beſides: marie there be far more M
waies to plant this than the reſt, but theſe three eſpecially. The firſt and the ſureſt is, to ſet the
Vine in a plot well and throughly delued: the next to it, is in the furrow: the laſt of all, in a
trench or ditch. As for digging a plot and planting therein, ynough hath been written already.

A

Chap. XXII.

¶ *Of furrowes and trenches wherein vines are planted: alſo of pruning vines.*

IT ſufficeth that the furrow or trench wherin a vine is to be planted, be a ſpade or ſhouels bit breadth: but ditches would be three foot long euery way. Be it furrow, trench, or ditch, wherin a vine is to be replanted, it ought to be three foot deepe; and therefore no plant thereof ſhould be remoued ſo little, but that it might ouer and beſides ſtand aboue ground, and ſhew two buds at the leaſt in ſight. Needful it is moreouer, that the earth be well looſened and made more tender and gentle, by ſmall furrowes ranged and trenched in the bottom of the ditch; yea
B and be tempered ſufficiently with dung. Now if the vineyard lie pendant vpon the hanging of the hill, it requireth deeper ditches, and thoſe raiſed vp well with earth and bedded, from the brims and edges on the lower ground. As for ſuch which ſhall be made longer, and able to receiue two vine-plants growing contrary one to the other, they ſhall be called in Latine, Alvei. Aboue al, the root of the vine ought to ſtand juſt in the midſt of the hole or ditch; but the head and wood thereof which reſteth vpon the ſound and firme ground, as neere as poſſible is, muſt beare directly into the point of the Æquinoctiall Sun-riſing: and withall, the firſt props that it leaneth vpon, would be of Reeds and Canes.

As touching the bounding and limitation of a vineyard, the * principall way which runneth ſtreight Eaſt and Weſt, ought to carry 18 foot in breadth, to the end that two carts may paſſe
C eaſily one by another, when they meet; the other croſſe allies, diuiding euery acre juſt into the mids, muſt be ten foot broad: but if the plot or modell of the vineyard wil beare it, theſe * allies alſo which lie North and South, would be as large ful as the foreſaid principal high way. Moreouer, this would be alwaies conſidered, That vines bee planted by fiues; (*i.*) that at euery fifth perch or pole that ſhoreth them vp, there be a path diuiding euery range and courſe, and one bed or quarter from another. If the ground be ſtiffe and hard, it muſt of neceſſitie bee twice digged ouer, and therein quick-ſets only that haue taken root, muſt be replanted: marie in caſe it be a looſe mould, light, and gentle, you may ſet very cuttings and ſions from the ſtock, either in furrow or in trench, chuſe you whether. But ſay it be a high ground and vpon the hill, better is it to caſt it into furrowes ouerthwart, than to dig it; that by this meanes the perches or props may
D keep vp the ground better, which by occaſion of raine water would ſettle downeward. When the weather is diſpoſed to raine, or the ground by nature drie, it is good planting vine-ſets, or ſions at the fall of the leafe, vnleſſe the conſtitution of the tract and qualitie of a country require the contrary: for a dry and hot ſoile would be planted in Autumne or the fal of the leafe, whereas a moiſt and cold coaſt may tarry, euen vntill the end of Spring. Let the ſoile be dry and hard, bootleſſe it will be to plant, yea though it were a very quick-ſet, root and all. Neither will it do well to venter the ſetting of imps cut from the tree, in a drie place, vnleſſe it be immediatly vpon a good ground ſhower: but in low grounds, where a man may haue water at will, there is no danger at all to ſet vine branches, euen with leaues on the head; for they will take well enough at any time before the Mid-ſummer Sun-ſtead, as we may ſee by experience in Spaine.
E When you will plant a vine chuſe a faire day; and if poſſibly you can, let it be when there is no wind ſtirring abroad; for ſuch a calme ſeaſon is beſt: and yet many are of opinion, that Southern winds be good, and they wiſh for them; which is cleane contrarie vnto *Cato* his mind, who expreſſely excepteth and reiecteth them. If the ground be of a middle temperature, there ought to be a ſpace of fiue foot diſtance between euery vine: and in caſe it be a rich and fertile ſoile, there would bee foure foot at leaſt from one to another; but in a leane hungrie piece of light ground, there ſhould be eight foot at the moſt: for whereas the Vmbrians and Marſians leaue twenty foot void betweene euery range of vines, they doe it for to plough and ſow in the place, and therein they haue quarters, beds and ridges, called Porculeta. If the place where you plant a vineyard be ſubiect to thicke and darke miſts, or to a rainie diſpoſition of the weather, vines
F ought to bee ſet the thinner: but in a drie quarter, it is meet they ſhould bee planted thicke. Moreouer, the wit and induſtrie of man hath found out meanes to ſaue charges, and in ſetting a nource-garden with vine-ſions to goe a nearer way, with ſmall expence and no loſſe of ground: for in replanting a vineyard with quicke-ſets vpon a leuell plot, onely digged and laied euen, they haue with one and the ſame labour (as it were by the way) repleniſhed the ground be-

* *Decumanus.* Limes.

* *Cardines.*

tween euery ſuch rooted plants,with vine cuttings for ſtore,ſo as the quickſets may grow in his G
owne place appointed,and the ſion or cutting (which another day is to be tranſplanted) in the
mean time take root between euery courſe and range of the ſaid vine quick-ſets,before they be
ready to take vp much ground. Thus within the compaſſe of one acre,by iuſt proportion a man
may haue about 16000 quick-ſets. This is the difference only,that ſuch beare not fruit ſo ſoon
by two yere:ſo much later are they that be ſet of ſions,than thoſe that were tranſplanted and re-
main ſtil on foot. When a quick-ſet of a vine is planted in a vineyard,and hath grown one yere,
it is vſually cut downe cloſe to the earth, ſo as but one eie or button be left aboue ground, and
one ſhore or ſtake muſt be ſtickt cloſe to it for to reſt vpon,and dung laid well about the root.
In like manner ought it to be cut the ſecond yeare. By this means it gathereth ſtrength inward-
ly, and maintaineth the ſame in ſuch wiſe, as it may be ſufficient another day to beare and ſu- H
ſtain the burden both of branch and bunch,when it ſhall be charged with them: for otherwiſe
if it be let alone and ſuffered to make haſt for to beare, it would prooue to be ſlender, vinewed,
leane,and poore:for ſurely this is the nature of a vine, That ſhe groweth moſt willingly: in ſuch
ſort,that vnleſſe ſhe be kept vnder,chaſtiſed,and bridled in this manner(her inordinat appetite
is ſuch) ſhe will run her ſelfe out of heart,and go all to branch and leafe.

As touching props and ſhores to ſupport vines,the beſt, (as we haue ſaid) are thoſe of the
Oke or Oliue tree;for default whereof,ye may take good ſtakes and forks of Iuniper, Cypreſſe,
Laburnium,and the Elder. As for thoſe perches that be of other kinds,they ought to be cut and
renewed euery yeare. Howbeit,to lay ouer a frame for vines to run vpon; the beſt poles are of
Reeds and Canes,for they will continue good fiue yeares,being bound many of them together. I
When the ſhorter branches of a vine are twiſted one within another in manner of cording or
ropes,and ſtrengthened with the wood of vine cuttings amongſt, thereof arch-worke is made,
which in Latine they call Funeta. Now by the time that a vine hath growne three yeares in the
vineyard, it putteth forth apace ſtrong branches, which in time may make vines themſelues;
theſe mount quickly vp to the frame:and then,ſome good husbands there be,who put out their
eies,that is to ſay,with a cutting hook(turning the edge vpward) fetch vp the eies budding out
beneath: thus by pruning,although they ſeem to do hurt and wrong vnto them, yet they draw
them to ſhoot out the longer by the meanes: for in good faith, the more profitable way it is,
thus to vſe & acquaint it with bearing branches luſtily;and far better and eaſier is it beſides to
cut away theſe yong imps as the vine lieth faſt joined to the frame, vntill ſuch time as a man
think it be ſtrong enough of the wood. Others there are, who in no caſe would haue a vine tou- K
ched or medled withall,the next yeare after that it is remooued into the vine-yard; nor yet to
feele the edge of the cutting hooke,vntill it haue fiue yeres ouer the head;mary then they agree
it ſhould be pruned & guelded of all the wood it hath,ſaue only three burgeons. You ſhal haue
ſome againe that will indeed cut them the very next yere after they be replanted,but ſo as they
may win euery yere three or foure ioints;and when they be foure yeres old and not before,they
giue them liberty to climbe vpon the frame. But this(I aſſure you) is the next way to make the
vine fructifie ſlowly and late: beſides,it cauſeth it to ſeem ſcortched and full of knots, yea and
to grow like a dwarfe or wreckling. The beſt ſimply, is to ſuffer the ſtocke or mother to bee
ſtrong firſt,and afterwards let the branches and yong imps hardly,be as forward and audacious
as they will. Neither is it ſafe truſting that vine which is full of cicatrices or skarres (a thing L
that proceeds of great errour and an vnskilfull hand;) for ſurely all ſuch branches grow of hurts
or wounds,and ſpring not one jot from the mother ſtock indeed: for all the while that ſhee ga-
thereth ſtrength,her whole vertue remaineth within her; but when ſhe is ſuffered to grow and
fructifie,ſhe goeth throughly to worke,and emploieth her forces full and whole to bring forth
that, which yeerely ſhee conceiued: for Nature produceth nothing by halfes nor by peece-
meale,but is deliuered of all at once. Well then,after that a vine is once full grown and ſtrong
enough,let it preſently run vpon perches, or be led in a traile vpon a frame; but in caſe it bee
yet with the weakeſt,let it be cut againe,and take vp her lodging hardly beneath vnder the very
frame:for in this point the queſtion is not,what Age,but what Strength it hath? for that is it
which muſt rule all. And verily great folly and raſhneſſe it were,to put a vine to it, and let her M
haue the will to grow ranke,before ſhe be as big full as a mans thumbe. The next yere after that
it is gotten to the frame, there would be ſaued and let to grow one or two branches, according
to the ſtrength and ability of the mother: & let the ſame the yere following alſo be preſerued,
nouriſhed,

20030
copy 1

A nouriſhed,and permitted to grow on end,vnleſſe her feebleneſſe be againſt it:but when the third yeare is come,and not afore,be bold to giue her the head with two branches more;and neuer let her goe but with foure at the moſt. In one word, hold a vine downe as much as you can, neuer cocker and cheriſh her,but rather repreſſe her fruitfulneſſe;for of this nature is the vine, Rather than her life,ſhe would be alwaies bearing;neither taketh ſhe ſuch pleaſure to liue long, as to beare much: and therefore the more you take away of her ranke and ſuperfluous wood, the better will ſhe imploy her radicall ſap and moiſture to fructifie and yeeld good ſtore of grapes:yet by her good will ſhe would be euer putting forth branches for new plants, rather than buſie in bearing fruit:for well woteth ſhe,that fruit will fall and is but tranſitory. Thus to her owne vndoing and ouerthrow, while ſhee thinketh to ſpread and gaine more ground, ſhee ſpends her
B ſtrength,her ſelfe and all. Howbeit,in this caſe.the nature of the ſoile will guide a man and adviſe him well: in a lean and hungry ground,although the vine be ſtrong enough, you ought to keep it downe with cutting, that it may make abode vnder the head of the traile and frame aboue;and howſoeuer ſhe may haue ſome hope that her young branches may get vp to the top, (as being at the very point to mount aboue it,and ſo neare as that they reach therevnto) yet let her ſtay there and proceed no farther:ſuffer her not(I ſay) to lay her head thereupon and couch vpon the traile,nor wantonly to ſpread and run on at her eaſe. In this manner (I ſay) hold her head in with the bridle,that ſhe may in the end chuſe rather to grow big in body & ſtrong withall,than to ſhoot forth branches about her euery way far and neare. The ſame branch now that is kept ſhort of the frame,ought to haue two or three buds to burgen at,and to bring forth more
C wood in time: and then let it be drawne and trained cloſe vnto the traile and tied faſt thereto, that it might ſeeme to beare vpon it and be ſupported thereby, and not to hang looſely thereupon. Being thus bound to the frame,it muſt likewiſe be tied anon,three buds or joints off: for by this means alſo the wood is reclaimed and repreſſed from running out in length beyond all meaſure,and the burgeons in the way between will come thicker & ſhoot vp on heigth, to furniſh the husbandman with ſtore of new ſets and ſions for the next yeare. The very top end in no wiſe muſt be tied. Certes this property and qualitie hath the vine, That what part ſoeuer of it is dejected and driuen downward, or els bound and tied faſt, the ſame ordinarily beareth fruit, and principally in that very place where it is bowed and bent in manner of an arch. As for the other parts which be backeward and neerer to the old maine ſtocke, they ſend out ſtore of new
D branches indeed,full of wood,but otherwiſe fruitleſſe that yeare:by reaſon(I ſuppoſe verily)of the ſpirit or vegetatiue life,and that marrow or pith whereof wee ſpeake before, which findeth many ſtops and lets in the way. Howbeit theſe new ſhoots thus putting forth, will yeeld fruit the next yere. Thus there offer vnto vs two kinds of vine branches:for that which ſpringeth out of the hard and old wood,and promiſeth for that yeare following nothing but ſprigs and twigs onely,is called Pampinarium: whereas that which commeth more forward beyond the cup or cicatrice,and beareth ſhew of grapes,is named Fructuarium. As for another, ſpringing from a yeare-old branch, it is left alwaies for a breeder and kept ſhort vnder the frame: as alſo that which they terme Cuſtos,[i.the Keeper,or Watch:]a young branch this is,and no longer than it may well carry three buds:which the next yeare is like to beare wood and repaire all, in caſe
E the old vine ſtocke ſhould miſcarry and ſpend it ſelfe by carrying too great a burden. Alſo another burgen there is cloſe to him,bearing out like a knob,of the bigneſſe of a wart(called heis Furunculus)who muſt ſerue the turne and make ſupply, if peraduenture the foreſaid Watch or Keeper faile.

Moreouer, a vine if it be ſuffered to beare before the ſeuenth yeare after it was firſt ſet of a cutting or ſion,decaieth ſenſibly and ſoon dieth:neither is it thought good to let the old wood run on ſtill in length vpon the frame, as far as to the fourth forke that vnderproppeth it, (ſuch old crooked branches ſome call Dracones, others Iuniculos) to make thereof huge and great trailes of vines termed Maſculeta. But worſt of all it is, to ſeeme for to propagate or draw in a long traile within the ground vines in a vineyard,when they be growne hard with age. When
F the vine is fiue yeares old,a man may boldly wind and twine the very branches,ſo as out of euerie one there be a twig let to grow at liberty: thus he may proceed forward to the next;cutting away the wood as he goeth that bare before. The ſurer way euermore is ſuppoſed to leaue the Watch or Keeper behind; marie he muſt be next vnto the vines maine bodie, and neareſt the root, and no longer than is before ſet downe. Now in caſe the branches proone ouer ranke,

they muſt be writhed and twiſted in maner aforeſaid,ſo as the vine ſtock may put forth no more G
than foure boughs at the moſt,or twaine if ſo be it reſt vpon one chanter or range of perches. If
you would order a vine ſo as it may ſtand alone without any props, at the beginning it would
deſire and haue ſome ſupporter or other (it makes no matter what) to reſt vpon, vntill it haue
learned to ſtand of it ſelfe,& riſe vpright:afterwards,it is to be vſed in manner of all other vines
when this training is paſt. This regard would be had in pruning and cutting the twigs of theſe
vines called Pollices, That a man well guide and ballance his hand,and go euen withall in eue-
ry part indifferently,for feare leſt one ſide be charged with fruit or branch more than the other:
where by the way,he muſt alſo remember to keepe downe the head,and not ſuffer it in any wiſe
to run vp in height: for if this kind of vine be aboue three foot high,it wil hang the head down-
ward. As for others, they may well grow to fiue foot and vpward, ſo that they paſſe not in any H
caſe the full height of a man. To come now vnto the other vines that creepe along and ſpread
ouer the ground;they be inuironed all the way as they run,with pretty ſhort hollow cages as it
were,to reſt and repoſe their branches in. They haue need moreouer of certaine trenches or dit-
ches round about to run in,to the end that as the ſaid branches wander too and fro,they ſhould
not incounter one another and ſtriue together. And verily in moſt parts of the world, they vſe
to gather their vintage of vines thus growing low by the ground:as we may ſee the manner is
in Africke, Ægypt, Syria, throughout all Asia, and in many places of Europe. For the good
vſage and dreſſing of theſe vines,a ſpeciall care would be had to keepe them downe cloſe to the
earth;and to fortifie the root,ſo long and in the ſame manner, as hath beene ſhewed before in
thoſe,that are ſhored or beare vpon frames;with this charge and regard beſides,to leaue alwaies
the ſhort twigs only called Pollices,with three buds a piece,in caſe the ground be fruitfull;or I
*Quinis,rather Binis,i. twaine. * fiue,if it be light and lean And in one word,better it is without all queſtion, that they be left
many,than long. As for thoſe points which we haue deliuered heretofore, as touching the na-
ture of the ſoile, they will be more effectually ſeen to proue either the goodneſſe or the contra-
ry,in the grapes of this vine,by how much nearer they lie to the ground than others. Wherein
conſideration is to be had of the ſundry ſorts of vines; namely,that they be ſeuered apart; and
nothing is better,than to ſort euery one with the tract or region that agreeth beſt with it, and
therein to plant them accordingly: for theſe mixtures of diuers kindes are neuer good,but al-
waies diſcordant: naught in old wines that come to our table, much worſe then you may bee
ſure,in thoſe that be new and not yet tunned vp. But if a man will intermingle plants of ſundry K
vines together,yet in any caſe thoſe would be ioined together(and none els) which ripen their
fruit at one and the ſame time.

For frames and trailes wherein vines are to run,the better and more battle that the ground of
the vineyard is,the plainer and euener that it lieth,the higher they would be from the ground;
likewiſe if the place be ſubiect to dews,fogs,and miſts,and nothing expoſed to the winds:con-
trariwiſe,if the ground be leane and dry,hot,and open to the winds,they muſt be the lower and
nearer the earth. As concerning the rafters,that lie ouer & reach from prop to prop,they ought
to be tied and faſtened thereto with as ſtreight and ſure a knot as is poſſible; whereas the Vine
would be bound vnto them, but ſlacke. Of the ſundry ſorts of Vines, as alſo which were to be
planted in this or that ſoile,and what coaſts & climats each one of them loueth, we haue ſhew- L
ed ſufficiently in the particular treatiſe of their nature,and of the wines that come of them.

Touching all other points of husbandry that remaine behind; much doubt and diuers que-
ſtions are made:for many there be that feare not all Summer long to bee digging in the vine-
yard about vine-roots,after euery little raine. Others again forbid to meddle & be luſty therin,
in the budding time:for it cannot be auoided, but that the yong oilets will either bee ſmitten
off clean,or els galled or bruiſed one time or other,with their gate that go in and out between:
which is the cauſe,that they would haue all kind of cattell to bee kept out that they come not
neare,and eſpecially ſuch as beare wooll on their backs; for ſheep of all others ſooneſt rub off
the buds as they paſſe by,with their ſhag coats. Moreouer, they are of opinion,that all manner
of raking and harrowing,is an enemy to vines when they bee in their floure,and putting foorth M
young grapes:and ſufficient it is(ſay they) if a vineyard be delued thrice in one yere;to wit,firſt
from the ſpring Æquinox,to the apparition of the Brood-hen ſtar; ſecondly, at the riſing of
the great Dog ſtar; and thirdly,when the grape beginneth to change colour and turne blacke.
Others ſet out theſe times after this maner: if the vineyard be old,they would haue it once dig-

ged

20030
copy 1

A ged betweene vintage and mid-winter; howſoeuer ſome be of this mind, That it ſufficeth them to bare the roots only of the vines and lay dung thereto. The ſecond deluing they would haue to be from the Ides of Aprill, and ſix daies before the Ides of May, that is, before they begin to conceiue and bud: and thirdly, before they fall to bloſſome; alſo when they haue done flouring; and alſo at the time when the grapes alter their hew. But the more skilfull and expert husbands affirme conſtantly, That if the ground be ouermuch laboured, and digged too often, the grapes will be ſo tender skinned, that they will burſt againe. Moreouer, theſe rules following are to bee obſerued, That when any vines do require ſuch deluing and digging, the laborers ought to goe to worke betimes before the heat of the day: mary if the vineyard ſtand vpon a mirie clay, it is not good then either to eare or dig it, but rather to wait for the hot ſeaſon; for the duſt that ri-
B ſeth by digging, is very good (by their ſaying) both to preſerue the vine and grapes from the parching Sun, and alſo to defend them againſt the dropping miſts.

As for disburgening of vines, and clenſing them of their ſuperfluous leaues, all men accord, that it ſhould be done once in the Spring; to wit, after the Ides of May, for the ſpace of eleuen daies following; and in any hand before they begin to put forth floure. And how much thereof muſt be thus diſſoiled for the firſt time? euen all that is vnder the traile or frame, & no more. As for the ſecond, men be not all of one minde; ſome would haue the leaues to be disbranched when the vine hath done flouring: others expect, vntill the grapes begin to be ripe. But as touching theſe points, the rules that *Cato* giueth, wil reſolue vs: for we are now alſo to ſhew the maner of cutting and pruning vines. Many men begin this worke immediatly after vintage, when
C the weather is warm and temperat: but indeed (by courſe of Nature) this ſhould neuer be done before the riſing of the Ægle ſtar (as we will more at large declare in the next booke, where we are to treat of the riſing and fall of the fixed ſtars and of their influences) or rather in truth, when the Weſterne wind Fauonius beginneth to blow, foraſmuch as there might be danger in going ouer ſoon to work, conſidering that haſt commonly maketh waſt. For this is certain, that if there come an after-winter, and chance to bite the vines newly medicined (as it were) or rather ſore with this pruning, if it happen (I ſay) that when euery man makes reckoning that winter is gon, it come vpon them againe and whiske with his taile, their buds pinched with cold will loſe their vigor, their wounds will cleaue and make rifts, in ſuch ſort, that when the humidity is di-
D ſtilled and dropped forth, the oilets wil be nipt and burnt away with the bitterneſſe of the vnſeaſonable weather; for who knoweth not, that in froſt it is tickliſh medling with vines, and that they be in danger ſoon to breake and knap aſunder? To ſay therefore a truth, by order of Nature there would not be ſuch haſt made. But here is the matter, they that haue a large domaine and much lands to look vnto, they that muſt go through a great deale of work, cannot wil nor chuſe but begin betimes, and make this computation and reckoning aforeſaid. And in one word, the ſooner that vines be pruned (if the time wil ſerue commodiouſly) the more they run into wood and leaues; and contrariwiſe, the later you go to work, the more plenty of grapes they wil yeeld: and therefore it is meet and expedient to prune vines that be poore and feeble, very timely; but ſuch as be ſtrong and hardy, laſt of all.

As for the manner and faſhion of the cut, it ought alwaies to be aſlant, like a goats foot, that
E no drops of raine may ſettle and reſt thereupon, but that euery ſhower may ſoon ſhoot off: alſo that it turn downeward to the ground, that it be euen and ſmooth made with a keen and ſharpe edged bill or cutting hook. Furthermore this heed would be taken, that the cut be iuſt between two buds, for feare of wounding any of the oylets neere vnto that part which is cut off: and commonly this is ſuppoſed to be blacke and duskiſh, and ſo long as it is ſo ſeen, it ought to be cut and cut again, vntill you come to that which is ſound and cleare indeed: for neuer ſhall yee haue out of a faulty and corrupt wood, any thing come forth that will bee worth ought. If the vine be ſo poore and lean that it affordeth no branches meet and ſufficient to beare, cut it down to the verie ground, for beſt it is then to fetch new from the root, and to ſee whether they will be more liuely. Ouer and beſide in disburgening and defoiling a vine, you muſt beware how
F you pluck off thoſe burgeons that are like to beare the grape, or to go with it; for that were the next way to ſupplant (as it were) the grapes, yea and kill the vine, vnleſſe it were a new and yong plant. Will you then know which are vnprofitable and may be ſpared? euen all thoſe are deemed ſuperfluous, which are come not directly from the knot or neere oilet, but grow out of the ſide: and no maruell, ſince that the verie branches of grapes which hang in this manner out of

the hard wood,are ſo ſtiffe and tough alſo,that vnneth a man may plucke them off with his fingers,but had need of a knife or hook to cut them away. G

As for the pitching of props into the ground,ſome are of opinion that the beſt way is to ſet them between two vines: and indeed that were the eaſier way to come about the vines, for to lay their roots bare when time ſerueth. Alſo, better it is far ſo to doe, in a vineyard where the vines run vpon one ſingle traile, in caſe the ſaid traile be ſtrong enough, and the vineyard not ſubiect to the danger of winds: but where a vine runneth foure waies, it muſt be relieued with prop and ſtayes as neer as may be,to ſupport the burden; yet ſo,as they be no hinderance when as men ſhould come about the foot to lay the root bare: and therefore they would be a cubit off,and no more. Moreouer,this is a general rule,that a vine be clenſed about the root beneath, before that it be pruned aboue. H

Cato treating generally of all maters concerning vines, writeth thus by way of rule and precept; Let your vine (quoth he) be as high as poſſibly you can: faſten it to the frame decently, but take heed you bind it not too hard. Dreſſe and order it after this manner: After you haue cut away the tips and tops therof,dig round about the roots, and be in then to eare vp & plow the vineyard: draw furrowes and ridges too and fro throughout. Whiles vines be yong & tender,couch the branches within the ground for propagation,with al ſpeed: as for old vines,geld them as little as you can,& keep them with a good head; rather if need require,lay them along on the ground,and two yeares after cut them hard to the root. If it be a yong vine,attend vntill it be of ſtrength ſufficient;then will it be time and not afore to prune it. If haply the vineyard be bare and naked of vines,and that they grow but thin here and there,make furrowes and trenches between,and therein plant new quickſets: but rid the weeds well from about thoſe Trenches,for ouerſhadowing them: be euer alſo digging and delving. Then,if it be an old vineyard, ſo drage and pulſe for prouender: if it be a lean and light ground,ſow nothing that bears grain or corn. Be ſure that ye lay about the heads of the ſaid quickeſets,dung,chaffe,refuſe of grapes preſſed,and ſuch like mullock. When the vine beginneth to put out leaues and look green, fall to disburgeoning. So long as the Vines be yong and tender,tie them ſurely in many places,for feare leſt the wood or ſtalk therof do break aſunder. But when a vine hath gotten head to perch aloft vpon a ſingle traile, gently binde the tender burgeons and branches thereof, extend and ſtretch them out,and lay them ſtreit. Now when they ſtand once vpright and are able to beare themſelues,mark when the grapes begin to change colour,bind them wel and ſure below. I K

As for graffing of vines, there are two ſeaſons of the yeare meet therefore: the one in the ſpring,the other when the vine doth floure;and this is held for the beſt. If you purpoſe to tranſlate an old ſtock of a vine into another place,and there to replant it,cut off the firſt thick arm only,leauing behind two buds and no more. In taking of it vp,be carefull that you do it with ſuch dexteritie,as that you race not nor wound the root. This done,look how it grew before, ſo ſet it now,either in trench or furrow: couch it wel and cloſe,and couer it throughly with good mould. After the ſame manner as is beforeſaid vnderſet and prop it vp, bind it,turn and winde it; but aboue all be euery while digging about it. As touching the drage called Ocymum, the which *Cato* wills to be ſowed in a vineyard,it is a kind of forage or prouender for horſes,which the Latines in old time named Pabulum; it commeth vp very ſpeedily and groweth faſt, and beſides can well away with ſhadowie places. L

Chap. XXIII.

¶ *Of Trees ranged in rewes for to ſupport Vines.*

IT remaineth now in this diſcourſe and treatiſe of Vines,to write of the manner of trees planted of purpoſe for to ſerue their turn. And here I canot chuſe but cal to mind,firſt,how this point of husbandry hath bin iudged naught, and altogether condemned by the two *Sarſennæ*,both father and ſonne; but contrariwiſe held for good, and highly commended by *Scroſa*: whereas all three were reputed the moſt antient writers,and skilfulleſt in this kind next to *Cato*. M And yet *Scroſa*, as great a patron as he is thereof, alloweth not this deuice in any clymate elſe but only in Italy. Howbeit,gon this hath for currant many yeares paſt, and time out of mind, That the beſt and moſt dainty Wines came of thoſe grapes onely which grew vpon ſuch Haut ins or trees beforeſaid. Yea,and it was thought generally, that the higher a Vine climbed vp-

on

20030
copy 1

A on theſe trees, the better grapes it bare, and yeelded more commendable wine: and againe, the lower that thoſe trees were, the greater plenty followed both of the one & the other. By which a man may ſee how materiall it is to raiſe Vines on high, and haue grapes growing in the top of trees. In which regard, choiſe alſo is to bee made of trees for this purpoſe. And here firſt and formoſt is preſented vnto vs the Elme: and yet I muſt except that kind of it which is called Atinia, by reaſon that it is ouermuch charged with boughes and leaues, and therewith too full of ſhade. Next vnto it may be ranged the blacke Poplar, euen for the ſame cauſe, becauſe it is not leaued nor branched ſo thick. Many men there be that refuſe not the Aſh, the Fig tree, yea and the Oliue, ſo that it ſtand not ouer thicke with boughs, and make too much ſhade. As for the ſetting, planting, and ordering of theſe trees in general, we haue ſufficiently and to the full treaB ted heretofore. But now for this ſpeciall and peculiar vſe that they be put vnto, this would bee conſidered, That Vines which are to be wedded to theſe trees, muſt in no wiſe feele the edge of the cutting hooke, before they be three yeares old full. After which time, this regard ought to be had, that euery ſecond branch or arme thereof is to be ſpared, and likewiſe each other yeare and no oftener they are in this wiſe to bee pruned: and by that they are ſix yeres old, it is good time to joine them in marriage vnto their husbands aforeſaid.

In Piemont, Lombardie, and thoſe parts of Italy beyond the riuer Po, they vſe for this purpoſe to plant their grounds with theſe trees ouer and beſides thoſe aforenamed, to wit, the Cornell, the Opiet or Wich-hazell, the Teil or Linden, the wild Aſh Ornus, the Carpin Carme or Horn-beame, and the Oke. About Venice and all that tract, the Willowes ſerue the turne and C none elſe, by reaſon that the whole ſoken ſtandeth ſo much vpon water.

As touching the Elme, named in the firſt place, it muſt be kept plaine and bare, and the great water-boughs vnderneath ſhread vntill you come to the middeſt of the tree, or thereabout; and then the reſt ought to bee arraunged and digeſted into good order, whereupon the Vine may climb as it were vpon ſtaires or ladder rounds: and lightly none of theſe trees vpward be aboue twentie foot high. Now in caſe it be a high ground vpon an hil, and drie, they are permitted to branch and ſhut out their armes, within eight foot of the ground. But in plaines and low moiſt grounds, they begin not to fork before they bear twelue foot. Howbeit, let the place be what it wil, the flat of the tree from whence the boughs begin to diuide, ought to regard the ſouth ſun. And the ſaid branches immediatly from their project muſt riſe ſomewhat vpright in maner of D fingers, ſtanding forth from the palm of ones hand, among which, the ſmal ſprigs muſt eftſoons be barbed (as it were) & ſhauen clean off, for feare they do not ouerſhadow the Vine branches.

As touching the ſpace or diſtance between one tree & another, the ordinarie proportion is, that afront and behind, in caſe the ground be erable, it beare fortie foot: but aflanke, or on the ſide, twentie. Marie, if it be not well tilled and husbanded, ſo much wil ſerue euery way, to wit, twentie foot and no more. Commonly euery one of theſe trees maintaineth tenne Vines at the foot therof: and a bad husband he is who hath fewer reared about it than three. But by the way, it is no good husbandrie to ſuffer a tree thus to be coupled (as it were) in marriage to ſo many Vines, before that it be of ſufficient ſtrength to entertain them: for there is nothing ſo hurtfull, by reaſon that the Vines will choke and kill them; ſo quick they be of their growth, and ſo reaE die to ouercharge them.

As for planting of Vine-ſets to the root of trees, needful it is to make therfore a ditch three foot deep: and they ought to be diſtant one from another a ful foot, and ſo much likewiſe from the tree. This don, there is no queſtion thereof the ſmal twigs or ſhoots what to do with them? neither is there any charge or expence required for digging and deluing: for this is the manner of it, and this peculiar gift haue theſe tree-rows, That in the ſame ground where they grow, the ſowing of corne is nothing hurtfull, nay, it is profitable and good for the Vines. Moreouer, this commoditie and eaſement commeth of their height, that they be able to ſaue themſelues: neither is there any ſuch need, as in other Vineyards, to be at the coaſt of walls, of mounds, pales, or hedges, ne yet of deep ditches or other fences, to keep off the violence or injuries of beaſts. Of F all other toiles before rehearſed, there is no more required but to looke vnto onely the getting of quick-ſets, or couching ſions: all the matter I ſay lieth herein, and there is no more to do.

But of couching ſions and that kind of propagation, there be two deuiſes. Firſt within paniers or baskets vpon the boughs of the tree, and that is the be beſt way, becauſe it is ſafeſt from the danger of cattel. The ſecond is, to bend the Vine, or a branch therof, cloſe to the foot of her

owne

owne tree,or elſe about the next vnto it:if it ſtand ſingle and haue no Vine joined vnto it. As much of this branch or Vine thus couched as is aboue the ground,muſt be kept with ſcraping; that is to ſay,the buds ought euer and anone to be knapt off,that it ſpring not forth. Within the earth there ſhould be no fewer than foure joints or budding knots buried and enterred for to take root;in the head without,two onely are left for to grow. [Where, note by the way,that the Vine which groweth to the foot of a tree,muſt be trenched in a ditch foure foot long in al, three in breadth,two and an halfe in deapth.] Now, when the ſion thus couched, hath lien one yere,the order is to cut it toward the ſtock to the very pith or marrow,that ſo by little and little it may be inured to fortifie it ſelfe vpon the own roots,and not to hang and cling alwaies to the mother:as for the other end or head thereof,it would be cut off alſo ſo neere the ground, as that there be but two only buds left. By the third yeare it muſt be quite cut in two,(where before it was but guelded to the pith)and that which remaines of it, laid deeper into the ground, for feare it ſhould ſprout foorth and beare leaues toward that ſide where it was cut in twaine. This done,no ſooner is Vintage paſt,but this new quicke-ſet,root and al,muſt be taken vp and replanted. G H

Of late daies deuiſed was the manner of couching or planting by a trees ſide a Vine Dragon (for ſo we vſe to call the old branch of a Vine paſt all ſeruice,which hath done bearing many a yeare,and is now grown to be hard.) And verily,they vſe to make choiſe of the biggeſt they can find,which when they haue cut from the ſtocke, they ſcrape and pil the bark, three foure parts in length,ſo farre forth as it is to lie within the ground[wherupon they name it in Latine Raſilis:]when it is thus couched low within a furrow, the reſt that is aboue the earth they rear vp againſt the tree. And it is thought,that there is not ſo good nor ſo ready a mean to make a Vine grow and beare than this. If it fall out ſo, that either the Vine be ſmal and weak,or the ground it ſelfe but lean and hungrie,it is an vſuall and ordinarie practiſe to cut and prune it as neer the ground as poſſibly may bee,vntill ſuch time as it bee well ſtrengthened in the root,as alſo,great regard is had, that it be not planted when the deaw ſtandeth vpon it, ne yet when the wind ſits ful in the North. The old Vine ſtock it ſelf ought to look into the Northeaſt,prouided alwaies that the yong branches turne Southward. Moreouer,new and tender Vines would not be proined and cut in haſt:but better it is to expect and tary vntil ſuch time as they be ſtrong ynough and able to beare the cutting bill: meane while,to gather the yong branches together round in maner of on houp or circle. [Where note by the way, That Vines which are erected vpon trees for the moſt part beare later by one yeare than thoſe in Vineyards that be pearched or run on frames.] Some would not haue them to be cut at all, before they haue raught vp to the top of the tree. At the firſt time when you come with the pruning hooke, the head muſt be cut off at ſix foot from the ground,leauing vnderneath one little top twig,which muſt be forced to beare by bending it downward in the head:and in the ſame,when it is thus pruned,there muſt be left behind three buds and no more. The branches which burgen out from thence, ought the next yeare to bee brought vp to the loweſt armes of the tree, and there ſeated: and ſo from yeare to yeare,let them climb vp higher to the vpper boughs,leauing alwaies vpon euery loft or ſcaffold as it were where they reſted,one branch of the old hard wood, and another young imp or twig, for to grow vp and climbe as high as it will. Furthermore, as often as a Vine is pruned afterwards, thoſe branches or boughs thereof in any wiſe muſt bee cut away wnich were bearers the yeare before:and in ſtead of them, the new after they be firſt cleanſed from all the hairy & curled tendrils on euery ſide ſhred off. The ordinarie manner of pruning and dreſſing of vines here about Rome, is to let the tender branches and ſprigs enterlace the boughes, inſomuch, as the whole tree is ouerſpread & clad therwith,like as the very ſame tendrils be alſo couered all ouer with grapes. But the French faſhion is to draw them in a traile along from bough to bough: whereas in Lumbardie and along the cauſey Æmilia [from Plaiſance to Rimino] they vſe to train them vpon forkes and poles:for albeit rhe Atinian Elmes be planted round about, yet the Vine commeth not neere their greene boughes. Some there be, who for want of ſill and good knowledge about vines,hang them by a ſtrong bond vnder the boughs:but this is to wrong,yea to ſtifle and ſtrangle them outright:whereas indeed a vine,as it ought to be kept down with oiſier twigs,ſo it muſt not bee tied ouer ſtreight. For which cauſe, euen they alſo who otherwiſe haue ſtore & plenty ynough euen to ſpare,of willows & oiſiers, yet chuſe rather to bind vines with ſome more ſoft and gentle matter,to wit,with a certain hearb,which the Sicilians in their I K L M

language

20030
copy 1

A language called Ampelodeſmos[*i.* Vine-bind.] But throughout all Greece they tie their vines with Ruſhes, Cyperus, or Gladon, Reeke, and ſea-graſſe. Ouer and beſides, the maner is otherwhiles to vntie the Vine, and for certain daies together to giue it liberty for to wander looſely, and to ſpred it ſelfe out of order, yea, and to lie at eaſe along the ground, which all the yere beſides it onely beheld from on high: in which repoſe it ſeemeth to take no ſmall contentment and refreſhing: for like as draught horſes, when they be out of their geeres, and haknies vnſadled, like as Oxen when they haue drawn in the yoke, yea, and greyhounds after they haue run in chaſe, loue to tumble themſelues and wallow vpon the earth: euen ſo the Vine alſo, hauing bin long tied vp and reſtrained, liketh wel now to ſtretch out her lims and loins, and ſuch eaſement and relaxation doth her much good. Nay, the tree it ſelfe findes ſome comfort and ioy therby,
B in being diſcharged of that burden which it carried continually as it were vpon the ſhoulders, and ſeemeth now to take breath and heart again. And certes, go through the whole courſe and worke of Nature, there is nothing, but by imitation of day and night, deſireth to haue ſome alternatiue eaſe and play dayes between. And it is by experience found very hurtfull, and therefore not allowed of, to prune and cut Vines preſently vpon the Vintage and grape-gathering, whiles they be ſtill wearie and ouertrauelled with bearing their fruit ſo lately: ne yet to binde them, thus pruned, in the ſame place again where they were tied before: for ſurely vines do feel the very prints and marks which the bonds made, and no doubt are vexed and put to pain therewith, and the worſe for them.

The maner of the Gaules in Lumbardy, in training of Vines from tree to tree, is to take two
C boughs or branches of both ſides, and draw them ouer, in caſe the ſtock Vines that beare them be forty foot aſunder: but foure, if they are but twenty foot diſtant. And theſe meet one with another in the ſpace between, and are interlaced, twiſted and tied together. But where they are ſomwhat weake and feeble, they be ſtrengthened with Oiſier twigs or ſuch like rods here and there by the way, vntill they beare out ſtiffe: and look where they be ſo ſhort that they wil not reach out, they are with an hook ſtretched and brought to the next tree that ſtandeth without a Vine coupled thereto.

A Vine branch drawn thus along in a traile, they were wont to cut when it had growne two yeares: for in ſuch Vine-ſtocks as by reaſon of age are charged with wood, it is the better way to giue time & leiſure for to grow and fortifie the ſaid branch that is to paſſe from tree to tree,
D ſo as the thicknes thereof will giue leaue: yea and otherwiſe it is good for the old main bough to feed ſtill and thriue in pulp and carnoſitie, if we purpoſe that it ſhould remaine and carrie a length with it.

Yet is there one maner beſides of planting and maintaining Vines, of a mean or middle nature between couching or interring a branch, by way of propagation, and drawing them thus in a traile from one to another: namely to ſupplant, that is, lay along vpon the ground the whole ſtock or main body of a Vine; which done, to cleaue it with wedges, and ſo to couch in many furrowes or raies, as many parcels thereof, comming all together from one. Now in caſe each one of theſe branches or armes proceeding from one body, be of it ſelfe ſmall, weake and tender, they muſt be ſtrengthned with long rods like ſtaues bound vnto them round about; neither
E ought the ſmall ſprigs and twigs that ſpring out of the ſide, be cut away.

The husbandmen of Novaria reſt not contented with a number of theſe trailed branches, nor with ſtore of boughs and trees to ſuſtaine and beare them, vnleſſe they be ſhored and ſupported alſo with poſts and ouerthwart railes, about which the yong tendrils may creep & wind. No maruell therefore if their wines be after a ſort rough, hard, and vnpleaſant: for beſides the badneſſe of their ſoile, the maner of their husbandry is ſo crooked and vntoward.

Our husbandmen moreouer here about vs, neer vnto the city of Rome, commit the like fault, and find the ſame defect thereupon, in the Varracine Vines, that be pruned but once in two yeres: a piece of husbandry by them practiſed, not for any good that it doth vnto the vine, but becauſe the wine thereof is ſo cheap, that oftner pruning would not quit coſt, neither doth the
F reuenue anſwer the labor and the charges.

In the territorie of Carſeoli (a champion and plain countrey about Rome, the peaſants take a better order, and hold a middle and temperat courſe. For their maner is to proin and cut away from the Vine thoſe parts onely that are faulty and rotten, when they begin once to drie and to wither, leauing all the reſt for to beare Grapes: and thus diſcharging it of the ſuperfluous

burden

burden that it caried, they hold opinion, that it is not good to wound it in diuers places: for by this means (ſay they) it will be nouriſhed and come on very well. But by their leaue, vnleſſe the ground be paſſing rich and fat, Vines thus ouercharged with wood, will for want of pruning degenerate into the baſtard wild wines called Labruſcæ. G

But to returne againe vnto our plots planted with Trees and Vines coupled together: ſuch grounds when they be plowed require a good deep ſtitch, although the corn therein ſown need it not. Alſo it is not the manner to disburgen or deffoile altogether ſuch trees, and thereby a great deale of toile and labor is ſaued: but when the Vines are a pruning, they would be diſbranched at once with them, where the boughs grow thickeſt; and to make a glade onely thorow, the ſuperfluous branches would be cut away, which otherwiſe might conſume the nutriment of the grape. As for the cuts and wounds remaining after ſuch pruning and debranching, we haue already forbidden, that they ſhould ſtand either againſt the North or the South. And I think moreouer it were very well, that they did not regard the Weſt where the Sunne ſetteth: for ſuch wounds will ſmart, and be long ſore, yea, and hardly heale again, if either extreme cold pinch, or extreme heate parch them. H

Furthermore, a Vine hath not the ſame liberty in a vineyard that it hath vpon a tree: for better means there are, and eaſier it is to hide the ſaid wounds from the weather flanked as they be within thoſe cloſe ſides; than to wryth and wreſt them to a mans mind to & fro. In lopping and ſhredding of trees, when the cut ſtandeth open, there would be no hollow places made like cups, for feare that water ſhould ſtand therein. Laſt of all, if a Vine be to climbe Trees that are of any great height, there would be ſtayes and appuies ſet to it, wherupon it may take hold, and ſo by little and little ariſe and mount vp aloft. I

Chap. XXIIII.

¶ *The maner of keeping and preſeruing Grapes. Alſo the maladies whereto Trees be ſubiect.*

IT is holden for a rule, That the beſt Vine-plants which run vpon a frame of rails, ought to be pruned in mid-March about the feaſt of *Minerua*, called Quinquatrus: and if a man would preſerue and keep their grapes, it would be done in the wane of the Moone. Alſo, that ſuch vines as be cut in the change of the Moon, wil not be ſubiect to the iniurie and hurt of any noiſom vermin. Although in ſome other reſpect men are of opinion, that they ſhould be cut in the night, at the full of the Moon, when the ſigne is in Leo, Scorpio, Sagittarius, and Taurus: and generally it is thought good to ſet them when the Moon is at the full, or at leaſtwiſe when ſhe is croiſſant. Moreouer, this is to be noted, that in Italy there need not aboue ten men for to look vnto a vineyard of an hundred acres. K

And now that I haue diſcourſed at large as touching the manner of planting, graffing, and dreſſing of Trees, I purpoſe not here to treat again of Date Trees & Tretrifoly, whereof I haue ſufficiently written already in the Treatiſe of ſtrange and forrein Trees: but foraſmuch as my meaning is to omit nothing, I will proceed forward to decipher thoſe matters which concerne principally the nature of Trees, and namely their maladies and imperfections, whereto they alſo as well as beaſts and other liuing creatures, are ſubiect. And to ſay a truth, what creature is there vnder heauen freed therefrom? And yet ſome ſay that wild and ſauage trees are in no ſuch danger: only the hail may hurt them in their budding and blooming time. True it is alſo, that ſcorched they may be otherwhiles with heate, and bitten with cold black winds, comming late and out of ſeaſon: for cold weather ſurely in due time is kindly and good for them, as hath bin ſaid before. But let me not forget my ſelf. See we not many times the cold froſt to kill the very Vines? Yes verily: but this is long of the ſoile and nothing elſe; for neuer hapneth this accident but in a cold ground. So as this concluſion holdeth ſtill, That in winter time we alwaies find froſt and cold weather to do much good: but we neuer allow of a cold and weake ground. Moreouer, it is neuer ſeen, that the weakeſt and ſmalleſt trees are indangered by froſt, but they are the greateſt and talleſt that feele the ſmart. And therefore no maruel if in ſuch, the tops being nipped therewith, ſeem firſt to fade and wither; by reaſon that the natiue and radical moiſture being bitten and dulled before, was neuer able to reach vp thither. L M

Now concerning the diſeaſes that haunt Trees: ſome there bee that are common vnto all; others

20030
copy 1

A others againe, that extend peculiarly to ſome certaine kind or other. As for the former ſort generall it is, that no trees are exempt from the worme, the blaſting, and the joint-ach. Hereof it commeth, that we ſee them more feeble and weake in one part or member than in another; as if they did participate the maladies and miſeries of mankind, ſo common are the names of diſeaſes vnto them both. For certes, we vſe to ſay indifferently, That trees are headleſſe, when they be lopt and topt, as wel as men who are beheaded: we tearme their eyes to bee enflamed, ſendged, and bloud-ſhotten, when their buds be blaſted: & many other infirmities, according to the like proportion. And therupon it is, that we ſay they be hungerſtarued and pined: and contrariwiſe, that they be full of crudites and raw vndigeſted humors; namely, when moiſture aboundeth in them. Yea, and ſome of them are ſaid to be groſſe and ouerfat, to wit, al ſuch as bear roſin; when
B by the means of too much greaſe (as it were) they begin to putrifie and turn into Torch-wood; yea, and it falleth out, that they die withall, in caſe the ſaid greaſe take once to the roots; euen as liuing creatures being ouergrowne with fat. Moreouer, ye ſhall ſee a kind of peſtilence light amongſt one peculiar kind of trees: like as it fareth ſometimes with men in ſundrie ſtates and degrees: whereby one while ſlaues only die of a plague, another while the Commons, and thoſe either artiſans in a citie, or peaſants and husbandmen of the countrey.

Now as touching the Worme, ſome trees are more ſubject vnto it than others: and to ſay a truth, in manner al, more or leſſe; and that, the birds know well ynough, for with their bills they will job vpon the barke, and by the ſound trie whether they be worm eaten or no. But what ſay we to our gluttons and belly gods in theſe daies, who make reckoning among their dainty di-
C ſhes, of wormes breeding in trees; and principally of thoſe great fat ones bred in Okes, which wormes they call Coſſi, & are eſteemed a moſt delicat meat? Theſe forſooth they feed in mue, and franke them vp like fat-ware, with good corn-meale. But aboue al others, Pear trees, Apple trees, and Fig trees, are ſooneſt worme-eaten: and if any trees eſcape, they be ſuch as are of a bitter wood in taſt, and odoriferous in ſmell. Touching thoſe wormes that be found in Fig trees, ſome are engendred of themſelues, and of the very wood: others are bred of a bigger vermine called Ceraſtes. Howbeit, al of them (which way ſoeuer they come) are ſhaped in maner of the ſaid Ceraſtes, and make a certaine ſmall noiſe like the ſhrill and creaking ſound of a little criquet. The Seruiſe tree likewiſe is haunted and plagued with little red and hairie wormes, that in the end doe kill it. The Medlar trees alſo when they be old, are ſubject to this maladie

D As for the miſliking of trees [calſed Sideratio] wherby they conſume, wither away, & crumble to powder; it is a thing cauſed only of the weather and influence of ſome Planet. And therfore in this ranke are to be raunged Haile, Blaſting with ſome vntoward winds, and froſts that bite and nip them to the heart. And verily it falleth out, that in a mild and warme Spring, when plants bee too forward, and put foorth their ſoft buds and tender ſprouts ouer-ſoone, the black wind taketh them on a ſuddaine, and a certaine rime ſettleth thereupon, ſendging and burning the oilets of the Burgeons, whiles they be ful of a milky ſap: which accident if it light in blooming time vpon the bloſſome, is called properly Carbunculus [i. a Mieldeaw.] As for the Froſt at ſuch a time, it is far worſe than the blaſting aforeſaid, for when it falleth vpon any trees or plants, it there reſteth and remains ſtil, it congealeth all into an yce, and no puffe of wind there
E is to remoue and diſlodge it: for why? ſuch froſts commonly are not but in time of a ſtil, cleer, and calm aire. Touching that manner of Blaſting or miſliking called Sideratio, as if they were ſmitten with the maligne aſpect of ſome planet, this danger chanceth peculiarly by ſome drie and hote winds, which are buſie commonly about the riſing of the Dog ſtar, at what time wee ſhall ſee yong trees and newly graffed, to die outright, eſpecially Figge trees and Vines. The Oliue, ouer and beſides the worme (whereto it is ſubject as wel as the Figge tree) hath another greefe and ſorance called in Latin Clavus, Fungus or Patella [i. a Knur, Puffe, Meazil or Bliſter] chuſe you whether: and nothing is it but a very ſendge or burne by the ſunne.

Furthermore, *Cato* ſaith, That the red Moſſe is hurtfull vnto trees. Oftentimes alſo wee find that as wel Oliues as Vines, take harm by ouermuch fertilitie and fruitfulnes. As for ſcab and
F ſkurfe, what tree is cleare of it? The running mange or tettar, is a miſcheefe peculiar vnto the Fig tree: as alſo, to breed certain Hoddy-dods or ſhell-Snailes ſticking hard therto and eating it. And yet theſe maladies are not indifferent and alike in all parts of the tree. For thus you muſt think, that ſome diſeaſes are appropriate to one place more than another. For like as men are troubled with the Arthriticall torments, or the Gout, euen ſo be trees: yea, and after 2 ſorts

as

as well as they: for either doth the diſeaſe take the way to the feet, that is to ſay, to the roots, & G
there breaketh out and ſheweth it ſelfe; or elſe it runneth to the exterior joynts and fingers, to wit, the ſmal branches and top twigs, which be fartheſt remote from the main body of the tree. Hereupon then begin they to drie, wither, and waxe blacke: and verily the Greeks haue proper names and tearms reſpectiue to the one infirmity and the other, which we in Latin want. Howbeit we are in ſome ſort able to expreſſe the Symptones following therupon; and namely, when we ſay, firſt, That a tree is ill at eaſe, ſicke, and in pain euery where: anon, that it falls away, looks ill, poore, and leane, when wee ſee the freſh green hew gone, and the branches fraile and brittle: laſt of all, that it is in a waſt, conſumption, or feuer hectick, and dieth ſenſibly, to wit, when it receiueth no nouriſhment (or not ſufficient) to reach vnto al parts, and furniſh them accordingly: and the tame Figge tree of al others, is more ſubject hereunto; as for the wild, they be exempt H
wholly from all theſe inconueniences hitherto named.

Now as touching the ſcab or ſcurfe incident vnto trees, it commeth of certain foggie miſts and clammie dewes, which light ſoftly and leiſurely after the riſing of the Brood-hen ſtar Vergiliæ, for if they be thin and ſubtile, they drench and waſh the trees wel, and do not infect them with the ſcab: howbeit in caſe they fall down right, or that there be an ouer great glut of ſhowers and raine, the Fig tree taketh harme another way, namely, by ſoaking of too much moiſture into the root.

Vines, ouer and aboue the Worme and the Blaſt, haue a diſeaſe proper vnto themſelues, called Articulatio, which is a certain barraineſſe of theirs when they leeſe their ſpring in the verie joynt. And this may come vpon three cauſes: the firſt, when by vnſeaſonable and ill weather, as I
froſt, heat, haile, or other forcible impreſſions of the aire, they forgoe their young ſprouts: the ſecond (as *Theophraſtus* hath well noted) if in pruning of them, the cut ſtand vpward and open to the weather: the third, when they be hurt by thoſe that haue the dreſſing of them, for want of skill and taking good heed: for all theſe wrongs and inconueniences they feele in their joynts or knots. A ſeuerall kind of blaſting or mortification there is beſides in vines, after they haue done blooming, which is called Roratio; namely, when either the grapes do fall off, or before they come to their full growth, be baked (as it were) into a thick and hard calloſitie. It happens alſo that they be otherwhiles ſick, in caſe after their pruning, their tender oilets or buds be either bitten with the froſt, or ſindged with ſome blaſt. The ſame befalleth likewiſe to them vpon ſome vntimely or vnſeaſonable heat: for ſurely in all things, a certaine meaſure and moderate K
temperature doth well, to bring them to their perfection. To ſay nothiug of the wrong that is done vnto them by the vine-maſters themſelues and husbandmen as they dreſſe and trim them, namely, when they bind them ouer-ſtreight, as hath been ſaid before, or when the labourer that diggeth about them, chanceth to do them one ſhrewd turne or other by ſome crooked croſſe blow; or elſe when the ploughman at vnawares doth looſen the root, or glance vpon it with the ſhare, and ſo disbarke the bodie of it: finally, they haue injurie done vnto them, in caſe the pruning-hooke bee ouer blunt, and ſo giue them a bruſe. In regard of all theſe cauſes, they are leſſe able to beare either cold or heat; for euery outward injurie is readie to pierce their freſh galls, and a skald head is ſoon broken. But the tendereſt and weakeſt of al others, be the Apple trees, and namely, the haſtie kind that bringeth ſweet Iennitings. Howbeit ſome trees there be which vpon ſuch feebleneſſe and hurt done vnto them, become barren onely, and die not; namely, the Pine and Date tree: for if a man fetch off their heads, you ſhall ſee them faile in bearing fruit, L
but this hurt will not kill them quite.

Moreouer, it falleth out otherwhiles, that the Apples only or other ſuch fruits, as they hang are diſeaſed, when as the tree aileth nothing; to wit, if in due time they wanted rain, warmth, or winds that were needfull; or contrariwiſe, if they had too much of euery one: for by ſuch means they either fall from the tree of themſelues, or els they are the worſe for it, if they proue worth ought at all.

The greateſt diſpleaſure that can happen to Vine or Oliue tree, is, when in their very blooming they be pelted with violent ſhowers of raine; for, together with the bloſſome, down goeth the fruit of them both. From the ſame cauſe, proceed the cankerwormes or caterpillars (a moſt M
daungerous and hurtfull kind of vermine to trees) which will eat out the greene bud, knot and all. Others there be that wil deuoure the bloſſome and leaues of Oliues alſo, as in Miletum: and thus hauing conſumed all the greene leaues, leaue the trees bare, naked, and ill-fauored to the

eye

20030
copy 1

A eye. Theſe wormes doe breed in moiſt and warme weather, and eſpecially if there be thick and foggie miſts. Of the ſame vermine, there is another engendred, namely, if there enſue vpon the former wet ſeaſon, hotter gleames of the ſunne more than ordinarie, which burne the foreſaid wormes, and therefore change them into other vermine. Moreouer, there is a fault or imperfection beſides, wherto Oliues and Vines eſpecially are ſubject, and this they cal in Latine Araneus, [i. the Spider] when cobwebs (as it were) doe enfold and wrap their fruit, keeping them from growing, and ſo in time killing them. Ouer and beſides, there be certaine winds which ſindge and burne Oliues and grapes principally, yea and all ſorts of fruits whatſoeuer. In ſome yeres alſo ye ſhall ſee all fruits worm-eaten, and eſpecially Apples, Peares, Medlars, and Pomegranats, without any ſuch hurt and offence to the trees that bear them. As for Oliues, the worm
B ſometimes doth them harme, otherwhiles good: for if the worme be engendred and formed before it take the Oliue, it conſumes and ſpoileth the fruit; but in caſe they breed within the kernel, it cauſeth the Oliue to thriue the better, by eating the ſaid kernel that drew away and ſucked the humor which nouriſhed it. The rain that falleth after the riſing of the ſtarre Arcturus, hindereth the generation of wormes, and preſerueth fruits from being worme-eaten: and yet if the wind ſit Southward in that time when it ſo raineth, ſuch raines will breed worms in oliues eſpecially, called Drupæ; which beginning but then to ripen, are moſt readie to fall from the tree. And verily thoſe trees that grow in waterie places or neer riuers, are more ſubject to haue worme-eaten fruit, which although it fall not ſo ſoone, yet it is as loathſome euery way.

Ouer and beſides, there is a certaine kind of flie reſembling the Gnat, which annoieth ſome
C trees and their fruits, and namely, Maſt and Figs: and it ſeemeth that this flie is engendred of a certaine ſweet humour that lyeth vnder their barkes. Thus much as touching all diſeaſes to ſpeake of, that trouble trees.

As for the impreſſions of the Aire at certaine ſeaſons, as alſo of other accidents occaſioned by the climat, they are not properly to bee called Maladies, becauſe they kill trees ſodainly: as namely, when a tree is blaſted outright, or all at once doth wither and drie away: like as when ſome puffe of an vntoward wind peculiar vnto any region, doth ſmite them: ſuch as in Apulia they call * Atabulus, and in Eubœa is named Olympias: For if this wind chaunce to blow in mid-winter, it biteth, burneth, and drieth vp trees with ſuch cold blaſts, as afterwards no heat of the Sunne is able to recouer againe. In this ſort likewiſe, al trees growing in vallies or ſtanding
D along riuers ſides, bee endaungered: and aboue all others, Vines, Oliues and Figge trees. This death that they thus take, is ſoone after diſcouered and ſeene in the budding time when trees begin to put foorth, how ſoeuer it be later ere the Oliue ſhew it. Howbeit, a good ſigne it is in them all of their recouery, when they loſe their leaues: for you ſhall ſee the leaues tarie on in many of them, and when you think they are paſt the worſt, ſodainly die. Otherwhiles alſo you ſhall haue the leaues to fade and ſeeme drie, yet afterwards the ſame trees to reuiue againe, and become greene. Furthermore, in the Northerly regions, as in Pontus and Phrygia, ſome trees there are that be ordinarily frozen to death; namely, when the froſt and yce continueth after mid-winter fortie daies. And not onely there, but alſo in other countries, if immediatly after that trees haue put forth their fruit, there follow a hard froſt, they wil die vpon it, although the froſt laſt not many daies.

* quaſi ἀτλῶ βάσαν. i. calamitatem, aut peſtem inferens

E In a ſecond ranke of cauſes that may kill trees, are to be ranged the injuries and wrongs that come by mans hand, Pitch, oyle, and greaſe, are very enemies and hurtfull to them al, but eſpecially to young trees. Againe, if trees be barked round about, they will die all, vnleſſe it be the Corke tree; for it will thriue and proſper the better, if it be in that wiſe diſcharged of the outward barke; for growing as it doth ouer thicke, it claſpeth and clingeth to the tree ſo hard, that it choketh and ſtrangleth it again. Neither doth the tree Adrachne find any hurt or offence by disbarking, vnleſſe the very wood be cut alſo together with it. As for cherie trees, Lindens, and Vines, it is ordinarie with them to caſt ther barke in ſome ſort, and take no harme thereby; but it is not the vitall and liuely inner barke indeed which is next vnto the bodie, but that onely
F which by comming of another underneath freſh and young, is driuen forth and thruſt out.

Some trees there be, which naturally haue their barke full of chaps and riſts, as the Planes for example. As for the Line or Linden tree, if it chance to leeſe the barke, it will come in manner whole and entire againe. In ſuch therefore the manner is, by way of cure to cloſe vp againe with clay and dung, the naked and bare place, and ſo to bring it to a cicatrize: and, I aſſure you,

this practiſe ſomtimes ſpeeds well, and doth the deed; prouided alwaies, that the naked place G
were not ſurpriſed before the cure, with extremity either of cold or heat. Certaine it is, that by
this means both kinds of the Oke, as wel the Robur as the Quercus, liue the longer, and die no-
thing ſo ſoone as otherwiſe they would. And herein the time of the yeare ought to be conſide-
red, when a tree is thus pilled and disbarked: for in caſe that a man pill the barke of the Firre or
Pine tree, during thoſe months wherein the ſunne paſſeth thorough the ſignes of Taurus or Ge-
mini, which is the very ſeaſon of their budding, there is no way but one with them, for preſent-
ly they die: but if this wrong ſhould befall them in winter, they would abide it the better and
longer liue, than being ſo miſuſed either in Aprill or May. The ſame is the caſe of the maſt-
Holme, the wild Robur alſo, and the common Oke. Howbeit, take this note by the way, that if
the void place where the tree hath beene barked round about, be but narrow, ſo as the brims of H
the barke remaining be not farre aſunder, the trees aforeſaid will take no harme at all thereby.
Mary in the tenderer ſort, and ſuch as a man may ſay are but of a weake complexion, and grow-
ing beſides in a leane and hungrie ground, if the barke be taken away but of one ſide and no
more, it is enough to kill them.

The like may be ſaid of the topping or beheading the Cypreſſe, the Pitch tree, and the Ce-
dar: for let theſe haue their heads either cut off with an axe, or burnt by fire, they will die, there
is no remedie. As much alſo is to be ſaid, when beaſts doe brouſe and eat them. As for the
Oliue tree, if a Goat chance but to licke thereof, it will thereupon proue barraine and beare no
more Oliues; ſo ſaith *Varro*, as we haue noted heretofore, But as ſome trees vpon the like injury
done vnto them, will die, ſo others againe will be but the worſe for it, and ſuch are the Almond I
trees: for where before they did beare ſweet Almonds, they will euer after bring bitter. Moreo-
uer, you ſhall haue ſome trees, that wil thriue & do the better after this hard dealing, & namely
a kind of peare tree called Phocis, in the Iſland Chios: for you haue heard by me already, which
trees they be that lopping and ſhredding is good for.

Moſt trees, and in manner all (except the Vine, Apple tree, Fig tree, and Pomegranate tree)
will die, if their ſtocke or bodie be clouen: and ſome be ſo tender, that vpon euery little wound
or race that is giuen them, yee ſhall ſee them to die: howbeit, the Figge tree and generally all
ſuch trees as breed Roſin, defie all ſuch wrongs and injuries, and will abide any wound or bruſe
whatſoeuer.

That trees ſhould die when their roots are cut away, it is no maruell: and yet many there bee
of them, that wi liue and proſper well neuertheleſſe, in caſe they be not all cut off, nor the grea- K
teſt maſter roots, ne yet any of the heart or vitall roots among the reſt.

Moreouer, it is often ſeene, that trees kill one another when they grow too thicke; and that
either by ouerſhadowing, or elſe by robbing one another of their food and nouriſhment. The
Iuie alſo, that with clipping and claſping bindeth trees too hard, haſteneth their death. Miſſelto
likewiſe doth them no good; no more than Cytiſus, or the hearbe Auro, which the Greekes
name Alimus, growing about them. The nature of ſome plants is, not to kill and deſtroy trees
out of hand, but to hurt and offend them only, either with their ſmell, or elſe with the mixture
and intermingling of their owne iuice with their ſap. Thus the Radiſh and the Lawrell doe
harme to the Vine if they grow neare vnto it: for ſurely the Vine is thought to haue the ſenſe
of ſmelling, and wonderfully to ſent any odours: and therefore it is obſerued in her by experi- L
ence, That if ſhee be neare vnto Radiſh or Lawrell, ſhee will turne away and withdraw her ſelfe
backeward from them, as if ſhee could not abide their ſtrong breath, but vtterly abhorred it as
her very enemie. And vpon the obſeruation of this ſecret in Nature, *Androcides* the Phyſitian
deuiſed a medicine againſt drunkenneſſe, and preſcribed his patients to eat Radiſh if they
would not be ouercome with wine. Neither can the Vine away with Coleworts or the Cab-
bage, nay it hateth generally all worts or pot-hearbs: it abhorreth alſo the Hazell and Filberd
tree; in ſuch ſort, as a man ſhal ſenſibly perceiue it to looke heauily and miſlike, if thoſe plants
aforeſaid grow not farther off from it. And now to conclude and knit vp this diſcourſe, would
you kill a Vine out of hand? lay to the root thereof nitre or ſalt-petre, and alumne, drench it
with hote ſea-water: or doe but apply vnto it Bean cods, or the ſhales or husks of the pulſe Er- M
uile, and you ſhall ſoone ſee the operation and effect of a moſt ranke and deadly poiſon.

A

Chap. XXV.

¶ *Of many and ſundry prodigies or ſtrange tokens and accidents about trees. Alſo of an Oliue plot which in times paſt was tranſported all and whole, from one ſide of an high port way, to another.*

IN this Treatiſe of the faults and imperfections incident to Trees, me thinks I ſhould do wel to ſay ſomwhat of the ſupernatural occurrences in them obſerued: for we haue known ſome of them to grow vp and proſper without any leaues at all. And as there haue bin Vines and Pomegranats ſeen to beare fruit, ſpringing immediately from the trunke, and not from branch
B or boughs: ſo there haue bin vines charged with grapes, and not clad with leaues: and Oliues likewiſe had their berries hanging vpon them whole and ſound, notwithſtanding all their leaues were ſhed and gon.

Moreouer, ſtrange wonders and miracles haue hapned about trees by meere chance and fortune: for there was an Oliue once, which being burnt to the very ſtump, reuiued & came again: and in Bœotia, certain Fig Trees, notwithſtanding they were eaten and gnawn moſt piteouſly with Locuſts, yet budded anew, and put forth a freſh ſpring. Alſo it hath bin marked, that trees haue changed their colour from black to white. And yet this is not alwayes a monſtrous thing beyond naturall reaſon, and ſpecially in ſuch as come of ſeed, as wee may obſerue in the Aſpe, which eſtſoones turneth to be a Poplar. Some are of opinion, That the Seruiſe Tree if it bee
C tranſplanted, and come into a hoter ground than is agreeable to the nature thereof, will leaue bearing, and be barren. But it is taken for no leſſe than a monſter out of kind, that ſweet Apples and ſuch like fruits ſhould proue ſowre, or ſowre fruit turne to be ſweet; as alſo that a wilde Fig Tree ſhould become tame, or contrariwiſe. And it is counted for an vnluckie ſign, if any Tree change from the better to the worſe; to wit, if a gentle garden Oliue degenerate into the wilde and ſauage: if a Vine that was wont to beare white grapes, haue now black vpon it: and ſo likewiſe if a Fig Tree which vſed to haue white Figs, chaunce afterwards to beare black. And here by the way I canot forget the ſtrange accident that befell in Laodicea, where vpon the arriuall of King *Xerxes*, a Plane tree was turned into an Oliue. But if any man be de-
D ſirous to know more of theſe and ſuch like miracles, for as much as I loue not to runne on ſtill and make no end, I refer him ouer to *Ariſtander* a Greek writer, who hath compiled a whole volume, and ſtuffed it full of ſuch like wonders: let him haue recourſe alſo to *C. Epidius*, a Countryman of ours, whoſe Commentaries are full of ſuch ſtuffe: where he ſhall find alſo, that trees ſometimes ſpake.

A little before the ciuil war brake out between *Iulius Cæſar* and *Pompey* the Great, there was reported an ominous and fearfull ſight preſaging no good, from out of the territory of Cumes, namely, That a great Tree there ſunke down into the earth ſo deep, that a very little of the top boughs was to be ſeen. Hereupon were the propheticall books of *Sibylla* peruſed, wherin it was found, that this prodegie portended ſome great carnage of men; and that the neerer that this ſlaughter and execution ſhould be to Rome, the greater ſhould the bloud ſhed be.

A prodigious ſigne and wonder it is reputed alſo, when trees ſeem to grow in places where they were not wont to be, and which are not agreeable to their natures; as namely on the chapters of pillars, the heads of ſtatues, or vpon altars: like as to ſee one tree of a diuers and contrary kinde growing vpon the top of another; as it befell about the city Cyzicum hard before the ſtreit ſiege that was laid vnto it [by *Mithridates*] both by ſea and land, where a Fig tree was ſeen to grow vpon a Lawrel. Likewiſe at Tralleis, about the time of the foreſaid ciuill war, a Date tree grew out of the baſe or foot of a Columne that *Cæſar* Dictator cauſed there to be erected. Semblably at Rome alſo, twice during the war between the Romans and K. *Perſeus*, there was a Date tree known to grow * vpon the lanterne or top of the Capitoll temple, foreſhewing thoſe victories and triumphs which afterward enſued, to the great honor of the people of Rome. And
F when this was by ſtormes and tempeſts ouerthrowne and laid along, there ſprung vp of it ſelfe in the very ſame place a Fig tree, at what time as *M. Meſſala* and *Caius Caſſius* the two Cenſors, held their Quinquennall ſolemne ſacrifices for the aſſoiling and purging of the city of Rome. From which time *Piſo* (a renowmed Hiſtoriographer and Writer of good credit) hath noted, that the Romans were giuen ouer to voluptuouſneſſe and ſenſuality, and that euer ſince all cha-

* Or as ſome read, the head of *Iupiter* within the Capitol.

ſtitie and honeſt life hath bin exiled. But aboue all the prodigies that were euer ſeen or heard, G
there is one that paſſeth, and the ſame hapned in our age, about the very time that *Nero* the emperor came to his vnhappy end and fall: for in the Marrucine territorie there was an oliue garden belonging to *Vectius Marcellus* a right worſhipfull knight of Rome, which of it ſelfe remoued all and whole as it ſtood, ouer the broad highway, to a place where lay tillage and earable ground: and the corn lands by way of exchange croſſed ouer the ſaid cauſey againe, and were found in lieu of the Oliue plot or hortyard aforeſaid.

Chap. XXVI.

¶ *The remedies for the maladies and diſeaſes of Trees.*

H

NOw that I haue declared the diſeaſes of Trees, meet it is that I ſhould ſet down the cure and remedies thereto. Where this one thing would be firſt noted, That of Remedies, ſome be common to all trees, others appropriate to certain. Common be theſe following, To bare and cleanſe the roots, to hil and bank them again; that is to ſay, to giue aire vnto the roots, & let the wind into them: and contrariwiſe to couer them, & keep both wind & weather from them: to water them, or to deriue & diuert water from them: to refreſh their roots with the fat liquor of dung: to diſcharge them of their burden by pruning their ſuperfluous branches. *Item*, to giue their humors iſſue, and as it were by way of phlebotomie to let them bloud, and to skice and ſcrape their bark round about, in maner of ſcarification. To take downe their ſtrength and keep them vnder that they be not too luſty & proud. Alſo, if the cold hath caught I
their buds or burgeons, & therby cauſed them to look burnt, rough, and vnpleaſant; to ſlick, poliſh, & ſmooth them again with the pumy ſtone. Theſe verily be the diuers helps to cure trees: howbeit, vſed they muſt be with great diſcretion, for that which is very good for one, is not ſo good for another: and ſome trees require this courſe, others that, to be taken with them. As for example, the Cypres tree canot abide either to be dunged or watered, it hateth all digging and deluing about it, it may not away with cutting and pruning, it is the worſe for all good phyſick, nay, all remedies to others are miſchiefs to it, and in one word, go about to medicine it you kil it. All Vines, and Pomegranat trees eſpecially, loue alife riuer ſides, & deſire to be watered, for thereby will they thriue and proſper. The Fig tree alſo it ſelfe is nouriſhed and fed in waterie grounds: but the fruit that it beareth is the poorer by that means. Almond trees if they be plied K
with digging, will either not bloome at all, or elſe ſhed their floures before due time. Neither muſt any yong plants or trees newly graffed, be digged about their roots, before they haue gathered ſufficient ſtrength and begin to beare fruit. Moſt trees are willing enough to be disburdened of their ſuperfluous and ouer-rank branches, like as we men can ſpare our nails to be pared, and buſh of hair to be cut, when they be ouergrowne. As for old trees, they would be cut down hard to the ground, for vſually they riſe again of ſome ſhoot ſpringing from the root, and yet not all of them. Regard therefore muſt be had, that none be ſo vſed but ſuch (as we haue noted before) as are able of nature to abide it. For trees to be watered at the roots in the heate of ſummer, it is good, but in winter it is as bad. In the fal of the leaf it may be wholſom, it may alſo be hurtfull, and therefore the nature of the ſoile would be conſidered: for the grape-gatherer in Spain meeteth with a good vintage, notwithſtanding the Vines ſtand in a mariſh and fennie ground; howbeit in moſt parts of the world beſides, it is thought good husbandry, to draine a- L
way from the roots the very rain water that falls from aboue in Autumne. About the riſing of the Dog-ſtar, trees deſire moſt of all to be wel watered; and yet they would not haue too much thereof euen in that time, for in caſe their roots be ouer-drenched and drowned therewith, they will catch harm. Herein alſo the age of trees is to be reſpected, which in this caſe preſcribeth what is meet and ſufficient: for yong trees be leſſe thirſty than others: alſo Cuſtome is a great matter. For ſuch as haue beene vſed vnto watering muſt not change their old woont, but they require moſt of all others to be vſed ſo ſtill. Contrariwiſe, Thoſe Trees which grow vpon dry grounds naturally, deſire no more moiſture than that which is needful. In the territory about Sulmo in Italy, and namely within the Liberties of Fabianum, the Vines which doe beare M
the harder and ſowrer Grapes, muſt of neceſſitie be watered. And no maruaile, for the verie lands and Corne-fields vſe to haue water let in vnto them. And here a wonderfull thing is to be obſerued; This water cheriſheth the Corne, but killeth all the hurtfull Graſſe among: and

the

20030
copy 1

A the riuer ouerflowing the lands, is as good as a weeding. In the ſame countrey the maner is in midwinter to open a ſluce or draw vp their floodgates, for to ouerflow their vine roots with the riuer: and ſo much the rather, if either it be an hard froſt, or ſnow lie vpon the ground: And why ſo? becauſe the pinching cold ſhould not burne them: and this they call there by the name of Tepidare, [*i.* to giue them a kindly warmth as in a ſtouve:] ſee the memorable nature of this only riuer, to be warme in winter, and yet the ſame in ſummer is ſo cold, that hardly a man can endure his hand in it.

Chap. XXVII.

¶ *Of caprification or ſcarifying trees: alſo the maner of dunging them.*

B TOuching the remedies for blaſting as well by heat as cold, I will treat in the booke next following. Meane while I cannot omit one manner of cure by way of Scarification. For when the bark is poore and lean, by reaſon of ſome diſeaſe or miſlike, ſo as it clengs together, preſſing and binding the quick wood ouermuch, wherby the tree is as it were hide-bound, they vſe to ſlit the ſame along with a very ſharpe cutting hooke, guiding and gaping the edge thereof with both hands, that it goe not ouer-deep: and ſo by theſe incitions they doe open it, and as it were loſen and enlarge the skin. Now, when this feat is wrought, the onely ſigne that it is wel don and good for the tree, is this, if the inciſions in tract of time appeare wide, and the void place incarnate again and fill vp with a kind of callous ſubſtance, compounded of the ſap, and wood together growing betweene. Whereby it appeareth, that in many caſes the cure of
C mens maladies & the diſeaſes of trees is very like: for that euen their bones alſo vſe to bee trepanized and bored through as well as ours. Alſo for to make ſweet almonds of bitter, firſt the tree muſt be digged round about, and then boared thorough with an augoer toward the root or butt end, whereby the wateriſh humor that runneth downward, may iſſue forth and paſſe away. Moreouer, if a man would diſcharge Elmes of their ſuperfluous moiſture, they muſt be pierced with a wimble, a little aboue the ground, as far as to the very heart or pith; if either they be old, or be perceiued to receiue ouermuch nutriment. In like maner the ſame exceſſiue humor is let out of Fig trees by meanes of certaine light ſlits or gaſhes made in the barke, aſlant or byas, in caſe it ſeeme to ſwell and be ouer-ſtreight, and by this deuiſe they preuent the falling of their fruit.

D Generally, what trees ſoeuer bearing Apples or ſuch like ſoft fruit without, if they chaunce at any time to proue barren, that is to ſay, to put foorth leafe only without any fruit, the vſe is, firſt to make a clift in the root; then, to put a ſtone therin, that the edges meet not and rejoin againe; and ſo they become fruitfull. The ſame is practiſed in Almond trees alſo, but in ſteed of the ſtone there muſt be a wedge of Oken wood driuen in. As for Pyrries and Medlar trees, thoſe wedges muſt be made of Pine Torch-wood. Moreouer, if either vines or fig trees, be ouer ranke of wood, it is very good to cut and skice the roots round about, and when they bee thus ſerued, to couer with aſhes the ſaid inciſions: but then they muſt bee cloſe couered with aſhes and earth aloft. If ye would haue trees beare Figs at the later end of the yere, pluck off the firſt green figs ſo ſoon as they be ſomwhat bigger than Beans: for vnder them there wil other come
E vp in the place, and be later ere they wax ripe. The ſame fig trees when they begin to ſpring leaf and look green, if the top-twigs of euery bough be cut off, becom the ſtronger & more fruitfull by it. For as touching the ripening of Figges by Caprification, true it is, that there be certain flies like gnats engender in greene figs, which are the occaſion thereof, for when they are flown out, there are no graines or ſeeds found within: whereby it is euident, that they be turned into thoſe flies. And when they do fly forth, ſo haſty they are to be gone, that many of them as they breake out, leaue either a foot or a wing behind them. Beſides, another kind there is of gnats, which they call Centtinæ, for ſloth and ſhrewdneſſe like in al the world to Drone-bees, ſo miſcheeuous they be to the good flies or gnats indeed, that cauſe the Figs to ripen: for, them they kill, and die themſelues when they haue done. Moreouer, there be certaine wormes like moths
F that ordinarily do much hurt to the graines or ſeeds within figs, and eat them quite: The only remedie againſt this vermine, it is to take a twig or imp of the Italian Lentisk tree, and to ſet or couch it with the wrong or top end downeward, in the very ſame trench were the fig tree was planted, For to haue fig trees bear moſt plentifully, take ruddle or red-earth tempered wel with the lees or grounds of oile, after that the ſame is mixed with dung, poure it to the roots of the

trees when they begin to put forth leaues. Among wild Fig trees, the beſt be the black & thoſe G
that grow in ſtonie grounds: for their Figges are fulleſt of cornes or graines within. And as for caprification, it would be practiſed after rain. And take this for a generall rule, That ye beware in any hand in curing of trees, leaſt yee vſe a miſcheefe for a remedie, a thing that commonly happeneth by ouer many medicines, or the ſame not applied in due ſeaſon: for as it is very good for trees, to cut and lop off their boughs where they grow too thicke: ſo to be hacking and mangling of them euery yeare, hurteth them as much. As for the vine, it requireth pruning once a yeare: but the Myrtle trees, Pomegranate, and Oliue trees, euery two yeares; becauſe they will quickly ſpring againe and ſhoot forth branches thicke. Other trees would not be lopped ſo often. Neither is it good to cut or prune any whatſoeuer it be, at the fal of the leafe. Nay, they are not ſo much as to be ſcraped, but in the pruning time, that is, in the Spring. All wounding of H
trees goes to the very heart, and hurt the quick, vnleſſe it be of thoſe parts that are ſuperfluous.

As great conſideration there would be had in the manner of mucking them. No doubt, they loue dung well: but carefull heed would be taken firſt, that none be laid to the roots in the hoteſt ſeaſon of the yeare. *Item*, That it be not greene, but thoroughly rotten: laſtly, that it bee not ouer ranke nor ſtronger than is needfull, Swines dung burnes the root of vines, vnleſſe it bee fiue yeares old, or the vines ſtand in ſome place where water is at commaundement for to coole the exceſſiue heat thereof. Alſo the filth of Tanners ooſe and Curriers ſcrapings doe the like, if they be not well delaied with water. Likewiſe it muſt not be laid too thicke. The ordinarie proportion is thought to be for euery ten foot ſquare, three Modij of dung. But herein no certaintie can be ſet downe: for the nature of the ſoile muſt rule all. With Swines and Pigeons I
dung, they vſe to ſoulder the cuts and wounds that are giuen to trees. In caſe the Pomegranats grow to bee tart and ſoure, the manner is to dig about the root and lay it bare, and then to put Hogs dung therto: for that yeare the Pomgranats will be full of a wine juice; and the next yeare following proue ſweet. Some good husbandmen there be, that think it meet and requiſit foure times a yere to water their roots with mans vrine and ſhere water together, and vpon euery one they beſtow a whole Amphore. Or elſe to bedeaw and ſprinckle the top branches of the Pomegranat trees with wine, wherein Laſer hath beene ſteeped. When the pomegranat doth cleaue & open vpon the tree, it is good to wreath the ſteal therof. If Figs doe the like, there would be oile lees caſt vpon them. Other trees when they are amiſſe or doe miſlike, ought to be drenched with wine lees: and Lupines if they be ſet about their roots, will helpe them. The water alſo or K
decoction wherein Lupines were ſodden, poured about the roots of Apple trees or ſuch like, doth them much good. If it happen to thunder about the feaſt Vulcanalia, Figs will fall from the tree. The remedy thereof is to ſtrow the plots before with Barley ſtraw. Would you haue haſtie Cherries? Lay lime to the roots of the tree, it will cauſe them to ripen their fruit ſpeedily. Of al fruits theſe haſtie Cherries would be plucked and gathered as they ripen, to the end that thoſe which be left behind, may thriue and grow big and faire.

Chap. XXVIII.

¶ *Many and ſundrie medicines ſeruing for trees, to wit, remedies againſt venomous vermine and Piſmires, likewiſe againſt all hurtfull beaſts.* L

Some trees there be which are the better for wrong and injurie done vnto them: yea, and if they be pinched or bitten, they ſhoot vp the rather, as Date trees and the Lentisks, for euen the very ſalt water nouriſheth them. And true it is, that aſhes hath the like nature and vertue that ſalt, howbeit, more mild and gentle. Hereupon it comes alſo, that Fig trees vſe to bee ſtrewed therewith, yea, and to be wet with the juice of Rue, to the end, that neither their fruit ſhould proue worm-eaten, nor their roots putrifie and rot. Moreouer, if vines be too full of moiſture and apt to bleed ouermuch, it is an ordinary thing to pour ſalt water to their roots. Alſo, in caſe their grapes be apt to fall, folk vſe to take aſhes and beſprinckle them with vinegre, and ſo to beſmear the roots therwith: or els with red Orpiment, in caſe the grapes be giuen to putri- M
faction. Say that vines be barren and will not bear grapes, their roots ought to be wel drenched and dawbed with ſharp vinegre and aſhes incorporat together. But what if a vine bring not her fruit to ful maturity, before it begin to wax drie and to wither? the ſuperfluous wood ought to be cut away about the root, and the cuts together with the ſmall ſtrings or beard of the root to bee

20030
copy 1

A be wet and ſoked in ſharp vineger,and ſtale chamber-lee,and then they ſhould be well couered and ſtopped with a kind of mortar made therewith, and often digged about. As for Oliues, if they make ſhew of ſmal increaſe,their roots muſt be bared and laid open to the cold in winter; for by this manner of chaſtiſement they will amend and do far better.

In all theſe remedies,proceed we muſt according to the courſe of the yere: for ſomtime the ſeaſon requireth,that the meanes ſhould bee ſooner vſed, and otherwhiles later. Some plants there be that fire is good for, and namely, canes and reeds: for if they be burnt,they will come vp again the thicker and more ſmooth. As for *Cato*, hee hath certain compound medicines for trees,diſtinct by ſundry meaſures by him preſcribed: for he hath ordained to the roots of the greater trees an * Amphore,but of the leſſe an * Vrna only,of Oile dregs,with an equall quan-

B tity of water: all which being tempered together,he would haue to be poured by little & little to the roots,but they ought before to be digged about and laid bare. And for the Oliue, he addeth moreouer,that the roots ſhould haue a bed of litter or ſtraw made before,and then vſed accordingly. In like manner alſo would the fig tree be ſerued: but eſpecially at the roots of it there ſhould be raiſed a bank of old earth; for by that means it wil come to paſſe,that the green figs will not fall, they will beare more plenteouſly, and the fruit be more ſmooth and pleaſant. To preuent in like maner,that the worme * Convolvulus bred not in a vine,hee appointed two gallons of oile dregs or lees,to be boiled firſt to the thicke conſiſtence of hony,and then afterwards to take a third part of the ſlime Bitumen,and a fourth part of brimſtone,and ſeeth all together again in the open aire; for within dores there would be ſome danger of ſetting the houſe

C a fire. With this mixture,if a vine be well annointed about the ioints, and vnder their hollow arm-pits,he aſſureth vs,that there will no ſuch worme breed therein. Some content themſelues to perfume vines onely with the ſmoke of this compoſition,ſo as it be done on the winde-ſide, that it may carry the fume directly to them; and this ſhould be continued for three daies together. Many are of opinion,that wine being mingled with like quantity of water (becauſe alone of it ſelfe it is hurtfull) is as good for this purpoſe as the oile dregs aboueſaid,which *Cato* hath preſcribed. Another kind of vermin or worme there is,that gnaweth the tender buds or burgeons of the vine,and the ſame is called Volvox: to preſerue vines from this harmefull creature, men are wont to take their vine-hooks when they be newly ground and ſharpned,then to ſcoure them with a Beauers skin,and with them to prune the vines: or elſe after they be pruned,to an-

D noint them with bears bloud. Moreouer, Ants or Piſmires make foule work otherwhile among trees. If you would driue them away,daub the ſtock or butt end with red Sinopre and Tar tempered together. Or do but hang vp any fiſh neere by,and all the Piſmires wil leaue their former haunt,and gather about it. Others make no more adoe,but ſtampe Lupines with oile, and therwith annoint the roots. Many there are, who kill both them and Mouldwarps with oile dregs. Alſo,againſt Palmer-worms or Caterpillars,and to keepe Apples from rotting,they giue order for to annoint the top twigs and branch ends of trees with the gal of a green Lizard. But more particularly againſt the ſaid caterpillars,they would haue a woman whiles her monthly ſickneſs is vpon her,to go round about euery tree by it ſelfe, barefooted and barelegged, vnbraced and vnlaced,and her haire hanging about her eares. Moreouer,to preſerue trees from wilde and noi-

E ſome beaſts,that none of them come neare to bruiſe and marre their green ſpring,they doe appoint to beſpreint their leaues with greene Cow or Oxe ſhearne,and water together, betweene ſome ſhowers,that the rain may waſh away the malice and hurtfull quality of the medicine. A wonder to ſee how inuentiue men are to deuiſe remedies for euery miſchiefe; for many you ſhal haue,who be verily perſuaded,that there are certain charms & inchantments to driue away the haile. But for mine own part,I thinke it meere mockery to ſet downe the very words, although *Cato* hath done it before me. Who alſo ſpeaketh of another ſpell for diſlocations or members out of ioint (an accident happening to trees) which he would haue to be ioined cloſe within the cliſt of canes. The ſame writer hath permitted men to cut down ſacred groues,trees alſo dedicated for religion and ſequeſtred from profane vſe (after a ſolemne ſacrifice to the gods firſt

F performed:) the reaſon and manner whereof he hath put downe in a certaine treatiſe, which hee compiled of purpoſe as touching that argument.

* *Amphora,or Quadranta*, was a meaſure Romane of liquor, containing 16 *Congij* which is about 16 wine gallons.

* *Vrna*, is halfe *Amphora*, to wit, 8 gallons, or thereabouts.

* Vine frettar, or the Diuels gold-ring.

THE

THE EIGHTHTEENTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

Chap. I.

¶ Of the exceeding loue and affection of our anceſtors in old time to Agriculture and Husbandrie. Alſo, of their ſingular paines and diligence about Gardens.

NOw followeth the treatiſe of corn, of Gardens, and Floures, and generally of al things elſe, that by the goodneſſe of Nature the Earth bringeth forth bountifully, beſides Trees and Shrubs. The ſpeculation whereof verily is infinit, if a man do but conſider the number and variety of Herbes and Floures, together with their odors and colors; the diuerſity alſo of their iuices, their ſeueral vertues and properties, whether it be to cure men of their maladies, or to giue them pleaſure and contentment to their ſenſes. But before that I enter into this diſcourſe, very willing I am to take in hand the cauſe of Earth (the common mother of vs all) and to aſſiſt her againſt all ſlanderous imputations, notwithſtanding I haue in the beginning of this my worke pleaded once already in her defence. For when we looke into the matter within her contained, we are ſet on fire inwardly to find fault with her for breeding and bearing noiſome things, charging vpon her our own faults, and imputing to her that, for which we of right ought to be blamed. Set caſe ſhe hath brought forth poiſon and venom, Who hath ſearchad them out but man? As for the fouls of the aire and wild beaſts, it is ſufficient that they touch them not, nay they know how to beware and auoid them. For ſay that the Elephants doe file their teeth ſharp againſt hard trees, ſay that the Rhinocerotes whet their horns againſt the rockes, and the wild Bores ſharpen their edge tuskes againſt both ſtocke and ſtone: ſay that all creatures know well enough how to prepare and frubbiſh their weapons to do miſchiefe, which of them all yet infect them with poiſon, but man alone? we haue the caſt to envenome and poiſon arrowes; we can tell how to put ſomthing to our darts of yron and ſteele, more hurtfull and miſchieuous than they be. It is ordinary with vs to poiſon riuers alſo; yea & the very Elements whereof the world doth ſtand, are by vs infected: for euen the aire it ſelfe, wherein and whereby al things ſhould liue, we corrupt to their miſchiefe and deſtruction. Neither can we truly ſay or think, that other creatures beſides vs are ignorant of theſe poiſons; for we haue already ſhewed, that they are not to ſeeke either what defenſatiues to prouide againſt they ſhould fight with ſerpents, or what remedies to find for their cure after they haue fought and are hurt. Moreouer, ſetting man aſide, there is no creature furniſhed or armed with any other venome, but their own. We cannot chuſe therefore but confeſſe our great fault and deadly malice, in that we reſt not contented with naturall poiſons, but betake our ſelues to many mixtures and compoſitions artificiall, made euen with our owne hands. But what ſay you to this? Are not ſome men themſelues meere poiſons by nature? for theſe ſlanderers and backbiters in the world, what doe they elſe but lance poiſon out of their black tongues, like hideous ſerpents? what doe theſe enuious perſons, but with their malicious and poiſonfull breath ſindge and burne all before them that they can reach or meet with, finding fault with euery thing whatſoeuer? Are they not well and fitly compared to theſe curſed fouls flying in the dark, which albeit they ſequeſter themſelues from

20030
copy 1

A from birds of the day,yet they bewray their ſpight and enuy euen to the night and the quiet repoſe thereof,by their heauie grones(the only voice that they vtter) diſquieting and troubling thoſe that be at reſt: & finally,all one they be with thoſe vnluckie creatures,which if they happen either to meet or croſſe the way vpon a man,preſage alwaies ſome il toward,oppoſing themſelues(as it were)to all goodneſſe,and hindering whatſoeuer is profitable for this life. Neither do theſe monſtrous and abominable ſprites know any other reward of this their deadly breath, their curſed and deteſtable malice,but to hate and abhor all things. Howbeit,herein may wee acknowledge and ſee the wonderfull majeſtie of dame Nature: for like as ſhe hath ſhewed her ſelfe more fruitfull and liberall in bringing forth profitable and holeſome plants, in greater plenty than hurtfull and noiſom;ſo ſurely hath ſhe furniſhed the world better with good men
B and vertuous for the weale publick. In which regard and conſideration,we alſo taking no ſmall joy and contentment (leauing theſe troubleſome ſpirits to themſelues for to broile and frie in their owne greace) will go on forward and proceed to declare the reſt of Natures workes; and with the better reſolution, for that wee ſeeke more pleaſure and contentment in the paines and trauell that we take,than expect any fame or bruit of men afterwards. For why? we are in hand to ſpeake of the countrey and countrie commodities,ſuch as in old time like as they were moſt neceſſary for this life,ſo they were accounted and honoured moſt highly.

Chap. II.

¶ *Of the firſt guirland or chaplet made of herbes and floures at Rome.*

C THe firſt order that K. *Romulus* inſtituted in Rome city newly built, was the guild or fraternitie of certaine Prieſts or Wardens ouer corn fields, which were in number twelue. And for to do the greater honour to this company,he cauſed himſelfe to be called the twelfth brother among them: and *Acca Laurentia*,the nource or foſter-mother of this Prince, beſtowed vpon him a garland of corn eares, twiſted and tied together with a white ribband, as the moſt ſacred badge and enſigne of this new Prieſthood, which he and his brethren ſhould weare with great reuerence and deuotion: and this was the very firſt chaplet known at Rome. Now the honor of this ornament was perpetuall,and continued for terme of life; ſo as a man once inueſted therein,could not be degraded and depriued thereof, though hee were baniſhed or taken priſo-
D ner;it accompanied him euer to his dying day. Then,and in thoſe daies, euery man within the whole body of the people of Rome,contented himſelfe with two acres of land,and King *Romulus* aſſigned to none of his ſubiects a greater proportion: whereas now ye ſhall haue thoſe that erewhile were but ſlaues and ſeruants vnder the emperor *Nero*(deſpiſing as not ſufficient,green encloſures and gardens of that compaſſe) muſt haue fiſh-pooles alſo bigger than ſo: and well it were if they would ſtay there and go no further,for ſhortly we ſhall ſee ſome one or other of them,neuer reſt vntill he haue kitchins alſo more than two acres wide. And thus much for king *Romulus*.

King *Numa* his ſucceſſor,ordained to worſhip the gods with an oblation of corne,yea and to offer prayers and ſupplications vnto them by no other means,than cakes made of ſalt and meal: yea and as *Hemina* mine author ſaith,for to induce the people of Rome the better vnto it, he al-
E lowed them to parch their corne in their ſacrifices;for that corne thus partched, was ſuppoſed to be a more wholſome food: by which meanes,this one thing inſued in the end, that no corne was counted pure and good, nor fit to be vſed in diuine ſeruice, but that which was thus baked or partched. He alſo inſtituted the feaſt Fornacalia;to wit,certaine holy-daies for the parching and baking of corne: as alſo another as religiouſly obſerued,called Terminalia;namely,for the bounds and limits of lands: for theſe and ſuch like gods,as then,they worſhipped moſt: as alſo the goddeſſe *Seia*,ſo called *aſerendo*: [*i.* of ſowing corne and ſetting plants:] and *Segeſta*, which name they gaue her *aſegetibus*,[*i.* of corn fields:]whoſe images we at this day do ſee in the grand
F Cirque or Shew-place at Rome. A * third goddeſſe there is among them, whom to name and inuocate within-houſe, they might not with ſafe conſcience. Laſtly, ſo religious and ceremonious they were in old time,that they would not ſo much as taſte of new corne or wine, before the Prieſts had taken a ſey of the firſt fruits.

* *Tertiam*, to wit, *Tutelina*, for preſeruing of trees planted, and corne ſowne: or as ſome reade (*Tertium*) meaning *Terminus*.

CHAP.

Chap. III.

¶ *Of Iugerum, and Actus. Of the antient Lawes ordained for Cattell in old time. How often and at what time Corne and victuals were exceeding cheape at Rome. What noble and famous persons addicted themselues wholly to Husbandrie and Tillage.*

AN Acre or Arpen of ground, called in Latine Iugerum, was as much as might be eared vp or ploughed in one day with a yoke of Oxen. And Actus in Latine is a Land, or so much just as two Oxen are driuen and occupied in, whiles they plough in one tract without any rest. This contained by the old time, 120 foot in length: and being doubled in length, made the Acre or Iugerum abouesaid.

In antient time of the old Romans, the greatest Present that could be giuen to captains and souldiers who had borne themselues valiantly in the seruice of their countrey, was as much ground as they could haue eared or broken vp in one day. And it was thought a great reward to receiue at the hands of the people of Rome halfe a pint (or a pint at the vtmost) of corn. Moreouer, in so great request was corn and Husbandry, that the first and chiefe houses in Rome, took their surnames from thence: and namely, the *Pilumni*, who deuised first the pestill to bray corne withall in their mils and backhouses: also, the family of the *Pisones*, who tooke their name, *a pisendo*, [*i.* of stamping or pounding corne in a mortar.] The *Fabij* in like manner, the *Lentuli*, and the *Ciceróes*, each one according to the seuerall pulse that they skilled best to set or sow. Moreouer, to the house of the *Iunij*, they gaue the surname of *Bubulcus*, by occasion of one of their ancestors, who knew passing well how to vse and order oxen. Ouer & besides all this, that you may know what regard was had of corn, among other sacred and holy ceremonies, there was nothing reputed more religious than the bond of Confarration, in knitting vp of mariages, & assurance making of the chiefe priests: yea, the manner of the new wedded brides was to carry openly before them a wheaten cake. In times past, the Magistrates called Censors, iudged it a trespasse worthy of great rebuke, to be an il husband; that is to say, to be careless and negligent in tilling the ground. And as *Cato* reporteth, if men called one by the name of a good husbandman, they were thought to haue praised & commended him in the highest degree: hereupon also it came, that rich and substantiall men were termed in Latine, Locupletes, as one would say, Loci-pleni, [*i.* wel landed.] And as for the very word Pecunia in Latine, which signifieth money, it took the name of Pecus, (*i.*) cattell. And euen at this day (as appeareth in the Registers of the Censors, and the accounts of the city Chamber) all their rents, reuenues, and customes growing vnto the people of Rome, are called Pascua; for that a long time the whole domaine of Rome, stood vpon pasturage and nothing els. The penalties and fines also, which offendants were put to pay, were raised of nothing else but of Kine, Oxen, and Sheep: where, by the way, I cannot conceale from you the fauorable regard that the antient lawes and ordinances of Rome had; whereby it was expressely forbidden, That no Iudge who had power to enioine or impose any paine and amercement, should name the fine of an Oxe, vnlesse he had passed that of a Sheep first. The solemne games and plaies also in the honour of Kine and oxen, they who frequented them, called Bubetij. Moreouer, king *Seruius* at the first when hee made brazen coine, stamped the peeces with the portraiture of Sheepe, Kine, and Oxen. By the lawes of the twelue Tables, all persons whatsoeuer aboue foureteen yeares of age, were forbidden vnder pain of death, either by stealth, to feed their cattell in the night time vpon any corn-field of another mans, ploughed and sown; or to cut the same downe by syth or sickle at such a time, and in that manner. By the same laws also ordained it was, That whosoeuer was attaint or conuicted thereupon, should be hanged by the head and strangled for satisfaction of the goddesse *Ceres*: and in one word, to be more grieuously punished than in case of man-slaughter. But if the offender were vnder that age beforesaid, the same law prouided, that hee should be whipped at the discretion of the Pretor or Lord chiefe Iustice for the time beeing: or, if this punishment were remitted by the partie who sustained the domage, then hee should satisfie vnto him for the trespasse as a slaue, and pay double for the losse, according as honest and indifferent men valued it. Furthermore, in antient time, the distinction of States and degrees in the city of Rome (both for wealth and worship) was according to their lands, and not otherwise. Insomuch, as those citizens were reputed for chiefe and principall, who were possessed of Land and liuing in the Countrey: and these made the State, called the Rusticke Tribes, in Rome: whereas contrariwise the other estate, reputed

the

20030
copy 1

A the meaner in degree, was named the Vrbane Tribes; conſiſting of Artiſans and ſuch like as were not landed perſons: into which, if a man were transferred from any of the reſt, it was thought a great ſhame and diſgrace, as if he were reproched for idleneſſe & negligence in huſbandry. And hereupon theſe foure Tribes alone took name of thoſe foure principall parts or quarters of the city wherein they were ſeated; to wit, Suburrana, Palatina, Collina, and Exquilina. Ouer and beſides, vpon faires and market daies, the Ruſtick Tribes vſually viſited the city: vpon which daies therefore no publick aſſemblies of the people were holden, to call the Commons away from their market affaires. Alſo the manner in thoſe daies was to take their ſleepe and repoſe in good ſtraw and litter. Yea, and when ſpeech was of glory and renowne, men would call it by no other term but Adorea, of Ador, a kind of fine red wheat. Where, by the way, I haue
B in great admiration the antique words of thoſe times, and it doth me good to think how ſignificant they were. For thus we read in the ſacred Pontificall Commentaries of the high prieſts, *For the Augurie or ſolemne ſacrifice called * Canarium, let there be certain daies appointed, to wit, before the corn ſhew eare out of the hoſe, yea, and before that it come into it.* But to return againe to the praiſe of Husbandry. When the world was thus addicted and giuen to Agriculture, Italy was not only well prouided and ſufficiently furniſhed of corne, without any help from out prouinces; but alſo all kind of grain and victuals were in thoſe daies ſo exceeding cheap, as it is incredible: for *Manius Martius* a Plebeian Edile of Rome, was the firſt man that ſerued the people wheat at one Aſſe the Modius: and after him *Minutius Augurinus*, the eleuenth Tribune of the commons (euen he who indited that mutinous and ſeditious citizen *Sp. Melius*) brought down the price of
C wheat for 3 market daies to an Aſſe the Modius. The people therefore of Rome, in regard of this good deed of his, erected a ſtatue for him without the gate Trigemina; and that with ſuch affection and deuotion, that euery man contributed ſomewhat thereto by way of beneuolence. *Trebius* alſo in the time of his Ædileſhip, cauſed wheat to be ſold vnto the people at the ſame rate; to wit, one Aſſe a Modius. For which cauſe, there were 2 ſtatues alſo in memorial of him ſet vp, both in the Capitoll and alſo in Palatium: and himſelfe when he was departed this life, had this honor done vnto him by the people, at his exequies, as to be carried on their ſhoulders to his funerall fire. It is reported moreouer, That in the very ſame yeare wherein the great goddeſſe *Cybele* (called alſo the mother of the gods) was brought to Rome, there was a more plentifull haruеſt that Summer, and corn was at a lower price than had bin known in ten yeares
D before. Likewiſe, *M. Varro* hath left in writing, That when *L. Metellus* made ſhew of ſo many Elephants in his triumph at Rome, a Modius of good red wheat, was worth no more than one Aſſe; alſo a gallon of wine coſt no more. And as for drie figges, thirty pound weight carried no higher price: and a man might haue bought a pound of Oile oliue, and 12 pound of fleſh at the very ſame reckoning. And yet all this plenty and cheapneſſe proceeded not from the great domaines and large poſſeſſions of thoſe priuate perſons that incroched vpon their neighbors, and hemmed them within narrow compaſſe. For by the law publiſhed by *Stolo Licinius*, prouided it was, that no Roman citizen ſhould hold in priuat aboue fiue hundred acres. The rigor of which law or ſtatute was extended and practiſed vpon the Law-maker himſelfe, and by vertue thereof he was condemned: who, for to poſſeſſe aboue that proportion, and to defraud the meaning of
E the ſaid Act, purchaſed more lands in the name of his Son. Loe what might be the proportion and meaſure of poſſeſſions allowed euen then, when as the State and Common-wealth of Rome was in the prime and began to flouriſh. And as for the Oration verily of *Manius Curius* after ſuch triumphs of his, and when he had ſubdued and brought vnder the obeiſance of the Roman Empire and laid to their dominion ſo many forrein nations; what it was, euery man knoweth, wherin he deliuered this ſpeech, That he was not to be counted a good man, but a dangerous citizen, who could not content himſelfe with a cloſe of ſeuen acres of ground. And to ſay a truth, after that the kings were baniſhed out of Rome, and their regiment aboliſhed, this was the very proportion of land aſſigned to a Roman Commoner. If this be ſo, What might be the cauſe of ſo great plenty & abundance aforeſaid in thoſe daies? Certes, this & nothing els, great LL. and
F generals of the field (as it ſhould ſeem) tilled themſelues their ground with their own hands: & the Earth again for her part, taking no ſmall pleaſure (as it were) to be eared and broken vp with ploughes Laureat, and ploughmen Triumphant, ſtrained her ſelfe to yeeld increaſe to the vttermoſt. Like it is alſo, that theſe braue men and worthy perſonages were as curious in ſowing a ground with corne, as in ordinance of a battell in array: as diligent (I ſay) in diſpoſing and ordering

* Made with a red dog to pacifie the Dog-ſtarre.

ring of their lands, as in pitching of a field: and commonly euery thing that commeth vnder G
good hands, the more neat and cleane that the vſage thereof is, and the greater paines that is taken about it, the better it thriueth and proſpereth afterwards. What ſhall we ſay more? was not [*C. Attilius*] *Serranus* (when the honorable dignity of Conſulſhip was preſented vnto him, with commiſſion to conduct the Roman army) found ſowing his own field and planting trees, whereupon he took that ſyrname *Serranus*? As for *Quintius Cincinnatus*, a purſeuant or meſſenger of the Senat brought vnto him the letters patents of his Dictatorſhip, at what time as he was in proper perſon ploughing a piece of ground of his owne, containing foure acres and no more, which are now called Prata Quintiana, [*i. Quintius* his medowes] lying within the Vaticane: and (as it is reported) not onely bare-headed was hee and open breaſted, but alſo all naked and full
„ of duſt. The foreſaid officer or ſergeant taking him in this maner, Do on your cloths ſir (quoth H
„ he) and couer your body, that I may deliuer vnto you the charge that I haue from the Senate
„ and people of Rome. Where, note by the way, that ſuch Purſeuants and Sergeants in thoſe daies were named Viatores; for that eftſoones they were ſent to fetch both Senatours and Generall captaines out of the fields where they were at worke: but now, ſee how the times be changed! They that doe this buſineſſe in the field, what are they but bond-ſlaues fettered, condemned malefactors manacled, and in one word, noted perſons, and ſuch as are branded and marked in their viſage with an hot yron? Howbeit the Earth, whom wee call our Mother, and whom wee would ſeem to worſhip, is not ſo deafe and ſenceleſſe, but ſhe knoweth well enough how ſhee is by them depriued of that honour which was done in old time vnto her: inſomuch, as wee may well weet, that againſt her will ſhee yeeldeth fruit as ſhee doth; howſoeuer wee would haue it I
thought, by theſe glorious titles giuen vnto her, that ſhe is nothing diſpleaſed therewith, namely, to be labored and wrought by ſuch vile and baſe hirelings. But we forſooth do maruell, that the labor of theſe contemptible bondſlaues and abiect villains doth not render the like profit, as that trauell in former times of great captains and LL. Generalls. And in very truth, euen among other forrein nations, it was counted a princelike profeſſion indeed, to be able for to giue rules and directions about Husbandry: for ſo we may ſee, that both kings haue ſtudied this argument, as namely, *Hiero*, *Philometor*, *Attalus*, and *Archelaus*: and alſo martiall captaines; to wit, *Xenophon*, and *Mago* the Carthaginian. As for *Mago* verily, our Senate did him that honour after Carthage was woon, that in ſacking it and giuing away among diuers LL. of Affricke, the Libraries there found; they thought good to reſerue only 28 volumes of his, and penned by K
him as touching Agriculture, and to haue them tranſlated into the Latin tongue (notwithſtanding that *M. Cato* had already beforetime put out in writing and ſet forth certaine rules & precepts therof:) giuing order for this tranſlation, to thoſe that were well ſeene in the Punicke or Carthaginian language: in which buſineſſe, *D. Syllanus* a Romane gentleman of a right worſhipfull houſe, went beyond all others. As for great ſchollers and men of profound and deep learning, a number there were beſides that trauelled in this matter, whom wee haue named already in the forefront; and eftſoones ſhall mention in the diſcourſe of this volume. In which range we muſt nominate not vnthankfully among the meaneſt writers, *M. Varro*, who beeing foureſcore yeares old and one, thought it not amiſſe to compile a ſpeciall booke and treatiſe of Huſbandry.

Chap. IIII. L

¶ *The manner of Husbandry in antient time.*

LAte it was ere the Romans began to ſet their minds vpon Vines and Vineyards: for at firſt they tilled only corne fields for very neceſſitie, euen as much as might ſuffice to ſerue the city. The order and manner whereof, I will ſet in hand to treat of; not after a vulgar and common ſort, but according to my vſuall manner hitherto more ſoundly: as hauing ſought out with all care and diligence, not only the antient practiſe in times paſt, but the inuentions alſo of late daies; & withal ſearched into the cauſes and reaſons of euery thing, and found them out. My purpoſe is beſides, to ſpeake in this treatiſe of the fixed Starres; their riſing and ſetting, M
their apparition and occultation, together with their influences, as they are vndoubtedly obſerued and ſeen here vpon earth. And this, my meaning is to do after a plain and familiar ſort, foraſmuch as they, who hitherto wrote of this argument, haue handled the ſame ſo ſubtilly, and penned

20030
copy 1

A penned it with ſo high a ſtile,as they may ſeeme to any man for to haue written books for Oratours to reade,rather than to the capacity of plaine husbandmen for to practice. Firſt and foremoſt therefore,I will for the moſt part deale by Oracles,that is to ſay,ſententious Sawes,for to determine this queſtion in hand: concerning which, there are as many to be found in number, and thoſe as true in effect,as in any other part and profeſſion of this our life whatſoeuer. And leaſt any man ſhould think it ſtrange,that I cal theſe rules of Husbandrie,Oracles;who would take them for leſſe conſidering how they proceed from Time,a god moſt certaine,and are deliuered and approoued by Experience,the trueſt prophet of all others. And beginne I will with *Cato* firſt.

Chap. V.

B ¶ *The praiſe and commendation of Husbandmen: what things are to be required in the purchaſing or taking to ferme of houſe and land.*

THe children (ſaith *Cato*) that are begotten by husbandmen,proue moſt valiant,the hardieſt ſouldiers,and ſuch as thinke leaſt harme of all others. In buying of land, take heed you be " not too hot and eager vpon the purchaſe. In the husbanding of ground, ſpare for no paine " and trauell;but in the purchaſing therof be you nothing forward: a thing ouer-bought, hath e- " uermore repentance,and had I wiſt,attending vpon it. They that are about a purchaſe, ought a- " boue all,to ſee how the ground is watered,what waies and auenues be about it, and what neigh- " bors be neare vnto it. Out of euery one of theſe points, matters of great importance and deepe "
C concluſions may be picked,and thoſe moſt certaine and infallible. *Cato* addeth moreouer and ſaith,That there would be good regard had of the people confining, and other grounds bounding thereupon,whether they be well liking,faire, and trim to ſee vnto? For theſe be his words, It is a good ſigne(quoth he) that the ferm is well ſeated and in a commodious quarter, if all about looke well. *Attilius Regulus* (hee who during the firſt Punicke warre was twiſe Conſull of Rome) was wont to ſay,That a man ſhould not purchaſe an vnwholeſome piece of land, were it neuer ſo rich and fruitfull;nor make choice of a barren ſoile,were it neuer ſo healthie. Now as touching the healthfulneſſe of a place,a man may not alwaies conclude therof by the color and freſh hue of the inhabitants: for many times it falleth out, that thoſe who be vſed to peſtilent places,hold out well and haue their health;yea and by their lookes bewray no harme that they
D take. Moreouer,ſome quarters and coaſts there be,which at ſome times of the yeare ſtand ſound and healthy enough:but I will count none holeſome,but ſuch as be healthfull all the yere long. An ill piece of land is that,which putteth the lord thereof to pain,and with which he is forced to wreſtle for to haue his health. *Cato* would haue this point eſpecially to be conſidered,that the ſoile of a ferme (ſcituat as hath bin ſaid) be good of it ſelfe,and fertile: alſo, that neere vnto it there be ſtore of laborers: and that it bee not farre from a good and ſtrong towne: moreouer, that it hath ſufficient meanes for tranſporting of the commodities which it yeeldeth,either by veſſels vpon water,or otherwiſe by waines vpon the land. Furthermore, that the manour houſe be well built,and the land about it as well husbanded. Howbeit, herein I ſee many men to erre much,and greatly to be deceiued: for they hold opinion,that the negligence and il husbandry
E of the former lord,is good for him that ſhall purchaſe land and come after him. But I ſay,there is nothing more dangerous and diſaduantageous to the buyer, than land ſo left waſt and out of heart: and therefore *Cato* giueth good counſell, to purchaſe land of a good husband, and not raſhly and hand ouer head to deſpiſe and ſet light by the skil and knowledge of another. Who ſaith moreouer, That as well land as men(which are of great charge and expence) how gaineful ſoeuer they may ſeeme to be, yeeld not much profit in the end to the maſter *declaro*, when all counts be caſt and reckonings made. He therfere judgeth,that the Vine veeldeth the beſt reuenue,of all commodities belonging to a ferme: and good reaſon he hath ſo to ſay,becauſe aboue all things he taketh order to cut off expence as much as may be. Next to it,he reckoneth Hortyards,ſuch eſpecially as haue water at command: and good cauſe why, prouided alwaies that
F they lie vnder a good towne ſide. [In the third place he rangeth the Oſier plots, and after them Oliue rewes:] then he counteth of medows, which our anceſtors called Parata, as a man would ſay, Ready and prouided. The ſame *Cato* being asked, What was the moſt aſſured profit riſing out of land? made this anſwer, *To feed Cattell well*: beeing asked againe, What was the next? *Marie* (quoth hee) *to feed in a meane*. By which anſwers he would ſeeme to conclude, That the

moſt certain and ſure reuenue was that, which would coſt leaſt. Howbeit, this is not ſo generall G
a rule, but it may alter according to the diuerſitie of places, & ſundry occaſions occurrent. Herunto alſo is to be referred another ſpeech of his, That a good husbandman ought to be a ſeller, [and not a buyer:] as alſo, That a man ſhould make ſpeed in his youth, and not delay to plant and ſtocke his ground; but not to build thereupon, before it be well and throughly ſtored that way: and euen then alſo, he ſhould not be forward thereto, but take leiſure ere he be a builder: for it is the beſt thing in the world (according to the common prouerbe) To make vſe and reap profit of other mens follies: prouided alwaies, that a mans land be not ouer-built, leſt the expence of keeping all in good repaire, be chargeable and burdenſome. Now when there is a ſufficient and competent houſe builded thereupon, a good husband will vſe to repaire often thereunto, and take pleaſure ſo to do: and verily a true ſaying it is, That the lords eie is far better for H
the land, than his heele.

Chap. VI.

¶ *How to chuſe a conuenient place for to build a manour houſe in the country. Alſo certain rules obſerued in antient time, as touching Husbandrie and tilling ground.*

IN building vpon a mans land, this mean and moderation is commended, That the houſe be anſwerable in proportion to the ground: for as it is a bad ſight to ſee a large domain and circuit of ground without a ſufficient graunge or home-ſtal to it; ſo it is as great a folly to ouer- I
build the ſame, & to make a faire houſe where there is not land enough lying to it. Like as there were two men at one time liuing, who faulted diuerſly in this behalfe; to wit, *L. Lucullus* and *Q. Scæuola*, for the one was poſſeſſed of faire lands without competent building thereto, whereas *Lucullus* contrariwiſe built a goodly houſe in the country, with little or no liuing adjoyning to it: in which regard, checked he was by the Cenſors, for ſweeping more floures than he ploughed lands. Now in building, there would be art and cunning ſhewed: for euen of late daies *C. Marius* (who had bin ſeuen times Conſull of Rome) was the laſt man that built an houſe within the territory of the cape Miſenum, and he ſeated it ſo, as if he had pitched & fortified a camp right skilfully; in ſuch ſort, that when *Sylla* ſyrnamed *Fœlix* [*i.* Happy] ſaw his manner of building, he gaue out and ſaid, That all the reſt in compariſon of him, were blind beetles, and knew neither K
how to build nor to encamp. Well then, a houſe in the country would be ſet neither neere vnto a fenny and dormant water, ne yet ouer-againſt the courſe and ſtream of a running riuer: and yet what ſaith *Homer* beſides to this purpoſe? The aire and miſts (quoth he, and that right truly) ariſing from a great riuer betimes in a morning before day-light, cannot chuſe but be euer cold and vnholeſome. How then? mary if the country or climat be hot, an houſe muſt ſtand into the North; but in caſe the quarter be cold, it ought to affront the South: if the tract be temperate between both, it ſhould lie open vpon the Eaſt point, where the Sun riſeth at the Æquinoxes.

As touching the goodneſſe of the ſoile, and namely what ſignes and marks there be of it; although I may ſeem to haue ſufficiently ſpoken already, in the diſcourſe which I had of the beſt kind of ground, yet I am content to ſubſcribe to other tokens thereof deliuered by other men, L
and eſpecially by *Cato* in theſe words following: *When you ſee* (quoth hee) *growing vpon any land, ſtore of Walwort, Skeg trees, Brambles, the little wild Bulbous Crow-toes*, [called otherwiſe our Ladies Cowſlips] *Clauer-graſſe or Trifoile, Melilote, Oke, wilde Pyrries, and Crab-trees; know yee, that theſe doe ſhew a ground good for Wheat, and ſuch like white-corne.* So doth alſo the blacke mould and that of aſhes colour, teſtifie no leſſe. Where there is ſtore of chalke or plaiſter, the ground is not ſo fit for corne; for all kinde of chalke doth heat ouermuch, vnleſſe the ſame be very leane. The like doth ſand alſo, if it be not paſſing fine and ſmall. And the effects aboueſaid are much more ſeen in the plaines and champaine vallies, than vpon the hills and mountaines. Our anceſtours in old time thought it a principall point of Husbandry, not to haue ouermuch ground about M
one graunge: for they ſuppoſed more profit grew by ſowing leſſe, and tilling it better: of which mind I perceiue **Virgil* was. And to ſay a truth, confeſſe we muſt needs, That theſe large enclo- ſures and great domains held by priuat perſons, haue long ſince bin the ruine of Italie, and of late daies haue vndone the prouinces alſo thereto belonging. Six Land-lords there were and no more, that poſſeſſed the one moitie of all Africke, at what time as the Emperour *Nero* defeated

Laudato ingentia rura, Exiguum colito.

and

20030
copy 1

A and put them to death. Where, by the way, I may not defraud *Cn. Pompeius* of the due glory anſwerable to that greatneſſe of his, who neuer in all his life would purchaſe any ground that butted or bordered vpon his owne land. *Mago* thought it no reaſon, but a very vngentle and vnkind part for the buying of land, to ſell a manſion houſe; and in his conceit, it preiudiced much the weale-publick. And verily this was the principall point that he recommended in the entrance of his treatiſe and rules ſet downe for Husbandry, ſo as a man might perceiue very euidently, that hee required continuall reſidence vpon the land. Next to theſe principles aboue named, great regard would be had in chuſing of good & skilful bayliffs of the husbandry, concerning whom *Cato* hath giuen many rules. For mine own part, it ſhal ſuffice to ſay thus much only, that the lord ought to loue his bayliffe very well, & ſet him next to his heart: but himſelf ſhould not
B let him know ſo much. Moreouer, I hold it the worſt thing that is, to ſet ſlaues & condemned perſons in their gyues & chains, about tilling and husbanding of a ferm: neither do I like of any thing don by ſuch forlorne and hopeleſſe perſons; for lightly nothing thriues vnder their hand. I would put down one ſaying more of our antient forefathers, but that haply it may ſeeme a fond & raſh ſpeech, yea and altogether incredible, & that is this, *Nothing is leſſe profitable, & expedient, than to labor a ground exceeding much, and to ouer-til it. L. Rarius Rufus*, a man of very baſe and low parentage deſcended, & yet aduanced to the Conſular dignity for his proweſſe in feats of arms; was otherwiſe very thrifty and ſparing, after the maner of the old world; inſomuch as partly by his niggardiſe and partly through the liberality of *Auguſtus Cæſar*, he had gathered good together amounting to the ſum of an hundred millions of Seſterces: all which maſſe of money,
C what with purchaſing land to land in the Picene country, and what with beſtowing ſuch a deale of husbandry vpon it, more ywis of a vain glory and oſtentation, than for any profit that he reaped thereby, he laid forth and ſpent euery whit of that ſtock; inſomuch as hardly he could finde any man that would take vpon him to be his executor, or to accept ſimply of the inheritance. What ſhall we ſay then? or what good commeth of ſuch houſes or lands ſo chargeable, as that they are like to coſt a man his life, and that by famine? I hold therfore, that in all things a mean is beſt, and bringeth greateſt profit in the end. To till and husband ground well, is neceſſary; to ouer-do the ſame and to exceed, turneth more to the damage than the profit of the lord, vnleſſe it were done by his own children, or to maintain the charge of keeping ſuch hinds as otherwiſe muſt be found if they ſat ſtill and did nothing: for ſetting that cauſe aſide, it falleth out often-
D times, that the gathering and inning of ſome harueſt (if a man count all the pains emploied and the mony of the purſe) is nothing beneficial to the maſter. In like maner, Oliues would not alwaies be tended and looked vnto ouermuch: neither do ſome grounds require much diligence, but are the worſe for ſuch attendance: as may be ſeen (by report) in Sicily; which is the cauſe that new commers thither for to be tenants, and to occupy thoſe lands, are many times deceiued and put beſides their reckoning.

After what manner then ſhall we proceed in the husbandry of our land to moſt benefit and behoofe? Learn a rule out of the Oracle or ſententious riddle, which goeth in this forme, *Malis bonis* [*i.* Cheapeſt, Beſt.] But herein, me thinks, good reaſon it is, that our old great grandfathers ſhould be defended and excuſed for holding theſe ſtrange and obſcure paradoxes; they (I ſay)
E who by ſuch rules and precepts, tooke great care and paines to inſtruct vs how to liue. Would you know then what they meant by this word *Malis*? ſurely they vnderſtood thoſe that were cheapeſt and ſtood them in leaſt. The chiefe point of all their prouidence and forecaſt, was to goe the neareſt way to worke, and to be at the ſmalleſt coſt: and no maruell; for who were they that gaue out theſe thriftie precepts? euen thoſe, who reproched a victorious General (and one who triumphed ouer the enemy) for hauing a cupboord of ſiluer plate weighing but ten pound: thoſe (I ſay) who if their bayliffes of husbandrie chanced to die, whereby their lands in the countrey ſtood void, would make ſuit to be gone themſelues thither, and to return to their own fermes; leauing behind them the glory of all their victories by them atchieued: and to conclude, euen thoſe who whiles they were imploied in the conduct of armies, had their grounds
F looked vnto and tilled at the charges of the common-weale, and had no other for their bayliffs than the noble Senators of Rome. From their mouths came theſe other oracles and wiſe ſentences following: An ill husband is he, who is forced to buy that, which his ferme might affoord him. As bad is that houſholder & maſter of a family, who doth that in the day which might be don by night, vnleſſe vnſeaſonable weather driue him to it: worſe than either of theſe is he, who

doth that vpon work-daies which ſhould haue bin done on play daies or idle holidaies: but the G
worſt of all other is he, who when the weather is fair, wil chuſe to work rather within cloſe houſe
than abroad in the open field: & here I cannot hold and rule my ſelfe, but I muſt needs alledge
one example out of antient hiſtories, whereby it may be vnderſtood, How it was an ordinary
matter to commenſe actions and to maintaine pleas in open court before the body of the peo-
ple in the caſe of Husbandry: as alſo in what ſort thoſe good Husbandmen of old time were
wont to defend their owne cauſe when they were brought into queſtion. And this was the caſe.
There was one *C. Furius Creſinus*, late a bond-ſlaue, and newly infranchiſed, who after that hee
was ſet at liberty, purchaſed a very little piece of ground, out of which he gathered much more
commodity than all his neighbors about him out of their great and large poſſeſſions: whereu-
on he grew to be greatly enuied and hated; inſomuch, as they charged him with indirect means, H
as if he had vſed ſorcery, and by charmes and witch-craft drawne into his owne ground that in-
creaſe of fruits, which ſhould otherwiſe haue growne in his neighbors fields. Thus vpon com-
plaint and information giuen, he was preſented and indited, by *Spurius Albinus*, an Ædile Cu-
rule for the time being: and a day was ſet him down peremptorily for his perſonal appearance
to anſwer the matter. He therfore fearing the worſt, and doubting that he ſhould be caſt to pay
ſome grieuous fine; at what time as the Tribes were ready to giue their voices, either to acquit
or condemne him, brought into the common place his plough, with other inſtruments and fur-
niture belonging to husbandry: he preſented likewiſe in the open face of the court, his owne
daughter, a luſty ſtrong laſſe and big of bone; yea, and (as *Piſo* telleth the tale) well fed, and as
well clad: he ſhewed there (I ſay) his tooles and plough yrons of the beſt making, and kept in I
as good order; maine and heauy coulters, ſtrong and tough ſpades, maſſie and weighty plough-
ſhares, and withall his draught Oxen, ful and faire. Now, when his courſe came to plead his own
cauſe before the people, and to anſwer for him ſelfe, thus he began and ſaid: My maſters (quoth
» he) you that are citizens of Rome, behold, theſe are the ſorceries, charms, and all the inchant-
» ments that I vſe (pointing to his daughter, his oxen & furniture abouenamed:) I might beſides
» (quoth he) alledge mine owne trauell and toile that I take, the early riſing and late ſitting vp ſo
» ordinary with me, the carefull watching that I vſually abide, and the painefull ſweats which I
» daily indure; but I am not able to repreſent theſe to your view, nor to bring them hither with
» me into this aſſembly. The people no ſooner hard this plea of his, but with one voice they all
acquit him and declared him vnguilty, without any contradiction. By which example verily, a K
man may ſoone ſee, that good husbandrie goeth not all by much expence: but it is pains taking
and careful diligence that doth the deed. And hereupon came the old ſayd ſaw, ſo rife in euerie
mans mouth, that the only thing to make ground moſt fertile and fruitfull, is the Maſters eie.
As for all other rules and precepts of Agriculture, reſpectiue to this or that peculiar point of
husbandry, I will deliuer them in their proper places accordingly. And in the meane time I wil
not omit ſuch as be more generall, as they ſhal come into my mind and remembrance. Firſt and
formoſt, there offereth it ſelfe to me one aboue the reſt, wherof *Cato* is the Author, and which of
all others I hold to be moſt profitable and founding to ciuilitie; to wit, that in all our doings we
» aime at this, To haue the loue and good will of our neighbors: and that for many and ſufficient
» reaſons by him alledged, which I ſuppoſe no man will make any doubt of. *Imprimis*, hee giueth L
» a good caueat, That our ſeruitors and people about vs be not ſhrewd, but well ordered, and that
» none of our family be ill diſpoſed to offer any wrong. *Item*, All good husbands agree in this, that
» nothing would be done too late and when the time is ouerhipt. And againe, That euery worke
» ſhould haue the due and conuenient ſeaſon: to the ſame effect there is a third admonition, name-
» ly, That when the opportunity is once paſt, in vain we ſeek to recall and recouer it. As touching
a rotten and putrified ground, we haue at large ſhewed already how much *Cato* doth abhor and
curſe it. And yet he ceaſeth not to forewarne vs of it, and beſides, to giue vs theſe rules follow-
ing. What work ſoeuer may be performed by a poore Aſſe, is thought to coſt little or nothing,
and to be done very cheape. Ferne or Brake will die at the root in two yeares, if you wil not ſuf-
fer it to branch and grow aboue ground: and this ſhall you hinder moſt effectually, in caſe you
knap off the head of the firſt ſpring with a wand or walking ſtaffe: for the liquid juice dropping M
downe from them, doth kill the root. It is commonly ſaid alſo, that if they be pulled vp about
the ſummer Sun-ſtead, they will not come againe but die: as alſo, if they be topt, or their heads
whipt off with a reed: or if they be eared vp with the plough, ſo as there be a reed faſtned to the

ſhare.

20030
copy 1

A ſhare. Semblably, for to kill reeds, they giue order to plough them vp, with ſome Fern likewiſe laid vpon the ſhare. A ruſhie ground muſt be broken vp and turned ouer & ouer with the broad ſpade: but if it be ſtony, it would be digged with a mattock or two tined fork. Rough grounds and giuen to beare ſhrubs, if a man would ſtork, the beſt way is to burne them vp by the roots. If the place lie low, and be ouermoiſt, the onely meanes to make it ſound and drie, is to draine away the water by trenching. In caſe a ground doe ſtand vpon chalke or plaiſter, the ditches or trenches therin ſhould be left wide open: but if the ſoile be more looſe & not ſo faſt, they muſt be ſtrengthned and kept vp with quick-ſet hedges, for feare of falling: or elſe they ought to be made in ſuch ſort, as both the ſides thereof be well bedded and couched, bearing out a belly a-ſlope, and not digged plum downe-right. Some would be cloſed vp aboue and made very ſtrait
B and narrow, for to run directly into others that are more wide and large: alſo, if occaſion doe ſo require, the bottome of their channell would be paued with pebble, or laied with good grauell. As for the mouth and end therof (to wit, for entrance and iſſue) they ought both of them to be fortified and vnderſet with two ſtones at either ſide, and a third laied croſſe ouer them. Laſt of all, if a ground run to wood and be ouergrowne therewith, *Democritus* hath taught vs the means how to kill the ſame in this manner, Take Lupine floures, let them be ſteeped one whole day in the juice of Hemlock, and therewith beſprinckle and drench the roots of the ſhrubs that ouer-run the place, and they will die.

Chap. VII.

¶ *Sundry ſorts of corne, and their ſeuerall natures.*

C NOw that we haue thus ſhewed the way how to prepare a field for to beare corne, it remaineth to declare the nature of corne. And to ſpeake generally of all graine, there are two principall kinds thereof; to wit, firſt Fourment, containing vnder it wheat and Barley, and ſuch like: ſecondly, Pulſe, compriſing Beans, Peaſe, Chiches, &c. The difference obſerued both in the one ſort and the other, is ſo euident and plaine, that needleſſe it is for me to vſe any words thereof. And as for the former kind called Fourment, it is diuided alſo into ſundry ſorts, according to the ſeuerall ſeaſons wherein they be ſowne. Firſt there is the Winter corn, which being ſowed about the ſetting of the ſtar Virgilia, *i.* in Nouember, lieth all winter long in the ground and there is nouriſhed, as for example, Wheat, Rie, and barley. Secondly, Summer corne, which
D is put into the earth in Summer about the riſing of the foreſaid ſtar Virgilia, *i.* The Brood-hen, to wit, in May; namely, Millet, Panick, Horminum, and Irio (two kinds of grain.) But note that I ſpeak here of the manner vſed in Italy. For otherwiſe in Greece and Aſia, they ſow all indifferently at the retrait or occultation of Virgiliæ: and to come again to our Italy, ſome grain there is which is ſown there, both in Winter and Summer: as alſo, you ſhall haue other corne ſowed in a third ſeaſon; to wit, in the Spring. Some there be who take for Spring-corn, Millet, Panick, Lentils, cich Peaſe, and the grain wherof * Fourmenty is made. But Wheat, Barley, Beans, Na-
E uews, Turneps, and Rapes, they hold for Seméntina, *i.* to be ſowed at the proper and timely ſeaſon of ſeeds, *i.* in Autumne. In that kind of corne which comprehendeth Wheat, there is to be reckoned that grain which ſerueth for prouender and forrage, and is ſown for beaſts, & namely, that which they call dredge or ballimong. Likewiſe, in the other kind, to wit, of Pulſe, the Vetches be compriſed: but that which is good indifferently both for man and beaſt, is the Lupine. All ſorts of Pulſe called in Latine Legumina, vnleſſe it be the Bean, haue but one root apiece, and ſuch be as hard as wood, and full of ſhoots, and thoſe diuided into forked branches: and the roots of the cich Peaſe run deepeſt into the ground. But all other corne vnder the name of Frumenta, haue many ſmall fillets or ſtrings appendant to the roots, & otherwiſe branch not: as for Barly, it chitteth and begins to ſhew within 7 daies after it is firſt ſowne. All ſorts of Pulſe appeare aboue ground by the fourth day or the fift at the vtmoſt. And yet Beans ordinarily do lie in the ground 15 or 20 daies. Howſoeuer in Ægypt all Pulſe commeth vp by the third day. In Barly, one end of the ſeed runneth to root downward, and the other into blade, and that * bloo-
F meth firſt. Now, if you would know which end ſerueth for the one and the other; certaine it is, that the bigger and thicker part of the grain yeeldeth root, and the ſmaller the greene blade. In all other ſeeds there is no ſuch diuerſitie, for from one and the ſame end breaketh out both root and greene blade. All kind of corn carying ſpike or eare, called Frumenta, ſhew nothing but the green blade during winter: howbeit, no ſooner commeth the ſpring, but they begin to grow vp

* *Alica.*

* No maruell being ſowed before winter.

into ſtraw, and to ſpindle vpward pointwiſe, I meane all that be of the winter kind. But Millet G
and Panick run vp into an hollow ſtem full of knots and ioynts: and Seſama by it ſelf into a kex
or hollow ſtem in maner of fenell and ſuch like. The fruit or ſeed of all graine that is ſowne or
ſet, is contained within eares, as we ſee in (bearded) wheat and barley, and the ſame is defended
as it were with a paliſaide of eales, diſpoſed ſquare in foure rankes; or is incloſed within long
cods and husks, as the Pulſe kind; or els lieth in little cups, as Seſame and Poppie. Millet and
Panick only put forth their fruit grape-wiſe and openly, without any partitions and defences,
ſo as their ſeed is expoſed to the little birds of the aire: for no otherwiſe are they defended,
than within ſmall skins and thin huls. And as for Panick, it taketh the name of certain panicles
or chats hanging from the top thereof, whereby the head bendeth and leaneth downward, as if
it were weake and wearie of the burden. The ſtem or ſtalk thereof groweth ſmaller and ſmaller, H
and pointed vpward: inſomuch as by little and little it runneth vp in maner of a little ſprig, or
ſion, and there you ſhall ſee a number of ſeeds or grains cluſtered together thicke, inſomuch as
they are ſomtimes bunched with an head a good foot long. As touching the Millet, the head
thereof bearing ſeed round about is bent likewiſe and curbed, beſet alſo with fringes, as it were,
of hairy fillets. But to return to Panick againe, there be ſundry ſorts thereof: for ſome of it is
found with a tuft or bunch, from which depend certain ſmall cluſtered chats or panicles, & the
ſame alſo hath two knaps or heads, and this is called Mammoſum, as one would ſay, the Panick
with bigs or dugs. Moreouer, you ſhall haue Panick ſeed of ſundry colours, white, blacke, and
red, yea and purple. Of Mill or Millet there be diuers ſorts of bread made in many places; but
of panick it is not ſo common: howbeit there is no grain more ponderous and weighty than it, I
or which in the ſeething or baking ſwelleth and riſeth more; for, out of one Modius or pecke
thereof there is ordinarily made 60 pound of dough for bread. Moreouer, take but 3 ſextares or
quarts of it being ſteeped, and it will yeeld a meaſure called Modius, of thicke gruel or batter,
* i. Turkiſh Millet. called in Latine Puls. It is not fully ten yeres ſince there was a kind of * Millet brought out of
India into Italy, and the ſame was of colour black, the ſeed or grain in quantitie big and faire,
and for ſtem like vnto a reed. It riſeth vp in height ſeuen foot: the ſtalks are mighty and great,
ſome call them Lobæ or Phobæ. Of all ſorts of corne it is moſt fruitfull, and yeeldeth greateſt
increaſe: for of one grain a man ſhal haue 3 ſextars or quarts again. But it loueth, yea & ought
to be ſown in a moiſt ſoile.

Moreouer, ſome kinds of ſpiked corn begin to ſpindle and gather eare at the third ioynt, o- K
thers at the fourth: but there it lieth as yet hidden and incloſed. Now as touching theſe ioints,
wheat beareth vſually foure, beere Barly ſix, and the common ſprit Barly eight, which is wel to
be conſidered: for no corn vſeth to ſpier before it be fully knotted or iointed in maner aboue-
ſaid. And ſo ſoon as the ſaid ſpier ſheweth ſome hope of an eare, within 4 or fiue daies after at
the moſt, they begin to bloum: and in as many dayes ſpace, or little more, they will haue done
and ſhed their floures. And yet I muſt needs ſay, that all ſorts of barley are a ſeuen-night at the
vtmoſt in ſo doing. *Varro* ſaith, that in foure times 9 daies this kind of corn commeth to perfe-
ction: but it ought to ſtay nine moneths before it be ripe for to be reaped and mowne downe.
As for Beanes, after they be ſet or caſt into the ground, firſt they put forth leafe, and afterward
ſtalk, that ſhooteth vp euen, without any partition of ioynts or knots between. All other pulſe L
beſides the Bean, haue a more ſollid and wooddy ſubſtance in the ſtraw. Of which, the Chich
peaſe, the Ervile, and Lentils doe ſpred forth in branches. And ſome of them runne ſo low that
they creep along the ground, vnleſſe they be born vp and ſupported with ſome props, as for ex-
ample Peaſe, which help if they miſſe they proue the worſe for it. Of all manner of Pulſe, the
Bean alone and Lupine beare but one ſingle ſtalke apiece: the reſt doe branch into very ſmall
ſprigs or tendrils. Howbeit none of them but their ſtalke or ſtraw is fiſtulous and hollow in
maner of reeds. Some pulſe put out leaues preſently from the root: others again from the top
or head only: wheat and Barly both the one and the other: and what corn ſoeuer ſtandeth vp-
on a ſtalk, beareth one leafe in the head or top thereof. But the leaues of Barly are rough, wher-
as in other corn they be ſmooth. Contrariwiſe, Beanes, Chiches, and Peaſe haue many leaues.
In ſpiked corn the leafe reſembleth that which groweth to reeds: in beans they be round, and M
ſo likewiſe in the moſt kinds of puls, howbeit in peaſe and Ervile we ſee they be ſomwhat lon-
ger. The leaues of Faſels or Kidney beanes are ribbed and full of veines: of Seſama and * Irio
* i. Turkiſh corne. they be red and reſemble bloud. The Lupines only and the Poppies do ſhed their leaues. All

pulſe

20030
copy 1

A pulſe is long in the bloom, and namely Ervile and the Cich peaſe: but Beans continue longeſt, euen for the ſpace of 40 daies together: howbeit euery ſingle ſtalk beareth not bloom ſo long: but thus it is, as one hath done and giuen ouer, another beginneth afreſh. Neither bloometh the whole field at once, as ſpiked corn doth. Alſo, all kinds of Pulſe doe cod at ſundrie times, and not vpon the ſame day: beginning firſt at the bottome, and ſo likewiſe the floure riſeth vp higher by little and little. All corne growing in ſpike or eare, ſo ſoone as it hath done blooming, waxeth big and ſtrong, and commeth to maturitie within forty daies at the fartheſt: ſo doth Beanes alſo: but the Cich peaſe receiueth her full perfection in very few daies: for from the time that it was firſt ſowed, it groweth to be ripe in forty daies. Millet, Panick, Seſame, and all Summer corn, haue their full ripeneſſe forty daies after their blooming. But herein there is
B great diuerſitie, according to the clyme and the ſoile: in which reſpects corne ripeneth ſooner or later. For in Ægypt Barley is readie to be reaped in the ſixt moneth after it was ſowne, and Wheat in ſeuen: but in the region of Hellas in Greece, the Barley tarieth ſeuen moneths; and in Peloponneſus or Morea, eight. As for wheat and ſuch like hard corne, longer it is ere it be ripe and ready for the ſycle. All Corne that groweth aloft vpon a ſtalke or ſtraw, beareth the graines arranged ſpikewiſe, and as if they were plaited and braided like a border of haire. In Bean ſtalks and other ſuch like pulſe, the cods grow in alternatiue courſe, ſome on the right ſide, others on the left, in order. Wheat and ſuch like ſpiked corne withſtand the winter cold better than Pulſe: but theſe yeeld a ſtronger food, and fill the belly ſooner. Wheat, Rie, and ſuch like grain are well wrapped within many tunicles. Barley for the moſt part lieth bare and
C naked: ſo doth Arinca [*i.* a kind of Rice or Amel corn] and Oats eſpecially. The ſtraw of wheat and Rie is commonly taller than that of Barly. But the eiles of Barley are more rough and prickie than thoſe of the other. Pol-wheat both red and white, yea and Barley alſo, is threſhed and driuen out of the huſk vpon a floore, and being thus threſhed clean and pure, it is either ground or ſowne againe without any parching or drying in a furnace. Contrariwiſe, the Beare corne or Bearded wheat, Far, Millet, and Panick, cannot poſſibly be made clean, vnleſſe they be firſt ſendged and ſo dried. Theſe ſorts of graine therefore vſe to be ſowed raw and rude with their very huls: like as the Beare corn or bearded Far men are wont to keep ſtill incloſed within the huſk againſt ſeed time, and neuer parch or dry it at the fire. Of all the ſorts of grain before reheaſed, Barley is the lighteſt; for a Modius or pecke thereof ſeldome weigheth aboue 15 pounds,
D whereas the like meaſure of Beans poiſeth 22. The bearded corne Far is yet more ponderous than it; and Wheat more than all the reſt. In Ægypt they vſe to make certain frumenty meat or naked grotes of a kind of Rice or white Amel-corn, called Olyra, which is among them holden for the third ſort of Spike-corne. In Gaule likewiſe they haue a kinde of frumentie corne or gurts by themſelues, named in their language Brance, and with vs in Italy and about Rome, Sandalum: this grain is of all others moſt neat and faire, and this ſingular propertie it hath beſides different from the reſt, That ordinarily in euery meaſure called Modius, it yeeldeth more bread by foure pound weight than any other corne husked and dreſſed in maner aforeſaid. *Verrius* reporteth, That the people of Rome for 300 yeares together vſed no other meat than the grotes made of common Wheat. And as touching Wheat, there be many ſorts therof, diſtin-
E guiſhed by the names of the Regions and countries where they be found growing. Howbeit for my part I thinke verily, that there is no wheat in the world comparable to ours here in Italy, for it ſurpaſſeth all others both in whiteneſſe and alſo in weight: by which two marks eſpecially, as it is knowne from the reſt, ſo it is reputed for the very beſt. And if you take the wheat growing in the mountain countries of Italy, the beſt haply of forrein regions may match it, and that is the wheat of Bœotia: the principall of all others next to it, is that which growes in Sicily; and then that of Africk may be ranged in the laſt place: in a third rank is to be reckoned the Thracian and Syrian Wheat, and after them the Ægyptian, in regard of the weight that it carieth. Now theſe degrees of weight we gather by the proportion aſſigned to champions and wreſtlers, whoſe allowance was much like to the liurie giuen to laboring horſes, and as much in
F maner would their paunches both require and receiue: for according as they could eate of the one ſort more meaſures than of the other, * ſo aroſe theſe diſtinct degrees in the weight aboue ſaid. The Greeks make great account of the Wheat growing by Pontus, and highly commend it: but this neuer came into Italy, neither know wee what it is. The ſame Grecians preferred before all other grain, theſe three ſorts, to wit, Dracontias, Strangias, and Selinuſium; eſteeming

* For whereas of the Athenian Wheat, fiue demy Sextars, (*i.* two quarts and a halfe) were but ſufficient, three would ſerue and content them of the Bœotian (*i.* a quart & halfe: wherby it was collected, how much weightier this was than that.

ming the goodneſſe of the corn by the thickneſſe and bignes of the ſtraw, and attributing theſe three kinds by that ſigne and argument, to the goodneſſe and riches of the ſoile: and therefore they preſcribed to ſow this corn in a fat and battle ground. But the lighteſt in weight and pooreſt in ſubſtance, becauſe it required much nutriment, they appointed to be ſowed in moiſt places. Of this opinion and iudgment were the antient Greeks, during the reign of *Alexander* the Great, at what time as Greece was in the floure and height of her glory, as hauing the monarchie and ſoueraigntie ouer the whole world. Howbeit, before his death 145 yeares or thereabout, *Sophocles* the Poet in a Tragedie entituled Triptolemus, praiſed the Italian wheat aboue all other: for in effect thus he ſaith word for word; G

Et fortunatam Italiam frumento canére candidò. H

And Italy, a land (I ſay) ſo happy and ſo bleſt,
Where ſtand the fields all hoare and gray with white Wheat of the beſt.

And in very truth our Italian wheat at this day carieth the name alone in that regard. I wonder therefore ſo much the more at the modern Greeks of late time, who made no mention at all of this our wheat. Now at this preſent, of all thoſe kinds of outlandiſh wheat which are tranſported by ſea into Italy, the lighteſt is that which commeth out of France and Cherſoneſus, [*i.* the ſtreits of Callipolis] for a Modius or peck thereof containeth not aboue 20 pound weight, weigh the very graine it ſelfe as it groweth, vncleanſed, huske and all. The Sardinian wheat is more weighty than it by halfe a pound in a Modius. And that of Alexandria exceedeth the I
* *i.* 4 ounces. French halfe a pound and * one third part, in euery meaſure before named. And this is the very poiſe alſo of the Sicilian wheat. The Bœotian is yet a full pound heauier: and that of Africk
* *i.* 9 ounces. as much, and * three fourth parts of a pound more. In Lombardy & that tract of Italy beyond the riuer Po, I know ful wel that a Modius of their wheat weighed 25 pounds; and about Cluſium 26. But be the corne whatſoeuer it will, this is the ordinarie proportion by the courſe of Nature, that being made into down-right houſhold bread for ſoldiers, and to ſerue the campe, it ought to weigh as much as it did in corne, and one third part ouer and aboue. As alſo this is a rule, That the beſt Wheat is that which to euerie Modius will take and drink vp a gallon of water ere it be made dough. And yet ſome kindes of Wheat there be that will yeeld the full weight aforeſaid in bread, and neuer count the water going thereto, & namely that which commeth out of the Balear Iſlands; for a Modius of that wheat yeeldeth in bread 30 pound weight: yet otherwhiles it falleth out in ſome kinds of wheat (being blended two ſorts together, as namely that of Cyprus and Alexandria, whereof neither exceed little or nothing more than 20 pound weight to the Modius) that the bread made thereof will ariſe to the ordinary proportion: for the Cyprian wheat is not bright, but brown and duskiſh, and therefore makes a blacke kind of bread; in which regard the Alexandrian wheat, which is faire and white, is mixed with it, and ſo both together do yeeld in bread 25 pound weight. The wheat of Thebes addeth a ſurpluſage thereto of one pound.

As for the maner of working and kneading dough, I like not their faſhions who take ſea water for that purpoſe, as moſt do that inhabit the ſea coaſts, thinking thereby to ſaue the charge of ſalt; for I hold this very hurtfull and dangerous. Neither doe I thinke, that vpon any other L
cauſe mens bodies are made more ſubiect to maladies, than by this means. In France & Spain,
* *Zythum & turmi.* when the Bruers haue ſteeped their wheat or frument in water, and maſht it for their * drink of diuers ſorts, as heretofore hath bin ſhewed; they take the * skum or froth that gathereth aloft
* Yeſt or barm by the working of the wort, and vſe the ſame in ſtead of leuen for to make their bread; which is the reaſon that their bread is lighter and more houved vp than any other.

Moreouer, there is great difference in wheat by reaſon of the ſtraw or ſtalk that bears it: for the thicker that it is and more full, the better is the corne taken to be. The Thracian wheat is incloſed and well clad (as it were) with many tunicles and coats; throughly prouided by that means (and good cauſe why) to reſiſt the exceſſiue cold of that climat; which gaue the Thracians iuſt occaſion alſo to caſt about and deuiſe to haue a kind of wheat that remaineth vpon the M
ground not aboue three moneths, by reaſon that the ſnow ouerſpreadeth the face of the earth all the yeare beſides: and verily this kinde of corne is come into other parts of the world, and lightly within three moneths after it is ſowed, you ſhall haue it readie to bee reaped. A practiſe

20030
copy 1

A &iſe well knowne all the Alpes ouer, and in other cold and winterly regions, where (by report of the inhabitants) this kind of corne doth wondrous well, and none proſpereth better or groweth more ranke than it. Ouer and beſides, there is another kind of wheat that putteth vp from euery root one ſtalk and no more in any place whatſoeuer: the manner is to ſow it in no ground but that which is light, and it neuer miſſeth. Alſo about the Thracian gulfe, there is wheat that within 40 daies after the ſowing, will be ripe, and therupon it is called the Two-month wheat. And would you heare a wonder? there is no wheat more weighty than it, and beſides it yeelds no branne at all. In Sicilie and Achaia both, there is great vſe thereof, and namely among the mountainers of thoſe two countries. Much ſeeking alſo there is after that corne in the Iſle Euboea, about Caryſtus. See how much *Columella* was deceiued, who thought that there was not to
B be found ſo much as any kind of three months wheat: whereas it is plaine, that ſuch hath beene of old and time out of mind. The Greeks alſo haue a proper name for it, and call it Trimenon. Furthermore, it is reported, that in the countrey Bactriana, there is ſome corne of that bignes, that euery graine is full as much as one of the eares of ours.

But to returne againe to our husbandry; of all ſpiked corne, Barley is ſowed firſt: but I purpoſe to ſet down the very juſt time and ſeaſon apropriat to each kind, according to the ſeueral nature of euery ſort, which my meaning alſo is to declare. Mean while I canot omit, that there is among the Indians, barley both ſowne and alſo wild, whereof they make the beſt bread that they haue. As for vs Italians (to ſay a truth) we ſet moſt ſtore by rice, wherof (being husked and cleanſed) we make grotes, like for all the world to thoſe which other men beſides doe make of
C barley husked. The leaues verily that this graine Rice doth beare, be pulpous and fleſhy, reſembling Porret or Leeks, but that they be broader: the ſtem groweth a cubit high, the floure is of purple colour, and the root round like a jem or pearle.

Barley [husked] was the moſt ancient meat in old time, as may appeare by the ordinarie cuſtome of the Athenians (according to the teſtimonie of *Menander*) as alſo by the addition or ſirname giuen to ſword-fencers, who vpon their allowance or penſion giuen them in barly, were called Hordearij, [*i.* Barley-men.] The ordinarie drie grout or meale alſo Polenta, which the Greeks ſo highly commend, was made of nothing els but of barley: and the preparing thereof was after ſundrie waies. The manner that the Greeks vſed, was firſt to ſteepe the barly in water, and giue it one nights drying; the morrow after they parched or fried it, and then ground it in
D a mill. Others there be, who (when it is well fried and parched hard) beſprinckle it once againe with a little water, and then dry it before it be ground. There are ſome again, who take the ears of barley when they are green, beat & driue the corn out, and while it is freſh and new, cleanſe it pure; which don, they infuſe it in water, and while it is wet, bray it in a mortar: then, they waſh it well in oſier paniers, and ſo let the water run from it; and beeing dried in the ſun, they pound or ſtamp it againe; and beeing throughly husked and cleanſed, grind it into meale as is aforeſaid. Now when it is thus prepared one way or other, to twenty pound of this barley they put of Line ſeed three pound, of Coriander ſeed halfe a pound, of ſalt about two * ounces and two drams: and after they haue pearched them all well, they blend them together and grind them in a quern. They that would haue this meale to keep long, put vp into new earthen veſſels al to-
E gether both floure and bran. But in Italy they neuer vſe to ſteep or ſoke it in water, but preſently parch it, and grind it ſmal into a fine meale, putting thereto the former ingredients, and the graine of Millet beſides.

* *Acet. Hilum.*

As for bread of Barley, ſo much vſed of our forefathers in old time, the poſterity that liued after, found to be naught and condemned it: in ſuch ſort, as they allowed it for prouender only to feed their beaſts and cattel with. But in ſtead therof came vp the vſe of * husked barly to be ſodden for grewell; ſo highly commended as a moſt nutritiue and ſtrong meat; and withal, paſſing wholeſome for mans bodie: inſomuch as *Hippocrates* (who for skill and knowledge was the prince of all Phyſicians) hath written one whole booke in the praiſes onely of it. Now the beſt Ptiſana or husked barley, is that which commeth from Vtica. As for that which wee haue from
F Ægypt, it is made of the flat barley which groweth vpon the eare in two ranks or ſides only. *Turannius* ſaith, That in the realms of Granade, Andaluſia, and Africk, the barley wherof the ſaid Ptiſane is made, is ſmooth and naked in the eare without eiles or beard at all. He alſo is of opinion, that Rice and the graine Olyra, are all one. The manner of preparing husked barley and making Ptiſana is ſo commonly knowne, that I need not to ſay a word thereof.

* *P. iſand.*

As

As for Tragum, it is a kind of Ptiſane, made of Wheat, after the ſame order that the former of Barley. Howbeit, there is none of it to be found but in Ægypt and Campaine. Touching Starch-floure called Amylum, it may be made of all kinds of wheat, and of the fine corne Siligo, *i.* Winter wheat: but the principall is that which they make of the three-month or ſummer wheat. We are beholden to the Iſland Chios for the inuention of Starch: and euen at this day, the very beſt is that which commeth from thence: called it is in Greek Amylum, becauſe it neuer came into the mill, nor was ground vpon ſtones. The next to it in goodneſſe, is made of a certaine Summer Wheat that is nothing ponderous and weightie. The way to make it, is to ſteep the wheat within certaine cooperie veſſels, made of wood, in freſh water ſo much as will couer it wel. But it would not be forgotten, that the water muſt be changed fiue times in a day: and if it were ſo ſerued alſo in the night, it would be the better, to that end, that beeing thus ſoaked and ſoftened, it might be well mixed and incorporated, yea, and reſolued (as it were) into a kind of paſt, before that it become ſoure and bitter. This beeing done, it muſt be laid to drie either vpon linnen cloths, or elſe in twiggen paniers, that the liquor which is therein may draine away: afterwards vpon tiles, beſmeared ouer with ſome leauen, it is poured forth to take the Sunne, to drie and harden againſt it. After the Chian Starch, that of Candie is moſt eſteemed and liked of: and laſtly, that which commeth out of Ægypt. The good Starch outht to be light, ſmooth, and euen, and withall, freſh made: for thoſe properties hath *Cato* ſet downe alreadie.

To returne againe vnto our Barley: the meale thereof is of great vſe here with vs in Phyſick. And that which more is, a ſtraunge effect it worketh in Horſes, Aſſes, and ſuch like labouring beaſts: for take Barley when it is dried and hardened at the fire, grind it to meale, reduce it into a paſte, and make thereof gobbets: let theſe be put downe by a mans hand into their bellie, after the manner of cramming Pullen, and you ſhall ſoone ſee, that this food and manner of feeding, ſhall make the beaſts more ſtrong and luſtie, and their fleſh more faſt and compact.

As for Barley eares, ſome there be which haue but two rankes or rewes: others againe haue more, euen to the number of ſixe. In the very graine alſo there is much difference: for there be many of them longer than other, lighter, ſhorter, rounder, whiter, blacker, and laſt of all, enclining to a reddiſh or purple color. This is the worſt of all others for to make drie Grout or Polenta: and as for the white, it is beſt for that purpoſe, but will not abide any tempeſtuous or hard weather. And to ſay a truth, of all corne, Barley is the ſofteſt and tendereſt, and will leaſt endure any hardneſſe: It would not be ſowed, but in a drie and fine ground, laid light, and brought into temper: howbeit, good it muſt be, and well in heart. The chaffe and pugs that come of Barly, is ſuppoſed to be as good as the beſt: but for ſtraw it hath no fellow, eſpecially to make litter of. Moreouer, in this regard, Barley of all other graine, is leaſt ſubject vnto blaſting, for lightly it is cut downe before Wheat is mieldeawed. And therefore it is, That the wiſer ſort of huſbandmen in the countrey, ſow no more Wheat than will ſerue for the prouiſion of their houſe only. Furthermore, they ſay, that Barley is ſowed with the rake, namely, when the mould lightly couereth it: and therefore it commeth vp ſooneſt, and bringeth moſt encreaſe and plentie. That which is gathered at Carthage in Spaine, within the moneth of Aprill, is ſowed the very ſame moneth in Celtiberia, ſo as in one yeare it yeeldeth two crops. It is no ſooner ripe, but they make greater haſt to cut it downe, and to inne it, than any other corne: for the ſtraw is very brittle, and the huske which contains the grain is as thin and ſmall. To conclude, it is thought to yeeld the better groats if it be taken whiles it is ſomwhat green, rather than if it ſhould haue the full ripeneſſe.

Chap. VIII.

¶ *That all kinds of Wheat or Fourmenty corne grow not indifferently in euerie place. Alſo, of other ſorts of corne in the Leuant or Eaſt countries.*

You ſhall not find in all places the ſame kinds of Wheat: and where you meet with the very ſame, yet they bear not one name, but haue ſundry appellations. The red bearded wheat named in Latin Far, and which in old time they called Adoreum; the winter wheat Siligo, and the

20030
copy 1

A the ordinarie white Fourmentie wheat Triticum, are the commoneſt of all others. And indeed theſe grow all in moſt countries. As for Arinca it loueth Gaule beſt, and that is the natiue and proper country for it. Howbeit there is plenty thereof in Italy alſo. As for Zea, Olyra, and Typhe, there be ſundry ſorts of wheat and Rie peculiar and appropriate to Ægypt, Syria, Silicia, Aſia, and Greece. The Egyptians make of their wheat a kind of floure or ſifted meale, but nothing comparable to the Italian. They that vſe Zea or Spelt haue not the fine red Wheat Far. And yet we are ſtored therewith in Italy, and moſt of all in Campain, where it is called by the generall name of Seed: which name no doubt was giuen vnto it for excellencie and ſingularitie, as ſhall be ſhewed anon more at large. This is the very grain for which *Homer* the poet called the earth, ζείδωρον ἄρουραν, *i.* yeelding the corn Zea: and not becauſe ſhe giueth life to all liuing
B creatures, as ſome would haue to be meant by that Epithete. Thereof is made alſo a kinde of ſtarch, but groſſer than the former, whereof we ſpake before: for no difference is there els. Of all kinds of wheat, Far (which is taken for the red bearded wheat) is moſt hardy, and beſt reſiſteth winter cold: it will wel abide the coldeſt ſoile that is, and that which is leaſt labored and tilled: it may endure alſo hot and dry places: it yeelded the firſt food and meat to our antient forefathers in Latium; as may appeare by this good argument, that publique preſents and rewards by way of remuneration were giuen of Far, which they called Adorea, as hath beene ſaid before. Moreouer, that the Romans for a long time liued of a kinde of batter or gruell made of meale ſod, and not of bread, is very euident by old records and Chronicles: for euen at this day ſuch thick gruels or pottage be called Pulmentaria in Latine. And *Ennius* a moſt antient poet,
C when he would expreſſe the famin of a city that had endured long ſiege, reporteth, that the parents took by force from their children their ſops, notwithſtanding they cried pitteouſly for very hunger. Moreouer, euen in our time wherein we liue, the ſacred and ceremonious feaſts by vs obſerued in memorial of our birth daies and natiuitie, ſtandeth much vpon furmenty, gruel, fritters, and pan-cakes. It ſeemeth alſo, that our gruels and ſuch like pottage were as much vnknown to Greeks, as their Polenta or dried groats were ſtrange to vs here in Italy. There is no corn more hungry and greedy of nouriſhment than Seed [wheat;] or that draweth more vertue and fat out of the earth for nutriment. As touching the winter grain, called in Latine Siligo, I may be bold to ſay, it is the daintieſt and moſt delicate wheat that is, for whiteneſſe, mildneſſe, and lightneſſe. It agreeth wel with moſt countries, ſuch as Italy is, and that part of Gaul cal-
D led Comata, *i.* Lumbardy Beyond the Alps alſo in Sauoy only, and the territorie of the Meninians, it will endure and hold the owne very well. Mary in other parts of that countrey, within two yeares it turneth into the common wheat. The only remedy therefore is, to chuſe forth the heauieſt and weightieſt cornes, and them to ſow.

Chap. IX.

¶ *Of Paſtry, of Grinding, and of Meale.*

THe beſt manchet bread for to ſerue the table, is made of the winter white Wheat Siligo, and the moſt excellent works of paſtrie likewiſe are wrought thereof. And yet in Italie
E it paſſeth all the reſt, in caſe that of Campain bee blended with another ſort which doth grow about Piſæ: for the Wheat of Campaine is redder, but this of Piſæ whiter: and more weighty it is, if it come from a chalky ground, or haue chalk mingled among. Moreouer, this is the ordinary proportion, that of the very pure corn of Campain wheat, which they cal guelded, *i.* wel husked and clenſed, a meaſure named Modius ſhould yeeld four Sextars or quarts of fine meale: but of the vulgar and common grain, which is not ſo guelded, 5 ſextars, and half a Modius beſides of bolted floure: and for a courſer houſhold bred, which they call the ſecond bread, 4 ſextars of meale, and as many of brans. Alſo of the Piſane wheat, one Modius ſhould yeeld fiue ſextares of good meale, and the reſt equall to the former. As for the Cluſine and Aretine wheat, in euery Modius it anſwereth again ſix ſextars of meale, that is to ſay, one more than the
F reſt: otherwiſe they be all alike. Now if you liſt to range and boult it for cork flower to make bread, ye ſhall haue of manchet 16 pound, of courſe houſhold bread three, and halfe a Modius of brans. But this proportion doth not alwaies hold, for it altreth according to the good or bad grinding vpon the mill: for that which is ground dry rendereth againe more meale: but if it be wet or beſprinckled with ſalt water, it maketh the fairer meale, and fuller of fine flower: and

then ſhall ye haue more go away in brans. As for the word Farina in Latine, *i.* meale, it is deriued of Far, which in old time was the beſt & fineſt red wheat, as may appeare by the very name that it carieth. Finally, a Modius of meale comming of the French Siligo, called Blancheen, or Ble-blanch, maketh in bread 22 pound weight: but of our Italian, 3 or 4 pound more in bread pan-baked: for what corn ſoeuer it be, there muſt be allowance of two pound vantage ouer and aboue, for ouen-baked bread. G

Chap. X.

¶ *Of the meale called Similago: of the white flower Siligo. Of other ſorts of Meale. and of the maner of baking.*

H

THe beſt meale of that kind, which they call in Latine Similago, is made of the common wheat. If the corne come out of Africk, it yeeldeth ordinarily for euery Modius, half ſo much in ordinarie meale, and fiue ſextars beſides of flower called Pollen: [for that is the Latine tearme which they vſe in the fineſt of the common wheat Triticum, proportionable to that which in the other winter wheat Siligo, they call Flos. And great vſe herof there is in copper-ſmiths forges, and in work-houſes where paper is made.] Ouer and beſides, of courſer grodgeons for brown bread foure ſextars, and as much of brans. Moreouer, the ordinarie proportion goeth thus, that of one Modius of the fine meale Similago, there ſhould be made 122 loues of bread: & that a Modius of the pure flower of Siligo ſhould yeeld 117. As touching the price, thus it goeth commonly in the market one yere with another, when corn is at a reaſonable and indifferent rate: A Modius of down-right meale is worth *40 Aſſes: but if the meale be ſifted and ranged from the groſſe brans vntill it be Similago, it will coſt eight Aſſes more: and if it be boulted yet finer to the nature of the fine flower Siligo, the ouer-deale in the price wil be double. Another diſtinction or difference there was known of this proportion, when a Modius comming of wheat of Similago, was ſeen to anſwer 17 pound in bread: and as much of Wheat flower called Pollen, thirtie pound and foure ounces: beſides, for ſecond houſhold bread, two pound and a halfe; and of the courſeſt or browneſt as many, and ſix Sextars ouer and aboue of brans. I

*i. 2 ſh. 6 d.

But to return to our winter white wheat called Siligo, it neuer ripens kindly & all together, as other corn doth: and for that it is ſo tender and tickliſh, as that no corn wil leſſe abide delay and tarry on worſe, great heed muſt be taken thereof; for ſo ſoone as any is ripe, preſently the ſeed ſheds and falls out of the eare. Howbeit, leſſe danger is it ſubiect vnto whiles it ſtandeth in the field, than other kindes of wheat, for it beareth alwaies an vpright ſpike or eare: neither wil it hold and retain that mildew which blaſteth corn ſo much, and turneth it into black pouder. As for that kind of corn which they call Arinca, it maketh the ſweeteſt bread: the grain it ſelfe is more faſt & ful than the fine red wheat Far, it carieth a bigger eare, and is beſides more ponderous and weighty. Seldom is it ſeen, that a Modius of this grain maketh full 16 pound. In Greece they haue much ado with it, to threſh it cleane and falter it from the huls and eiles. For which cauſe *Homer* ſaith, that they were wont to giue it as prouender to horſes, and ſuch labouring garrons; and the very ſame it is which he calleth Olyra. Howbeit this corn in Ægypt goeth out eaſily vnder the flaile, is better to grind, and withal yeeldeth better, and is more fruitfull. The Red-wheat called Far is polled wheat [in Ægypt] and carieth no beard or eiles about it. So is the white winter Wheat Siligo, ſaue onely that which is named Laconica. To theſe may be adioyned other kinds alſo, to wit, * Bromos, the poll wheat Siligo, (differing from all the other of that name) and Tragos: ſtrangers all brought from the Levant or Eaſt parts, and reſembling Rice euerie one. Typhe likewiſe is of the ſame kind, whereof in Italy and this part of the world is made that husked corne which goeth among vs for Rice, for it turneth into it. The Greeks haue a kind of wheat called Zea or Spelt: & it is commonly ſaid, that both it and Typhæ (conſidering that they vſe to degenerate and proue baſtard) will turne to their kinde again, and become wheat, if they be husked before a man ſow them: howbeit this change will not be ſeen preſently, nor before the third yeare. As touching our common wheat, there is no grain more fruitfull than it: this gift hath Nature endued it withall, becauſe ſhe meant thereby to nouriſh mankinde moſt; for one Modius thereof ſowne, if the ſoile be good and agreeable thereto (ſuch as lieth about Bizacium, the champian countrey of Africke) will yeeld an hundred K L M

Some take it for a kinde of Barley, or rather Oats.

20030
copy 1

A hundred and fiftie fold againe. The procurator generall of that prouince vnder *Auguſtus Ceſar* ſent from thence vnto him one plant thereof (a wondrous thing and incredible to be reported) which had little vnder 400 ſtraws ſpringing from one grain & meeting all in one and the ſame root, as it appeareth vpon records by the letters ſent, teſtifying no leſſe. Likewiſe to the Emperour *Nero* he ſent 340 ſtrawes out of the ſame country, riſing all from one onely corne. But to goe no farther than to Sicilie; within the territorie about Leontium, there haue beene certaine fields knowne, wherein one graine putteth forth no fewer than a hundred ſtalks with ears vpon them: and not there onely, but alſo in many other parts of that Iſland. And this is ordinarie throughout all the kingdome of Granade, and Andaluſia in Spaine. But aboue all, the land of Ægypt may make boaſt in rendring ſuch intereſt to the husbandmen. Moreouer, of all thoſe
B kinds of wheat which are ſo plentiful, there is principal account made of that which branches; as alſo of another which men call Centigranum, *i.* the wheat that beareth 100 graines.

To leaue this kind of graine, and to come to Pulſe: there hath been found in Italie, and goe no farther, one beane ſtalke laden with an hundred beanes. Touching Summer corne, to wit, Seſama, Millet, and Panicke, we haue alreadie ſpoken. As for Seſama, it commeth from the Indians, whereof they make a certaine kind of oile. The color of this graine is white. Like vnto it there is another grain called Eryſinum, which is rife in Aſia & Greece: and I would ſay it were the very ſame, that with vs in Latine is named Irio, but that it is more oileous and fatty; and indeed to be counted a medicinable or Phyſicall plant, rather than a kind of corne. Of the ſame nature, is that which the Greekes call Hormium: it reſembleth Cumin, aed is vſually ſowed
C with Seſama: howbeit no beaſt will eat thereof while it is greene, no more than they do of Irio aforeſaid.

To come now to the manner of husking and cleanſing of corne: the feat is not ſo eaſily done in all, as in ſome; for in Tuſcane, they take the eares of their red wheat called Far, when they be parched and dried at the fire, they pound or bray them with a peſtill headed at the nether end with yron, or els fiſtulous and hollow within, yet bound about with a hoop or ring of yron, and the ſame withinforth toothed in manner of a ſtar; ſo as if they be not heedfull in the ſtamping, the yron-work at the peſtill end will either cut the cornes in two, or elſe bruiſe and break them clean. In Italy (for the moſt part) they vſe a reed or plain peſtill, not headed with yron, to huske and dreſſe their corn; or els certain wheeles that are turned and driuen apace with water, which
D going very ſwift doe alſo grind the ſaid corne. But ſince we are fallen into this treatiſe concerning husking and grinding of corn, it ſhall not be amiſſe for to ſet down the opinion and reſolution of *Mago* in this behalfe: Firſt, for common wheat he giueth order, that it be well ſteeped and ſoked in good ſtore of water; afterwards, to be rid from the hulls and eiles that it hath, in a mortar: which done, it ought to be dried in the ſunne, and followed a ſecond time with a peſtil. In like maner (ſaith he) ſhould barley be vſed: howbeit, two Sextars or quarts of water will be ſufficient to beſprinckle and wet twentie Sextars of barly. As for Lentils, he would haue them firſt parched and dried, and then lightly punned or ſtamped together with brans; or els to put vnto twentie Sextars thereof, a fragment or peece of a broken ſemeld brick, and half a Modius or peck of ſand. Eruile would be cleanſed or husked as Lentils be: but Seſama, after it hath bin
E infuſed or ſoked in hot water, he ſaith, ought to be laid abroad a ſunning; then to be rubbed hard together; and afterwards to be put into cold water and therewith couered, ſo as the huls or chaffes do flote and ſwim aloft: which done, to be laid forth a ſecond time in the ſun vpon linnen clothes, for to drie. Now if all this be not don one thing after another and diſpatched with the more ſpeed and haſt, it wil ſoone vinew or catch a mouldineſſe, and beſides loſe the bright natiue hew, and looke wan and of a leaden colour. Now, ſay that corn be cleanſed and husked, ſome one way and ſome another, it is ground afterwards in diuers ſorts. If the ears be bolted by themſelues alone for goldſmiths worke, the chaffe comming thereof is called in Latine, Acus; but if it be threſhed and beaten vpon a paued floor, eare, ſtraw, and al together (as in moſt parts of the world they vſe to doe, for to fodder cattell and to giue in prouender to horſes, then it is
F tearmed Palea: but the refuſe or chaffe remaining after that Panick or Seſama be clenſed, they call in Latine Appluda, howſoeuer in other countries it be otherwiſe named.

To ſpeake more particularly of Millet, there is great ſtore thereof in Campaine, and there they ſet much by it, for of it they make a kind of white grewel or pottage: alſo the bread thereof is paſſing ſauorie and ſweet. The Tartarians alſo & nations in Sarmatia, feed moſt of this water

gruell made with Millet: as alſo with the crude and raw meale thereof vnſodden and vnbaked G
tempered with mares milk, or els with horſe-bloud that runneth out of their maſter leg-vains, by way of inciſion made for the purpoſe with the phleame. As for the Æthiopians, they know no other corne but Millet and Barley. Panicke is eaten in ſome parts of Gaule, and principally in Aquitane or Guien: in Piemont alſo, and all about the Po, it is a great feeding, ſo there bee beanes among; for without beans they canot skill how to dreſſe any thing for their daily food. The regions that confine vpon the Euxin ſea or Pontus, haue no daintier meat than that which is made of Panick. To conclude, all Summer corn abouenamed, delight more ro grow in moiſt and watery grounds, than to be wet with ſhowres and raine from aboue. And yet I muſt needs ſay, that Millet and Panick care leaſt for water or moiſture, when they begin to put forth their blade. Laſt of all, there is no good husbandman but wil forbid to ſow Millet and Panick either H
in vineyards, or among trees that beare fruit; being perſuaded, that the ſowing thereof doth eat out the heart of the ground.

Chap. XI.

¶ Of Leuains: the manner of making bread: ſundrie kinds of bread: about what time Bakers were firſt knowne at Rome: of Sieues and Serces, of Rangers and Bulters. Laſt of all, of the Frumentie called Alica.

THe meale of Millet is ſingular good for Leuains, if it be wrought and incorporat in new wine, for ſo it may be kept a whole yeare. The like is made of the better brans of wheat, ſo I
they be ſmall, fat, and not to neer raunged; and the ſame be kneaded in new white wine of three daies old, and then dried in the ſunne. Hereof is made a dough or paſt, and the ſame is reduced into certain round cakes or Troſches to ſerue for the making of bread; for theſe muſt be ſoked and diſſolued in hot water with the floure of the corn Zea, and therein be ſodden, which don, they vſe to mingle it with the meale and floure to make paſt of, which they hold to be the beſt way of making bread. The Greeks haue ſet down this proportion, allowing to euery pecke or Modius of Meale, 8 ounces of leuaine; and this they thinke to be ſufficient. Now theſe kinds of leuains verily canot be made, but only in time of vintage. But if a man would make leuaines at any other time, he may take of barly meal tempred with water ſo much as it may be brought into a paſt; and when there be certain lumps or cakes herof made, weighing two pound apeece, K
they muſt be baked either vpon the hearth vnder hot embres, or els in an earthen pan ouer the coles, vntill ſuch time as they looke brown and red withal. Afterwards they be put vp cloſe couered in pots or ſuch like veſſels, & there remain vntil they wax ſower. Now when a man would vſe leuain, herof he taketh what he will, and diſſolueth it as is aforeſaid. In old time when they made barley bread, they vſed no other leuain for it but only the meale of Eruile or Cich peaſe; and ordinarie it was, to take two pound thereof for * two peckes and an halfe of meale: but now adaies the order of our huſwiues is, to make leuaines of the very ſame meale which is kneaded and wrought into dough, before ſalt be put therto, which they ſeeth tothe conſiſtence of a pulp or thicke batter, and ſo let it lie vntill it become ſowre. And yet commonly they doe not boile their leuains but only reſerue ſome of the paſt or dough, wherof they make their bread the day L
before. As tonching the nature of Leuain, certain it is that it proceeded of ſoureneſſe, like as it is generally held, that they be ſtronger of bodie who feed of leuained bread: for in old time it was verily thought, that of the weightieſt and heauieſt kind of wheat, there was made the holeſomeſt bread.

* *quinque ſedecos.*

Concerning the ſundrie ſorts of bread that is made, it ſeemeth a needleſſe peece of work to ſet them down euery one in particular: for ſometimes bread taketh the name of the meats and viands that be eaten therewith: as for example, Oiſter-bread, ſo called for that it was good with oiſters: otherwhiles it bears the name of ſome daintie cates, as Artologanus, [*i.* pancake, fritter, or fine cake bread.] As for the bread called Speuſticus, [*i.* Haſtie] it is ſo called, becauſe it was made in haſt. The manner alſo of the baking giueth denomination to ſome bread; as to Furnaceus panis, which was made in a furnace; to Artoptitius, made in a baking-pan called Artopta: M
as alſo to that which was baked in an ouen. Not long ſince alſo there was a new deuice of making bread brought out of Parthia, which becauſe the paſt is drawne through water (and yet a ſpungious, light, and hollow ſubſtance it carries) they call water-bread, and giue it the denomi-

nation

20030
copy 1

A nation of Parthicke bread. But howſoeuer it be, the beſt bread is of the fineſt wheat floure, that hath paſſed through a ſmal tamis bulter. Some countries there be, that knead their dough with milke or egs; others alſo put butter thereto: but thoſe be ſuch nations as are not troubled with wars, ſince that they can haue while to ſet their minds on ſundry ſorts of paſtry. The Picenes in times paſt inuented away by themſelues of making bread, with the very matter or ſubſtance of the frumentie Alica; and ſurely that deuiſe holdeth ſtil and is much vſed. The manner thereof is this: They take the ſaid frumentie paſt and ſteep it in water nine daies; on the tenth day they work or knead it with the juice of Raiſons, to the faſhion of the Parthick cake driuen thin and broad, after this they put it into earthen pots, ſet them in ouens for to frie & bake, that the ſaid pots may there breake in ſunder: and beeing thus hard baked, it is not to be eaten vnleſſe it be
B ſoked in ſome lipuor, which ordinarily is milke, or mead eſpecially.

There were no Bakers known at Rome for the ſpace of 580 yeres after the foundation of the citie, vntill the Perſian warre. Before that time euery Roman citizen had his owne bread baked at home, and womens work commonly it was, like as at this day it is in moſt countries: for this appeareth by *Plautus*, who in his Comœdy entituled Aulularia, maketh mention of * Artopta, a baking pan [which men haue vſually in their houſes:] and hereupon is growne much diſpute and controuerſie betweene learned men about this Queſtion. Whether that verſe were of that Poets making or no? for certain it is (acording to the opinion of *A. Atteius Capito*) that at ſuch mens bourds as kept great houſes and delicate fare, there was no other bread eaten but ſuch as Cookes were wont to make them, after the maner of ſimnels: for Piſtores were thoſe only then
C called, who husked and cleanſed the bearded red wheat named in Latin Far; and others Bakers than they, were there none. Neither had the Romane citizens in ordinarie, any Cookes as their houſhold ſeruants, but hired them out of the market whenſoeuer they had any meat to dreſſe.

* *Ego hanc Artoptam ex proximo vtendam puto.*

Diuers ſorts of ſieues and bulters there be. The Sarce made of horſe haire, was a deuiſe of the Frenchmen: the tamis raunger for courſe bread, as alſo the fine floure boulter for manchet, (made both of linnen cloth) the Spaniards inuented. In Ægypt they made them of Papyr reed and ruſhes. But now that we are entred ſo far into this matter as touching corne, I thinke it not amiſſe before I proceed any farther, to ſpeak (with the firſt) of the frumentie called Alica, and the manner thereof being (as it is) ſo excellent and wholſome to be eaten; and which, no doubt, throughout all Italy, bears the name for the very beſt of all corne whatſoeuer. No queſtion, but
D there is made thereof in Ægypt; howbeit nothing to the other. In Italy, many places there be where it is to be had, as namely in the territories of Verona and Piſæ: but that of Campain carieth the price and praiſe aboue all the reſt: a champion or plaine countrey this is, for the ſpace of forty miles lying as a vale vnder the hils and mountaines, ſubject to watery clouds and tempeſtuous winds. The ſoile of this whole tract (to ſpeake directly of the nature thereof and defer no longer) is light and duſtie, if a man reſpect the vpper coat thereof, but vnderneath it drinks in much moiſture, whereunto apt it is by reaſon of certain fiſtulous poroſities therin, like a pumiſh ſtone: in which regard, the mountaines commanding theſe plaines (ill neighbors otherwhiles) do it much good and mend the ſoile very well; for many a ſound ſhowre, which ordinarie falleth from the hills) paſſeth and runneth through it, as it were a colander; by means wher-
E of, the ground ſtandeth not drenched and ſoked with water, but is thereby more pliable & eaſie to be tilled. Now this ſoile hauing thus receiued ſtore of water, doth not yeeld it vp again boiling out at any ſprings, but keepeth and cheriſheth it ſtill within, as it were the radical and nutritiue humor, concocting the ſame to a very good temperature. All the yere long a man ſhall ſee it ſown and ſtanding with corn, one or other; for the ſame ground bears one crop of Panick. and two of the red wheat Far: it neuer reſteth but beareth ſomwhat: for ſay that ſome lands lye fallow betweeen-while, and are not ſowed with corn; they yeeld roſes in the ſpring of themſelues naturally, and thoſe far ſweeter than the garden roſes: ſo fruitful is it and canot abide to be idle and do nothing. Herupon aroſe the prouerb of this land of Campaine, *That greater ſtore is there to be found of ſweet perfumes and odoriferous ointments, than of ſimple oyle in other countries whatſoeuer.*
F And looke how much this tract of Campaine ſurpaſſeth all other lands in goodneſſe and fertility, ſo much excelleth one quarter therof (called in Latin Laboriæ, and by the Greeks Phlegræum) all the reſt, and goeth beyond it ſelfe. This plain aforeſaid named Laboriæ, is confined on both ſides with the great cauſeis or high waies raiſed by the Conſuls, and thereupon called Conſulares; the one goeth from Puteoli, the other from Cumes, and lead both to Capua.

But to come againe vnto our Frumentie Alica, made it is of the graine Zea, which before we tearmed by the generall name of Seed. This corne for to make Frumenty, is to be pound in a wodden morter, when it ſhould be cleanſed from the huske: for if a man beat in one of ſtone, the hardneſſe thereof would bruiſe and breake it. The beſt way of cleanſing and husking it, is with a peſtill, ſuch as bond ſlaues and priſoners do vſe to ſtamp withall, and to work by task for their puniſhment: in the forepart therof it hath a circle of yron, made in faſhion of a round Box: wherewith after the corne is drawn naked out of the husk, the very ſame inſtrument ſerueth again to ſtamp and bruiſe the white marrow and floure thereof within. And thus by this means there be three ſorts of Alica or Fourmentie aforeſaid. The fineſt, which is the beſt: the meane, which is the ſecond: and the greateſt or groſſeſt, which the Greekes call Aphærema. G

When all this is done, yet haue they not that whiteneſſe of their owne, for which cauſe they are ſo much eſteemd; as namely, thoſe that are come nowadays from Alexandria, which are taken to be the beſt and to excell all other. And therfore there is chalk (a wonderfull thing to be ſpoken) mingled afterwards and incorporate therwith, and ſo by that means the Frumenty becomes white and tender withall. Now this chalke or plaſtre is found between Puteoli and Naples, in a little hill which thereupon is called Leuco-gæon, [*i.* white earth.] And in truth when *Auguſtus Cæſar*, late Emperor of Rome, erected a colonie at Capua, and peopled it with Roman citizens, he aſſigned vnto the Neapolitanes (by vertue of a decree, now extant) an yerely rent or penſion of twentie thouſand deniers to be paid out of his owne treaſure, in regard of the chalk which came from the hill aforeſaid, being within their territorie and ſiegnorie. He rendereth alſo a reaſon inducing him thus to do, Becauſe the inhabitants of Capua, alleadged, that they could not make good Alica or Frumenty without that mineral of chalke. In the ſame hil there is alſo found a Brimſtone mine, and out of the veines thereof, fountaines ſpringing, called Oraxi, the water whereof is ſingular good to cleer the eies, to cure and heale green wounds, and to faſten the teeth that are looſe in ones head. H I

As touching a baſtard kind of Frumenty, it is made verily for the moſt part of a Speltor Zea in Affrick, which there doth degenerat and grow out of kind. The ears that it carieth, are broader and blacker than the other, and the ſtraw is but ſhort. They vſe to cleanſe and huske it by ſtamping or braying it together with ſand, and for all that deuiſe, much ado they haue to fetch off the huls and huskes wherein the graine lieth encloſed: now when it is thus cleanſed and naked, it is not paſt halfe as much in meaſure as it was before. Which done, there is a fourth part of plaſtre ſtrewed & mingled among: and when al is together, they ſift it down through a meal ſieue. That which remaineth behind and paſſeth not through, is the groſſeſt part thereof, and is called in Latine Exceptitia. That which was thus ſearced, is driuen againe through a narrower and finer ſieue, and thoſe groats that tarie in the ranger, the call Secundaria. In like manner doe they a third time, ſearcing it through ſo fine a ſieue, that nothing can paſſe but the very ſmall ſand and pouder: and this laſt kind of Frumenty gurts they name Cribraria. Another way there is beſides in all places practiſed, to ſophiſticat, and counterfeit the right Frumenty groats indeed: They chuſe out of our common Wheat, the faireſt, fulleſt, and whiteſt grains, which beeing half ſodden in an earthen pot, they lay out afterwards in the Sun, till they be as drie as they were at firſt: which don, they lightly ſprinckle ſome water ouer, & then bruiſe them in a quearn mill. Fairer Frumentie groats be made of Zea than of Wheat, and called it is Granum or Granatum, although in Alica that be counted a fault. To conclude, they that wil not vſe chalk, do blanch and make their Frumentie white by ſeething milke with it, and mingling all together. K L

Chap. XII.

¶ *Of Pulſe.*

IT followeth now to write of the nature of Pulſe, among which, Beanes do challenge the firſt ranke and principall place: for thereof men haue aſſaied to make bread. The meale of Beans is called in Latine Lomentum. There is not a Pulſe weigheth more than it, and Beane meale makes euery thing heauier wherin it is. Now adaies they vſe to ſel it for prouender to feed horſes. And indeed Beanes are dreſſed and vſed many waies, not only to ſerue all kind of four-footed beaſts, but alſo for man eſpecially. For in moſt countries it is mingled with Frumentie corn: and namely with Pannicke moſt of all, whole and entire as it is: but the more delicat and M

daintie

20030
copy 1

A daintie way is to break and bruiſe it firſt. Moreo uer, by ancient rites and religious ceremonies, at the ſolemn ſacrifice called Fabraria, the maner was to offer vnto certain gods and goddeſſes Beane cakes. This was taken for a ſtrong food, being eaten with a thick grewel or pottage; howbeit, men thought that it dulled a mans ſences and vnderſtanding, yea, and cauſed troubleſome dreames in the night. In regard of which inconueniences, *Pythagoras* expreſſely forbad to eat Beanes: but as ſome haue thought and taught, it was becauſe folke imagined, that the ſoules of ſuch as were departed, had reſidence therein: which is the reaſon alſo, that they be ordinarily vſed and eaten at the funerals and obſequies of the dead. *Varro* alſo affirmeth, That the great Prieſt or Sacrificer called the Flamine, abſtains from Beanes both in thoſe reſpects aforeſaid, as alſo for that there are to be ſeen in the floure thereof certain letters or characters that ſhew-
B heauines and ſigns of death. Further, there was obſerued in old time a religious ceremonie in Beanes: for when they had ſown their grounds, their maner was, of all other corne to bring back with them out of the fieldes ſome Beanes: for good luck ſake; preſaging thereby, that their corne would returne home again vnto them; and theſe Beanes thereupon were called in Latine Refriuæ, or Referiuæ. Likewiſe in all port-ſales it was thought, that if Beanes were entermingled with the goods offered to be ſold, they would be luckie and gainefull to the ſeller. This is cerataine, that of all the fruits of the earth, this only will be full and ſound when the Moone is croiſant, notwithſtanding it were gnawne and halfe eaten with ſome thing before. Set them ouer the fire in a pan with ſea water or any other that is ſaltiſh, they will neuer be thoroughly ſodden. They are ſet or ſowne before the retrait of the Starre Vergiliæ, [*i.* the Brood-hen] the
C firſt of al other Pulſe, becauſe they might take root betimes and preuent the Winter. And yet * *Virgill* would haue them to be put into the ground in the Spring: like as the manner is in Piemont and Lombardie, all about the riuer Po.

**Vere fabis ſatis. Georg. lib. 1.*

But the greater part of good Husbandmen are of this opinion, That the ſtalke or ſtraw of Beanes ſowne early or ſet betimes, are better than the very fruit it ſelfe, which hath had but three months being in the ground. For the cods and ſtalks only of Beans are paſſing good fodder and forage for cattell. Beanes when they are blouming, and in their floure deſire moſt of al to be refreſhed with good ſtore of rain: but after they haue don flouring, they care for little: the ſowing of this Pulſe in any ground, is as good as a mucking vnto it, for it enriches it mightily. And therefore towards Macedonie and about Theſſalie, the manner is when Beanes begin to
D bloſſom, for to turne them into the ground with the plough. Beans come vp and grow in moſt places, of their owne accord without ſowing; and namely, in certaine Iſlands lying within the Northern ocean, which our countrymen therupon haue named Fabariæ. Semblably, they grow wild commonly thoroughout Mauritania, but exceeding hard and tough they be, and ſuch as poſſibly canot be ſodden tender. There are likewiſe in Ægypt to be found Beanes, with a ſtalk beſet full of prickles or thornes: which is the cauſe that Crocodiles wil not come neer them, for feare of hurting their eyes. The ſtemme of theſe Beanes is foure cubites in height, but exceeding thicke and big withall: tender it is notwithſtanding, and ſoft, running vp euen and ſmooth without any knots or joints at al, it caries a head in the top like Chesboule or Poppy, of a roſe red color: wherin are contained not aboue 30 Beanes at the moſt. The leaues be large: the fruit
E it ſelfe (or the Bean) is bitter in taſt, and the ſmel not pleaſant: howbeit the root is a moſt dainty meat, which the inhabitants do eat as wel raw as ſodden; and like it is to reed & cane roots. Theſe grow in Syria and Cylicia, as alſo about the lake Torone, within Chalcis.

Much like to the prouerbe here in England, *March Ote ſtraw is better than Aprill Otes.*

As touching other Pulſe, Lentils be ſown in Nouember, and ſo are Peaſe, but in Greece only. Lentils loue a light ground better than a fat & heauie: they like alſo drie and faire weather. Two kinds thereof be found in Ægypt: the one more round and blacke than the other; the reſt be faſhioned as common Lentils. According to the manifold vſe and diuers effects of Lentils, there haue ſundrie names and denominations beene borrowed from them: for I find in writers, that the eating of Lentils maketh men to be mild and patient, whereupon they be called Lenti and Lenes. As for Peaſe, it ought to be ſowed in warm places lying well vpon the Sunne: for
F of all things it cannot abide the cold. Which is the cauſe, that in Italie and in other countries where the clime is tough and hard, they are not ſowne vſually but in the Spring, and folke chuſe a gentle, light, and looſe ground.

To come now to the Cich peaſe, the nature of it is to be nitrous and ſaltiſh, and therefore it burneth the ground where it grows. Neither muſt it be ſowne, vnleſſe it were well ſteeped and

ſoked in water the day before: many ſorts there be of theſe cich-peaſe, different in bignes, form, colour, and taſt: for there are both blacke and white, and thoſe in faſhion ſhaped like to a Rams head, and therupon they are ſo called. There is a ſecond kind named Columbinum, or by others Venerium. Theſe are white, round, light, leſſe than the former Rams-head ciches, which men do eat ceremoniouſly with great religion, when they meane to watch thoroughly all night long. There is a little cich peaſe alſo, called Cicercula, made cornered and otherwiſe vneuen, like vnto a Peaſe. But the beſt ciches and moſt pleaſant are thoſe that come neereſt in reſemblance to the Eruile: and generally the red kind and the black are more firm and faſt than the white: cich peaſe grow within round cods, whereas other Pulſe he contained in long and flat, according to the forme and figure of the ſeed which they hold: Peaſe by themſelues haue a long round cod in forme of a Cylinder. G H

The Pulſe called Phaſeoli, [*i.* Kidney Beans] vſe to be eaten cod and al together. Theſe may be ſet or ſowne in what ground you liſt, from the Ides of October to the Calends of Nouember. Finally, all kinds of Pulſe, ſo ſoone as they begin to ripen, are to be gathered or plucked haſtily: for ſtay neuer ſo little, they leape out of their cods, and ſhed, and being once fallen, they lie hidden in the ground, like as the Lupine alſo.

Chap. XIII.

¶ *Of Rapes or Neuewes of Amiternium Turneps.*

NOw let vs proceed and paſſe to other matters: and yet in this diſcourſe, it were meet to write ſomwhat as touching Rapes or Nauews. The Latin writers, our countreymen, haue ſlightly paſſed by and touched them only by the way. The Greeks haue treated of them ſomwhat more diligently, and yet among pot-hearbes and worts growing in gardens; whereas indeed according to good order they would be ſpoken of immediatly after Corne, or Beanes at leaſt wiſe, conſidering there is not a plant of more or better vſe than is the Rape or Nauew. Firſt and formoſt, they grow not only for beaſts of the earth and the Foules of the aire, but alſo for men. For all kinds of Pullen about a Farme-houſe in the countrey, doe feed vpon the ſeed thereof as much as of any thing elſe, eſpecially if they be boiled firſt in water. As for four-footed beaſts, they eat the leaues thereof with great delight, and wax fat therewith. Laſt of al, men alſo take as great pleaſure and delight in eating the leaues and heads of Rapes or Nauewes in their ſeaſon, as they do of young Coly-flories, Cabbages, or any tender crops of hearbs whatſoeuer; yea, when they are faded, flaggie, and dead in the Barn, they are eſteemed better, than being freſh and green. As for Rapes or Nauewes, they will keep long and laſt al Winter, both within the ground where they grew: and being well wintered, they will continue afterwards out of the earth lying abroad euen almoſt till new come: ſo as they yeeld men great comfort to withſtand hunger and famin. In Piemont, Lombardie, & thoſe countries beyond the Po, the people make the moſt account of gaine by gathering Rapes, next to wine vintage and corne harueſt. It is not choiſe and daintie, of the ground where it will grow: for lightly it wil proſper where nothing els can be ſowed. In foggy miſts, hard froſts, and other cold weather, it thriues paſſing wel, and grows to a wonderfull bignes. I haue ſeene one of their roots weigh aboue fortie pounds. As touching the handling and dreſſing of them for our table, there be many waies and deuiſes to commend and ſet them out. Preſerued they may be till new come, ſpecially condite with ſharp and biting Senuie or Muſtard ſeed. Moreouer, our Cooks know how to giue them ſix other colours beſides their owne which is pure and naturall; they haue the caſt to ſet euen a purple hew vpon them. And to ſay a truth, there is no kind of viands beſides that, being thus painted & colored, hath the like grace. The Greeke writers haue diuided them by the ſexe, and therby made two principal kinds therof, to wit, the male and the female. Nay, more than that, out of one and the ſame ſeed, according as it is ſowed, they can make male or female, whether they pleaſe. For if they ſow thicke, and chuſe therto a hard and churliſh ground, it will proue of the male kind. Alſo, the ſmaller that the ſeed is, the better it is eſteemed. But of al Rapes male or female, three eſpeciall ſorts there be & no more. For ſome roots ſpread flat and broad, others are knit round like a ball; the third ſort that runs downe into the ground with a long root in manner of a Raddiſh, they cal the wild Rape or Nauew: this bears a rough leaſe and ful of angles or corners; the iuice that it yeelds is ſharp, hote, and biting, which being gathered in harueſt time & reſerued, I K L M

mundi-

20030
copy 1

A mundifieth the eies,and cleareth the ſight,eſpecially being tempered with breſt-milke. If the weather be cold,they are thought not only to thriue in bigneſſe of the root, but alſo to prooue the ſweeter,whereas contrariwiſe in a warm ſeaſon they run vp all to ſtalke and leafe. The beſt ſimply are thoſe that grow in the Nurſine territory. For they are ſold by the weight: and euery pound is worth a Roman Seſterce,yea,and otherwhiles twaine,if there be any ſcarcity of them. Next to theſe in goodnes be thoſe that come out of Algidum. Thus much of Rapes & Navews

As for the Turneps of Amiternum, they be in a manner of the ſame nature that the Rapes aforeſaid,& cold they loue as well. Sown they are before the Calends of March;& foure quarts of their ſeed will take vp a whole acre of ground. The beſt Husbandmen, and ſuch as are more exquiſite in their practiſe of Agriculture,giue order,That the ground for Turneps ſhould haue
B fiue tilthes,whereas Rapes or Nauewes are content with foure: but both the one and the other had need of a ſoile well inriched with dung or compoſt. By their ſayings alſo,Rapes will proſper the better and come vp thicker,if they be ſowed in their huls,chaffe and all together. Moreouer, they would haue the ſeeds-man to be naked when he ſowes them,and in ſowing to proteſt, that this which he doth is for himſelfe and his neighbors,and withall to pray as he goeth. The proper ſeaſon for the ſeedneſſe of them both, is between the feaſts of the two gods; to wit, *Neptune* and *Vulcan*.

To conclude,there is a ſubtill and curious obſeruation that many go by and do hold, namely this,To marke how many daies old the Moon was,when the firſt ſnow fel the winter next before;for if a man do ſow Rapes or Turneps,within the foreſaid compaſſe of that time,the moon
C being ſo many daies old,they will come to be wondrous great, and increaſe exceedingly. Men vſe to ſow them alſo in the Spring:but then they make choiſe of moiſt and hot grounds.

Chap. XIIII.

¶ *Of Lupines.*

AFter Rapes and Turneps, the Lupines haue greateſt vſe, and ſerue to be raunged next: for that they indifferently ſerue both men and alſo all foure footed beaſts that be houſed, either whole or clouen. Now for that the ſtalke is very ſhittle in mowing, and therefore flyeth from the edge of the ſyth, the onely remedie therefore (that the mower may catch it) is to
D goe to worke preſently after a good ſhower. And verily there is not a plant growing vpon the earth (I meane of ſuch as are ſowne of ſeed) more admirable than the Lupine, in regard of the great amity and ſympathie betweene the earth and it. Looke how the Sun keepeth his courſe in our Horizon aboue,ſo doth it turne and go withall;inſomuch as the Husbandmen of the countrey go by no other clocke to know how the day paſſeth,in cloſe and cloudie weather,than this obſeruation. Moreouer,it hath three ſeaſons of blowming: it loueth the earth well,but yet willingly it would not be couered ouer with mould: for this is the onely ſeed that is ſowne vpon ground without any ploughing or digging: it would grow to chuſe,in a moſt grauelly,drie,and ſandy ſoile,and in no caſe can it abide any tending or husbandry about it:ſo affected is it to the earth,that caſt it vpon any rough ground,among buſhes,leaues, briers and brambles,it will chit
E and ſpurt neuertheleſſe,& neuer lin til it take root within the earth. If Lupines be ſowed either in vineyards or vpon corne lands, they inrich the ſame and make the ground better, as we haue before written: and ſo little need haue they of dung,that they ſtand in ſtead of the very beſt. To ſay a truth,there is no graine leſſe chargeable to be ſowne, than it; nay there is none coſteth nought at all,but it;for it needeth not ſo much as to be brought into the field:and why? it ſoweth it ſelfe preſently in the ſame field where it grew: and ſhedding as it doth of the own accord, a man neuer needs to caſt and throw it vpon the land,as other corne. It is firſt ſowne,and laſt gathered: and lightly both theſe ſeaſons fall out in the moneth of September,for if the Seed-nes preuent not the winter,ſo as it may haue good root before it commeth, it will be in danger of the cold. Ouer and beſides,if it chance to lie bare and vncouered aboue-ground, left careleſſely
F without any keeping, and that no raine come vpon it preſently for to driue it into the ground, it is ſafe enough and catcheth no harme; for ſo bitter it is,that no liuing creature will touch it: and yet for the moſt part the husbandmen beſtow a light furrow vpon it, and ſo couer it verie ſhallow. If the ground be faſt and heauie, it loueth that beſt which ſtandeth vpon a red clay. And for the maintaining and inriching of this kind of ſoile, it muſt be turned vp or eared

after

after the third flouring;but in caſe it be grauelly or ſandy,it wil ſerue to do it after the ſecond. G
Chalkie grounds onely and myrie it hateth,and therein it wil not grow. As bitter as otherwiſe it is,yet if it be ſteeped and ſoked in hot water,it is mans meat alſo. Moreouer,one Modius,or pecke of Lupines is ſufficient for to ſatisfie and feed an Oxe or a cow at a time:and this kind of prouender will make beaſts ſtrong and healthfull. Moreouer, the meale of Lupines applied to the bellies of yong children that haue the wormes,is a ſingular remedy. For the good keeping of Lupines,all men agree that they ſhould be laid vp in ſome chimney or ſmokie place eſpecially;for if they lie in a moiſt roome,there be certain little worms that wil nibble off and eat the tip or nauill that it hath,and by that meanes marre it for euer ſprouting againe. Finally, if Lupines be eaten downe by beaſts,while they be greene in the leafe, the ground where they grew muſt preſently be ploughed vp. H

Chap. XV.

¶ *Of Vetches and Eruile.*

VEtches alſo do manure and fat the ground where they be ſowed;neither be they chargeable or ſtand the husbandman in much:they be ſown with one tilth;otherwiſe there needs no harrowing nor weeding: there is required no mucking; onely they would be couered with mould and the clods broken;for ſowing of vetches,there be three ſundry times;firſt,about the ſetting of the ſtar Arcturus,that by the moneth of December it may get a good head for to be eaten with beaſts;and it is generally holden,that being ſowne in this ſeaſon,it will bring the I
beſt ſeed;for ſay it be eaten downe then,it will carry the burden neuertheleſſe:the ſecond Seedneſſe is in Ianuarie: the laſt in March;and being then put into the ground,it will run vp moſt to blade, and yeeld the beſt forrage for cattell. Of all ſeeds that are caſt into the earth, it loueth drought moſt: it can brooke alſo ſhadie places well enough. The chaffe that commeth of the ſeed thereof,is excellent good;and better than any other,in caſe it were ripe when it was gathered. It robbeth vines of their nouriſhment,if it be ſowed neere thoſe trees wherto vines are wedded;inſomuch as a man may ſee euidently how they languiſh.

As touching Eruile,it asketh no great hand or trauell about it: yet thus much more attendance it requireth than Vetches,for that it muſt be weeded and grubbed about the roots. Beſides,this kind of Pulſe is of great vſe in Phyſick;for *Auguſtus Cæſar* was cured of a diſeaſe that K
he had,and recouered his health by the means of Eruile, as himſelfe reporteth in ſome of his letters now extant. Moreouer, fiue Modij or pecks of Eruile ſown, is ſufficient to maintain and find a yoke of oxen. As for that which is ſowne in March,it is hurtfull forage(men ſay)for kine and oxen:as alſo that which is ſowne in Autumne,maketh beaſts heauie and ſtuffed in the head: but that which is put into the ground in the beginning of the Spring is harmleſſe.

Chap. XVI.

¶ *Of Fœnigreeke: of Rie: of Dredge: of the prouender corne or Bolimong Ocymum: of Spaniſh Trefoile or horned Clauer-graſſe,called in Latine Medica: of the ſhrub Trifoile,named Cytiſus.* L

FOr the ſowing of Silicia or Siliqua,otherwiſe called Fœnigreeke, there needs no more but to ſcarrifie or ſcrape it lightly vp with a furrow not aboue foure fingers breadth deepe; for the leſſe coſt and husbandry that is beſtowed about it,and the worſe that it is vſed, the better it proſpereth and yeeldeth greater increaſe: a ſtrange thing to be ſpoken and ſeldom verified,*That Negligence ſhould be any waies profitable*;and yet herein it prooueth true. That which is called Secale and Farrago in Latine,(*i.*Rie)needeth no more adoe but to be harrowed & the clods well broken. There is a kinde of Secale or Rie, which the people called Taurines dwelling vnder the Alpes doe call Aſia: it is ſimply worſt of all other, and good for nothing but onely to driue away hunger:plentifull enough this corne is and yeeldeth good increaſe, but the ſtraw is ſlender:blacke it is and of an vnpleaſant colour, howbeit exceeding weightie and ponderous: M
they vſe to mingle the red wheat Far therewith,and make thereof a Maſcelline,to allay the bitterneſſe thereof;and yet for all that,the bread which it maketh is moſt vnſauorie to the mouth and ill for the ſtomack. It wil come vp in any ground whatſoeuer,and bring forth a hundred fold

ordina-

20030
copy 1

A ordinarily; neither doth it eat the ground out of heart, but rather maketh it more battle, and ſerueth in ſtead of compoſt or mucke.

As for that kind of dredge or farrage which commeth of the refuſe and light corne purged from the red wheat Far, it ought to be ſowne very thicke, with Vetches otherwhiles mingled among. In Africke, the ſame mixture is made of Barley. All theſe are good onely for prouender and beaſts forage: as alſo a baſtard kind of Vetches called * Cracca, which pigeons loue ſo well, that if they be fed once therewith, they will neuer leaue the place where they taſted it, nor flie far from thence. In time paſt our anceſtors had a kind of fodder or prouender, which *Cato* called Ocymum, wherewith they *vſed to ſtay the gurrie in kine and oxen. This forrage was made of *beane ſtalks cut downe greene as it ſtood before it was iointed and codded. But *Sura Manlius*

B taketh this dredge to be another thing, ſaying, that in old time they vſed to put vnto ten Modij of beanes, two of Vetches, and as many of Eruile, and ſo were wont to blend al together and ſow them in an acre of ground at the fal of the leafe; and (ſaith he) it would be the better balimong if there were ſome Greek Otes mingled withall, ſuch as neuer ſhed the ſeed out of the haw: this manner of dredge was called vſually Ocymum, and was woont to be ſowne for a kind of forrage to ſerue kine and Oxen. *Varro* ſaith, that it tooke that name becauſe it commeth vp ſo ſpeedily as being deriued from the Greeke word ὠκὺς, which ſignifieth, Quicke, or Swift.

As for the graſſe or herbe Medica (a kind of Clauer or Trefoile) the Greekes held it in old time for a meere ſtranger, as being brought into Greece from Media during the Perſian warres, which king *Darius* leuied againſt Greece: howbeit, an excellent Simple it is, and worthie to be

C written of in the firſt place. And to begin withal, this ſingular property it hath, That with once ſowing, it continueth aboue thirty yeares without any need of renewing. Like it is to Clauer or three leaued graſſe, both in leafe and ſtalke, but that the ſtemme is parted by knots and ioints. Moreouer, as it riſeth higher and runneth vp in the ſtalke, the leaues grow narrower: of this herb alone and of Cytiſus, *Amphilochus* compiled one whole book; howbeit, he wrote of them both confuſedly. The ground wherein it is to be ſowed, after it is well rid of ſtones and clenſed, muſt be broken vp and well tilled in the fall of the leafe. Soone after it needeth to haue another fallow and be harrowed withall, and then couered with hardles: this would be done two or three times (fiue daies between) and therewith it ought to be throughly dunged. This herb requireth a ſound dry ground, and yet ſuch as is full of ſucculent moiſture within, or elſe where water is

D neere at hand to command. The ground being thus prepared, ought to be ſowed in the moneth of May following, for otherwiſe the froſt would take it and marre all. Moreouer, requiſite it is, that it be ſowed very thick, ſo as euery place be taken vp therewith, thereby to exclude all other weeds and giue them no roome there to grow. To this effect therefore euery acre will take 20 Modij or pecks of ſeed. But take heed withall, that it be not burnt ſo ſoon as it is put into the ground, & therfore immediatly it muſt be couered with mould. If the ſoile be moiſt and giuen to bear other graſſe, the ſeed is ſoon ouergrown and choked, and then al wil run to graſſe, & turn to be a medow: which graſſe or coich when you ſee begin to ouerrun the ground, it muſt be all weeded out preſently an inch deepe within the ground, and by hand rather than any weeding-hooke or thiſtle ſpade. Now, when this hearbe Medica or Clauer graſſe begins once to floure

E cut it down: and ſo oftenas it floureth againe, downe with it. Thus you may haue ſix mathes in one yere or four at the leaſt. You muſt neuer let it ſpindle and beare ſeed: for better is it to take it thus in the growth, while it is but young and greene graſſe, for three yeares together: and the forrage or fodder is moſt profitable. Sowne (I ſay) it muſt be in the Spring, and weeded for the firſt three yeares. The green ſourd afterwards ought to be pared away with hookes and ſpades cloſe to the ground: for by this meanes you ſhall be ſure, that all other weeds will die, and this hearbe take no harme by it, for that by this time it is deepely rooted. If the weeds do get head and ouercome it, the onely remedie is by the plough, to turne vp the ground ouer and ouer ſo many times, vntill all other roots be killed. Moreouer, heed muſt be taken, that of this herbage or fodder, beaſts do not eat their fil; for feare you be driuen of neceſſitie to let them bloud, and

F take downe their rankeneſſe The greener that it is, the more profit commeth thereof, for it drieth branch after branch, vntil at length it will crumble like duſt or powder, and then is it good for nothing.

As touching Cytiſus, [*i.* the Shrub Trifolie] which is a ſingular kind of paſturage, & paſſes al the reſt, I haue written at ful in my diſcourſe of ſhrubs. For now at this preſent I am to proſecute

* Or rather *Arachos*

* *Siſebant Varro* ſaith *Citabant*, which is clean contrarie.

* *Fabali ſegete antiquam generet.*

cure and goe through the treatiſe of other ſorts of corne and their nature, if I had once written ſomewhat in one part thereof as touching the accidents and imperfections that happen among them. G

Chap. XVII.

¶ *The faults incident to corne, and their remedies. Alſo what corne is reſpectiue to this or that ſoile, for to be ſowne therein.*

THe firſt and principall defect obſerued in bread-corne, and Wheat eſpecially, is when it doth degenerate and turne into Otes: and not only it, but Barley alſo doth the like. Semblably, Otes otherwhiles ſerue the turne in ſtead of bread corne: as wee may ſee in ſome countries of Almaine, where they do vſually ſow it, and commonly they haue no other pottage there, than Oatmeale gruell [which they call Abremouz.] The foreſaid defect and imperfection is occaſioned chiefely by the moiſt ſoile or ouerwet weather. Another cauſe there followeth alſo thereupon, proceeding from the feebleneſſe and weakneſſe of the ſeed; namely, when it lieth long ſobbing in the ground, before it come vp: and hereto may be referred the faultines of the ſeed otherwiſe; namely, if it were worm-eaten or otherwiſe rotten at the time of ſowing: and verily, no ſooner appeareth it aboue ground, but the foreſaid change or baſtardie may be ſeene, whereby it doth appeare, that the cauſe is in the root. H

A ſecond defect or imperfection there is alſo incident to corn, which hath ſome neer reſemblance to the Otes aforeſaid; namely, when the graine being formed and newly come to the iuſt proportion of bigneſſe (howbeit, not yet full and ripe) before that it is firm and hard, is ſmitten with a noiſome blaſt, and ſo, like an abortiue fruit, decaieth and windereth away within the eare in ſuch ſort, as there is no ſubſtance left therein, but appeareth void and emptie. Now theſe aduerſe and malignant winds hurt all ſpiked corne, as well Wheat as Barly, at three ſeueral times, to wit, in their floure; preſently vpon their blooming, and laſt of all, when they begin to ripen; for then, namely when they are vpon the point of maturitie, thoſe blaſts conſume the grain, and bring it to nothing, which before was full: whereas at the two former ſeaſons they hinder it altogether from knitting and growing. The hot gleames moreouer of the Sun, betweene often clouding, do much harme to corne. I

Furthermore, there be certaine little wormes breeding in the root, that do eat it: which happeneth by occaſion of much raine falling immediatly after the ſeednesſe, eſpecially, when ſome ſudden heat and drowth enſueth therupon; which bindeth the earth aboue and ſo encloſeth the moiſture conceiued within, the very cauſe & nourice of putrifaction. Ye ſhall haue other ſuch like vermin engender likewiſe in the very grain of the corn, namely, when the ear doth glow within, and is chafed with ſultry hot rains. Ouer and beſides, there be certain [green] flies like ſmall Beetles, called Cantharides, which do gnaw and eat the corne. But al theſe, and ſuch like worms or flies die preſently, when the corn (which was their food) is gone. Moreouer, Oile, Pitch, and Tarre, all manner of greace alſo, be contrarie to ſeed-corne eſpecially; and therefore take heed that you ſow none ſuch as hath caught oile, pitch, or greaſe. As for ſhowers of raine, good they are for corne, ſo long only as it is in the green blade: when corne is blooming, be it either wheat or barley, or ſuch like) raine is hurtfull. Mary Pulſe takes no harme thereby, vnleſſe it be the Cich-peaſe. K L

All kinds of wheat and other bread corne, when they be toward ripeneſſe, catch hurt by ſhowers, but Barley more than any. Beſides all this, there is a certaine white hearbe or weed reſembling Panicke, growing among corne, and ouerſpreading whole fields; which not onely hindereth corne, but alſo killeth all the cattell that feedeth thereupon. For as touching ray or darnel, burs, thiſtles, and brambles, I may hold and reckon them, not ſo much for faults and imperfections of corn, as rather the plagues and infections proceeding from the very earth. And for blaſting, which commeth of ſome diſtemperature of the aire (a miſchiefe common as well to corn, as vines) it is as hurtful as any other malady whatſoeuer. This vnhappie blaſt falleth moſt often in places ſubiect to miſts and dewes, and namely, hollow vallies and low grounds lying vnder the winde: for contrariwiſe, windie quarters, and ſuch as are mounted high, are not ſubiect to this inconuenience. Alſo we may number among the faults incident to corne, their rankeneſſe; namely, when the blade is ſo ouergrowne, and the ſtalke ſo charged and loden with a heauie head that the corn ſtandeth not vpright, but is lodged & lieth along. Moreouer, when there fals M

a great

20030
copy 1

A a great glut of rain, inſomuch as the ground ſtands with water, there befalleth vnto all corn and pulſe, yea, and what ſoeuer is ſowne, a certaine diſeaſe called in Latine Vrica; inſomuch, as the very Cich-peaſe taketh hurt therby; for by reaſon that the rain waſhed from them that ſalt quality which was naturall thereunto, it becommeth ſweeter than it ſhould be, and loſeth the kind taſt. There is a weed that claſpeth and tieth about Ciches and Eruiles, wherby it choketh and killeth them both: and thereupon it is called Orobanctum, *i.* Choke Eruile. After the ſame maner dealeth * Ray or Darnel by wheat; wild Otes likewiſe, named by ſome Ægilops, with barly; as alſo the weed Securidaca, *i.* Ax-fitch, which the Greeks alſo (for the reſemblance that it hath to an axe head) call Pelicinon, * with Lentils. Theſe weeds (I ſay) kill corne by winding about it. Another herb there is, growing neere to the city Philippi, which killeth Beans: if the ground be fat and good, they name the ſaid weed Ateramnon; but if it be found in a hungry and leane B ſoile, and namely, when being wet, ſome vnhappy wind bloweth vpon it, they call it Teramnon. As for the graine of Raie or Darnell, it is very ſmall, and lieth incloſed with a ſharpe-pointed huſk. The bread which hath any of this ſeed in it, ſoone cauſeth dizineſſe and ſwimming of the head. And (by report) in Aſia and Greece the maſters of the common Bains and Stuphes, when they would keep away the great reſort of multitude thither, haue a deuiſe to caſt Darnell ſeeds vpon burning coles, for this perfume will quickly ſet them farther off. Moreouer, if the Winter proue to be wet and wateriſh, ye ſhall haue in the Pulſe called Eruile, a little vermin ingendred there called Phalangion, and it is of the kind of theſe ſpiders. Likewiſe vpon Vetches there wil breed naked dew-ſnails, yea, & otherwhile thoſe little ones with ſhels or houſes on their backs, which creeping from the ground, wil gnaw & eat them, that it is a wonder to ſee what foul work C they will make. Thus much concerning all the maladies and inconueniences (to ſpeak of) incident to corne. It remaineth now to treat of the remedies.

As touching the cure of thoſe harms that come by hurtful weeds to the corn in blade, it conſiſteth principally in two things: namely, either in the vſe of the weeding knife or hooke, when they be newly come vp; or els in ſtrewing aſhes when the corn is a ſowing. But as for thoſe dangers that touch the ſeed or grain in the eare and cod, as alſo that ſettle about the root, they muſt be preuented by good forecaſt, euen before it be thrown into the ground. It is generaly thought that if ſeed-corn lie ſteeped beforehand in Wine, it will be better able afterwards to reſiſt all diſeaſes whatſoeuer. *Virgil* giueth order to infuſe or ſoke the Beanes that muſt be ſown, in nitre D and oile lees or dregs; and he aſſureth vs, that they will proſper mightily beſides, and become exceeding great. But others are of opinion, that if for 3 daies before they be caſt into the earth they lie in vrine & ſhere water mingled together, they wil, being thus prepared come on apace, and thriue paſſing well. It is ſaid moreouer, That if Beans be thrice raked and rid from weedes, one Modius of them being whole and ſolid, wil yeeld a Modius again after it is husked & broken. As for other ſeed-corn, it wil eſcape the danger of the worme, if either it lie before among Cypreſſe leaues bruiſed; or be ſowed in and about the change of the Moon, namely, when ſhe is not to be ſeen aboue the earth in our hemiſphære. Many there be who practiſe other remedies: & namely for the Millet, they would haue a toad to be caried round about the field before that it be harrowed: which done, to be put cloſe within an earthen pot, and ſo buried in the middeſt E of the ſaid field: and by this meanes forſooth, neither Sparrows will lie vpon the corn, nor any worm hurt it. Mary, in any caſe this ſame toad muſt be digged out of the ground againe before the field be mowed, els will the Millet proue bitter in taſt. The like experiment they ſay is of a Moldwarps ſhoulder, for if any corn be ſowed or touched therewith before, it will come vp the better and bring more increaſe. *Democritus* had a deuiſe by himſelfe for all ſeed & corn whatſoeuer, namely, to temper & ſoke the ſame corn in the iuice of the herb houſleeke or Sen-greene, growing vpon houſes either tiled or ſhindled; which in Greeke is called Aizoon, and in Latine Sedum or Digitellum; for this medicine will ſerue for all maladies. The common practiſe of our husbandmen is this: in caſe through the ouerſweet ſap or juice in greene corne, wormes take to the roots: for to ſprinkle them with ſimple oile lees pure and clean without any ſalt, & afterF wards to rake it in. Alſo, when the corn begins to ioint and gathet into knots, then to clenſe the ground, and put off no longer, for feare leaſt the weeds do get head & ouergrow. This I am ſure vpon mine owne knowledge, that there is an herbe (but what proper name it hath I wote not) which if it be interred in the foure corners of a field that is ſown with Millet, it wil driue away Stares and Sparrows, which otherwiſe would by whole flights and flocks lie thereupon and do much

* ἀεγίλωψ, but more truly ἀραῖλον, out of *Theophraſtus*. Thus *Plinie* miſtaketh in many places: and for example, immediatly in the word *Ateramnos*, which is appropriate to all Pulſe that require much ſeething or be hard of digeſtion. *Theophraſt. c. 12. & 14. l. 4. de plant.*

much harme; nay I will ſpeake a greater word and which may ſeeme wonderfull, There is not a G
bird of the aire one or other, that dare enter or approch ſuch a field. Field-mice and Rats are
skared away and will not touch corne, which before the ſowing was either beſtrewed with the
aſhes of weaſels or cats, or els drenched with the liquor and decoction of water wherein they
were boiled; howbeit this inconuenience inſueth hereupon, That bread made of ſuch corn will
haue a ſmach, and ſent ſtrongly of ſuch cats and Weaſels: and therefore it is ſuppoſed a more
expedient and ſafer way to medicine our ſeed corne with oxe gall, for to preſerue it from the
ſaid Mice and Rats. But what remedy againſt the blaſt and mildew, the greateſt plague that can
befall vpon corn? Mary prick downe certaine Lawrell boughes here and there among the ſtan-
ding corne, all the ſaid miſts and mildewes will leaue the corne and paſſe to the Bay leaues, and
there ſettle. What ſhall we do then to corne when it is ouer-rank? Eat it me downe with ſheep H
and ſpare not, whiles it is young and in the blade onely, before (I ſay) it be knotted: and neuer
feare harm by the ſheeps teeth as neere as they go to the ground: for let it be thus eaten many
times, the corn will be the better, yea and the head will take no harme thereby but prooue the
fairer. If ſuch rank corne be once cut down with the ſyth, & no more, certain it is that the grain
in the eare will be the longer to ſee to, howbeit void and without any floure within it; for ſow
ſuch ſeed again, & it wil neuer grow nor come vp. And yet about Babylon, the maner is to mow
it twiſe firſt, and the third time to put in ſheep to it for to eat it down; otherwiſe the corn would
neuer ſpindle, but blade ſtill, and run all to leafe. But being thus cut and cut again, and eaten in
* *Fœlicitas ſoli* the end, ye ſhall haue it to increaſe and multiply 50 for one, * ſo fertile is the ſoile: and if the
owner be a good husband beſides, and vſe the ground accordingly, he ſhall reap thrice as much, I
euen a 150 ſold. And what carefull diligence is that which is here required? Surely neither
much, nor difficult: only he muſt be ſure to keep the ground well with watering for a long time
together, to the end that it may be diſcharged of the ouermuch fat within it, which by this
means will be waſhed all away, and the rankneſſe delaied. Yet as rich and fertile as this ſoile is,
the two riuers Euphrates and Tigris (which vſe to ouerflow and water the country) bring no ſli-
my mud with them, as Nilus doth in Egypt, wherby the ground is made ſo fat as it is: neither is
the nature of the earth there, giuen to breed herbs that it ſhould need any weeding: and yet ſo
plenteous and fruitfull it is, that it ſoweth it ſelfe againſt the next yere; for the corne that ſhed-
deth in the reaping and mowing, being troden vnder foot into the ground, is as good as a ſow-
ing, and riſeth of it ſelfe without any further labor. K

Seeing then there is ſo great difference in the ſoile, I am put in minde thereby to fit euery
ground with ſeed reſpectiuely, according to the nature and goodneſſe thereof. This therfore is
the opinion of *Cato*, that in a groſſe and fat ſoile, there would be wheat and ſuch like hard corne
ſown; and if the ſame be ſubiect alſo to miſts and dews, there may be ſown therein raddiſh, mil-
let, and Panick, muſt be ſowne firſt in a cold and wateriſh ground; and afterwards for change in
a hot ſoile. *Item*, the red bearded wheat Far or Adoreum, requireth a chalkie and ſandy ground,
and namely if it be well watered. *Item*, the common wheat loueth a drie ſoile, expoſed to the
Sun, and not giuen much to breed ſuperfluous weeds. *Item*, Beanes will doe well in a ſound and
faſt ſoile. As for Vetches, they care not how little they be ſowed in a moiſt piece of ground, and
ſuch as is apt to run to graſſe. Moreouer, for the fine winter wheat Siligo, whereof the beſt man- L
chet is made, and alſo for the common frumenty wheat, there would be choſen an open & high
ground, lying pleaſantly vpon the Sunne, that it might haue the heat thereof to parch it as long
and as much as is poſſible. As for Lentils, they doe like a good rough and ſhrubbie ſoile, full of
* οἱ τῷ δὲ σπλῷ σπείρω δ' ὁ κύριλ. *Plutarch.* red earth, ſo as it be not apt quickly to gather a green-ſord. * Barly would gladly grow vpon a re-
ſtie ground new broken vp, or elſe ſuch as be in heart to beare euery yeare. And as for Summer
(barley) of three moneths, it would be ſowne in a ground where it could not haue an earely or
timely Seednes, & which is ſo fat and rich, as it may affoord to beare crop, yere by yere: finally,
to ſpeak to the purpoſe indeed, this alſo is *Catoes* witty reſolution in one word for all: if the ſoile
be light and lean, ſeed it with ſuch grain or forage ſeed, as require no great nouriſhment, as for
example, with Cytiſus; and excepting the Cich-peaſe, with all pulſe that are vſed to be plucked M
out of the earth, and not mowed downe: and thereupon indeed are theſe pulſe called in Latine
Legumina, becauſe they are plucked and gathered in that ſort: but in caſe the ground be good
and fat, ſow ſuch things as require fuller food and nutriment; and namely, all garden worts and
pot-herbes; wheat, both the common and the fine; and Linſeed. Then, according to this rule, a

leane

20030
copy 1

A leane and hungry ſoile will well agree with barly, for the root is contented with leſſe nutriture: wheras contrariwiſe we allow both lighter, and alſo more maſſie and richer ground for our ordinary wheat. In a low and wet piece of ground, it is good to ſow the red wheat Adoreum, rather than the common wheat Triticum: but both it and barley will ſort well with a ſoile of a middle temperature. The hills yeeld a firm, faſt, and ſtrong kind of wheat, but the grain is but ſmal. And to conclude, the beſt kinds of wheat, to wit, Far and Siligo, challenge for their lot to bee ſeated in a chalky ſoile, and therwith alwaies wet and ſoked in water.

Chap. XVIII.

B ¶ *Of ſtrange prodigies and wonders obſerued in corne: the knowledge and skill of earing and tilling the ground: alſo diuers ſorts of plough-ſhares.*

ALbeit I haue in the title of this chapter purpoſed to write of prodigies ſeen in corne, yet to my knowledge, there neuer happened but once the like wonder and portenteous ſight to this which I ſhall tell, and which befell in the time that *P. Ælius* and *Cn. Cornelius* were Conſuls of Rome, that very yeare wherein *Annibal* with his whole armie was defeated and vanquiſhed: for then (by report) there was corne grew vpon trees.

But foraſmuch as I haue diſcourſed at large of the ſundry kinds as well of corn as of ground, I will proceed now forward and come to the manner of ploughing the earth, after I haue firſt ſet downe before all things els, how eaſie the husbandrie is in Egypt: for there the riuer Nilus ſeruing in ſtead of a good ploughman, beginneth to ſwel and ouerflow (aswe haue before rehearſed) at the firſt new Moone after the Summer Sunſtead. Hee beginneth faire and ſoftly, and ſo
C increaſeth more and more by little and little; but all the while that the Sun paſſeth vnder the ſigne Leo, he higheth apace vntill he be riſen to his ful heigth: being entered once into Virgo, his fury ſlaketh, then decreaſeth he as faſt, vntill hee be fallen againe into his wonted channell, which ordinarily happeneth by the time that the Sun is in Libra. Now this is obſerued, That if he riſe not plumb aboue 12 cubits high, the people are ſure to haue a famine of corn that yere: the like alſo do they make account of, in caſe he paſſe the gage of ſixteen cubits: for the higher that he is riſen, the longer it is again ere he be fully fallen, by which time the Seedneſſe is paſt, and men cannot ſow the ground in due ſeaſon. It hath bin generally receiued for a truth, That
D preſently vpon the departure of this deluge and ouerflowing of Nilus, they were woont to caſt their ſeed-corne vpon the floten ground, and preſently let in their ſwine after for to trample it with their feet into the earth whiles it was ſoft and drenched. And verily, for mine owne part, I beleeue wel, they vſed ſo to do in old time: for euen now adaies alſo, much more ado they make not about it. Howbeit, this is certaine, that firſt they caſt their ſeed vpon the ſlime and mud ſo ſoone as the riuer is downe, which commonly falleth out in the very beginning of Nouember: which done, they go ouer it with the plough and giue it a light tilth, ſo as it may be couered only and lie vnder a ſmall furrow. Some few there be that afterwards fall a weeding, which point of husbandry they call Botaniſmos: but the moſt part, after they haue once ſowed and turned their ſeed into the ground, neuer after make a ſtep into field to ſee how their corne groweth, vn-
E til they go once for all with ſyth on neck or ſickle in hand, namely at the end of March; for then they fall to reaping and cutting it downe; ſo as by the moneth of May they ſing in Egypt, Harueſt in, and all is done for that yeare. As touching this corne gathered in Baſe Egypt, the ſtraw is neuer a cubit long: the reaſon is, becauſe the ſeed lieth very ebbe, and hath no other nutriment than from the mud and ſlime aforeſaid; for vnder it is nothing but ſand and grauell. But thoſe that inhabit higher vp into the countrey, namely about Thebais, they be far better prouided for corne, becauſe Egypt indeed (for the moſt part) lyeth low vpon marais ground. Toward Babylon likewiſe and Seleucia (where the riuers Euphrates and Tigris doe ſwell ouer their banks and water the country) the ſame husbandry is practiſed, but to better effect and greater profit, by reaſon that the people may let in the water at ſluces and floud-gates, more or leſſe
F with their owne hands, according as they liſt themſelues. Alſo in Syria, they haue their ſmall ploughs for the nones to take a ſhallow ſtitch and make light worke: whereas in many places here with vs in Italy, eight oxen are little enough to euery plough, and to go away withall they muſt labor at it till they blow and pant again. It is an old ſaid Saw, and may goe for an Oracle to be practiſed in all parts of husbandry, but in this point of ploughing eſpecially, *Bee ruled by*

the nature of euery countrey, and see what each ground will abide. To come now vnto our ploughes. Of Shares, there be many sorts: first, there is that instrument called a culter, which serueth to make way before, cutting and cleauing the hard and thick ground as it goeth, before it be broken vp and turned atone side: this sheweth by the slits and incisions that it maketh (as it were by a true line drawn) how the furrows shal go; after which commeth the broad bit of the ploughshare indeed, lying flat-wise, and in earing casteth vp all before it, and cleareth the furrow. A second sort there is, commonly vsed in many places, and it is no more but a bar of yron pointed sharpe in manner of a beak-head or stem of a ship; and it may be called a Rostle. And when the ground is not stubborn but gentle to be wrought, there is a third kind vsed, which is nothing but a piece of yron not reaching all ouer the* plough head and shooing it to the full, but turning vp like a snout with a small point sharp at the end. This neb is somewhat broader in a fourth kinde of shares, but as it is broader in blade and trenchant withall, so it is sharper also at the end; insomuch, that both with the point forward & the edges of the sides, it not only pierces the ground before it poinctant like a sword, but also cutteth the roots of weeds which it incountreth: a deuise inuented not long since in Rhœtia. As for the Gaules, they set too besides, certain small roundles or wheels; & a plough thus shod & harnaised, they call in their language * Planarati: the head of their share is broad, fashioned like vnto the bit of a spade: and thus they sow their grounds for the most part, new broken vp and not tilled nor eared before. And for that their plough-shares be large and broad, so much the easier turn they vp good turfs of earth and make broad furrows. Presently after the plough, they throw in their seed, and mould or couer it afterwards with yron-toothed harrows drawn aloft. Lands in this manner sown, need no other raking or weeding; for commonly they make not past two or three bouts in a land, and as many ridges. Finally it is thought, that in this manner there may be sown in one yere by the help of one yoke of oxen, 40 arpens or acres of land ordinarily, if the ground be gentle and easie to be eared; but if it be stiffe and stubborne, they shall haue worke enough to go through thirty.

* *Dentali.*

* or as some think, *Plugradi.*

G H I

Chap. XIX.

¶ *The seasons that be proper for tilling the ground: also the manner of coupling oxen in yoke.*

IN this operation of ploughing ground, I am of mind to follow that Oracle or Aphorisme of *Cato*, who being asked which was the first and principall point of Agriculture, answered thus, *Euen to husband, order, and tend ground well*: being demanded againe, what was the second, hee made answer, *To plough well.* And when the question was propounded concerning the third point of husbandry, he said, *That it consisted in manuring and dunging it well.* There be other necessarie rules besides, set downe by him as touching this matter; namely, Make no vnequall furrowes in ploughing, but lay them alike with one and the same plough. Passe not the kindly season, but eare the ground in due time. In the warmer countries, lands would be broken vp and fallowes made, immediatly after the Winter Solstice or Sun-stead. In colder regions, touch them not before the spring Æquinox or Mid-march. In a drie quarter, plough more early than in a moist: sooner also in a fast and compact soile, than in a loose and light ground: in a fat and rich field, than in a leane and poore land. Looke in what climat the Summer is ordinarily drie and hot, it is thought more profitable to eare vp a chalky or a light and leane ground, between the Summer Sunstead and the Æquinoctiall in the fall of the leafe. If the climat be such as yeeldeth but little heat in Summer, and therewith many showers of raine, where the soile also is fat and beareth a thick green-sourd, it were better to break vp ground and fallow in the hotest season: where the soile is heauie, grosse, and fat, and wherein a man may tread deepe, I like well that it should be tilled and stirred in winter: but in case it be very light and drie withall, it would not be medled with but a little before *seednes. Here also be other proper rules set down by *Cato*, pertinent to Agriculture: Touch not (qd. he) in any hand a piece of ground that soon will turne to dust and mire. When thou doest plough indeed for to sow, imploy thy whole strength thereto: but before thou take a deep stitch for all, giue it a pin-fallow before; this commodity commeth therof, that by turning vp the turfe with the bottom vpward, the roots of weeds are killed. Some are of this opinion, that how soeuer we do els, a ground should haue the first breaking vp about the spring equinox: a land that thus hath bin once plowed in the spring, is called in Latin Vervactum, & hath that name of the foresaid time Ver [*i.* spring.] Indeed ley grounds & such as

* *Bene colere.*

A reſt each other yere, muſt be in this wiſe followed. Now if you would know what the Latines mean by Nouale, they take it for a field ſowed euery ſecond yere. And thus much of the land.

To come now vnto our draught oxen that muſt labour at the plough: they ought to be coupled in yoke, as cloſe together & as ſtreight as is poſſible, to the end that whilſt they be at work and ploughing, they may beare vp their heads; for by that meanes they leaſt doe gall or bruiſe their necks. If they chance to goe to plough among trees and vines, they muſt be muzled with ſome frailes or deuiſes made of twigs, to the end they ſhould not brouſe and crop off the yong ſprings and ſoft tendrils. Moreouer, there ought a little hatchet to hang euermore faſt to the plough beame before, therewith to cut through roots within the ground, that might breake or ſtay the plough: for better is it ſo to do, than to put the plough to it, to keep a plucking at them
B or to force the poore oxen to lie tugging & wreſtling with them. Alſo in ploughing, this order is to be kept, That when the oxen are* gone down with one furrow to the lands end, they turne *Verſum peragi and goe vp againe with another; ſo that in ploughing of a land they * reſt betweene whiles as * Stigare. little as may be, but euermore go forward in their labour vntill they haue made an end of their * halfe acre, or halfe daies worke: and verily it is thought ſufficient for a teem of oxen to breake * Actu. vp (at the firſt tilth) in one day of reſtie or ley ground, one acre, taking a furrow or ſtitch of nine inches; but at the ſecond tilth or ſtirring, an acre and a halfe; which is to be vnderſtood of an eaſie and mellow ſoile to be wrought, for if it be tough and churliſh, it is wel if they eare vp at the firſt, halfe an acre; and at the next time they may go through with one whole acre, how hard ſoeuer the ground be; for thus haue poore beaſts their taske ſet, and their labour limited by Na-
C tures lore and appointment. Euery field to be ſown muſt be eared at firſt with ſtreight & direct furrows; but thoſe that follow after, ought to go byas and winding. If a ground vpon the pendant or hanging of the hil be to be broken vp, the furrowes muſt go croſſe and ouerthwart: howbeit, the point and beak of the plough-ſhare muſt be ſo guided, that one while it beare hard aboue on the one ſide, and another while beneath on the other ſide: and verily in this mountaine worke, the ploughman that holdeth the plough hath toile enough, and laboreth at it as hard as the oxen do. Certes, there be ſome mountaines that haue no vſe at all of this beaſt, but they eare their ground with raking and ſcraping hooks only. The ploughman, vnleſſe he bend and ſtoope forward with his body, muſt needs make ſleight worke, and leaue much vndon as it ought to be;
D a fault which in Latine we call Preuarication: and this terme appropriate vnto husbandrie, is borrowed from thence by Lawyers, and tranſlated by them into their courts and halls of pleas: if it be then a reprochfull crime for Lawyers to abuſe their clients by way of colluſion, wee ought to take heed how we deceiue and mocke the ground, where this fault was firſt found and diſcouered. To proceed, the plough-man euer and anone had need to cleanſe the culter and the ſhare with his ſtaffe, tipped and pointed at the end like a thiſtle-ſpade: he muſt beware that betweene two furrowes, he leaue no naked balks raw and vntilled: alſo that the clots ride not one vpon anothers back. Badly is that land ploughed, which after the corn is ſowed, needs the great harrows and clotting. Contrariwiſe, a man may know where there is good worke; namely, if the turfe be ſo cloſe couched that there be no ſeams to be ſeen where the plough-ſhare went: finally, it is a profitable point of husbandry and much practiſed (where the ground doth both beare
E and require it) For to draw here and there broad gutters or furrows, to drain away the water into ditches and trenches caſt for the nones betweene the lands, that otherwiſe would ſtand within and drowne the corne.

Chap. XX.

¶ Of harrowing and breaking clods. Of a certaine kind of ploughing vſed in old time. Of the ſecond tilth or fallow called Stirring: and of cutting.

After the ſecond fallow called Stirring, done with croſſe and ouerthwart furrow to the firſt; then followeth clodding, if need be, either with rakes or great harrowes: vpon which inſueth ſowing: and when the ſeed is in the ground, harrowing a ſecond time with the ſmal har-
F row. In ſome places, where the manner of the country doth ſo require, this is performed with a tined or toothed harrow, or els with a broad planke faſtened vnto the plough taile, which doth hide and couer the ſeed newly ſown: and in this maner to rake or harrow, is called in Latine Lirare, from whence came firſt the word Delirare, which is to leaue bare balks vncouered, and by a Metaphore and borrowed ſpeech, to raue and ſpeake idlely.

* *Illa ſeges demum votis reſpondet auari, Agricolæ, bis quæ ſoli bis frigora ſenſit.*

* 1 Breaking. 2 Stirring. 3 Cruſhing. 4 Setting vp. 5 Caſting downe.

It ſhould ſeem that * *Virgil* preſcribed, that the ground ſhould haue foure tilthes in all, by G theſe words, when he ſaid, That the corne was beſt, which had two Summers and two Winters. But if the ground be ſtrong and tough, as in moſt parts of Italy, there needs a * fift tilth before ſowing, and in Tuſcan verily they giue their ground, otherwhiles no fewer than nine fallowes, before it be brought into tillage. As for Beans and Vetches, they may be ſowed vnder furrow, without breaking vp the ground before; for this is a ready way, gaining time, ſauing charges, & ſparing labour.

And here I cannot ouerpaſſe one inuention more as touching earing and ploughing the ground, deuiſed in Piemont and thoſe parts beyond the Po, by occaſion of ſome hard meaſure and wrong offered to the people and peiſants of that country during the wars. And thus ſtood the caſe. The Salaſſians making rodes into the vale lying vnder the Alpes, as they forraied and H harried the country all ouer, aſſaied alſo to ouerrun their fields of Panick and Millet being now come vp and wel growne, meaning thereby to deſtroy it: but ſeeing the nature of that graine to be ſuch, as to riſe againe and to check this iniury, they ſet ploughs into it, and turned all vnder furrow, imagining by that means to ſpoil it for euer. But ſee! what inſued therupon? thoſe fields thus miſuſed (in their conceit) bare a twofold crop, in proportion to other yeres; & yeelded ſo plentifull an harueſt, as that thereby the peiſants aforeſaid learned the deuiſe of turning corn in the blade into the ground, which I ſuppoſe in thoſe days when it new came vp, they called Aratrare. And this point of husbandry they put in practiſe, when the corne beginnes to gather and ſhew the ſtem or ſtraw; to wit, ſo ſoone as it hath put forth two or three leaues and no more.

Neither will I conceale from you another new deuiſe, practiſed and inuented firſt, not aboue I three yeres paſt in the territory of Treuiers, neer to Ferrara. For at what time as their corn fields by reaſon of an extreme cold winter, ſeemed to be froſt-bitten and ſpoiled, they ſowed the ſame again in the month of March, raking and ſcraping the vpper coat of the ground onely without more ado: and neuer in their liues had they the like increaſe when harueſt came. Now as touching all other tillage and husbandry meet for the ground, I will write thereof reſpectiuely to the ſeuerall kinds of corne.

Chap. XXI.

¶ *Of the tillage and ordering of the ground.*

K THe fine Wheat Siligo, the red bearded Wheat Far, and the common Wheat Triticum; Spelt or Zea (generally called Seed) and Barly, when they be new ſown, would be wel clotted and couered firſt, harrowed afterwards, & weeded at the laſt to the very root; al at ſuch ſeaſons as ſhall be ſhewed hereafter. And to ſay a truth, euery one of theſe is a ſufficient worke for one man to do in a day throughout an acre. As for the Sarcling or ſecond harrowing, it doth much good to corn: for by looſening the ground about it, which by the winter cold was hardened, clunged, and (as it were) hide bound, it is ſomwhat inlarged and at libertie againſt the Spring tide, and full gladly admitteth and receiueth the benefit of the freſh and new come Sunſhine daies: let him take heed who thus ſarcles or rakes the ground, that he neither vndermine the roots of the corn, nor yet race or diſquiet & looſen them. The common wheat, Barley, the L Seed Zea (*i.* Spelt) and Beans, would do the better if they were thus ſarcled, and the earth laied looſe about them twice: the grubbing vp of weeds by the root, at what time as the corne is iointed (namely, when the vnprofitable and hurtful hearbs are plucked forth and rid out of the way) much helpeth the root of the corn, diſcharging it from noiſom weeds, procuring it more nutriment and ſeuering it apart from the other green ſourd of common graſſe. Of all Pulſe, the cich peaſe asketh the ſame dreſſing and ordering, as the red wheat Far. As for beans, they paſſe not at all for weeding; and why? they ouergrow all the weeds about, and choke them. The Lupines require nought els to be done to them but only weeding. Millet and Panick, muſt be clotted and once harrowed vntill they be couered: they call not for a ſecond raking & ſcraping about them, for to looſen the earth, and to lay freſh mould vnto them; much leſſe to be weeded. As for Silicia or Siliqua, *i.* * Fenigreeke, and Faſels, *i.* Kidney-beans, they care onely for clodding, & there M an end.

* For ſo he interpreteth it himſelf in the 1 chap. of this booke.

Moreouer, there be certain grounds ſo fertile, that the corn comming vp ſo thick & ranke in the blade, ought then to be kembed (as it were) & raked with a kind of harrow ſet with teeth or

ſpikes

20030
copy 1

A ſpikes of yron:and yet for all this,they muſt be graſed or eaten down beſides neuertheleſſe with ſheep. Now we muſt remember,that after ſuch cattel hath gon ouer it with their teeth,the ſame corne thus eaten downe,muſt of neceſſity be farcled, and the earth lightly raked and raiſed vp freſh againe. Howbeit,in Bactriana, Africke,and Cyrene, there needs no ſuch hand at all: for the climate is ſo good,ſo kinde,and beneficiall,that none of all this paines is required: for after the ſeed is once ſowne,they neuer viſit it but once for all at nine months end,at what time they returne to cut it down and lay it vpon their thraſhing floores:the reaſon is,becauſe the drought keepeth downe all weeds;and the dewes that fall by night, are ſufficient to refreſh and nouriſh the corne.

Virgil is of opinion,That fallowes would be made euery yeare,and that our corn field ſhould
B reſt betweene whiles,and beare but each other yere. And ſurely,I doe find this rule of his moſt true,and doubtleſſe right profitable;in caſe a man haue land enough for to let his grounds play them,and reſt euery ſecond yere. But how if a man is ſtreighted that way,and hath no ſuch reach and circuit lying to his liuing? Let him help himſelfe this way:let him(I ſay)ſow his good red wheat Far againſt the next yere,vpon that ground from whence he gathered this yeare a crop of Lupines,Vetches,or Beans,or ſome ſuch grain as doth inrich and muck the ground. For this alſo is principally to be noted,that ſome corne is ſowne for no other purpoſe,but by the way as it were to aduance and help others to fructifie:howbeit,ſmall fruit and increaſe (to ſpeak of) ariſeth thereby,as I haue obſerued once for all in the booke immediatly going before, becauſe I would not willingly reiterate and inculcate one thing often. For herein regard eſpecially ought
C to be had,vnto the nature and property of euery ſoile.

Chap. XXII.

¶ *Of certaine countries exceeding fertile and fruitfull. Of a Vine bearing grapes twiſe in one yeare. Of the difference and diuerſitie obſerued in waters.*

THere is in Africke or Barbary a city called Tacape, ſcituate in the midſt of the ſands, as men go to the Syrts and Leptis the great:the territory lying about which city, by reaſon that it is ſo well watered,is maruellous fruitfull,and indeed paſſeth a wonder and is incredible. Within this tract there is a fountain,which ſerueth abundantly for three miles well neer,
D euery way;the head therof verily is large enough otherwiſe, howbeit the inhabitants about it are ſerued with water from thence by turns,and diſpenſed it is among them at certain ſet hours, and not otherwiſe. There ſtandeth there a mighty great date-tree, hauing vnder it growing an oliue,vnder which there is a fig-tree,and that ouerſpreadeth a Pomegranat tree,vnder the ſhade whereof there is a Vine: and vnder the compaſſe thereof,firſt they ſow Frument or cared corne, after that Pulſe,and then worts and herbs for the pot,all in one and the ſame yere. Euery one of theſe rehearſed,liue,joy,and thriue vnder the ſhade of others. Euery foure cubits ſquare of this ſoile(taking the meaſure of a cubit from the elbow, not to the fingers ends ſtretched out in length,but claſped together into the fiſt) is ſold for * 4 deniers Roman: but this one ſurpaſſeth all the reſt. The vines in the ſaid territory beare twice a yeare, and yeeld their grapes ripe for a
E double Vintage. So exceeding fruitfull is the ſoile,that vnleſſe the rankneſſe thereof were abated and taken downe, by bearing ſundry fruits one vnder and after another, ſo that it were imploied to one thing alone,the inhabitants ſhould neuer haue any good thereof:for by reaſon of the ouer-rankneſſe,each ſeuerall fruit would periſh and come to nought:but now by meanes of plying and following it ſtill with ſeed, a man ſhall gather one fruit or other ripe, all the yeare long. And for certaine it is knowne,that men cannot ouercharge the ground,no nor feed the fertilitie of it ſufficiently.

* 2.*ſh.*6.*d.ſterl.* By which reckoning one acre would coſt aboue 20: pound ſterling ſo much in proportion of the whole, as this cubit is vnder our halfe yard or 18 inches.

Moreouer,all kinds of water are not of like nature nor of equall goodneſſe,for to drench and refreſh the ground. In the prouince of Narbon,now Languedoc,there is a famous wel or fountain named Orge,within the very head wherof there grow certaine herbes, ſo much deſired and
F ſought for by kine and oxen,that to ſeeke and get a mouthfull of them, they will thruſt in their whole heads ouer their eares,vntill they meet therewith: but howſoeuer theſe herbs ſeeme to ſpring & grow within the water,certain it is,that nouriſhed they are not,but by rain from aboue. And therfore to conclude & knit vp all in one word,Let euery man be wel acquainted with the nature both of his own land which he hath,and alſo of the water wherewith he is ſerued.

Chap. XXIII.

¶ *Of the diuers qualities of the ſoile. Alſo, the manner of dunging or manuring grounds.*

IF you meet with a ground of your owne, which we called heretofore by the name of Tenera, the floure indeed and principall of all others; after you haue taken off a crop of Barley, you may very wel ſow Millet thereupon: and when that is inned and laid vp in the barne, proceed to Raddiſh. Laſt of all, after they be drawne, there may be barly or common wheat ſowed in the place, like as they do in Campaine; for ſurely ſuch a piece of ground needs no other tillage, but often ſowing. Another order there is beſides this in ſowing of ſuch ſoile; namely, that where there grew the red wheat Adoreum or Far, there the ground ſhould reſt all the four winter moneths, and in the Spring be ſowed again with Beans; ſo that it alwaies be imploied and kept occupied vntill Winter without any intermiſſion. And ſay that the ground be not altogether ſo fat, yet it may be ordered ſo, that it be euer bearing by turns in this ſort, that after the Frumenty or Spike corne be taken off, there be pulſe ſowne three times, one after another. But in caſe the ground be ouer poore and lean, it muſt be ſuffered to reſt and take repoſe two yeares in three. Moreouer, many husbandmen do hold, that it is not good to ſow white corne or Frument vpon any land, but ſuch as lay fallow and reſted the yeare before.

Howeuer it be, the principall thing in this part of Agriculture, conſiſteth in dunging, whereof I haue written already in the former book next to this. This one point only is reſolued vpon by all men, that none of our grounds ought to be ſowed, vnleſſe they be manured and mucked before. And yet herein muſt we be directed by certain rules peculiar and proper thereunto, as follow. Millet, Panick, Rapes, Turneps, or Navews, ought neuer to be ſowed but in a ground that is dunged. If there be no compoſt laid vpon a ground, ſow vpon it Frument or bread-corne, rather than Barley. Likewiſe in grounds that reſt and lie fallow euery other yere, albeit in all mens opinion, they are thought good for to beare Beans, yet notwithſtanding beans loue better whereſoeuer they come to be ſowed in a ground but newly mucked. He that mindeth to ſow at the fal of the leafe, muſt in the month of September before, ſpread his dung, turn it in with the plough, and ſo incorporat it with the ſoile preſently after a ſhower of rain: euen ſo alſo, if a man purpoſe to ſow in the ſpring, let him in the winter time diſpoſe of his mucke vpon the lands and ſpread it. The ordinary proportion is, to lay 18 tumbrels or loads therof vpon euery acre. Throwne abroad it muſt be alſo before it be dried, and ere you ſow, or els ſo ſoone as the ſeede is in the ground, that it may be harrowed in with the corne. But in caſe this manner of dunging be neglected, it followeth then before that you do harrow, to ſtrew the ſhort ſmall dung in manner of duſt gathered out of Coupes, Mues, and Bartons, where foule are fed; or els to caſt Goats treddles vpon the land, as if you would ſow ſeed, and then with rakes and harrowes to mingle it with the ſoile.

To the end now that we may determine fully as touching this care alſo, belonging to dung, euery ſheep or goat and ſuch ſmall cattell, ſhould by right yeeld ordinarily in dung one load in *ten daies: and euery head of bigger beaſts ten load; for vnleſſe this proportion and quantity of muck be gathered, plain it is, that the granger or maſter of husbandry, hath not don his part, but failed in litering of his cattell. Some hold opinion, that the beſt way of mucking a land is, to fold ſheep and ſuch like ſmall cattell thereupon, euen in the broad open field; and to this purpoſe they incloſe or impark them within hurdles. In a word, a ground not dunged at al, groweth to be cold; and again if it be ouermuch dunged, the heart thereof is burned away. And therefore the better and ſafer way is to muck by little at once and often, rather than to ouerdo it at once. The hotter that a ſoile is, it ſtands by good reaſon, that the leſſe compoſt it requireth.

*or rather (after *Columella*) 39 daies.

Chap. XXIIII.

¶ *Of good ſeed-corne. The manner of ſowing ground well. How much ſeed of euery kind of graine an acre will take. The due ſeaſons of Seedneſſe.*

THe beſt corne or Zea for ſeede, is of one yeares age, two yeares old is not ſo good: that of three, is worſt of all: for beyond that time, the heart is dead, and ſuch corne wil neuer ſpurt.

And

20030
copy 1

A And verily this that is ſaid of one ſort may be verified of all kindes. The corne that ſetleth to the bottome of the mowgh in a barn toward the floore, is euer to be reſerued for ſeed. And that muſt needs be beſt, becauſe it is weightieſt, for therein lieth the goodneſſe: neither is there a better way to diſcern and diſtinguiſh good corn from other. If you ſee an eare of corn hauing grains in it here and there ſtaring diſtant aſunder, be ſure the corn is not good for this purpoſe; and therefore it muſt be caſt aſide. The beſt graine looketh reddiſh, and being broken between ones teeth, retaineth ſtil the ſame colour within: the worſe corn for ſeed is that which ſheweth more of the white flower within.

Furthermore, this is certain, that ſome grounds take more ſeed, and ſome leſſe. And hereby verily do husbandmen gather their firſt preſage religiouſly, of a good or bad harueſt; for when
B they ſee the ground ſwallow more ſeed than ordinary, they haue a ceremonie to ſay & beleeue that it is hungry, and hath greedily eaten the ſeed. When a man is to ſow a moiſt ground, good reaſon there is to make the quicker diſpatch, and to do it betimes, for fear leſt rain come to rot it. But contrariwiſe in dry places it is not amiſſe to ſtay the later, and attend till raine follow, leſt by lying long in the earth, and not conceiuing for want of moiſture, it loſe the heart & turn to nothing. Semblably, when a man ſoweth early, he muſt beſtow the more ſeed and ſow thick, becauſe it is long ere it ſwel and be ready to chit. But if he be late in his ſeednes, he ſhould caſt it thin into the ground, for thick ſowing will choke and kill the ſeed. Moreouer, in this feat of ſowing there is a pretty skil and cunning, namely to cary an euen hand, and caſt the ſeed equally thorowout the whole field. The hand (in any caſe) of the ſeeds-man muſt agree with his gate
C and march: it ought alwaies to go iuſt with his right foot. Herein alſo this would not be forgotten, that one is more fortunate and hath a more lucky hand than another: and the ſeed will proſper better and yeeld more encreaſe that ſuch a one ſoweth: an hidden ſecret ſurely in Nature, and whereof we can yeeld no ſound reaſon. Ouer and beſides, this is to be conſidered, that corn comming from a cold ſoile, muſt not be ſowne in a hot ground; nor that which grew in a forward and haſty field, ought to be transferred into lateward lands. How ſoeuer, ſome there be that haue giuen rule clean contrary: howbeit they haue deceiued themſelues with al their fooliſh curioſitie.

Now as touching the quantitie of ſeed that muſt be giuen, according to the varietie both of ground and grain, theſe principles following are to be obſerued: in a reaſonable good ground
D of a mean temperature, an acre in ordinarie proportion wil ask of common wheat Triticum, or of the fine wheat Siligo, 5 modij; of the red wheat Far, or of * ſeed [for ſo we cal a kind of bread corn] ten Modij; of Barly ſix; of Beans as much as of common wheat, and a fift part or one Modius ouer; of Vetches 12; of Cich peaſe the greater, Cichlings the leſſe, and of peaſe three; of Lupines ten; of Lentils 3; [as for theſe, folk would haue them ſowed together with dry dung] of Ervile ſix; of Silicia or Feni-greek ſix; of Phaſeols or Kidny beans foure; of Dradge or Balimong for horſe prouender, 20; but of Millet and Panick 4 Sextars. Howbeit herein can be ſet down no iuſt proportion, for the ſoile may alter all. And in one word, a fat ground will receiue more, and a lean leſſe. Beſides, there ariſeth a difference another way, in this manner; if it be a maſſie, faſt, chalky, and moiſt ground, you may beſtow in one acre thereof ſix Modij, either of
E common wheat or of fine Siligo; but in caſe it be looſe and light, naked, dry, and yet in good heart and free, it will aske but foure. For the leaner that a ground is, vnleſſe it be ſown ſcant, and the ſtraw come vp alſo thinne, the ſhorter eare will the corne haue, and the ſame light in the head, and nothing therein. Be the ground rich and fat, ye ſhall ſee out of one root a number of ſtems to ſpring; ſo that although the grain be thin ſown, yet will it come vp thick, and beare a faire and full eare. And therefore in an acre of ground you ſhall not do amiſſe to keep a meane between foure and ſix Modij, hauing reſpect to the nature of the ſoile. And yet ſome there be who would haue [of wheat] fiue Modij ſown at all aduenture, and neither more nor leſſe, whatſoeuer the ground be. To conclude, if the ground be ſet with trees, or lying on the ſide of an hill, all is one, as if it were lean, hungry, and out of heart. And hereto may be reduced that notable
F Aphoriſme, worthy to be kept and obſerued as a diuine Oracle: Take not too much of a land, weare not out all the fatneſſe, but leaue it in ſome heart. Ouer and aboue the rules aforeſaid, *Accius* in his Treatiſe called Praxidicus, comes in with one more of his own: Sow your ground (ſaith he) when the Moone is in any of theſe ſignes, Aries, Gemini, Leo, Libra, and Aquarius. And *Zoroaſtres* hath another Aſtronomicall obſeruation by himſelfe, That the Sun ſhould be entred

* He meaneth Zea or Spelt.

entred into Scorpio, and paſt twelue degrees thereof, the Moone being at the ſame time in Taurus. G

Now followeth the deep queſtion to be diſcuſſed and determined, As touching the fit time and ſeaſon of ſowing corn: which I haue put off and deferred to this preſent place. And this would be handled and conſidered vpon with exceeding great care and regard, as depending for the moſt part of Aſtronomie, and requiring good inſight in the courſe and motion of the Planets, in the order alſo and influence of the fixed ſtars: and therefore I purpoſe to lay abroad the opinions and judgments of antient writers principally in that behalf. To begin therefore with *Heſiod*, eſteemed the prince and chiefe of all thoſe that gaue precepts of Agriculture; hee hath ſet down one certain time of Seednes, to wit, preſently after the fall or occultation of the Star Vergiliæ, *i.* the Brood-hen: and no maruell, for he wrot that book of his in Bœotia, a countrey in H the very heart of Hellas or Greece, reſpectiuely to his own countrymen and that climat: and in very truth that was the time of ſowing there, as we haue noted and ſpecified already. The beſt Authors of name, and who haue written moſt exactly of this argument, are all agreed vpon this point and concluſion, ſaying, That as all fowles of the aire and foure footed beaſts haue their due ſeaſon of ingendring; euen ſo there is a certaine time when as the earth is as it were in the ruit, and hath a luſt to be conceiued. The Greeks in general termes haue deſcribed that ſeaſon in this wiſe, namely, When the earth is hot and moiſt. *Virgil* giueth a precept to ſow the common wheat Triticum, and the red bearded wheat Far, after the retrait or departure aforeſaid of the Brood-hen Vergiliæ. As for Barly, he would haue it caſt into the ground betweene the Æquinox in Autumne, and the winter Sun-ſted: but Vetches, Kidney-beans, or Lentils, at the ſet- I ting or going downe of the ſtar Boote. Which being ſo, it would do well to digeſt the riſing and falling both of theſe ſtars and alſo of others, into their ſet dayes; to ſhew (I ſay) at what fixed time they appear, and when again they are hidden. Some there be who are of opinion, that it is good ſowing euen before the occultation of the ſaid ſtar Virgiliæ, but in a dry ground only and in hot countries: for ſo (ſay they) will the ſeed ſwell and mortifie the better; which the naturall humiditie only of the earth is ſufficient to putrifie and prepare ſo, that when the next rain falleth, it will be ready to ſpurt and chit within a day. Others attend and wait ſeuen dayes after the retrait of the foreſaid Brood-hen, for the rain that commonly falleth about that time. There be again that begin to ſow in cold regions immediatly after the Æquinox in Autumne: but in hot countries they be later in their ſeednes, for fear that the corn would be winter-proud K and grow ouermuch before the cold weather come. But all writers accord herein, that it is not good ſowing before the winter Solſtice, when the daies be at the ſhorteſt: the reaſon is verie pregnant and apparant, for winter ſeed if it be ſown before mid-winter, will ſpurt and ſpring at the ſeuen-nights end; ſow after that time, you ſhall haue it lie in the ground forty daies before it make any ſhew of comming vp. Many make haſt and put their ſeed into the ground betimes, hauing this prouerbe vſually in their mouth, *Well may ouertimely and haſty ſowing oftentimes faile, but late ſowing ſhall euer miſſe and deceiue the maſter.* Contrariwiſe, others there are of this minde, That it were better ſtay vntil the ſpring to do it wel and ſurely, rather than to ſow in a bad Autumne, and haſard the loſing of all. If there be no remedie therefore but to take the ſpring ſeaſon, a man muſt make choiſe of the time betweene the midſt of Februarie [at what time as the L Weſt wind Fauonius doth riſe and begin to blow] and the Æquinox in March. Some haue no regard at all to the conſtitution and figure of the heauens in this caſe, thinking the riſing and falling of ſtars, the courſe and motions of cœleſtial bodies to be friuolous matters and nothing pertinent to this purpoſe, but content themſelues only with obſeruing the cardinall ſeaſons of the yeare, and ſome other times, in a generality. In the ſpring (ſay they) ſow Lineſeed, Otes, and Poppies, and ſo hold on vnto the feſtiuall holydaies of *Minerva*, called Quinquatrus; like as at this day throughout all Lombardie and beyond the Po, they go by no other rule. As for Beans and the fine wheat Siligo, put them into the ground in the moneth of Nouember. Let the winter red wheat Far take his fortune and be interred, from the end of September, vntill the midſt or fifteenth day of October. Others goe beyond that day, and continue their ſeedneſſe vnto to the Calends or firſt day of Nouember. Now as theſe men haue no regard at all to the ſpecu- M lation of Nature, and the courſe of the ſtarres; ſo the other before named are giuen too much thereto, and wrapt they are ſo high among the ſtars and planets, that their owne eyes be dazeled therewith: and beſides, their ſubtilties and quidities do blind others, conſidering that the pra-

ctiſe

20030
copy 1

A ctiſe of theſe matters muſt paſſe through the hands of ruſtical peaſants, who are ſo far off from conceiuing Aſtronomy, & the conſtellations aboue, that they know not one letter of the book, nor neuer learned their A.B.C. Howbeit, we canot chuſe but confeſſe, that the true reaſon and knowledge of Agriculture, depends principally vpon the obſeruation of the order in heauenly bodies: for *Virgill* ſaith very wel, That before all other things, a husbandman ſhould be skilfull in the winds and haue the foreknowledge and prediction of them: alſo to haue an inſight into the nature and influence of the ſtarres, and in one word, to obſerue both the one and the other, as well as the Sailers and mariners at ſea. Certes, a hard peece of worke it is, and infinite; and ſmal hope I haue that euer I ſhal be able to driue into their heads that are ſo ignorant & groſſe of conceit, this high learning and heauenly diuinitie, as touching the Planets, the fixed ſtarres,
B together with the reaſon of their orderly motions and cœleſtiall powers: howbeit conſidering the great profit that may ariſe and grow therupon to mankind, I will caſt a profer and giue the attempt to make ploughmen Aſtrologers, or Aſtronomers at leaſtwiſe, if it may be. But firſt my purpoſe is, to lay open before their eies certain difficultys (which troubled alſo ſome of the auncient writers, and thoſe not vnskilfull in this part of Philoſophie) as touching the courſe and order of the Starres: which beeing not onely diſcouered, but alſo aſſoiled and cleared, their minds with better contentment may goe from the contemplation of heauen to the reſt of Natures workes, and ſee thoſe things by the effects, which they could not poſſibly foreſee by their cauſes.

C

Chap. XXV.

¶ *The times and ſeaſons of the riſing and ſetting of Starres, digeſted into order, as well by* * *day as night,*

* i. Euening and morning.

IN the firſt place, there offereth it ſelfe vnto vs one difficultie aboue the reſt, ſo intricate, as hardly is it poſſible to reſolue vpon it; namely, as touching the very daies of the yere, how many they be, in number; and the reuolution of the Sunne, how and when he returneth againe to to the ſame point? For wheras ſome do account the ſolare yere to be 365 daies juſt, others adde thereunto certaine quadrants or foure parts of day and night together, to wit, ſix houres euery yeare, which beeing put together, make the fourth yeare Biſſextile or Leape yeare: ſo as it is in
D manner impoſſible to aſſigne the certaine daies and houres of the Starres apparition or occultation. Ouer and beſides, how obſcure, how darke and confuſed all this matter is, appeareth manifeſtly herin, That the times and ſeaſons of the yere prefixed by ancient writers, fal not out accordingly; and namely, in the obſeruation of the winter ſeaſons & tempeſts by them ſet down: for one while you ſhall haue them to preuent and come ſooner by many daies than ordinarie, which the Greekes call προκμάζειν: another while to draw back and come later, which they terme ὀψικμάζειν. Yea and for the moſt part this happeneth, by reaſon that the influence of the cœleſtiall ſtarres reacheth ſooner or later to the earth, and therafter ſheweth the effects: ſo as, the common people, when they ſee the ſaid foule weather paſt, and all cleare and faire againe, ſay then and not before, That ſuch a planet or Starre hath performed his courſe, and is vpon the point
E of his Tropicke or return againe. Moreouer, conſidering that al theſe occurrents depend much vpon thoſe ſtars which be ſet & fixed in the firmament, yet ſhall ye haue the Planets play their parts beſides, which by their motions and operations, worke no ſmall effects vpon the earth, as we haue ſhewed before; and namely, cauſing betweene-whiles ſtormes of raine and haile out of courſe: no maruell then, if they trouble our heads and put vs out of our account, interrupting that order of the fixed Stars, vpon which we conceiued and built our hope of the faire ſeaſon, and our new ſpring. And herin, not we only that be men faile of our reckoning, but other liuing creatures alſo be deceiued, which naturally haue much more ſenſe and vnderſtanding of theſe workes of Nature, than we, in as much as their whole life ſtandeth thereupon: for the Summer-birds (as great fore-ſight as they haue of ſuch ſeaſons and tempeſts) are ouer-taken and killed
F by Winter froſts and cold, comming ſooner than they looked for, and before they be gone out of the countrey, as alſo winter foules miſcarrie by the hot weather of ſummer, continuing longer than it was woont, and holding on ſtill after they be come. Hereupon it is, that *Virgil* expreſſely willeth vs to learne throughly the skill of the wandring Starres or Planets alſo, and principally giueth vs warning to marke the courſe of that cold Planet Saturne.

But

But now to come more particularly to the ſigns which fore-token the Spring: ſome there be G
that goe by the Butterflie, and hold that their brood comming abroad, is an aſſured token that the Spring is come, for that theſe creatures ſo feeble, are not able to abide any cold: howbeit, this was checked that very yere, wherin I wrote this Book or Hiſtory of Natures work: for ſeen it was and marked very well, that 3 flights of them one after another were killed with the cold weather that ſurpriſed them thrice, for that they were ſtirring too early, and came abroad ouerſoon. Yea, and the very birds who are our gueſts in warm weather, viſited vs fiue or ſixe daies before Februarie, & made a goodly ſhew of a timely Spring, putting vs in good hope, that al cold weather was gone: howbeit, there enſued a moſt bitter after winter ſtreight vpon it, that nipped and killed them in manner euerie one. Hard and doubtfull therefore is the caſe, that whereas
firſt and principally we were to fetch our rule from the heauens to guide and direct vs, then af- H
terwards we ſhould be driuen to goe by other ſignes and arguments meere conjecturall. But aboue all, the cauſe of this incertitude and difficultie, is partly the conuexity of the cope of heauen, and partly the diuerſe climats obſerued in the globe of the earth, by meanes whereof, one and the ſame ſtar ſeemeth to riſe at ſundrie times in diuerſe countres, and appears ſooner or later to ſome than to others: and therefore the cauſe depending thereupon, is not in all places of like validity, nor ſheweth the ſame effects alwaies at the ſame times. And yet there is one difficultie more, ariſing from thoſe Authors who writing of one and the ſame thing, haue deliuered diuers opinions, according to the ſundry climates wherein they were, at what time as they obſerued the figure and conſtitution of the heauens. Now were there of theſe Aſtronomers three
Sects, to wit, the Chaldæans, the Ægyptians, and the Greekes. To which there may be added a I
fourth, which among vs *Cæſar* the Dictatour firſt erected: who obſeruing the courſe of the Sun, and taking with him alſo the aduiſe of *Soſigenes* (a learned Mathematitian and skilfull Aſtronomer in his time) reduced the yeare vnto the ſaid reuolution. Howbeit, in this calculation of his, there was found an error, and ſhort he came of the marke, which he aimed at, by reaſon that there was no Biſſextile or leap yere by him inſerted, but after 12 yeres. Now, when it was obſerued by this reckoning, that the ſun had performed his reuolution ſooner than the yere turned about, which before was wont to preuent the courſe of the Sun, this error was reformed: and after euery fourth yeare expired, came about the Biſſextile aforeſaid, and made al ſtreight. *Soſigenes* alſo himſelfe, albeit he was reputed a more curious and exquiſite Mathematician than the
reſt, yet in three ſeuerall treatiſes that he made, retracting or correcting that in one booke that K
he had ſet down in another, ſeemed euermore to write doubtfully, and left the thing in as great ambiguitie & vndetermined as he found it. As for theſe writers whoſe names I haue alleadged & prefixed in the front of this preſent volume now in hand, they haue likewiſe deliuered their opinions as touching this point, but hardly ſhal you find two of them in one & the ſame mind. Leſſe maruell then if the reſt haue varied one from another, who may pretend for their excuſe the diuers tracts and climates wherein they wrote. As for thoſe who liued in the ſame region, and yet wrot contrarie, I canot tel what to make of them: howbeit, I care not much to ſet downe one example of their diſcord & diſagreement. *Heſiodus* the Poet (for vnder his name alſo there goeth a Treatiſe of Aſtrologie) hath put down in writing the matutine ſetting of the ſtar Vergiliæ (which is the occultation thereof by the raies and beames of the Sunne toward morning) L
to begin ordinarily vpon the day of the Æquinox in Autumne. *Thales* the Mileſian ſaith, That it falleth out vpon the fiue and twentieth after the ſaid Æquinox. *Anaximander* writeth, That it is nine and twenty daies after: and finally, *Euctemon* hath noted the 48 day following the ſaid Æquinox, for the retrait or occultation of the forenamed Brood-hen ſtar Vergiliæ. Loe what varietie there is among theſe deepe clearkes and great Aſtrologers.

For mine owne part I hold well with *Cæſars* calculation, and wil keep me to his obſeruations as neere as I can, for that the ſame wil fit beſt with our meridian here in al Italie. Yet neuertheleſſe I will not ſticke to ſet downe the opinions of others, becauſe my deſſeigne tendeth not to one particular place alone, but I purpoſe and profeſſe to repreſent vnto the reader the vniuerſall hiſtory of Nature, and the whole world. But my meaning is not to rehearſe the names of euery Author one by one (for that were a tedious peece of work, and would require a long train M
of ſuperfluous words) but only to put down the regions of euery climate, and that as ſuccinctly and briefely as I can. Where, by the way I muſt aduertiſe the Readers, that they remember wel this one thing, how when for breuities ſake I name the land or region Attica, they muſt with-

all

20030
copy 1

A all vnderſtand the Iſlands Cyclades: when I name Macedonie, I comprehend therewith Magneſia and Thracia: vnder Ægypt I compriſe Phœnice, Cyprus, and Cilicia: vnder Bœotia, the regions of Locris and Phocis: and in one word, alwaies the tracts and Countries adiacent and confining together. *Item*, In making mention of Helleſpontus onely, I take together with it, Cherſoneſus, and all the continent or main firme land, as far as to the mountaine Athos: in naming Ionia, I reckon alſo Aſia the leſſe or Natolia, and the Iſles thereto adioyning: vnder the name of Peloponneſus I count Achaia, and other lands in that climat lying to the Weſt. Finally, the Chaldæans ſhall make demonſtration, as in a map, of Aſſyria and Babylonia. As for Africke or Barbary, Spaine and France, maruell not if I paſſe them ouer in ſilence: for there is not a writer in all theſe Nations, one or other, who hath either obſerued or penned downe the
B time when theſe fixed ſtars riſe or fall. Howbeit it were no hard matter to come to the knowledge thereof in thoſe climats and countries alſo, by the meridionall lines and conformitie of the Parallele-circles, which I digeſted orderly in the ſixt book of this work. For thereby a man may vnderſtand the vniforme agreement in the poſition of the heauen, not only for whole Climats and countries, but alſo for euery ſeuerall city by it ſelfe, vnder the ſame meridian or Parallel: following ſtil the known paralels of theſe regions which we haue named, and taking withall the eleuation of any circle pertaining to euery ſuch land as a man wil ſeeke, and reſpectiue to the riſing of the ſtars, according to the equal ſhadowes throughout all thoſe paralel circles. Moreouer, it ought to be ſhewed and declared, that ordinarily the times and ſeaſons haue their temperature and influence euery foure yeres together: and thoſe lightly return the ſame with-
C out any great alteration, from yeare to yeare duly according to the courſe and recourſe of the Sun, during that term: mary in eight yeares they ſenſibly do increaſe, namely by what time as the Moon is in her hundreth reuolution.

Now all the knowledge of the heauens pertinent to Agriculture, ſtandeth principally vpon three ſorts of obſeruations, to wit, the riſing of the fixed ſtars, the ſetting of the ſame, and the four cardinal points, to wit, of the two Tropicks or Sunſteads, and the double Æquinox, which diuide the whole yeare into foure quarters and notable ſeaſons. Where note, that the riſe and fall of thoſe ſtars beforeſaid is to be conſidered and taken two waies. For firſt when the Sun approcheth vnto them with his beams, they be hidden and no more ſeen: likewiſe after his departure they ſhew themſelues again: and as the one, me thinks, might haue bin more aptly called
D an Apparition than a Riſing, ſo we ſhould haue framed our tongue in common ſpeech to haue termed the other Occultation, rather than Setting. Secondly, according as the ſaid ſtars begin either to ſhine out or be hidden in the morning before the Sunne be vp, or at euening after the Sun is ſet, they be ſaid to riſe and go downe, and thereupon are named Matutine or Veſpertine, Orientall or Occidental, according as the one or the other hapneth vnto them in the twi-light, morning, or euening. Certes, when they are to be ſeene Matutine or Veſpertine, it muſt be at the leaſt three quarters of an houre either before the Sun is vp, or after he is downe: for within that ſpace there is no looking after them. Moreouer, ſome ſtars there be that riſe and fal twice. But take this with you, ere I proceed further, that all this ſpeech of mine is to be vnderſtood of the fixed ſtars, which being ſetled faſt in the ſky, moue not of themſelues: and in no wiſe of the
E planets.

* *Ortus & occaſus Heliacus.*

* *ortus & occaſus Coſmicus.*

As touching the foure cardinal ſeaſons of the yeare, whereby it is diuided into foure quarters; limited they be according to the light more or leſſe, and as the daies be longer or ſhorter: for ſo ſoon as the winter Sunſted is paſt, the daies do lengthen; and by that time that 90 daies and three houres be gon and paſt, they be iuſt as long as the night, and this is called the ſpring Æquinox. From which very day, for ninety three days together and twelue houres, namely vnto the ſummer Sun-ſtead, the daies be longer than the night, and ſo continue vntill the Autumne Æquinox, at what time the daies and nights be equall againe; from which time they ſhorten and decreaſe as they grew in length and increaſed before, for eighty nine daies together, and three houres, vntill the foreſaid winter Sunſtead, when as the daies be ſhorteſt. And here you
F muſt note, that in all theſe additions of houres at this preſent, I mean thoſe only that be Æquinoctiall, which diuide the day and night equally in foure and twenty parts, and not the common houres of any other day artificiall whatſoeuer. Alſo take this with you, that all theſe diſtinctions and diuiſions of the foure ſeaſons, begin alwaies in the eight degree of thoſe ſignes vnder which the Sunne is at thoſe times: as for example, The winter Sunſtead or ſhorteſt day

of

of the yeare,called in Latine Bruma,falleth out in the eight degree of Capricorn,which light- G
ly is vpon the * 18 day before the Calends of Ianuary. The Spring Æquinox,when nights and
daies be of a length,in the eight degree of Aries. Semblably,the ſummer Sunſtead, or longeſt
day of the yeare, is alwaies when the Sun is entred eight degrees into Cancer. Laſt of all, the
other Æquinox in Autumne, when day and night is equall, lighteth vpon the eight degree of
Libra. And certes,ſeldom or neuer ſhall you ſee any of theſe foure daies without euident ſhew
of ſome notable change in the weather. Again,theſe cardinall ſeaſons or quarters of the yeare
admit alſo their ſub-diuiſions ſtill into ſome notable and ſpecial times,obſerued in the * very
middle ſpace from the one and the other. For betweene the ſummer Sunſtead and the Æqui-
nox in Autumne iuſt vpon the fiue and forty day after the ſame Sunſtead, the retrait or ſetting
of the ſtar called in Latine Fidicula,*i.*the Harp,beginneth the Autumne. Likewiſe,betweene H
that Æquinox and the winter Sunſtead or ſhorteſt day of the yeare, the Matutine or morning
fall of the ſtar Virgiliæ,vpon the three and fortieth day after the ſaid Æquinox, ſetteth the be-
ginning of the winter. So likewiſe vpon the fiue and fortieth day between mid-winter or the
ſhorteſt day of the yeare,and the ſpring Æquinox,the blowing of the Weſtern wind Favonius
beginneth the Spring. And laſt of all,vpon the three and fortieth day from the ſayd Æquinox
toward the Summer Sunſtead,at what time as the ſtar Virgiliæ doth riſe Matutine,begins the
Summer

* 15 of December.

*Called *Interualla* afterward in this chapter: and contain much about ſixe weekes.

But to returne again to our Agriculture, begin I will at the Seednes of Frument corne,that
is to ſay,at the riſing or apparition of the ſtarre Vergiliæ in the morning,without making any
mention at all of other pety ſtars,for to interrupt the train and courſe of our treatiſe,& to heap I
difficulties one vpon another,conſidering that the fierce and vehement ſtar Orion is departed a
great way off from vs by that time. I am not ignorant,that many fall to ſowing corne long be-
fore,and preuent this time,beginning their Seednes within 11 daies after the Æquinox in Au-
tumne, namely, at the approch and riſing of the ſtar Corona, *i.* the Crowne; promiſing them-
ſelues aſſuredly to haue rain vpon it for certain daies together. *Xenophon* would not haue vs be-
gin to ſow before that God giue vs ſome good ſigne and token ſo to do. And *Cicero* our coun-
tryman expounding this ſaying of *Xenophon*, taketh the raines in * Nouember to be that ſigne
which God giueth: whereas in very deed the true and vndoubted rule to goe by, is to make no
great haſt into the field for to ſow,before the leaues begin to fall: and this euery man holdeth
to be at the very occultation or retrait of the ſtar Vergiliæ. Some,as we haue before ſaid,haue K
obſerued it about 3 daies before the Ides of Nouember. And for that the ſaid ſtar is ſo euident
in the heauen,and eaſieſt to be known of all others,called it is by the name of a garment hang-
ing out at a Brokers ſhop. And therefore by the fall or retrait thereof, as many men as haue a
care and forecaſt to preuent the couetous dealing of the merchant-Tailor (as commonly ſuch
occupiers lie in the wind for gain) gueſſe aforehand what winter will follow: for if it be a clou-
die ſeaſon when the ſtar retireth,it threatens a rainy winter,and then theſe merchants preſently
raiſe the price of the clokes which they ſel: but if the weather be faire and cleare at the ſetting
or occultation thereof,it ſheweth a pinching and hard winter toward;and then they hold other
garments alſo very deare. But this Husbandman of ours,who cannot skill at all to looke vp and
to learn the order and poſition of the heauens,muſt ſpy this ſigne of winter amongſt his briers L
and brambles: he muſt find (I ſay) the time of Seednes as he looketh downe vpon the ground,
namely,when he ſees the leaues fallen and lying vnder his feet. Thus may a man know the tem-
perature of the climat,and the yeare,according as he perceiues the leaues be fallen more at one
time than another,ſooner alſo in ſome places,and later elſewhere. For as the ſeaſon is forward
or late,as the climate alſo is affected, ſo are the trees knowne to ſhed their leaues accordingly.
And in very truth this is the trueſt ſigne of all others. And the beſt thing therein is this, that
being generall throughout the whole world,and yet peculiar to each place,it neuer faileth. A
man might make a wonder hereat,if he did not ſee and remember, that vpon the very ſhorteſt
day in the yere,euen in midwinter when the Sun is entred Capricorn,the herb Penyroyal vſeth
of it ſelfe to floure,either ſet in chaplets, or otherwiſe hanging and ſticking in the ſhambles;
ſo willing is Nature to ſhew vs all her ſecrets, and to keepe nothing hidden from vs. For loe M
what ſignes and marks ſhe hath giuen vs,wherby we might know the time of ſowing corn; and
verily,this is the only true and infallible direction grounded vpon approoued experience, and
the ſame ſhewed firſt by dame Nature: for by this dropping & fall of leaues what doth ſhe els

*Called by our Husbandmen Gore-moone.

teach

20030
copy 1

A teach and counſell vs but to haue our eye vpon the ground, and to caſt ſeed into it, aſſuring vs of a certain ſupply of dung and compoſt, by ouerſpreading the ground, and caſt ſeed into it, that ſoon will turne into muck? what doth ſhe elſe (I ſay) but by couering the earth in this manner with leaues, ſhew how carefull ſhe is to defend it againſt hard froſts and pinching winds, and in one word, thereby putteth vs in mind to make the more haſt and get our ſeed vnder mould? As for *Varro*, he is of the ſame opinion for beans alſo, and willeth vs to obſerue the ſaid rule in ſowing them at the fall of the leafe. Others are of this mind, that the beſt ſowing thereof is in the full Moone. But for Lentils, we ſhould attend the laſt quarter toward the change, to wit, from the 25 day to the thirtieth. Alſo, that Vetches muſt be ſowed at the ſaid age of the Moon: for in ſo doing we ſhall preſerue ſuch pulſe from the naked ſnaile. Howbeit, ſome others there be
B that indeed would haue theſe kindes of Pulſe to be ſowed at this time of the yeare and age of the Moon for prouender and forrage to be ſpent out of hand: mary if we would keepe the ſame for ſeed, then we ſhould take the ſeaſon of the Spring.

Beſides thoſe rules and tokens aboue ſpecified, there is one more, which Nature vpon an extraordinarie prouidence ouer vs, hath preſented vnto our eies after a wonderfull manner, which *Cicero* expreſſeth in theſe termes

Iam vero ſemper viridis, ſemperq; gravata
Lentiſcus, triplici ſolita eſt grandeſcere fœtu:
Ter fruges fundens, tria tempora monſtrat arandi.

C
The Maſtick tree
All times, you ſee,
Is clad and richly dight,
With green in cold,
With fruit three-fold,
A faire and goodly ſight.

As ſhe therefore,
By Natures lore,
Doth fruit thrice yearely beare:
So thereby we
Know ſeaſons three,
Our land to duly eare.

Of which three ſeaſons, one is appropriate for the ſowing both of Poppy and alſo of Lineſeed: But ſince I haue named Poppy, I will tell you what *Cato* ſaith as touching the ſowing thereof: vpon that land (quoth he) where you mean to ſow Poppy, burn your winding rods, the cuttings
D alſo and twigs of vines, which remained and were left at the pruning time: when you haue burned them, ſow wild Poppy ſeed in the place; for it is a ſingular medicine being boiled vp to a ſyrrup in honey, for to cure the maladies incident to the chawes and throat. As for the garden Poppy, it hath an excellent and effectuall vertue to procure ſleep. And thus much concerning Winter corne and the Seednes thereof.

Chap. XXVI.

¶ *A ſummarie or recapitulation of all points of Husbandry: and to what outworks in the field a husbandman ſhould be imployed, reſpectiuely to euerie moneth of the yeare.*

E
BVt now to compaſſe vnder a certain briefe Abridgement or Breviarie, all points of husbandrie together: At the ſame time before named [to wit, at the falling of the leafe] it is good alſo to lay dung vnto the roots of trees; likewiſe to mold and bank vines: and one workeman is ſufficient for one acre. Alſo, where the nature of the ground will beare it, the husbandman ſhall not do amiſſe to disbranch and lop his tree-groues, to prune his vineyards, to hollow the ground of his ſeminaries and nourſe-plots with mattocke and ſpade, and dreſſe the mould light; to open his ſluces and trenches for water-courſe, to driue and drain it out of the fields; and finally, to waſh his Wine-preſſes firſt, and then to ſhut and lay them vp dry and ſafe. *Item*, after the Calends or firſt day of Nouember, let him ſet no hens vpon egs vntill the winter Sun-
F ſtead be paſt: when that time is come and gon, ſet Hens hardly, and let them couve 13 egs; marie better it were all Summer long to put ſo many vnder them; for in winter fewer will ſerue: howbeit neuer vnder nine.

Democritus giueth a gueſſe what Winter we ſhall haue, by the very day of the Winter Sunſtead: for look what weather is then and for threedaies about it, the like winter (he ſuppoſeth)

will enſue. Semblably, for the Summer he goeth by the other Sunſtead or longeſt day of the yeare: and yet commonly for a fortnight about the ſhorteſt day in the yeare (to wit, during the time that the fowles Halcyones do lay, couve, and hatch their egs in the ſea) the windes lie, and the weather is more mild and temperat. But as well by theſe ſignes as all other whatſoeuer, we muſt gueſſe the influences and effects of the ſtars, according to the euent, within ſome latitude of time; and not ſo preciſely to limit and tie them alwaies to certain daies prefixed, as if they were bound to make their appearance peremptorily in court, iuſt then, and faile not. G

Moreouer, in mid-winter meddle not at all with vines, touch them not in any hand, but let them alone. What then is the husbandman to do? Mary then (quoth *Hyginus*) after ſeuen daies be once paſt from the Sunneſtead, he is to refine his wines from the lees, and let them ſettle, yea and to poure them out of one veſſel into another, prouided withall, that the Moon be a quarter old. Alſo about that ſeaſon (to wit, when the Sun is in Capricorn) it is not amiſſe to plant cherrie trees, and ſet their ſtones: then is it good alſo to giue oxen Maſt to feed them; and one Modius or pecke is ſufficient to ſerue a yoke at one refection: allow them more at once, you glut them and fill them full of diſeaſes: but at what time ſoeuer you make them this allowance, vnleſſe you hold on thirty daies together, folke ſay, they will be ſcabbed and mangie when the Spring commeth, that you will repent for cutting them ſo ſhort. As for felling timber trees, this was the proper ſeaſon which we appointed heretofore. All other winter works for an husbandman to be buſied in, would be done in the night for the moſt part: ſit vp he muſt late, and riſe betimes by candle light, and watch hardly about them, for that the nights be ſo much longer than the daies: let him a Gods name find himſelfe occupied with making Wicker baskets and hampers, winding of hurdles, & twiſting of frailes and paniers: let him thwite torch wood taperwiſe with links and lights: and when he hath by day light made ready and prepared thirtie poles or railes for vines to run on, and ſixty ſtakes or props to ſupport them, hee may in the euening make fiue poles or perches, and ten forks or ſupporters; and likewiſe as many early in the morning before day light. H I

But now to come to *Cæſars* reckoning of the times & digeſtion of the cœleſtial ſignes: theſe be the notable ſtars which are ſignificant and do rule that quarter which is between the winter Sunſtead and the riſing of the Weſtern wind Fauonius. Vpon the third day (ſaith he) before the Calends of Ianuarie, which is the 30 day of December, the Dog-ſtarre goeth downe in the morning: vpon which day in Attica and the whole tract thereto adioyning, the ſtar Aquila, [*i.* the Ægle] ſetteth (by report) in the euening, and loſeth her light. The euen before the Nones of Ianuarie, *i.* the fourth day thereof, by *Cæſars* account [I mean for the meridian of Italy] the Dolphin ſtar riſeth in the morning, and the morrow after, the Harp-ſtar Fidicula; vpon which day, in Ægypt, the ſtar Sagitta [*i.* the Arrow] ſetteth in the euening. *Item*, from that time to the ſixt day before the Ides of Ianuarie [*i.* the eighth day of that moneth] when as the ſame Dolphin goeth down or retireth out of ſight in the euening, vſually we haue in Italy continual froſt and winter weather: as alſo when the Sun is perceiued to enter into Aquarius, which ordinarily falleth out ſixteen daies before the Calends of Februarie [*i.* the ſeuenteenth of Ianuary.] As for the cleare and bright ſtar, called the ſtar Royal, appearing in the breaſt of the ſigne Leo, *Tubero* mine Author ſaith, that eight daies before the Calends of Februarie, to wit, the 25 day of Ianuarie, it goeth out of our ſight in the morning: alſo ouer-night before the Nones of Februarie [*i.* the fourth day of the ſame moneth] the Harp-ſtar Fidicula goeth down and is no more ſeene. Toward the later end of this quarter, it is good and neceſſarie to dig and turne vp freſh mould with mattock and ſpade, againſt the time that roſes or vines ſhal be ſet, whereſoeuer the temperature of the climat will beare it: and for an acre of ſuch worke, ſixty labourers in a day are ſufficient to doe it well. At which time alſo old trenches and ditches would be ſcoured or new made. For morning worke before day the Husbandman muſt look to his iron tooles, that they be ground, whetted, and ſharpned; that their ſteles, helues, or handles, be fitted and ſet to their heads; that ſhaken tubs, barrels, and ſuch like veſſels, be new cowped, bound with hoops, and calfretted; that their ſtaues be well ſcraped and cleanſed, or elſe new ſet into them. And thus much of this Winter Quarter, as farre as to the comming of the Weſterne winde Fauonius. K L M

Now as touching the entrance of the new Spring, which is from the riſing of the ſaid winde to the Equinox in March; *Cæſar* ſets downe for it the time, which for three daies together is variable

20030
copy 1

A riable and inconſtant weather, to wit, ſeuenteen daies before the calends of March, which is the thirteenth of Februarie. Alſo 8 daies before the ſaid Calends, which is the 22 of Februarie, vpon the ſight of the * firſt Swallow; and the morrow after, vpon which day the ſtar Arcturus riſeth Veſpertine, *i.* appeareth in the euening. In like manner, *Cæſar* hath obſerued, that the ſaid wind hath begun to blow three daies before the Nones of March, to wit, the fift of March, juſt with the riſing or apparition of the Crab-ſtar Cancer. Howbeit moſt writers of Aſtrologie do aſſigne the firſt entry of the Spring and the comming of this wind, to the 8 day before the Ides of March, which is the eight of that moneth, when as the ſtar Vindemiator, *id eſt*, the Grape-gatherer, beginneth to appeare: at what time alſo the Northerly ſtarre called the Fiſh, ariſeth: vpon the morrow whereof, to wit, the ninth day, the great ſtarre Orion ſheweth himſelfe in his

B likeneſſe. In the region Attica where Athens ſtandeth, it is obſerued, that the ſtar Milvus, *i* the Kite or Glede, appeareth then in that climat. *Cæſar* moreouer noted, that the ſtar Scorpio riſes vpon the * Ides of March, thoſe fatall Ides (I ſay) that were ſo vnfortunate vnto himſelfe: alſo, that vpon the 15 Calends of Aprill, which is the 18 of March, the foreſaid Milvus, *i* the Kite-ſtar, appeareth to them in Italie, and three daies after, the Horſe-ſtar is hidden toward the morning. This is the freſheſt, the moſt buſie or ſtirring interual or time between that husbandmen haue; and yet therin they be oftneſt deceiued, for commonly called they are not to their work the very ſame day that the wind Fauonius ſhould by courſe blow, but when it begins to be aloft; which is a point to be conſidered and obſerued with right great regard: for if a man would take heede and marke well, this is that moneth wherein God giueth vs that ſure and infallible

C ſign which neuer faileth. Now from what quarter or coaſt this wind doth blow, and which way it commeth, albeit I haue ſhewed alreadie in the ſecond booke of this ſtorie, yet will I ſpeake thereof more diſtinctly and exactly anon; meanwhile, from that day (whenſoeuer it hapneth) on which that wind beginneth to blow, come it ſooner (as namely, when it is a timely and forward ſpring) or come it later, if it be a long winter (for it is not alwaies the * ſixth day juſt before the Ides of February) from that time, I ſay, muſt the ruſtical paiſants fettle to their work, then are they to goe about a world of toileſome labour, then muſt they plie their buſineſſe and make ſpeed to diſpatch thoſe things firſt that may not be defer'd & put off, then or neuer would their ſummer three month corne be ſowne, their vines be pruned in manner aboueſaid, their Oliue trees dreſſed and trimmed accordingly: Apple-tree ſtocks and ſuch like fruits, are then to

D to be ſet and graffed; then is the time to be digging and deluing in vineyards, to remoue ſome yong plants out of their ſeminaries, and digeſt them in order as they muſt grow, and to ſupply their plots with new ſeed and impes: Canes and Reeds, Willows and Oſiers, Broom alſo would then ſome be ſet, and others cut downe: Elmes, Poplars, and Plane trees, ought then to be planted, as hath been ſaid before: then is the meeteſt ſeaſon to cleanſe the corne fields, to ſarcle and rid the winter corn from weeds, and eſpecially the bearded red wheat Far: in doing wherof, this muſt be the certain rule to direct the husbandmen, namely, when the root of the ſaid Far begins to haue foure ſtrings or threads to it. As for Beans, they muſt not be medled withall in that order, before they haue put out three leaues; and then verily they muſt be lightly gone ouer, and cleanſed rather with a light hooke, than otherwiſe. When Beanes be bloumed, for 15 daies to-

E gether they ought not to be touched. As touching Barley, it would not be * ſarcled or raked, but in a drie ground, and when the weather holds vp. Order the matter ſo, that by the Æquinox in March, all your pruning and binding of Vines be done and finiſhed. If it be a vineyard, foure men are enough to cut and tie an acre of vines: and if they grow to trees, one good workeman will be able to ouercome fifteen trees in one day. This is the very time moreouer of gardening and dreſſing roſe-plots or roſiers [whereof I mean to treat apart and ſeuerally in the booke next following] of drawing vinets alſo, knots, and fine ſtorie works in gardens: this is the only ſeaſon to make trenches and ditches: the ground alſo would now be broken vp for a fallow againſt the next yeare, according to the mind and counſell of *Virgil* eſpecially, to the end that the Sunne might throughly parch and concoct the clots, and thereby make it more mellow for the Seed-

F nes. Howbeit I doe like better of their opinion (as the more thriftie and profitable of the two) who aduiſe to plough no ground in the mids of the Spring, but that which is of a mean temperature: for if it be rich and fat, preſently the weeds will ouergrow and take vp the ſeams and furrowes: againe, ſay it be poore and leane, the hot weather comming ſo ſoon vpon the fallow, will dry it too faſt, ſpend all the moiſture, and kill the heart therof, which ſhould maintain the ſeed

* Whereupon the ſaid wind *Fauonius*, is called *Chelidonias* and *Ornethias*.

*13 of March: for vpon that day was he murdered.

*i the ſeuenth of Februarie.

*Sarrito.

to be ſowne therein. *Cato* ſetteth downe the Husbandmens worke for the Spring time, in theſe G
tearmes. Caſt trenches (quoth he) couch young branches, and interre them for ſeminaries by way of propagation, in caſe the ground be ſtrong, fat, and moiſt withal. Lay dung to your Elms, Fig trees, Apple trees, and others of like fruit; to Oliues alſo doe the like: neither forget to manure and mucke your medow grounds; but al in a drie Moon and about the change. Such fields as are not well watered, defend them as well as you can from the Weſt wind Fauonius: downe with ſuperfluous weeds and rid them out of the way; but if they be hurtful beſides, pluck them vp by the roots. Cleanſe Fig trees betweene, where need is: make new ſeminaries and nource-gardens, and repaire the old. All this would be done before the vine begin to floure. Moreouer, ſo ſoone as the Peare tree ſheweth bloſſome, begin to plough leane, light, and ſandy grounds, but afterwards you may be bold to goe in hand with the fatteſt, faſteſt, and moſt wateriſh that H
be: let theſe (I ſay) be laſt tilled. And to conclude briefely, as touching this time of ploughing, let this be the marke and rule to guide you; namely, to ſet vnto your worke and put plough in ground, when you ſee either the Lentisk tree to ſhew the hope of her firſt fruit, or the Pear tree to bloſſom and haue a white head. There would be alſo a third tilth or cruſhing of the ground, obſerued by the ſea onyon Squilla, among thoſe hearbes which haue bulbous roots: likewiſe among floures, by the Daffodill. For as theſe doe bloume thrice, ſo they point vnto three times of ploughing. For by their firſt bloſſom, they ſhew the firſt tilth or breaking vp of the ground, by their middle flouring, the ſecond fallow or ſtirring: and by their third, the laſt cruſhing. Wherein a man may ſee the wonderfull chaine (as it were) that linketh this world together, whereby all creatures therein contained, giue lightſome tokens and ſignes one to another. And I
this may be obſerued alſo in the yuie (a thing verily not of the leaſt and laſt regard) that muſt not in any caſe be touched or medled with all, ſo long as Beanes be in their bloume; for that is the very time and meane to hurt it moſt and kill it for euer. Now, as ſome plants there be that ſerue for ſignes vnto others, ſo there be other that carie about with them their own mark, as for ample, the fig-trees, for looke when they put forth in the head a few leaues hollow, and with the edges turning vpward in manner of a ſawcer or goblet, be ſure that is the right ſeaſon and beſt time to plant them.

Now is it time to returne from whence we were digreſſed, namely, to the calculation of the principall times and quarters of the yeres, and namely, to the Spring Æquinox, which ſeemeth to be come and gon alwaies by the 8 day before the Calends of April, to wit, the 25 of March. K
From which day forward, by *Cæſars* calculation, the calends of April, to wit, the firſt day of April, are ſignificant, as whereupon the ſtar Vergiliæ, *i.* the Brood-hen, begins to riſe or appear in the morning; howſoeuer in Attica and the parts therabout, the ſame ſtar ſeems to ſet or be hidden in the euening vpon the third day before the Nones of Aprill, *i.* the third of that moneth: and the morow after, the ſame ſtar doth the like in Bœtia. Howbeit, according to *Cæſars* Ephemerides for Italie, and the Chaldæans for Aſſyria and Babylon, the foreſaid ſtarre goes downe or retireth out of ſight vpon the Nones of Aprill, *i.* the fifth of Aprill: at what time in Ægypt, as well *Orion* as his ſword [both ſtars in heauen ſo called] begin to be hidden. After *Cæſars* reckoning, the ſign or ſtar Libra ſetteth in Italy the ſixt day before the Ides of Aprill, which is the eight of the ſame moneth, and ſignifieth ſtore of raine. The fourteenth day before the Calends
* or *Hyades*, which ſome ſay are fiue in number, as *Heſiod*: others 7, as *Proclus*. of May, which is the eighteenth of April, the * Suculæ (a violent and troubleſome ſtar cauſing L
ſtormes and tempeſts raging both on land and ſea) goe downe at euening in Ægypt, but in Attica two daies before, to wit, the ſixteenth of Aprill: and in Italy, by *Cæſars* booke, the day between both; that is to ſay, the ſeuenteenth day of the ſaid moneth; the influence whereof is effectuall for three daies together: but in Aſſyria it falleth out twelue daies before the calends of May, *i.* the nineteenth of Aprill. This is the ſtar or ſigne in the heauens commonly named Palilicium; becauſe the eleuenth day before the Calends of May, *i.* the 20 of April, the very birth-day and memorial feaſt of Rome cities foundation (on which day the weather commonly cleareth vp and is faire again) gaue folk a notable occaſion of obſeruing the ſaid ſtars retreat or occultation: howſoeuer the Greekes haue tearmed them * Hyades, by reaſon of the rain and foule
* Ὑάδες ἀπὸ τοῦ ὕειν, *i.* of raine. weather which ordinarily they bring. And wheras our countrymen haue called them in Latine M
Suculæ, *i.* porkets or ſmal ſwine (according to the apparent Greeke denomination, which they thought to be deriued of ὗς, ſounding in Latine *Sus*, *i.* a ſwine, their ſuppoſal was falſe, and bewraied their great ignorance. Moreouer, *Cæſar* noteth the eighth day before the Calends of

May,

20030
copy 1

A May,which is the 24 of Aprill,for the time that the ſtar Hœdi,*i.* the Kids,do riſe in Italy:but the next day after,they are obſerued to appeare in Ægypt, the morrow following,within Bœotia and Attica,the Dog-ſtar is marked to be hidden & gon in the euening, when as the Harp-ſtar is ſeene in the morning. Now the day after that,which is the 5 day before the Calends of May,*i.* the 27 of April,in Aſſyria Oryon is quite hidden,and two daies after,the Dog-ſtar. Alſo the ſixt day before the Nones of May, which is the ſecond of that moneth, *Cæſar* obſerueth, That in Italy the foreſaid ſtars Suculæ,riſe matutine and ſhew in the morning:like as alſo the rainy Goat-ſtarre Capella,vpon the eigth day before the Ides of May, which alſo is the eigth day of that month,and the very ſame day the Ægyptians do obſerue in their countrey, that the great Dog-ſtar goeth downe in the euening,and is no more ſeene. Thus you ſee how theſe fixed
B ſtarres and ſignes aboue rehearſed do ordinarily keepe their courſes,ruling and gouerning this time between,to wit,from the Spring Æquinox in March, vnto the ſixt day before the Ides of May,which is the ninth of the ſaid moneth. During the firſt 15 daies of which halfe quarter, the husbandmen muſt make haſt and take in hand that work that he was not able to go through with and diſpatch before the Æquinox; knowing full well,that vpon neglect of this buſineſſe, aroſe firſt, the opprobrious reproches that vine-pruners and cutters doe heare on both ſides of their eares,from paſſengers and waifaring men,by way of counterfeiting the ſong of that Summer-bird which they call the Cuckow:for it is counted ſo foule a ſhame, worthie a checke and rebuke,that the ſaid bird ſhould come and find a pruning hooke or bill in a vine at that time of the yere; that folk therefore ſtick not to let flie at them bold taunts,& broad biting ſcofs euen
C in the firſt beginning of the ſpring, And verily as theſe birds,ſo their ſong counterfeited in this ſort,ſeemeth to carrie an ominous and curſed preſage with them. See how the leaſt things belonging to Agriculture,are guided and carried by naturall reaſons! As for the later end of this foreſaid time,it muſt be employed in the ſowing of Panicke and Millet; for it is ordinarie and vſual to ſow this kind of graine after that haſtie Barley is ripe, and alſo vpon the the very ſame lands where it grew. Now the ſigne common to them both,teſtifying as wel the ripenes of one, as the Seednes of the other,are the glo-birds or glo-worms Cicindelæ, ſhining in the euening ouer the corne-fields, for ſo the ruſtical paiſants and country clowns cal certain flies or worms glowing and glittering ſtar-like;and the Greeks name them Lampyrides: wherein we may ſee the wonderfull bounty and incredible goodnes of Nature, in teaching vs by by that ſilly crea-
D ture.

Chap. XXVII.

¶ That Husbandmen ſhould not gaze at ſtarres ſo much, but rather goe by the ſeaſons of the yeare meet for ſowing. Alſo,that they ſhould marke the riſing, the ſetting,and the courſe of the Sun in ſome hearbes. And of the riſing and ſetting of other ſtarres.

E NAture contented not her ſelfe to aſſemble a troup of ſtarres together in a knot (I meane the Brood-hen Vergiliæ,wherby it is a ſign in heauen aboue, conſpicuous ynough alreadie,and of great mark)but ſhe would needs giue the Husbandman other ſtarres beneath vpon the earth, as ſignes to ſhew him the true ſeaſons and times when and how to go to worke: as if ſhe cried out and ſpake vnto him after this manner: Why ſhouldeſt thou looke vp to the heauens,thou that art to till the ground? Why keepeſt thou a ſeeking among the ſtars for thy countrey worke? Take thy reſt and repoſe thy wearied lims good man, for the nights be now ſhorter than they were:to bed therefore,for thou haſt but a while to ſleep: Behold I ſcatter and ſpread here and there among thy very weeds and graſſe growing vpon the ground,other eſpeciall ſhining ſtars, and thoſe I repreſent vnto thine eies in the euening,and when thou doeſt vnyoke and giue order thy daies work:and that thou ſhouldſt not either plead ignorance,or negle& the ſame,I prouoke thee to regard and looke thereat, as a ſtrange wonder. Seeſt thou not
F theſe flies or glo-birds aforeſaid couer their bright and glittering light, reſembling ſparckles of fire,when they keep their wings cloſe together, and carrie fire-light about them euen in the night? More than ſo, I haue giuen thee certaine hearbs to tell thee what it is a clocke,and how the day goes:and to eaſe thee more,that thou needſt not take the pain to auert thine eies away from the earth where thy worke lies,and caſt them ſo much as vp to the Sun,loe the hearb Heliotropium

Iiotropium and the Lupine turn about with him. What ſtandeſt thou ſtaring ſtill into the ſky, G
and holdeſt vp thy noſe aloft into the aire ? why art thou amuſed vpon the courſe of the ſtars,
and ſearcheſt into heauen ? Haſt thou not I pray thee another Brood-hen ſtar, other Vergiliæ,
I ſay, euen before and vnder thy very feet, I mean theſe prettie glo-wormes ? Surely theſe come
duly at their ſet days: theſe keep time iuſt with thoſe of the heauen, and ſo long as they appeare
and ſhine aboue, theſe glo and glitter beneath: as if they were linked to that ſtar by ſome neere
alliance & affinitie: in ſuch ſort, as a man may reſolue & hold for certain, that engendred they
be no otherwiſe but by the influence thereof, and are the very chickens and brood of the fore-
ſaid Hen. And therefore conclude we may, that whatſoeuer ſoweth his ſummer corn, and looks
to reap fruit accordingly before theſe are to be ſeen, deceiueth himſelfe, and loſeth all his coſt
and pains. In this meane time and ſpace between, the prettie Bee commeth abroad, and telleth H
vs that Beanes bloume, for it is the Beane bloſſome that calleth her forth of her hiue.

Wouldſt thou know another ſigne yet, that winter is paſt and all the cold clean gon ? when
thou ſeeſt the Mulberry tree to bud & put out yong leaues, fear no more froſt nor hard weather
to doe any harme for that yere. Then (hardly) go to thy worke appropriat for this ſeaſon: now is
it good to plant yong ſions and quick-ſets of Oliues; now is the time to ſcrape and cleanſe here
and there where need is, the old oliue trees; and now would meddows be watered, euen preſent-
ly after the Æquinox. What is elſe to be done in the field this Spring time ? Mary, ſo ſoone as
the graſſe in the medow is grown to a ſtem and begins once to ſpindle, then let forth the water,
and draine your meddowes. Then do the Vines looke for to be disburgened and rid from their
ſuperfluous leaues and needleſſe branches. And herein there is a certaine gage let, and a rule to I
goe by, namely, when as the ſaid burgeons are ſhot out foure-fingers in length. Where, note by
the way, that the disbranching of an acre in vineyard, is one mans work a day and no more. This
is the ſeaſon to giue corne lands their ſtirring, that is to ſay, the ſecond tilth or fallow. As for
the ſarceling or weeding of [Winter] corne, it would be done within twentie daies. For let this
Æquinoctiall ſeaſon paſſe, it is thought that ſarceling and weeding will hurt not only corne,
but vines alſo. To conclude, this is the very time alſo to waſh ſheepe.

And now to come againe to our ſtars where we left. The morrow after the riſing or apparitio-
on of the ſtar Vergiliæ beforeſaid. *Cæſar* reckoneth, that the ſign Arcturus loſeth his light and
is hidden in the morning. Alſo, that the third day before the Ides of May, to wit, the 13 day of
that month, the Harpe ſtar ariſeth and begins to ſhine. Moreouer, twelue daies before the Ca- K
lends of Iune, which is the 21 day therof, the Kid-ſtar goeth down in the euening: at what time
as in the region of Attica the Dog-ſtar alſo ſetteth after the ſame manner. The next day after
(by *Cæſars* account for the Meridian of Italy) Orions Sword beginneth by little and little to re-
tire and goe out of our ſight. The third day before the Nones of Iune, *i.* the third day of that
month (after *Cæſars* Ephimerides for our climate of Italie, as alſo according to the Chaldæans
calculation for the Meridian of Aſſyria) the Eagle-ſtar beginneth to riſe and appeare in the e-
uening. In which region, Arcturus goeth downe, and we loſe the ſight thereof in the morning,
eight daies before the Ides of Iune, which is the ſixt of the moneth: howſoeuer with vs here in
Italie, he ſetteth two daies later. As alſo two daies after that, *i.* the tenth of Iune, the Dolphin
ſtar appeareth and giueth light in the euening. But ſeuenteen daies before the calends of Iuly, L
which is the fifteenth of Iune, we in Italy ſee the riſing of Orions Sword, which they in Æ-
gypt do obſerue foure daies after. And eleuen daies before the ſaid calends, to wit, the one and
twentieth day of Iune, the ſame ſtar (I meane the Sword of Orion) beginneth to goe down and
be obſcured in Italy, if *Cæſars* Almanack be true. Now are we come to the eight day before the
Calends of Iulie, namely, that four and twentieth day of Iune, the very longeſt day and ſhorteſt
night of the whole yeare, and the Summer Sunſtead. In this ſeaſon alſo be vines disburgeoned
and cleanſed from their vnprofitable leaues and branches: then required it is, and care would be
had, that an old Vineyard ſhould haue once digging, and the new, twice. This is the time of
ſheepe-ſhearing. Now, would Lupines be turned in with the plough, for to enrich and manure
the ground. Now are the lands to be cruſhed and ſet vp againſt the ſeed time. Now Vetches
wouldſt and no longer, but be cut for to make forrage. Beans alſo would be now mowed downe: M
and thraſhed out of the way ſoone after.

CHAP.

A

Chap. XXVIII.

¶ Of Medowes and lay grounds for hay and paſture. The manner how to refreſh and repaire a medow. Of ſith-ſtones and whet-ſtones: of Sithes and Sickles. Alſo, the time for ſowing corne, and the deſcription of thoſe fixed ſtarres that gouerne this ſeaſon.

THe ordinary ſeaſon to mow medowes, is about the Calends or beginning of Iune. And verily, albeit theſe kind of grounds ask leaſt care and toile about them for to be maintained, and ſtand the Husbandman in as little charges, yet ſomething would be ſaid thereof, and
B theſe few rules following obſerued. Firſt therfore, a ground would be hained in, left lay, and kept for graſſe and hey, which is for ſoile good and fat, for ſcituation lying either low and moiſt, or elſe hauing water at command from a brooke or riuer neere at hand: but aboue all, if it be poſſible, it muſt lie ſo, that it may haue the benefit of the rain by letting in land-flouds into it (running along the lanes and high-waies) for to refreſh and water the ſame. Alſo it is paſſing good otherwhiles to plough vp a medow ground (for the graſſe will come and grow afterwards the better) ſo it be wel harrowed or raked thereupon, and laid euen and leuel. Prouided alwaies that hey-ſeeds, floures, & al, be ſowed vpon it (ſuch as be found in hey lofts and ricks, or els that ſhed out from the rack into the crib or manger) which would be don before the ſame ground be harrowed as is aboueſaid. Howbeit, neither ought a medow that is laid for hey and paſture, be watered the firſt yere, ne yet graſed with cattell, before the ſecond math; for feare leaſt the beaſts
C pluck vp the graſſe quite ere it be well rooted, or kill the heart therof by ſteining and trampling it vnder their feet. Moreouer, it is to be noted, that ſuch medow grounds in time will age (as it were) and decay; in which regard, they ought to be helped and reſtored to their heart againe, by ſowing therein either Beans, Rapes, Navews, or Millet: and when you haue taken a crop of one of theſe from thence, the yeare following they would be ſowne with ſome Frument or bread-corne: and ſo the third yeare left lay for medow again. Ouer and beſides, this would not be forgotten, that at euery math, ſo often as the graſſe is mowed for hey with the ſyth, there come one after with an hooke, to cut downe thoſe tufts and manes which the mowiers paſſed ouer & left ſtanding behinde them: for there is nothing worſe for a medow, than to ſuffer graſſe grow to
D ſeed. The beſt hearbe in a medow is the Clauer graſſe or Trefoile: next vnto it is the common graſſe called Gramen, *i.* Coich or Dogs-tooth: the worſt is * Mimmulus. Alſo the Camocke or Whin, called Reſt-harrow, and ſuch like codded graſſe, is not for mowiers, for they cry out vpon ſuch, and curſe it. Moreouer, they cannot away with the herbe Equiſetis, *i.* Horſe-taile, ſo called for the reſemblance it hath to an horſ-taile or mane.

* Some read *Nummulus*, i. *Nummularia* Penny-graſſe.

The fit time to mow downe graſſe, is when the ſpike or head thereof beginneth once to ſhed floures, and to wax ſtiffe: for in no caſe muſt it ſtand vntil it be dr and withered. Be not too late (quoth *Cato*) in your hey harueſt, but down with your medows, before the ſeed of your graſſe be ripe. Some, the day before that they ſet ſyth into their medows, water them, if there be a brook at hand to be let in. And indeed the beſt cutting downe of graſſe is preſently vpon ſome good
E dewes that haue fallen ouernight. * In ſome parts of Italy the manner is to cut their medowes after corn harueſt. Moreouer, in old time it was more coſtly and painfull to mow (by far) than it is now adaies: for they vſed no other whetſtones, but ſuch as were known & ordinary, as brought out of Candy and from beyond ſea; which would not giue an edge to their ſythes and make them keen, without they were whetted with oile (as Barbers do their raſors, & grauers their fine chezils and caruing yrons:) and to that purpoſe the mowier went euer with a horne full of oile, tied faſt to his ſhanke. Since which time there haue bin found in Italy other manner of grind-ſtones, with water, which will bring any yron toole to an edge quickly, as wel as a file. But theſe water grindleſtones ſoone get a ſwarth and preſently become greene.

* Haply he meaneth a ſecond math.

As touching the very Sythes, there be two ſorts of them. For thoſe of Italy be ſhorter than
F other, eaſie to handle and weld, and it were among buſhes, briers, and brambles. In France where their fields and medows be large, they go a nearer and ſhorter way to worke, for they make no more ado, but cut the graſſe down at the middle, and let that alone which is ſhort. Our mowiers here in Italy, take but one hand to it, and that is commonly their right, and ſo cut downe their graſſe: thus you ſhall haue a man ordinarily in one day go ouer an acre and cut it down cleane.

Alſo

Alſo it is one mans work to bind the hay of one acre into bottles: and vſually you ſhal haue in G
* Which is almoſt three of our ſale lodes. ſo much ground * 1200 prety ones, of foure pound weight apiece. So ſoon as the graſſe is cut down and laid in ſwath, it muſt be tedded, brought into windrowes, and turned eftſoones with the Sun: neither ought it to be cocked vp but dry: for otherwiſe, if this be not carefully looked vnto, you ſhall ſee it reeke and ſmoke againe by the morning, for the heate that it hath caught within: but let the Sunne take it beſides, you ſhall be ſure to ſee the cockes kindle and be of a light fire.

So ſoon as this firſt graſſe is down and the hay made, the medow muſt preſently be watered
* Some call it woodcock hey again, to the end there may be a ſecond math of rowen hay in * Autumne, which the Latins cal Cordum. In the territorie of Interamna they vſe commonly to mow their medowes 4 times a yeare, yea, though they lie high and far from the benefit of water. And in moſt places of Ita- H
lie thrice is ordinarie: and the rowen graſſe afterward commeth vp ſo thicke and high for paſturage and forrage, that it yeeldeth as great a benefit as the crops of hay before: mary, to raiſe this commoditie and gain thoſe know full well who are drouers of greater cattell, breeders alſo of yong colts, and principally Chariottiers that keepe choach-horſes; for all theſe haue the beſt means to imploy this graſſe for their moſt behoofe.

To proceed now to the conſideration of the heauens. The ſummer Sunſtead falleth out alwaies [in Italy] to be iuſt vpon the 24 day of Iune, at what time as the Sunne is entred eight degrees within Cancer, as hath bin ſaid before. This is that great point & Tropick of the world: now is the heauen in moſt force, and the Sun at the higheſt of his power and vertue. From the midwinter or ſhorteſt day of the yeare, vnto this preſent, during the ſpace of ſixe moneths the I
daies lengthen: and now the Sunne being paſſed far into the North, and hauing mounted and raught to the higheſt pitch of his intended laborious iourney, beginneth to turn againe from this Tropick of Cancer in the North, and bendeth his courſe toward the other Tropick of Capricorn in the South, intending by this means for other ſix months to lengthen the nights and to ſhorten the daies proportionably. Which the husbandman no ſooner ſeeth, but hee taketh his opportunitie, and woteth well, that now is the time wherein he muſt of neceſſitie make haſt to gather and inne the fruits of the yeare, each one reſpectiuely in their ſeueral ſeaſons: now or neuer ought he to lay in his prouiſion againſt the winter: now muſt he arme and prepare himſelfe, no remedie, to withſtand the rigour of cold and froſty weather: and therefore meet it was, that dame Nature, our kind Nurſe and tender mother, ſhould giue vs warning hereof, and fore- K
ſhew this alteration of the yeare, by moſt vndoubted and infallible arguments. Hereupon ſhe hath preſented theſe marks and ſignes to the husbandman, & brought them euen to his hand, commanding ſundry trees vpon that very day of the Sunſtead to turne their leaues toward the Sunne, as if ſhe pointed vnto them by the finger, and ſhewed how that Planet began to retire from whence he came: ſo willing ſhe is, not to conceale from him theſe ſecrets, that ſhe hath not ſet theſe marks vpon wild and ſauage trees far remote, out of the way, (becauſe ſhee would not haue him take ſo much pains as to go into deſart forreſts, vnpaſſable welds and mountains, to ſeeke for the ſignes and tokens aforeſaid) ne yet vpon ſuch as grow within good townes and cities, much leſſe then thoſe that ſerue and are in requeſt for arbors and vines onely in Hort-
yards and gardens of pleaſure, that he ſhould be faine to leaue his terme in the country and go L
thither (and yet theſe trees alſo teſtifie of the Sunſtead and his returne:) what hath ſhe done then? Mary ſhe hath cauſed the oliue tree, which he ſeeth euery houre planted at his very foot, to turne about her leafe: ſhe hath willed the Linden, a tree that hee hath recourſe vnto euerie foot for a thouſand vſes, to doe the like: ſhe hath enioyned the white Poplar or Aſpe alſo the ſemblable, wedded as it is ſo commonly to Vines. Haſt thou not enough yet (quoth ſhe) and will not all this make thee perfect? Looke then to the Elme, at the foot whereof thou planteſt thy Vine, and which thou ſeeſt continually indowed and inriched therewith, I wil make it alſo to turn the leafe when the Sun returnes. Thou ſtrippeſt her of her leaues and branches for thy cattell to eat and brouſe; thou getteſt vp into it for to prune the Vine; How canſt thou chuſe but ſee the leaues turned? How canſt thou be ignorant, but take knowledge of the Solſtice M
and Suns return? Surely that ſide of the leafe which was from the Sunne but yeſterday, is now clean contrary and looks toward him; and in one word, all are turned vpſide down. Thou occupieſt the oiſier and willow twigs euer and anon, to bind and tie one thing or other; loweſt they grow of all the reſt, and higher thou art than they by the head: neuer looke vp nor caſt thine

eye

20030
copy 1

A eie aloft for the matter: thou ſhalt ſee how I wil haue them alſo, growing euen vnder thy noſe, to turn their leaues about and follow the Sun. Why complaineſt thou and whineſt, ſaying, I am a ſimple countrieman, I am not book learned, I neuer went to Grammer ſchoole, and I wot not what? Certes, I cannot do withall if thou be ignorant of the heauens, and canſt not skill of the cœleſtiall ſigns and courſe of the ſtars: it ſhal not be long of me, but thou maiſt be an Aſtronomer and Clearke ſufficient. For if all this teaching wil not ſerue, in caſe, I ſay, thine eies wil not inſtruct thee enough to learne theſe ſignes: one ſigne more will I preſent vnto thine eare. Doe but liſten to the groning tune and pitiful mone that the Quoiſt and Stocke-doue makes; and neuer think that the Sunſtead is paſt, before ſhe haue left ſinging, and that thou ſeeſt her couve and ſitting vpon her egs.

B But now to go on ſtill with our Aſtrologie and Speculation of heauen as we haue begun: among thoſe ſtars that rule this ſeaſon from the Sunſtead beforeſaid, vnto the ſetting or occultation of the * Harp-ſtar; *Cæſar* ſaith, that ſix daies before the Calends of Iuly; to wit, the 26 of Iune, Orion riſeth to the inhabitants of Italy: how ſoeuer the ſtar called Orions * girdle, appeareth not to the Aſſyrians before the fourth day of Iuly, vpon which day in Egypt the ſtar Procyon, *i.* the fore-runner of the Dog-ſtar Syrius, ſheweth in the morning, and commeth in very hot and fierie: and ſurely what Latine name this ſtar ſhould haue among the Romanes, I wot not, vnleſſe we would haue it to be Canicula (*i.*) the leſſe Dog-ſtarre, according to the pourtrait that it ſeemeth to reſemble among thoſe fixed ſtars in the firmament: and yet is this a ſigne in the heauen of great marke and conſequence, as anon we will declare more plainely. The third C day before the Nones of Iuly, *i.* the fift of the ſaid moneth, after the Chaldæans account in Syria and Babylon, the ſtar named Corona, *i.* the Crowne, goeth downe in the morning: but on the very ſame day to the people of Attica, Orion is ſeene to riſe all whole as he is. The euen of the Ides of Iuly, which is the 14 of that moneth, the ſame Orion ceaſeth to be ſeene of them that dwell in Egypt: and ſixteen daies before the Calends of Auguſt, to wit, the ſeuenteenth of Iuly, the foreſaid ſtar Procyon riſeth to them in Aſſyria. The morrow after, which is the 18 day, all Writers in manner doe agree vpon the riſing of that ſignificant and notorious ſigne, which commonly we call the Dog-ſtar; to wit, when as the Sun is entred the firſt degree of Leo, which falleth out to be the 23 day after the Summer Sun-ſtead. And in truth both ſea and land doe find and feele the arriuall or comming of this ſtar, yea, and many a wild beaſt beſides, according D as we haue ſhewed already in place conuenient. Neither is this ſtarre leſſe worſhipped and adored than thoſe renowned Planets which carrie the names of gods and goddeſſes, and haue Diuine honours done vnto them. He it is that inflameth and ſetteth the Sunne on fire: to him is imputed the greateſt cauſe of that extreame hot weather during the canicular daies. Two daies before, which is the fifteenth of Iuly: on which day the Ægle ſtar goeth downe in the morning, and then the Eteſian winds (called the Auant Curriers) begin, which *Cæſar* thought were not felt nor knowne in Italy vntill eight daies after, namely, the three and twentieth of Iuly: on which day the Eagle ſtar is knowne to ſet and goe out of ſight in the region of Attica and that tract, in the morning. As for the Roiall ſtar ſeated in the breaſt of Leo, *Cæſar* affirmeth, That it goeth downe and is all hidden betimes in the morning, the thirtieth day of Iuly, which is three E daies before the Calends of Auguſt. Now the eight day before the Ides of Auguſt, which is the ſixt day of the moneth, the one moity or halfe of Arcturus goeth downe: but the third day before the ſame ides, which is the eleuenth of that moneth, the Harpe ſtar by his occultation or going downe, beginneth Autumne, according as the ſame *Cæſar* noteth; but indeed and verily, as it hath bin found by true demonſtration, it is the ſixt day before the Ides; to wit, the eight of Auguſt. This halfe quarter or ſix weeks ſpace, is that which determineth of vines and vintage, by the meanes of that ſtar which wee called Canicula, the very ruler indeed ouer Vineyards, and whereupon dependeth the good or bad ſeaſon for all our grapes and wine the next yeare. From hence it is, and not otherwiſe, that the vines are ſaid to be blaſted, & the grapes burnt (as it were) to a coale. No haile ſtormes, no tempeſt of wind or raine is comparable hereunto, nor doth the F like harme to corn and grapes: this cauſeth many a time ſcarcitie, and bringeth extreame dearth and famine, which neither haile nor tempeſt doth. As for theſe tempeſts, they indomage haply, and hurt ſome fields here and there: but the blaſt beforeſaid plagueth whole countries, far and neare. Howbeit, it were no hard matter to deuiſe how to withſtand and remedy this miſchiefe, but that men haue more pleaſure to take occaſion for to blame Nature & her workes, vnder pretence

* *Fidicula.*
* *Zona.*

tence and colour of ſuch vntoward blaſts, than to ſeek and find means to do themſelues good. It G
is reported of *Democritus*, the firſt Philoſopher who vnderſtood himſelfe, and afterwards ſhewed
vnto the world, the great affinity and agreement that was between heauen and earth (which ſtu-
dy of his the richeſt and wealthieſt citizens where he liued, ſeemed to ſcorne and deſpiſe) fore-
ſeeing by the courſe of the ſtars, to wit, by the riſing that would be of the Virgiliæ or Broodhen
(according as I haue ſhewed already, and wil anon declar more at large) that oliues would faile
that yere, and conſequently a dearth inſue of oile; bought vp all the oile in that tract & coun-
try, which as then for the hope of great plenty of Oliues, bare no price: whereat the great mer-
chants of the city (who dreamed of nothing leſſe than of a ſcarcity of oile, conſidering the oliues
made ſo faire a ſhew vpon the trees) were aſtonied and maruelled much, that *Democritus* ſo lear-
ned a Philoſopher, & a man who they knew, was wont by his profeſſion to content himſelf with H
pouerty, to ſet his mind vpon nothing ſo much as a quiet life, and wholly to buſie his braine in
attaining of knowledge and learning, was now on a ſudden become a merchant. In the end, they
perceiued what the cauſe was, & acknowledged his diuine skill in foreſeeing & preuenting a
dearth, and he for his part ſhewed plainly, That it was not auarice & deſire of lucre that moued
him to take this courſe, but to let the world know, that if he were ſo diſpoſed, hee could by the
meanes of his learning only, be ſoon a rich man (as indeed he grew hereby to exceeding wealth)
for preſently of his own accord he reſtored again to the former owners, who God wot were diſ-
pleaſed with themſelues for that they had don, & wiſhed withall their hearts, that they had met
with the like bargain; he remitted (I ſay) all this commodity which he had gotten into his own
hands, at their own price: reſting herein, that he had made good proofe, how ſoone and eaſily he I
could be rich when he would. Long time after him, *Sextius* one of our Roman Philoſophers, did
the like at Athens, & after the ſame maner: wherby we may ſee, in what ſtead learning and lite-
rature ſerueth, if a man will imploy the ſame to his own benefit. And I care not much verily to
giue the countriman a taſt therof, as much as concerns the cauſe of the Blaſting aforeſaid, & to
intermeddle the ſame with his ruſtick affairs, but as plainly and with as great facility & light-
ſomneſſe as poſſibly I can. Moſt are of this opinion & haue deliuered in writing, that as wel the
blaſting in corn called Ruligo, as the ſindging & burning of vines named Carbunculus, proceed
from certain dews ſetling vpon them, which caught a cauſtick quality from the Acrimony and
extraordinary heat of the Sun. This conjecture and reaſon of theirs, I hold in ſome part to be
falſe, for the Sun neuer doth harm either to the one or the other in this reſpect; but looke what K
blaſt ſoeuer it be that ſindgeth or burneth corn and vines, it is occaſioned by cold only: & if you
take good heed and mark how this commeth about, you will ſay it is cleare & paſt all perad-
uenture: for firſt & formoſt this is well known, that it neuer hapneth but in the night, or at leaſt-
wiſe before the Sun is riſen: ſo as we may conclude wel & truly, that all this dependeth vpon the
influence of the moon. For neuer ſhall a man ſee any of theſe hurtful blaſts, but either about the
change or full of the moone, namely, when ſhe is in her greateſt force: for at both theſe times, as
well in the coniunction with the Sun, as in oppoſition, powerfull ſhe is, and in ſome ſort may be
termed Full, as I haue many a time already ſaid. But at the change, look what light ſhe receiued
from the Sun, the ſame ſhe ſendeth all vp again to heauen. Great difference therefore there is in
the effects of the moone in both theſe habits, and the ſame very euident and apparant: for be it L
in ſummer, hotteſt ſhee is in the change; but in winter, cold: contrariwiſe, the moone in Sum-
mer being at the full, maketh cold nights, and in winter is warme: the cauſe whereof is plaine
and manifeſt. Howbeit, *Fabianus* and the Greeke writers, render another reaſon: for in ſummer
time, the moone being in coniunction with the Sun, and meeting with him when he is in a cir-
cle neareſt vnto vs, muſt of neceſſitie be inflamed with the fire that it receiueth from the ſunne,
ſo neare vnto her and vs both: whereas contrariwiſe, during winter, in the time of the change or
conjunction, ſhe cannot chuſe but be cold, as being remote farre from vs; like as the ſunne alſo,
who is retired far South toward the Tropicke of Capricorne. Semblably, at the full in Sum-
mer, ſhe is far off from vs, as being oppoſite vnto the ſunne ſo neere vnto vs: no maruell there-
fore if ſhee be cold in regard of our climate: but in winter, at the ſame time of her oppoſition M
as ſhe is nearer vnto vs, taking her courſe through the ſummer circle of the ſun; ſo we may con-
clude, ſhe doth moderate the rigour of winter cold, and conſequently that then, ordinarily ſhe
is warme. Conſidering then that the moone being (at the full in ſummer) ſo cold, and charged
ordinarily as ſhee is of her owne nature with much dew, what wonder is it if at ſuch a time

the

20030
copy 1

A the froſts and dewes that fall be exceeding cold and congealed againe, which are the cauſe of all the ſaid blaſtings? But aboue all we muſt remember, that there be 2 ſorts of accidents comming from aboue, that mightily do wrong and annoy the fruits of the earth. The one wee call tempeſts, which comprehend hails, ſtorms of wind and rain, and ſuch like impreſſions of the air, which whenſoeuer they do light, are termed by the Lawyers, *Vis maior*, *i.* the greater violence: and theſe for the moſt part proceed from ſome of the horrible and dreadfull ſtarres, as wee haue many times noted; to wit, Arcturus, Orion, and the Kids. Of the ſecond ſort of theſe calamities, be they which happen when the weather is ſtill and quiet without any trouble of windes, in the faireſt and cleareſt nights, and no man euer perceiueth them vntill the harme be done: theſe bee more publick and vniuerſall, theſe differ much from the former; ſome cal them Mildews, others
B Hot-Planets; ſome again term them blaſts and ſindging Carbuncles: but it skils not much what names they haue, for all men confeſſe that ſcarcitie and dearth is their effect. And foraſmuch as no man hitherto hath written of theſe Blaſts, &c. I mean to deliuer mine opinion of them, and firſt to ſet downe the cauſe and reaſon thereof.

or the hand of God.

Chap. XXIX.

¶ *Of the Tempeſts and calamities incident to the fruits of the earth, as well in Winter as Summer: the meanes alſo to remedie ſuch accidents cauſing ſterilitie and ſcarcitie.*

C THeſe Blaſts, theſe wicked Planets, that ſindge and burne the fruits of the earth, beſides the influence and power of the moone, proceed from other cauſes, and twaine eſpecially, and thoſe are not to be found in many coaſts and quarters of the heauen: for the ſtar Vergiliæ, regardeth principally the fruits of the earth, and ouer them is very predominant; as being the only ſtar, which in her riſing and apparition begins Summer; in her fal and occultation, ſheweth the entrance of winter; by which means for ſix moneths ſpace, whiles ſhe is in ſight, ſhe compriſeth harueſt and vintage, and generally cauſeth all fruits to ripen kindly or vnkindly.

There is beſides in the heauen, a certain white circle called the milkway [or Watling ſtreet] which is not imaginarie as others, but very conſpicuous and eaſie to be ſeene. By the influence of this circle, as it were out of ſome vdder, all plants receiue their milke, their humidity and nu-
D triment, and namely, by the means of two notable ſtars obſerued therein; to wit, the Ægle in the North-ſide thereof, and the Dog Canicula (whereof we made mention in place conuenient) ſcituate toward the South. This circle then paſſing through the ſignes of the Zodiacke, Sagittarius and Gemini, and ſtretching by the centre of the Sun, cutteth the Equinoctial line twice in two ſeuerall places: the commiſſures or ioints of which two ſignes, are poſſeſſed of the one ſide with the Eagle ſtar, and on the other ſide with the Dog Canicula beforeſaid. No maruell therfore if all countries habitable and fruitfull, be ſubiect to the influence of theſe two ſtarres and feele their effects; becauſe in thoſe parts only of the Zodiack wherein they are placed, the centre and middle of the earth, together with the centre alſo of the Sun, agree and meet juſt in one and the ſame point of the Equinoctial. Hereupon it is, that if in the ſeueral ſeaſons of theſe two
E ſtars aboueſaid (to wit, when the Egle and the Dog Canicula, doe either riſe or fall, appeare or couch) the aire be pure, cleare, and mild, and thereby the humour genitall diſtilling from that Milkeway or circle aforeſaid downe to the earth, meet with that faire and calme aire, then all plants and fruits of the earth are the better for it, and proſper mightily. Now in caſe the moone either at change or full, do ſend downe and ſprinkle vpon them a cold congealed dew (in manner aboueſaid) the humor and nouriture likewiſe deſcending from the Milk-circle, is infected therwith and becommeth bitter, killing all the fruit vpon which it falleth: much like as if a young babe or infant new borne, ſhould ſucke bitter and vnwholſome milke, and thereupon ſoon after die. Thus you ſee, how in euery climate whatſoeuer, the correſpondence of the moone and the ſtars aboueſaid more or leſſe, cauſeth thoſe vntoward Blaſts, Mildewes, and ſuch like; nor in like
F meaſure at one time and in euery place. Which is the cauſe that this kind of iniury and calamitie is not felt at one inſtant throughout the world, no more than the day is one and the ſame in all parts of the earth: for the Ægle (as I haue ſaid before) ariſeth to vs in Italy thirteen daies before the Calends of Ianuarie, *i.* the 20 of December: now before that day be paſt (by the ordinarie courſe of Nature) there can be no aſſured hope of the fruits of the earth, but that they

may

may miſcarry: but if it fall out beſides, that the moon vpon that day do change, all fruits as well G
winter fruits as thoſe which be called Haſtie, muſt of neceſſity take harme and be hurt thereby.
Rude and ſimple, I confeſſe, were our anceſtors in old time, and altogether vnlettered, howbeit
as wittie (as ſhall appeare) in their obſeruations and ceremonies, as our Moderns in theſe daies
be reſolute, with all their skill they haue, grounded vpon reaſon and conſequence: for accor-
ding as they feared three ſeaſons aboue the reſt; leſt they ſhould do harm vnto the fruits of the
earth; ſo they inſtituted as many Holy-daies and ſet feaſts; to wit, Rubigalia, Floralia, and Vina-
lia. As touching Rubigalia, they were ordained firſt by King *Numa* in the eleuenth yeare of his
*S. *Markes* day with vs. raigne, which now we celebrate a * ſeuen-night before May-day, to wit, the 25 of April: the rea-
ſon is, for that about this time corne is ſubiect to the blaſt. Howbeit, *Varro* following the order
obſerued in his daies, ſetteth downe this dangerous time to be, when the Sun is in the tenth de- H
gree of Taurus, and occaſioned thereby. But indeed, according to the calcull of others, the true
reaſon and cauſe is this, That about nineteen daies after the Spring Æquinox, diuers nations
haue obſerued foure malignant daies, which reach to the 28 of Aprill: in which time, the Dog-
ſtar Canis coucheth (a violent and dangerous ſtar of himſelfe by nature) and before which of
neceſſitie the other little ſtar Canicula muſt retire and goe downe. And therefore thoſe ance-
ſtors and forefathers of ours, inſtituted the feaſt of Floralia, as they were aduiſed out of the
bookes of *Sibylla*, in the 516 yeare after the foundation of Rome citie: who ordained alſo, that
the ſaid feaſt ſhould be held the fourth day before the Calends of May; to wit, the 28 day be-
fore named of Aprill, for this intent, That all Plants might bloome kindly, and ſhed their bloſ-
ſoms as well. *Varro* ſetteth downe this day to fall out, when as the Sunne is entered foureteene I
degrees into Taurus. Therefore in caſe it be full moone during theſe foure daies of the Feaſt
Floralia, not onely corne, but all other plants what ſoeuer that ſhall bloſſome, are ſure to take
great harme thereby. As for the former feaſt called Vinalia, which is kept fiue daies before; to
*S. *George* day with vs. wit, the * 23 of Aprill, it concerns nothing at al the fruits of the earth, but was appointed onely
as a fit time for to taſt wines. And yet for all theſe obſeruations before-named, there is none of
them pertinent either to Vines or Oliue-trees, for their time of conception beginneth at the ri-
ſing of the ſtar Vergiliæ; to wit, ſix daies before the Ides of May, which is the tenth of that mo-
neth, as we haue before declared. About which time, there be other foure dangerous daies, in
which husbandmen in no wiſe would haue any groſſe and filthie ſtinking dewes to fall, for feare
of their Vines and Oliues (for aboue all, they ſtand in dread of the ſtarre Arcturus, which goeth K
downe the morrow after the riſing of Virgiliæ, and commonly brings with it raw and vnkindly
rimes) and much leſſe that the moone ſhould happen to be in the full at ſuch a time: the fourth
day before the Nones of Iune, which is the ſecond of the ſame moneth, the Eagle ſtarre appea-
reth the ſecond time in the euening: a judiciall day is this day, and it will goe hard with oliues
and Vines now in their flour, eſpecially if the ful moon alſo light therupon, and giue euidence
againſt them. For mine owne part, I would thinke verily, that the Summer Sunſtead ordinarily
vpon the 25 of Iune is as dangerous; as alſo the riſing of the great Dog-ſtar which alwaies fal-
leth out to be 23 daies after the ſaid ſunſtead, if ſo be that the moon doe change in any of thoſe
two daies; for then commeth the harm by extremity of heat, which doth ſo bake and harden the
yong kernels of the grapes and Oliues new knit, that they be tanned as it were into a tough cal- L
loſity, that they can thriue and grow no more from that day forward. Againe, the full of the
moone is as hurtfull as it, to vines and Oliues, if it happen the fourth day before the Nones of
Iuly; to wit, the fourth day of the ſaid moneth, at what time the leſſe Dog-ſtarre Canicula ri-
ſeth to them in Egypt; or at leaſtwiſe the ſixteenth day before the Calends of Auguſt, which
is the ſeuenteenth of Iuly, when we in Italy diſcouer the riſing of the ſaid Canicula. Likewiſe if
the moone chance to be in the full betweene the twentie and three and twentieth daies of the
ſaid Iuly, what time the Eagle ſtar goeth down, the ſame danger befalleth Vines and Oliues: as
touching the ſecond Feaſt Vinalia, which is obſerued & kept thirteen daies before September,
to wit, the 20 of Auguſt, it is not to be ranged among theſe, as being of another nature, and inſti-
tuted at firſt for other cauſes. *Varro* would haue this feaſt to beginne at the departure of the
Harpe-ſtar Fidicula, which beginneth to retire in the morning, and which day he ſetteth downe M
for the firſt entry of Autumn: ſaying moreouer, that this feaſt was inſtituted for appeaſing the
ſtormes and tempeſts incident to that ſeaſon. And now obſerued it is, that the ſaid Harp-ſtarre
Fidicula ſetteth ſix daies before the Ides of Auguſt, which is the 8 day of that moneth: Thus
much

20030
copy 1

A much as touching the cauſes of ſterilitie and dearth, occaſioned by the conſtellations, according to ſundrie ſeaſons of the yeare, after that calculation which I goe by: But I will not bind euery man thereto, for well I know and cannot denie, but the readers may change and alter the ſame at their pleaſures, according to the diuerſitie of the climats, in regard whereof, the obſeruation alſo of thoſe dangerous daies may vary from mine account. For this preſent, it ſufficeth my turne that I haue ſet down the true cauſe in Nature, from whence proceed thoſe calamities: all the reſt beſides, I refer to each mans conſideration, who for any thing that I haue ſaid, may take their libertie and obſerue what they thinke good. Certes this ſhall be found cleare and doubtleſſe in the end, That theſe vnkind dews and daungerous blaſts are occaſioned by one of theſe 2 cauſes, to wit, either the full or chaunge of the Moone. And herein verily, I cannot chuſe but meditate vpon and admire the wonderful goodnes and bounty of dame Nature, firſt in this
B That ſhe hath ſo limited and determined the ſet courſe of the ſtars, that theſe calamities cannot poſſibly happen euery yere; neither yet oftentimes in the ſame yere, but only ſome few nights, to wit, in the chaunge or full of the Moone: and when they will boone, it is eaſy to foreknow and fore-tell. And to the end that we ſhould not need to feare thoſe daungers euery moneth, ſhee hath ſo ordered the matter, and diuided the influence of the Moone by night in ſuch ſort, that ſetting aſide two daies in Summer, the chaunges of the Moone do no harm at all: no more than the full in Winter: neither are theſe two new Moones to be feared, but in Summer nights, and thoſe ſhorteſt of all other: wherby they haue leſſe time and leaſure to offend the earth: for al the day long they haue not the ſame force, nor worke the like effects. Ouer and beſides, ſo eaſie a
C matter ſhe would haue it for to know either the conjunction or oppoſition of the Moone, that the very Piſmire (the ſilliеſt and leaſt creature of all other) by inſtinct of Nature, is our guid to the one and the other: for in the change ſhe is ſeen commonly to reſt and take her repoſe; whereas at the full Moone ſhe works and labours both night and day. And that we ſhould not be ignorant of the Dogge-ſtar Sirius his riſing, looke what day he ſheweth firſt, the little Nonett or bird, called in Latine Parra, goeth aſide, and appeareth not again before he be hidden and gone downe. Contrariwiſe, the Loriot, Greene-finch, or Canarie bird Vireo, commeth abroad the very day of the Summers Sunſtead, and not before, that we ſhould not pretend ignorance of the longeſt day in the yere, a time wheron dependeth ſo great a conſequence. But be it change or be it full, neither the one nor the other habit of the Moone is daungerous, no not in the very
D night ſeaſon, vnleſſe it be cleare and calme, that is to ſay, faire ſtarlight, and all winds laid: for neither in cloudy and cloſe weather, ne yet when the winds are aloft, doe any dewes fall. And at ſuch times alſo as they vſe to come, there is a remedie prouided againſt them: for when thou feareſt a blaſt or Mieldeaw, lay me altogether ouer the fields and Vineyards (by heaps) Vine-cuttings and ſuch drie ſticks, chaffe, ſtraw, and other like mullock, drie weeds and ſhrubs which haue been plucked out of the ground, and ſet them all on fire; the very ſmoake will helpe this matter, and auert the daunger from corne and grapes. And as for the fume of chaffe and ſtraw, it is good againſt ſtinking fogs and miſts, when they are thought to doe harme. Some there be that preſcribe to take three Crab-fiſhes aliue, and to burn them in hortyards among the trees: to preſerue and defend them againſt the ſindging blaſt called the Carbuncle. Others take the
E fleſh of the fiſh Silurus, & roſt or broile it ſoftly vpon the fire, on the wind ſide, to the end, that the fume and ſmoke thereof might be caried and diſperſed al ouer the Vineyard, to chaſe away ſcorching blaſt aforeſaid. *Varro* affirmeth, That if about the retrait of the Harpe-ſtar Fidicula, which is the beginning of Autumne, a man paint a cluſter of grapes, and conſecrate it to the gods among the Vines, the ſtormes and tempeſts of wind and raine will doe leſſe harme to the fruit hanging thereupon. *Archibius* in a book that he wrote to king *Antiochus*, ſaith, That if a land-toad be put into a new earthen pot that neuer was occupied before, and the ſame enterred and couered within the ground in the middeſt of a corn field, the corne ſhall take no harm that yeare by any tempeſts whatſoeuer.

As touching the ruſtical work which ſhould be don in theſe ſix weeks ſpace, the Husband-
F man ought to giue his lands a ſecond fallow, to dig about the roots of trees, & (where the heat of the countrey doth ſo require) to mould and banke them again: howbeit, ſuch as be budding and putting forth new ſhoots, would not be digged, vnleſſe the ſoile be very good and rank. Seminaries or nource-gardens would now be ſarcled & cleanſed. Addreſſe himſelfe he muſt, and make all ready againſt Barley harueſt. Now is he to prepare his barn plot and thraſhing floore,

and to paue it with a coat of chalk, tempered wel & wrought with oile dregs, by *Catoes* aduiſe; G
howſoeuer *Virgil* is more curious in this behalfe. For the moſt part of Husbandmen, after they haue laid it euen and leuell, they go ouer it again with Oxe dung, tempered to a thin conſiſtence with water, for to bind the ſaid floore: and this is thought to be a ſufficient remedy, that the duſt ſhall not riſe.

CHAP. XXX.

¶ Of Corne harueſt: of common Wheat: of Chaffe: and the order how to keepe corne.

AS touching the manner of cutting downe or reaping corne, there be diuers and ſundry de- H
uiſes. In France where the fields be large, they vſe to ſet a iade or an aſſe vnto the taile of a mightie great wheele barrow or cart made in manner of a Van, and the ſame ſet with keen and trenchant teeth ſticking out on both ſides: now is this carre driuen forward before the ſaid beaſt vpon two wheeles, into the ſtanding ripe corne (contrary to the manner of other carts that are drawne after) the ſaid teeth or ſharp tines faſtened to the ſides of the wheele barrow or car aforeſaid, catch hold of the corn eares, and cut them off: yet ſo, as they fall preſently into the body of the wheele-barrow. In ſome places the faſhion is to cut with a hooke or ſyccle the ſtraw in the middeſt: and betweene euery two ſheaues they ſit down, and then crop off the eares iuſt at the ſtraw. In other countries they vſe to plucke vp the ſtanding corne by the root: and in ſo doing, perſuaded they are that this is a very neer and ready way to ſaue charges, & may ſerue for I
one tilth well enough: but by their leaue, they rob the ground by the means of her kinde and naturall moiſture. The reaſon of this diuerſitie is this: in ſuch countries where they vſe to thatch their houſes with ſtraw, they ſaue it to the full length, and go as neare as poſſibly they can: againe, where there is but ſmall ſtore of hay, they make account of their ſhort chaffe for to litter, yea, and fodder their beaſts. As for Panicke haulme, it neuer ſerueth the turne in any place for thatch. And for Millet ſtraw, they burne it ordinarily. Barly ſtraw is kept and ſaued very carefully for an excellent fodder, that kine and oxen loue very wel. To conclude, in France they haue another way to gather their Panicke and Millet eſpecially; to wit, cutting the ſame eare by eare vpon a combe with a handle to it [as Barbers vſe to clip or poll mens heads.]

Concerning the deuiſe of thraſhing, it is practiſed ſundry waies. In ſome places they vſe to K
eruſh the corne out of the eares with heauie and rugged dreies drawne ouer it, as it lieth vpon the barn floore. In others, they ſet mares to ſtampe and trample it vnder their feet, and ſo driue it out: and there be againe who beat and flap it forth with flailes or cudgels.

Common wheat, the later that it is reaped, the better it is found of caſt: but the ſooner that it goeth downe, the fairer is the graine, and more full and weighty. The beſt rule for the one and the other, is this; to goe downe with it, and lay it along, before the corne be very hard, and when it beginnes once to looke ruſſet, and to haue a browne or reddiſh blee. And here, remember the old ſaid Saw, that may goe well for an Oracle, Better two dayes too ſoone, than as many too late.

For the inning of the fine wheat Siligo, and the common Triticum, it is much after one ſort, L
and they would be ordered alike, both in barne, rike, and thraſhing floore. The good red bearded wheat Far, becauſe it commeth hardly out of the huske, and asketh ſome painefull thraſhing, ought to be laid vp in the garner, huske, and all together, euen in the chaffe; only it would be rid from the main ſtraw, and deſpoiled of the eiles or beard growing to the eare. Chaffe is good chaffre in many countries, and ſerues in ſtead of hay. Where note, that the finer and ſmaller that the chaffe is, and inclining nearer to pouder, the better it is thought to be. And therefore the beſt ſimply is that which commeth of Millet: the next in goodneſſe, Barley maketh: but the common wheat Triticum yeeldeth the worſt, vnleſſe it be for poore hungry iades and ſuch laboring garrons.

The ſtraw or haulm that remaineth ſtanding as boltings when corne is reaped by the eare or M
after it be well dried, the manner is to lay vpon ſome hard, craggie, and ſtonie ground, then all to beat and belabor it with cudgels, that it may be ſoft and ſerue in ſtead of litter to lie vnder cattell. If chaffe faile for fodder, the very haulme or ſtraw left in the field, ought to be braied and beaten ſhort, to ſupplie forrage in manner following. Cut it downe ſo much the ſooner, let it be well

20030
copy 1

A well ſprinkled and drenched a long time in brine: and when it is dried againe, make it vp round into certaine bottels or bals, and ſo giue it to kine and oxen for their fodder. There be that ſet fire on it, and ſtraw both, in the field whereas it grew. And ſurely, *Virgil* highly commendeth this for a great point of Husbandry: the chiefe reaſon herof was, to burn the ſeed that the weeds ſhed, and to kill their roots that remaine vpon arable ground. In ſum, the diuers faſhions and manners of reaping, proceed from this, That in ſome countries the haruеſts be gteater than in others: and beſides, Reapers and Mowiers are not to bee had in all places alike, nor ſo eaſily hired.

It followeth now by good order, as a matter hereunto annexed, to write of the manner how to lay vp and keep corne for ſtore. Some are very curious and indeed ouer preciſe in this point, and
B namely in building of barnes and garners. For they giue order, that in any wiſe their walls bee raiſed of bricke, and thoſe three foot in thickeneſſe. Alſo, that they be filled top full and cloſed, vp aloft, that they haue no windows at all, nor any place open to let in or admit wind. Others would haue windowes, but thoſe onely toward the Northeaſt winde, where the Sunne riſeth in Summer, or elſe into the North: and in any hand the bricke muſt not be laid with lime, for that it is moſt hurtfull to corne. For as touching oile dregs or lees, how they would haue it to be v-ſed, I haue declared already. Contrariwiſe, in ſome countries they build their garners of timber and ſet them aloft in the aire hollow from the ground, bearing vpon piles and poſts of wood: & ſuch are deuiſed of purpoſe with many ouertures on euery ſide to receiue wind, inſomuch, as from beneath alſo the bourds and plankes be open to take all aire. And yet others there be who
C miſlike altogether theſe kinde of frames, beeing of this opinion, That in ſuch ſolars and lofts reared ſo high into the aire, the corne will diminiſh and wither: yea, and if it lie neare to a roofe of tiles, it will be in danger to catch a fire and burne. There bee that would not haue corne to be turned in the garner, for to breath and take the winde: for that the mite or Weevill that eateth graine, neuer commeth within foure fingers of the bottome of the heap, ſo that beneath that gage there is no danger, and therefore it needs no ſuch ſtirring at all. *Columella* ſaith, That it were good to haue a garner open into the Weſt, for that the winde Fauonius is kinde for corn: whereat I maruell very much, conſidering that otherwiſe hee is carefull to ſeeke out the drieſt places. Laſt of all; there be ſome that would haue a land-toad tied by one of her hinder or lon-ger legges, and ſo to hang at the dore and entrie of the garner or barne where corne lieth. For
D mine owne part, if I ſhould ſpeake what I thinke, I hold, that the chiefe and principall thing for the keeping of corne well, is to know and vſe the very fit time and ſeaſon of laying it vp. For if it bee gathered when it is not fully ripe, and before it haue the due parching from the Sunne, and the firme ſubſtance hardened as it ought, likewiſe if it bee brought vnto the barne or garner hote, it cannot bee auoided, but Vermine will breed therein to doe it much harme.

That ſome kinde of graine will continue good and ſound, yea, and laſt longer than other, there be many cauſes. For either it proceedeth from the skinne or huske, when it is manifold, as in Millet; or the fatneſſe of the marrow and floure within, which maintaineth and feedeth the graine as the radicall and nutritiue humour, as in Seſama; or laſtly, of bitterneſſe, as in Lupines
E and the ſmall bitter Cichets. As for the Frument or wheat Triticum, apt it is moſt of all other to ingender and breed weeuils and ſuch like wormes, becauſe it ſoone catcheth a heat, and is quickly enchaufed, by reaſon of the thicke and faſt ſubſtance of the owne, and beſides incloſed and clad it is within a thicke and groſſe skin, which is the bran. Barly hath a finer and ſlenderer huſk: and ſome Pulſe a thinner than it: ſuch therefore are not ſubiect to the ſaid vermin: how-beit, Beanes be couered with thicke pillings or tunicles, and therefore eaſie to take an vnnatu-rall heat and putrifie. Some vſe a deuiſe to keepe Frument corne a long time, with oile lees, be-ſtowing onely the ſprinckle of one Quadrantall, to a thouſand Modij thereof. Others beſtrew amongſt it the powder of Chalke brought either from Chalcis or Caria; or elſe lay ſome Worme-wood among it. There is a kind of earth in Olynthus and Cerynthus within Eubœa, which is highly commended in this caſe, for it will not ſuffer corne to corrupt. And lightly,
F what corne ſoeuer it be that is laid vp in the eare, neuer taketh any harme, keep it as long as you will. Howbeit, the beſt and moſt aſſured way to preſerue corne, is in caues or vaults vnder the ground, which in Latine be called Siri, as the practiſe is in Cappadocia and Thracia. In Egypt and Barbarie, aboue all things they looke to this, That their garners ſtand vpon a drie ground:

and how drie ſoeuer the floore be, yet they lay a courſe of chaffe vnderneath between it and the corne. Moreouer, they put vp their corne in garners and bins, together with their ſpike or eare; by which deuiſe they are ſure (if no aire come in) that no hurtfull worme or vermine will breed among it. And verily *Varro* ſaith for certaine, That wheat in that manner laid vp, will laſt fiftie yeres, and Millet an hundred. He affirmeth moreouer, that beans and other pulſe wil keep good a long time in oile barrels, if they be calked with aſhes. Hee auoucheth moreouer, that beanes were knowne to haue continued from the time wherein king *Pyrrhus* liued, vnto the Pyrats war, which vnder the conduct of *Pompey* the Great was diſpatched & brought to an end; which prouiſion of beans had beene laied vp 120 yeares before, and kept cloſe in a certaine caue vnder the ground, within the citie of Ambracia. The Cich pea ſe is the onely graine that is ſubiect to no vermine breeding in it while it lieth in garner or barne. Some there are who take certaine pitchers of earth hauing vineger in them, vpon which beeing well bedded in aſhes and done ouer with pitch, they make their heapes of Pulſe, and by this meanes they are verily perſuaded, that no Meuils, mites, and other wormes will breed therein to doe harme. Others, for to preſerue their pulſe, put them into ſalt-fiſh barrels, but they dawbe the ſame firſt with a certaine kind of mortar made of plaſtre. Laſt of all, for to keepe Lentils, there be that drench them with the vineger confected with Laſerpitium, and when they be dried againe beſmeare them ouer with oile. But will you haue indeed one ſhort rule for all? To be ſure that no worme or vermine ſhall breed in your corne, cut it downe and gather it about the change of the moon. Therefore it skilleth very much to know a mans intention, whether he mean to keep or to ſell his corne: for certain it is, that as the moone groweth, ſo doth corne wax full and great, and therefore filleth the ſtrike a great deale better. G H I

Chap. XXXI.

¶ *Of Vintage: and the particular ſeaſons in Autumne.*

According to our partition of the yere into foure quarters, it followeth now by courſe and order, to treat of the Autumne, which beginneth at the retreat or occultation of the Harp ſtar Fidicula; and ſo forward to the Equinox in September: from whence I will proceed to the couching or going down of the Brood-hen Vergiliæ, the very beginning & firſt entrance of the winter. In which mean ſpaces and equall diſtances, both before & after the ſaid Equinox, theſe ſtars following are ſignificant, and ſet out the particular ſeaſons: firſt, the day before the Ides of Auguſt, (*i.* the twelfth of the moneth) the ſtar called the Horſe, appeareth in the Hæmiſphære to the people of Attica: but at euen-tide the ſame day, the Dolphin ſtar ſetteth vnto them in Egypt, and likewiſe to vs here in Italy, according to *Cæſars* account. Alſo eleuen daies before the Calends of September, which is the 22 day of Auguſt (by the calculation of *Cæſar* and the Chaldæans) the ſtar named in Latine *Vindemiator, *i.* the Vintager, beginneth to ſhew in the morning, both to the Aſſyrians and the Italians; a truſtie vaunt-curriour, bringing certain tidings with him, and promiſing aſſured hope of a vintage, & that the grapes will be ripe anon: and for a farther token and appearance thereof, marke the grapes then, for now beginne they to change colour. To the people of Aſſyria, the fift day before the Calends of September, *ideſt*, the 28 of Auguſt, both the ſtar Sagitta ſeemeth to go downe, and withall the Eteſian winds lie, and giue ouer blowing. The Vintager himſelfe, to wit, the ſtarre ſo called, to the inhabitants of Egypt riſeth vpon the Nones of September, *i.* the fifth day of the moneth: vpon which day to the people of Attica, the ſtar Arcturus riſeth in the morning; and the Sagitta, *i.* the Shaft, goeth downe in the euening. To come now to the Ides of September: fiue daies before them, that is to ſay, the ninth day of the moneth (after *Cæſars* card) the ſtar called Capella, *i.* the Kid, ſheweth it ſelfe here in Italy toward euening: but the day before the ſaid Ides, *i.* the twelfth day of the moneth, the one halfe of Arcturus appeareth to riſe: and then for fiue daies together (his influence is ſuch) hee keepeth ſuch foule work both by ſea and land, that both Sailer and Husbandman feele the violence of his arriuall: and this reaſon is giuen therof; for if (ſay they) at the fall or occultation of the Dolphin ſtar, there be no ſhowers of raine, none will Arcturus bring with him at his comming. An euident ſigne there is, that the ſtarre Arcturus will not be long before he ariſe, and that is this, The departure of the Swallowes; for this is certain, if he chance to ſurpriſe any of them, and that they be not gone before out of the countrey, they are ſure to pay for K L M

their

*rather, *Prouindemiator, i.* the forerunner of the Vintage, ὀπωρινὸς: for *Vindemiator* followeth afterward in September.

20030
copy 1

A their long tarrying and to die for it. The 16 day before the calends of October, which is the ſixteenth day of September, the ſtar called Spica, *i.* the eare of corne, which the ſigne Virgo (*i.* the Virgin) holdeth in her hand, riſeth in the morning to them in Egypt; & then the Eteſian winds alſo are quiet & laid in that country. Howbeit after *Cæſars* calculation, this falleth out vpon the fourteenth day before the Calends of October, *i.* the 18 of September, to vs in Italy: and by the account of the Chaldæans, a day after to them that dwell in Aſſyria. Moreouer, the 21 of September (after the ſupputation of *Cæſar*) the Knot of the two fiſhes, a ſigne or ſtar ſo called, goeth downe to our ſight in Italy; like as the very Equinoctiall ſtarre it ſelfe three daies after. After which time, *Philippus*, *Calippus*, *Doſitheus*, *Parmeniſcus*, *Conon*, *Criton*, *Democritus*, *Eudoxus*, and *Ion*, agree all in this (and that is maruell to ſee ſo many Aſtrologers to accord) That foure daies be-
B fore the Calends of October, the ſtar Capella, *i.* the Kid, riſeth in the morning: and the morrow after, the [two] Kids doe the like. The ſixth day before the Nones of October, which is the ſecond day of the moneth, in Attica and the regions adioining, the ſtar named the Crowne appeareth betimes in the morning: but in Aſia, and to vs Italians (after the reckoning of *Cæſar*) the next day following, the ſtar Heniochus goeth downe in the morning. Two daies after that, to wit, the fift of October (according to *Cæſars* computation) the ſtar named Corona, *i.* the Crown, beginneth to ſhine in Italy: the next day after, the ſtars called the Kids, loſe their light in the euening: The eighth day of October, which is eight daies before the Ides thereof, the ſhining ſtar within the foreſaid Corona, ſheweth it ſelfe in Italy by *Cæſars* booke: but the thirteenth day of the ſame moneth, the ſtar Virgiliæ, *i.* the Brood-hen, ſheweth in the euening: and vpon the
C very Ides, which is the 15 day of the moneth, the Crowne ſtar aforeſaid appeareth full & whole. Now ſix daies before the Calends of Nouember, *i.* the 27 of October, the ſtars called Suculæ, or the rainie Hyades, begin to ſhew in the euening: and the laſt day of October, which is the Euen of the Calends of Nouember (if *Cæſar* ſay true) Arcturus ſetteth in Italy, and the ſaid Suculæ, or the rainie Hyades riſe the ſame day together with the Sunne. Foure daies before the Nones of Nouember, *i.* the ſecond day of the moneth, Arcturus goeth down in the euening: like as the fift day before the Ides, *i.* the ninth day of Nouember, the ſtar named Orions ſword beginneth to retire: and likewiſe two daies after, the Brood-hen Virgiliæ is hidden and appeareth no more.

As touching now the country worke that Husbandmen are to employ themſelues about du-
D ring this ſpace of time or halfe quarter thus deſcribed, they ought if they did well, to ſow Nawes, Turneps, and Radiſhes, vpon thoſe daies that I haue appointed heretofore: and let them neuer goe by the voice of the rurall ſort, who thinke it not good to ſow ſo much as Rapes, after the departure of the Storke: for bold may we be here in Italy, euen after the feaſt Vulcanalia to put them into the ground; as alſo our early white corne, together with Panicke. But after the going down of the Harp-ſtar, good I hold it to ſow Vetches, Phaſeols, or Kidney-beans; as alſo the dradge or bollemong for horſes, called Pabulum, *i.* Forage: howbeit, folke ſay, that this forage would not be ſowne but about the new moone. This is the time alſo to ſtrip greene leaues, and ſlip tendrons from trees, thereof to make fodder for beaſts in winter: and one good daies worke it is for a man to fill foure hampers made of purpoſe for ſuch brouſe. Now if theſe leaues
E be gathered and prepared before-hand when the moone is in the wane, they will neuer corrupt and putrifie. Greene muſt this brouſe be in any wiſe when it is gathered, and not ſeere or withered.

To come now vnto Vintage: men thought in old time that it was not ready nor the grapes ripe enough, before the Equinox in September: but now adaies I ſee how they goe to worke euery where ſooner, and fall haſtily to gather grapes halfe ripe. Therefore it were not amiſſe to ſet downe certaine markes and ſignes to direct the husbandman for this ſeaſon. The rules therfore to guid him, be theſe: gather no grapes hot, that is to ſay, when they be dry, nor vnleſſe a good ſhower of raine come betweene: yet take heed you muſt, that you pluck them not full of dew, namely while the dew that fell ouer-night, doth ſtand vpon them; nor before the Sun hath
F drunke vp the ſaid moiſture, and dried them. Set into thy vintage hardly and fall to gathering, when either the vine leaues or greene branches called the Portoirs, doe fall and reſt vpon the old wood: or when, after you haue taken one grape from the reſt of his fellows ſtanding thicke together in the cluſter, you ſee the void place not to fill vp again, whereby it appeareth that the grapes and kernels about it, grow no more. Very good it is for grapes, if they be gathered when

the moone is croiſſant, to wit, before the full. At one preſſing ordinarily, there ſhould be filled G
twentie meaſures called Culei, *i.* Cowles: now is this meaſure for liquours the greateſt of all o-
thers, and by which the reſt ought to be proportioned juſtly. For to preſſe thus many Cowls at
once, and to ſerue twenty acres of vineyard, one wine-preſſe is ſufficient; and likewiſe to hold
the ſame, one veſſell or keelvat. Some vſe but one plank or ſtocke to preſſe withall, but better it
is to haue them double: although thoſe that be ſingle be exceeding huge. As touching theſe
preſſing planks, it is not ſo much their thickneſſe and maſſiue ſubſtance that is to be regarded, as
their length; for indeed the longer and larger they bee, the better they doe their deed. In old
time they vſed Ropes, leather thongs, and leauers, and by force of them pulled downe and forced
hard the preſſe-Planks. Within this hundred yeres were the frames deuiſed which we cal Græ-
canica; wherein the maine planke or vpper ſtocke of the preſſe, went with a vice in manner of a H
skrew; for the wrinckles of the ſpindle were fitted and ſerued in an engine or windlace in maner
and forme of a ſtar, ſet faſt to the worm or vice of the ſpindle aforeſaid, and which as it was tur-
ned and wreſted, lifted vp or let downe the preſſe-planke or lid, together with the weights of
ſtones thereupon: and verily this faſhion of preſſes was held to be beſt and moſt approoued: how
beit, it is not 22 yeares ſince there came vp another deuiſe and inuention to make ſmall preſſe-
planks; leſſe winding pieces alſo, and the whole frame ſhorter: howbeit in the middeſt thereof
ſtood vp the ſpindle of the ſaid skrew or vice. Now when they purpoſed to ſqueize out the
grapes, they laid certain lids or planks thereupon called Tympana, and thoſe they forced with a
wreſt from aloft, vſing alſo the poiſe and weight of ſuch matters as they heaped vpon the planks
aforeſaid. I

Culeus containeth 20 Amphores, which is 320 *Congij* or gallons.

Moreouer, the cuſtome is to gather apples and ſuch like ſoft fruit, about this time, with this
obſeruation or direction; namely, To go in hand with this buſineſſe when any are ſeen to fal of
themſelues, as mellow and ripe, and not blowne downe by force of wind and tempeſt: now is the
ſeaſon alſo to preſſe out the lees or ſediment of the grapes: now the time ſerueth to ſeeth new
wine to the halfe, and make cuit thereof; with this regard and conſideration, that if the moon be
vpon the change, this be done by night; but if in the ful, by day-light. As for other daies, it mat-
ters not much, ſo that the cuit be boiled either before the moone riſe, or after ſhe be gon down.
Moreouer, heed is to be taken, that the grapes of yong vines or ſuch as grow vpon low and ma-
riſh grounds be not vſed hereabout; and much leſſe thoſe that be not fully ripe. In the ſcum-
ming alſo and clarifying of the liquor while it boileth, no other thing but leaues are meet for K
that purpoſe: for if any wood come neare & touch the veſſell or lead wherein the liquor is ſod-
den, it is thought that the cuit will be ſmokie and ſmell of the fire. Furthermore, the ordinarie
time of vintage holdeth forty foure daies; to wit, from the Equinoctiall in September, vnto the
going downe or occultation of the Brood-hen Vergiliæ: after which time, remember the ora-
cle and common prouerbe, That wine veſſels are not to be roſined, calked, and trimmed in cold;
for good husbands would do this before-hand in hot weather. Howbeit in theſe daies I haue
ſeene thoſe that for want of veſſels haue gone in hand to tun vp their wine in the beginning of
* Ianuarie: yea I haue knowne when the vintage hath beene ſo great, that wines newly preſſed
haue bin kept in fiſh ceſterns: and for default of other pipes & tuns, when the wine-cellars haue
bin full already, I haue ſeen them that would let the old run out into ſuch ceſterns, for to make L
roome for the new, and ſuch as a man would ſay were neither made nor vnmade. And yet this is
not ſo often practiſed by occaſion of the exceeding ſtore of new wine that lieth on mens hands,
as of a wicked and couetous mind that ſome carry to gather a deale together for to ſet vp a Mo-
nopolie, thinking thereby to make a dearth and to raiſe the price of their wines, to the great de-
triment and hinderance of a common-weale. But a good and honeſt minded houſholder wil reſt
contented to furniſh himſelfe with a competent prouiſion of wine, and lay vp no more than hee
ſhall ſpend euery yeare: and this is found alſo by experience the moſt profitable way for his
purſe. As for all other matters concerning wine, becauſe I haue already ſpoken at large thereof,
I will here lay a ſtraw and make an end. But this would not be forgotten, that ſo ſoon as grapes
be gathered, men muſt high them apace and make haſt to get in their Oliues: for preſently after M
vintage and wine-preſſing, they muſt thinke of drawing their oile, and employ themſelues in o-
ther works of this ſeaſon, which are to be done a little before and after the retreat of the Brood-
hen ſtar Virgiliæ.

* Some reade Nouember.

CHAP. XXXII.

¶ *The conſideration of the Moone and her courſe, reſpectiue vnto Husbandrie.*

HEreunto ſhall be annexed a diſcourſe as touching the Moon ea nd the Winds, together with the Prognoſtication depending thereupon, as much as may be thought neceſſarie and pertinent to Agriculture; to the end, that our ruſticke Aſtrology may in all points be accompliſhed and perfect. For *Virgil* alſo was of this opinion, That ſome buſineſſe and workes
B of Husbandrie were to be digeſted and diuided according to the daies of euery Moone in order as they goe, following herein the vanity and oſtentation of *Democritus*. For mine owne part as I haue hitherto in all my work throughout reſted vpon the good & profitable rules of our anceſtors, ſo in this point alſo I meane to take their direction, and goe by no other. According to their ordinances and precepts therefore, this firſt is to be obſerued, That whatſoeuer is to be « cut, gathered, or laid vp, be it wood, fruict, or grain, it ought to be done rather in the wane of the « Moone, than whiles ſhe is croiſant toward the ful, & leſſe danger is it ſubject vnto. *Item*, Touch « no mucke, nor lay it vpon thy lands but after the full, when ſhee is in the wane. *Item*, Dung thy « ground, whiles the Moon is in conjunction with the Sun, and in the firſt or laſt quarter. Gueld « Bores and Steeres, lib Rams and Kids or yong Goats in the old moon. *Item*, Set Hens to couve «
C egs in the new of the moon. Make thy trenches by night in the ful Moone. Likewiſe, couer the « roots of trees with mould when the Moone is at the full. *Item*, In moiſt grounds ſow and ſet ei- « ther in the very chaunge, or 4 daies before and after. As for the winnowing, vanning, and laying « vp either of corne or pulſe, they would haue it done in the old Moon, about the laſt quarter. As « alſo, That Pepiniers, Seminaries, or Nource-gardens, be made when the Moone appears aboue « the earth. But grapes ought to be troden & new wine preſſed, whiles ſhe is vnder our horizon. « Likewiſe, timber is to be hewed, and many things elſe to be don accordingly, whereof we haue written alreadie in their ſeuerall places. And albeit the obſeruation of the Moone, her age and change is eaſie ynough, and nothing more familiar: whereof alſo I haue written ſufficiently in the ſecond volume of this worke: yet further to inſtruct the ſimple countreyman who knoweth
D neuer a letter of his book, and to ſet before his eies the true order and courſe of her motion and mutation, let him but obſerue and marke thus much, That ſo often as ſhe is ſeen Weſtward after the Sunne is gone downe, and ſhineth the forepart of the night onely, ſhe is croiſant, and in her firſt quarter, and then ſhall a man diſcerne euidently by the eie the one halfe of her bodie light: but looke when, as the Sun ſetteth in the Weſt, ſhe riſeth at the ſame inſtant oueragainſt him in the Eaſt, ſo as they may be both ſeene at once, but ſure ſhe is in the full. Againe whenſoeuer ſhe riſeth late in the Weſt, and ſhineth not in the fore-part of the night, but toward the morning, make account ſhe is in the wane, and ſheweth but her halfe part againe. But ſo long as ſhe appeareth not at all, and giueth no light, aſſure your ſelfe ſhe is in the conjunction with the Sunne all that while and this in Latine is called Interlunium, [*i.* the change.] Now at the
E very inſtant of her conjunction or change, and the firſt day, vntill ſhe be one day old, ſhe will remaine aboue the earth ſo long as the Sunne is there alſo with her: the ſecond day ſhe will be in our hemiſphære by night, tenne * twelue parts of an houre, and a quarter of one twelfth part. Thus in proportion will ſhe riſe vpon the fifteenth day after her change, multiplying euery day the ſaid portion of the houres. When this fifteenth day is come, ſhe wil be all the night whole aboue the earth, and all day long vnder. Vpon the ſixteenth day of her age ſhe will remaine beneath our Hemiſphære, after the firſt day, ten parts of twelue, and one qnarter of a twelfth part within night, before ſhe riſe and ſhew her ſelfe, and ſo will ſhe keepe daily the foreſaid proportion juſt, in late riſing: diminiſhing ſtill her light by the ſame degrees, vntill the chaunge. And looke how much ſhe ſtaieth in the beginning of the night vnder the earth ere ſhee appeare in
F our Horizon, ſo long in the next morning wil it be after day-light ere ſhe go downe. Finally, e- ſecond moneth the Moone hath thirtie daies full out, like as each other moneth betweene ſhee wanteth one of that number, and hath but nine and twentie. Thus much concerning the courſe of the Moone in regard of Husbandrie.

* 51 minutes & $\frac{1}{2}$

CHAP.

G

Chap. XXXIII.

¶ *The consideration of the Winds, respective to Agriculture.*

AS touching the winds, the reason and quartering of them is more intricate, fuller also of scrupulous doubts and difficulties, than was the obseruation of the Moon: notwithstanding that, there is not a day in the yeare goes ouer our head, but we may easily find & mark both South and North. For if a man doe obserue the Sunne rising any day whensoeuer he will, and vpon the sixt hour of the same day (to wit at noon) stand so as he haue his left shoulder directly turned against the said Sunne rising, he may be assured, that he hath the South fall vpon his face, or before him, and the North behind his back. Now the line or streight way that runneth in this manner through a field North and South, is called in Latin * Cardo. When a man standeth thus, if he would see his owne shadow, he shall do well to turn his bodie round about: for otherwise it will be behind him. Chaunging sides therefore, so as he haue the Sunrising or Leuant of that day iust against his right shoulder, and the setting vpon his left, he may know midday or South point as wel las before, namely, when his body casts just before him the shortest shaddow, enclining to the one hand no more than to the other. Let there be then either a small furrow rased along just through the mids of the shadow with a spittle spade, or the point of some hooke; or else a line drawne with a train of ashes, for the length of some twentie foot or thereabout (to make the thing more plaine.) Which done, cut the said line or furrow crosse ouerthwart the middle, to wit, at the tenth foot, if the whole be twentie, and then make a round small circle about it, which may serue in stead of a Nauil, and be so called. That part of the line then which goeth directly forward from the crowne of the head in the foresaid shadow, points out the North wind. Thou therfore that art to lop ot prune trees, rake heed thou makest not thy cuts so, as they look into that coast: neither let thine hortyards or vineyards stand open to that wind, vnlesse it be in Affricke, Cyrene, and Ægypt. Againe, so long as the wind sits in that corner beware Ploughman [for now I speake to thee] thou breake vp or eare no ground, nor enter into any such worke in the field as thou art alreadie forbidden by mee to doe. But marke what part of the line shal come from the foresaid circle straight before thy feet regarding the noontide or mid-day, assure thy selfe the same telleth thee which is the South wind, called by the Greeks Notus, as we haue declared already. Doth the wind rise and blow from that side? meddle not Husbandman during that time with thy vine. Carpenter, fell no trees then for timber I aduise thee. A wet wind this is and hot, within the climat of Italy. In Affrick verily dry ynough it is, and bringeth faire weather with it, but with al his faire looks, he kindleth fire otherwhiles, and burneth many things. Let hardly the Vine spread her branches, and run into this wind, in al places of Italie: but leaue not the cuts of tree or vine looking that way. He that sets out a plot of ground for Oliues, and planteth them, hath cause to be afraid of this wind, especially for four daies together, about the rising or apparition of the star Vergiliæ or Brood-hen. They also that graffe sions in the stocke by cleft, or set bud in the scutcheon by way of inoculation, must take heed how they meddle in this wind.

H

I

K

Moreouer, it will not be amisse to giue some caueat as touching the very houre of the noonday, which giues vs knowledge of this wind and this quarter; namely, what is to be don at such a time, and what not? Thou woodman and forrager both, see thou neither cut nor lop trees, see thou gather no greene leaues and tendrils for thy fodder at noon-tide. Thou sheepeheard, thou heardman whatsoeuer, when thou perceiuest in Summer time by the shaddow growing short, that noonestead is at hand, driue thy sheep and cattell out of the Sunne, into some worm-stall and place of shade. More yet I haue to say to thee, If thou keepe sheepe or other beasts at their pasture in Summer time, lead them or driue them before thee al the morning into the west before mid-day: but after noon turne thy face Eastward with thy flock and thy heard. Otherwise, and at other seasons, as namely, all Winter and in the Spring, thou shouldest doe thy cattaile hurt, to conduct or lead them after this manner out of the warme Sunne into moist places, and where the deaw falls. As charie also and heedfull must thou be to driue thy cattell Northward from the Sunne, and there to let them graze: for marke what I say, in so doing, they will not be able to hold open their eies; this wind wil make them bleared & bloudshotten; nay, it wil driue them into a gurry or flux of the belly, which will soone make an end of them. Howbeit, if thou

A wouldeſt haue the beaſts conceiue and bring forth females, force them when they be leaped and couered to ſtand with their heads in this wind, and thou ſhalt ſee the proofe hereof.

Chap. XXXIV.

¶ *Of the lines and limits that diuide and bound fields.*

WEe haue ſhewed in the next Chapter before, the manner how to draw a line or furrow North and South, and how in the middeſt thereof there ſhould be a round compaſſe made manner of a Nauill, which in Latine is called Vmbilicus. Now if you would know likewiſe the other parts of the heauen, let there run ſuch another line ouerthwart the Nauill or circle iuſt in the midſt: and then ſhalt thou ſee, that this line will direct thee to the Eaſt
B & Weſt points, Æquinoctial. [Now the way that thus cutteth through any field Eaſt & Weſt ought to be called Decumanus in Latine, or the Broad way.] Which done, draw other 2 lines through the centre of the foreſaid circle, cutting one another aſlant [like S. *Andrewes* croſſe] or the letter X, ſo as that line which at one end points to the right hand of the North, reach to the left hand of the South at the other. Likewiſe that which regards the left ſide of the North at the one end, run directly to the right hand of the South with the other. All theſe lines muſt be of an euen length, of equall diſtance one from another, and paſſe through the ſame Circle, which we call the Nauil. Hauing thus made the 4 croſſe paths or waies in euery field once for all, thou maiſt euer after know how the winds do ſtand. But if thou liſt to haue ſuch a deuiſe to ſerue thy vſe many times after, make a little inſtrument of wood, but the ſame as round as can
C be by the compaſſe, and therein draw or print 4 lines of an euen length and equal diſtance, paſſing as diameters al through the centre, to the circumference of the rundle: and this may ſerue thee in ſtead of a quadrant, where & whenſoeuer thou needeſt. The maner how to make and vſe this inſtrument I am content thus to ſhew, becauſe I haue to deale with ſimple ignorant men of dull wit and ſhallow conceit, who may ſoon erre and doe amiſſe. Let vs ſee then firſt for the meridian line and the South point of the noon day, for to be perfect therein, becauſe it is euer the ſame, and changeth not from one end of the yeare to another, whereas the Leuant varieth euery day, for that the Sun neuer riſeth the morrow morning, from the ſame point iuſt that he roſe the day before: which I note, leſt haply any man ſhould take one certain line for to point
D out the Sun-riſing or the Eaſt, and make his quadrant or compaſſe thereby. Now when thou haſt in this wiſe exactly ſet out the principall regions or quarters of the heauen, obſerue this, that the end or head of the line which is next to the North point Septentrio: on the Eaſt the ſame ſheweth the very place where the Sun riſeth at the ſummer Sunſtead, to wit, the longeſt day of the yere; and the wind there ſeated is called in Latine Aquilo, *i.* the North-eaſt winde, and in Greek Boreas. Thou knowing this perfectly, ſet thy trees and plant thy vines full vpon it. But ſo long as this wind bloweth, plow no lands, ſet no trees or plants that are to beare fruit, caſt no grain nor ſeed into the ground. For why? this wind pierceth, pincheth, and killeth the heart of any tree root aboue ground, that thou ſhalt bring to replant. Take warning therefore beforehand, and be aduiſed: for experience hath taught, that one thing is good for ſtrong and
E ſturdy trees, and another for yong and tender plants. Neither am I ignorant or forgetfull, that the Greekes haue placed in this corner the winds which they name Cæcias: but *Ariſtotle* himſelfe, a Philoſopher of an infinite ſpirit and high conceit (the man that hath ſo done) ſheweth a reaſon drawn from the conuexitie or bending cope of the heauen, wherby the Northeaſt wind or Aquilo bloweth ful oppoſit to the Southweſt Africus. Howbeit the husbandman is not afraid of this Northeaſt wind Aquilo all the yeare long, in thoſe particularities whereof hee is forewarned. For in the midſt of ſummer this wind doth moderat and temper the ardent heat of the ſtars raigning and raging in that time: then changeth hee his name, and [during the Dog-daies] is called Eteſias. When thou therefore feeleſt him blow cold, take heed and be not too bold. But learn this withall, that howſoeuer this wind may do harm, in ſome reſpect, for which
F thou art forewarned; yet the wind Septentrio that bloweth plumbe North is far more dangerous and miſchieuous than he. Againſt the Northeaſt wind aforeſaid, let both hort-yards, tree-rowes, groues and vineyards be ranged; in all Natolia, Greece, Spain, Maritime coaſts of Italy, Campaine, and Apulia. If thou deſireſt to breed males keepe thy cattell with their heads into this wind, and in that ſort let the females be couered.

* *Dextratus & Siniſtratus, Antiquis.*

When

When thou haſt found out in this maner the North-eaſt wind Aquilo, be ſure that the wind G
which bloweth ful againſt it from the point where the Sun ſetteth in midwinter when daies be
ſhorteſt, is the Southweſt, called in Latin, Africus; and in Greek, Lybs. Obſerue this wind wel,
for if a beaſt after ſhe be couered, turn about directly into this wind, ſhe will for certaine con-
ceiue a female. And thus much of the Line in the Quadrant next to the North point on the
Eaſt ſide.

The third line from the North point (which we drew firſt through the latitude of the ſhadow
beforeſaid, and which we called Decumana) pointeth out the Equinoctial Sun-riſing in March
and September; directeth thee alſo to the Eaſt wind vnder it, called in Latine Subſolanus, and
in Greek Apeliotes. Where the climat is healthful and temperat, let vineyards be planted and
arranged into this wind: let ferm-houſes alſo in the country be ſo built, as the dores and win- H
dowes open into it. This wind loueth well to be dropping, and to diſtil gentle ſhoures of rain;
howbeit drier it is than the Weſt wind Favonius, which bloweth ouer-againſt him from the E-
quinoctial Sun-ſetting full Weſt, called in * Zephyrus. Vpon this Weſtern wind Oliue rowes
ſhould ſtand, according to *Catoes* mind. This wind is he that beginneth the Spring: this winde
openeth the veins and pores of the earth, and with his milde coldneſſe is healthfull and whole-
ſome for all plants, for man alſo and beaſt. This wind gouerneth this whole ſeaſon, and preſcri-
beth the time for pruning Vines, for ſarcling and dreſſing corne, for planting trees, for graffing
fruit, for trimming and ordering Oliues; and to ſay all in one word, ſo kind he doth breath, that
he cheriſheth and foſtereth the earth and all things thereupon.

The fourth line in your quadrant or compaſſe (reckoning from the North point, which alſo I
reacheth next to the South point on the Eaſt ſide) noteth the Sun-riſing in mid-winter when
the day is ſhorteſt; and withall the Southeaſt wind called in Latine Vulturnus, and in Greeke
Eurus; which as it is a drier wind than the two laſt named, ſo is it alſo warmer. In regard where-
of it is good to ſet Bee-hiues and plant vines tending into this courſe, I meane in other parts of
Italy remote from the ſea, and alſo in Gaule. Then ſhall you haue to blow full oppoſit vnto it
the wind Corus, directly from the ſun-ſetting in mid-ſummer when the day is longeſt: by-weſt
from the North; and this North-weſt wind the Greeks call Argeſtes: one of the coldeſt he is,
like as all they be wich blow from any point of the North. No maruell therefore if he be as
much dread and feared as the North winde Septentrio, for commonly he bringeth with him
haile ſtormes good ſtore. K

As touching the Southeaſt wind Vulturnus, if the coaſt be cleare where and when he begin-
neth to riſe, it will not be long ere he lie, and commonly hee is down before night; but the Eaſt
wind indeed continueth moſt part of the night. But be the wind what he wil be, if he blow ſen-
ſibly hot, you ſhall haue him hold many daies together. And to conclude, would you know
when to haue a North-weſt wind? marke when the earth drieth ſuddenly at one inſtant, it will
not be long but he wil be with you: contrariwiſe, when you ſee the ground moiſt and wet with
a kind ſecret dew vnſeen and vnknown, reckon vpon it that ſhortly you ſhal haue a South wind
to blow. And thus much for winds.

Chap. XXXV. L

¶ *Signes to prognoſticate what weather is toward.*

HAuing thus ſet down ſufficiently a diſcourſe of the winds, becauſe I would not re-iterate
one thing often, what remaineth now, but in good order to paſſe & proceed to the prog-
noſtication and fore-knowledge of the weather? and the rather, for that I ſee that *Virgil*
took great pleaſure herein, and ſtood much vpon this point: for thus he relateth vnto the rude
and ignorant men of the countrey, That oftentimes in the very mids of harueſt hee hath ſeene
whirle-puffs and contrarie winds encounter and charge one another as it were in battell, doing
much harme to corne. Moreouer it is reported, that *Democritus* at what time as his brother *Da-*
maſus was entred well into harueſt worke, taking the opportunity (as he thought) of a moſt hot M
ſeaſon, beſought him earneſtly to let the reſt of his corne ſtand ſtil a while longer, and to make
haſt to get that into the Barne vnder rouſe, which was cut and reaped downe; and this he did
without any reaſon by him made, why and wherefore. And what enſued hereupon? Surely
within few houres after, there poured downe a mightie ſhowre of raine, and prooued *Democri-*
tus

* ὦ ἐπιτρέχει Homer.

20030
copy 1

A *tu* to be a wiſe man and a true prophet. Moreouer, it is a rule commonly giuen and obſerued, That neither Reeds would be ſet & planted but toward rain, nor corn ſowed but againſt a good ſhowre. And therfore ſince this skil is of ſuch importance, I am content briefly to touch thoſe ſignes that foreſhew what weather will be, and make choiſe of ſuch which by ſearch and experience are knowne principall and make moſt for this purpoſe.

And firſt begin I will at the Sun, the beſt prognoſticator of all others: When he riſes cleare and not fiery red, it is a ſigne that the day will be faire; but if he ſhew pale and wan, it preſages a cold winter-like haile-ſtorme that very day: but in caſe he went downe ouer-night cleare and bright, and ſo roſe the next morning, ſo much ſurer may you be of faire weather. If the Sunne in riſing ſeeme hollow, he foretelleth rain: and when before his riſing, the clouds be red, the winds
B will be aloft that day: but in caſe there be ſome blacke clouds intermingled among, you ſhall haue raine withall. If the raies and beames of the Sun be red, both when he riſeth and when hee ſetteth, there wil fall good ſtore of raine. Are the clouds red about the Sun as he goes downe? you ſhall haue a fair day the morrow after. If when the Sun doth riſe you ſee flying clouds diſperſed, ſome into the South, and others Northward (ſay all be cleer and faire otherwiſe about him) make reckoning that day of wind and raine both. Marke at his riſing or going downe, if his beames be ſhort and as it were drawne in, be ſure of a good ſhowre. If at the Suns ſetting it raine, or that his raies either looke darke and blew, or gather a banke of clouds, ſurely theſe be great tokens of tempeſtuous weather & ſtorms the morow after: when in his riſing the beams ſhine not bright and cleer, although they be not ouer-caſt with a cloud, yet they portend rain.
C If before he riſe, the clouds gather round together like globes, they threaten ſharpe, cold, and winter weather: but in caſe he driue them before him out of the Eaſt ſo as they retire into the Weſt, we haue a promiſe thereby of a faire time. If there appeare about the bodie of the Sun, a circle of clouds compaſſing it round, the nearer they come about him and the leſſe light that they leaue him, the more troubled and tempeſtuous weather wil follow: but in caſe he be enuironed with a double circle, ſo much more outragious and terrible wil the tempeſt be. If peraduenture this happen at his riſing, ſo as the ſaid clouds be red againe which compaſſe the Sun, look for a mighty tempeſt one time or other of that day. If haply theſe clouds encloſe him not round, but confront and ſeeme as if they charged vpon him, look from whence they come, from that quarter they portend great wind: and if they encounter him from the South, there will
D be raine good ſtore and wind both. If as the Sun riſeth he be compaſſed with a circle marke on what ſide the ſame breaketh and openeth firſt, and from thence look for wind without faile: but if the ſaid circle paſſe and vaniſh away all at once equally, as well of one part as another, you ſhal haue faire weather vpon it. If at his riſing you ſee him to caſt his beams afar off among the clouds, and the mids between be void therof, it ſignifieth raine. If he ſpread his beames before he be vp and appear in our Horizon, look for wind and water both. If about him toward his going down there be ſeene a white circle, there will be ſome little tempeſt and troubleſome weather that night enſuing: but in ſtead thereof if he be ouer-caſt with a thicke miſt, the tempeſt will be the greater and more violent. If the Sunne couchant appeare fierie and ardent, there is like to be wind. Finally, if the circle aforeſaid be blacke, marke on which ſide the ſame brea-
E keth, from thence ſhal you haue bluſtering winds. And ſo an end of the Sunne and his prognoſtications,

Now by right, the Moone challengeth the next place for her preſages of weather to come. Firſt and foremoſt, the Ægyptians obſerue moſt her prime: or the fourth day after the change: for if ſhe appeare then, pure, faire, and ſhining bright, they are verily perſuaded that it will bee faire weather: if red, they make no other reckoning but of winds: if dim and blackiſh, they look for no better than a foule and rainie moneth. Mark the tips of her hornes when ſhe is fiue daies old, if they be blunt, they foreſhew raine; if pricking vpright and ſharp pointed withall: they alwaies tell of winds toward: but vpon the fourth day eſpecially, this rule faileth not, for that day telleth trueſt. Now if that vpper horne of hers only which bendeth Northward, appeare ſharpe
F pointed and ſtiffe withall, it preſageth wind from that coaſt: if the nether horne alone ſeem ſo, the wind will come from the South: if both ſtand ſtreight and pricking at the point, the night following will be windie. If the fourth day after her change, ſhe haue a red circle or Halo about her, the ſame giueth warning of wind and raine. As for *Varro* he (treating of the preſages gathered from the Moone) writeth thus: If (quoth he) the new moon when ſhe is juſt foure daies old,

pur

put her horns direct and ſtreight forth, ſhe preſages therby ſome great tempeſt at ſea preſently to follow, vnleſſe it be ſo that ſhe haue a guirland or circle about her, and the ſame cleer and pure; for then there is good hope that there wil be no foule nor rough weather before the full. If at the full, one halfe of her ſeeme pure and neat, a ſigne it is of a faire ſeaſon; if it be red, the wind will be buſie; if enclined to blacke, what elſe but raine, raine. Doe you ſee at any time a darke miſt or cloud round about the body of the moone? it betokeneth winds from that part where it firſt breaketh: and in caſe there be two ſuch cloudie and miſtie circles enuironing her, the tempeſt will be the greater: but how if there be three of them for failing, and thoſe either black, or interrupted, diſtracted and not vnited? ſurely then there wil be more ſtorms & more. The new moone whiles ſhe is croiſſant, if ſhe riſe with the vpper tip or horne blackiſh, telleth beforehand that there will be ſtore of raine after the full, and when ſhe is in the wane: but if the nether tip be ſo affected, the rain will fall before ſhe be at the full. But what if that blackneſſe appeare in the middle of her body betweene; then (ſaith *Varro*) it will poure of rain in the very full. A full moone hauing about her a round circle, ſheweth that there will be wind from that part, where the ſaid circle is moſt ſplendant. If her hornes appeare when ſhe riſeth, more groſſe and thicke than ordinarie, look ſoon after for a terrible tempeſt and and ſtormie weather. If ſhe ſhew not in our Horizon before the prime or fourth day after the chaunge, and the Weſt wind blow withall, then that moone throughout threatneth cold and winter weather: and if the day after the full ſhe ſeeme extraordinarily enflamed, ſhe menaceth vnto vs ſharp ſhowres and bitter tempeſts. Finally, in euery moon there be eight points and ſo many daies (according as ſhe lighteth vpon the angles of the Sunne) which moſt men obſerue onely, and take their preſages of future weather by, to wit, the third, ſeuenth, eleuenth, fifteenth, ninteenth, one and twentieth, ſeuen and twentieth, and the very day of her conjunction or chaunge.

In the third place, a man may know the diſpoſition of the ſeaſons by the fixed ſtarres, and therefore it behoooueth to obſerue and marke them. They ſeeme otherwhiles in the sky to flit and run too and fro, and then we ſhal not be long without great winds, riſing from that quarter where ſuch appeared and gaue token.

The ſtarrie skie, if it ſhew cleare and bright al ouer, and in euery part alike, during that particular ſeaſon [namely, between the occultation of the Harp-ſtar, and the Æquinoctiall point] which I propoſed and ſet downe heretofore, it is a fore-token of a faire and drie Autumne, but yet cold.

If the Spring add Summer both, paſſed not cleare without ſome raine and wet weather, it will be an occaſion that the Autumne following ſhall be drie, and leſſe diſpoſed to wind; howbeit, thick, muddy, and enclined to miſts. A faire and drie Autumne, bringeth in alwaies a windie winter.

When all on a ſudden the ſtars loſe their brightneſſe and looke dim, and that neither vpon a cloud nor a miſt in the aire, it ſignifieth either raine or grieuous tempeſts.

If the ſtarres make ſemblance as if they flew vp and down many together, and in their flying ſeem whitiſh, they denounce winds from that coaſt where they thus do ſhoot. Now if it ſeeme to the eye, as if they ran and kept one certaine place, thoſe winds will hold and ſit long in one corner: but in caſe they do ſo in many quarters of the heauen, they betoken variable and inconſtant winds, going and comming, and neuer at reſt. [When you ſee a circle about any of the other fiue planets or wandring ſtars, you ſhall haue powring ſhowres ſoone after.] Within the ſigne Cancer, there be two prettie ſtars which the Mathematitians call Aſelli, [*i.* little Aſſes] betweene which there ſeemeth to be a ſmall cloud taking vp ſome little roome, and this they name in Latine Præſepia, [*i.* a Crib, Cratch, Bowzey, or Manger:] now if it chaunce that this Racke or Crib appeare not, and yet the aire bee faire and cleare otherwiſe, a ſigne it is of cold, foule, and winter weather. Alſo if one of theſe two little ſtars, to wit, that which ſtandeth Northerly, be hidden with a miſt, then ſhall you haue the South wind to rage; but in caſe the other which is more Southerly, be out of ſight, then the Northeaſt wind wil play his part.

As touching the Rainbow, if it appear double as if there were two of them at once, it telleth of raine toward. A Rainebow preſently after raine, is a ſigne of faire weather: but this is not ſo certaine, neither will it hold long. Alſo, when a man ſeeth new circles ſtill about any planets, there will be much raine ſoone after.

In Summer time, if there chaunce to be more thunder than lightning, it threatneth winds from

20030
copy 1

from that coaſt where it thundreth: contrariwiſe, if it lighten much & thunder little, looke for rain plentie: when you ſee it lighten, and the skie otherwiſe cleare & faire, it is a token that rain and thunder will follow thereupon, yea and rigorous cold weather beſides: but the cruelleſt and moſt bitter impreſſiions of the aire, enſue vpon ſuch lightnings as come from all the foure quarters of heauen at once: if it lighten from the Northweſt only it betokens rain the day following; if from North, it is a ſigne of wind from thence: if from the South, Northweſt, or full Weſt, it happen to lighten in the night & the ſame be faire, it ſheweth wind and rain from out of thoſe coaſts: morne thunders foreſhew winds, but if they be heard at noon, they preſage rain.

As touching clouds, if you ſee the rack ride apace in the aire, the weather being faire & drie,
B looke for wind from that quarter whence thoſe clouds doe come; and if they ſeeme to gather thick in that place, diſpearſed they will be and ſcattered when the Sun approacheth: but more particularly, if this happen from the Northeaſt, they portend rain; if from the South, ſtorm and tempeſt: if at the Sun ſetting the rack ſeeme to ride from both ſides of him into the open aire, they ſhew of tempeſts toward: if the clouds be very blacke, flying out of the Eaſt, they threaten rain againſt night: but if they come out of the Weſt, it will ſurely raine the morrow after, if the clouds be diſparkled many together out of the Eaſt, and flie like fleeces or flocks of wooll, they ſhew rain for 3 daies after: when clouds flie low, and ſeeme to ſettle vpon the tops of the hills; looke ſhortly for cold weather, contrariwiſe, if you perceiue thoſe tops of mountaines cleare without moiſt or cloud, the weather will ſoone take vp and turne to be faire: when the clouds ſeeme to be heauily charged and full, and yet looke white withall (which * conſtitution of the aire is called commonly the white weather) there is an haile-ſtorme at hand: moreouer, be the
C skie neuer ſo cleer, the leaſt cloud appearing therein, is enough to engender and foreſhew wind and ſtorme: miſts if they come downe and fall from the mountaines, or otherwiſe deſcend from heauen and ſettle vpon the vallies, promiſe a faire and drie ſeaſon.

* Some call them Towers.

Leauing the ſtars and clouds aboue, let vs come to our fires that we make and keepe in our houſes here beneath, for they are to be raunged in the next place of our prognoſtication. If the fire then burne in the chimney pale, and keep there with a huzzing noiſe, we find by experience it foreſhewes tempeſt and ſtormie weather: as alſo wee may be ſure of rain, in caſe we ſee a fungeous ſubſtance or foot gathered about lampes and candle ſnuffs: if you ſee the flame either of fire or candle mount winding and wauing as it were, long you ſhall not be without wind. The
D like is to be ſaid of fire and candle light, if either they ſeem to go out of themſelues, or to kindle and take fire with much adoe. Alſo, when we diſcern in the fire a number of ſparkles gathered together and hanging one to another: or if when the pot is taken off from the fire, the coles ſticke to the bottome and ſides: or when the fire being raked in embres, keepeth a ſpitting and ſparkling from it: alſo, if the aſhes lying vpon the hearth grow together: and laſt of all, when the liue-cole ſhineth brighter or ſcorcheth more than ordinarie, all theſe be ſignes of rain.

Goe we a little lower to the water, for that element alſo giues ſignes of the weather: and firſt of all, if you ſee the ſea within the hauen, after the floud is gone, in a low and ebb water to bee calme, and yet heare it keep a rumbling noiſe within, it foreſhews wind: if it doe thus by times and fits one after another, reſting ſtil and quiet between whiles, it preſages cold weather & rain.
Item, if in calme and faire weather the ſea ſtrond or water banks reſound and make a noiſe, it is a
E token of a bitter tempeſt: ſo it fares alſo with the very ſea it ſelfe; for if it be calm, & yet make a roaring; or if the ſome thereof be ſeen to ſcatter to & fro, or the very water to boile & buble, you may be bold to foretell of tempeſts: the Puffins alſo of the ſea, [*i.* fiſhes named in Latin Pulmones] if they appear ſwimming aboue water, foreſignifie cold weather for many daies together: oftentimes the ſea being otherwiſe calme, ſwells, & by hoouing higher than ordinarie, ſheweth ſhe had wind good ſtore encloſed within her, which ſoon after will breake out into a tempeſt.

Let vs come aland againe, and marke the diſpoſition of woods and hills: you ſhall heare the mountains and forreſts both, keep a ſounding and rumbling noiſe, and then they foretell ſome change of weather, nay you ſhall mark the leaues of trees to moue, flicker, and play themſelues,
F & yet no wind at all ſtirring: but be ſure then you ſhall not be long without. The like prediction is to be gathered by the light downe of either poplars or thiſtles flying too and fro in the aire; alſo of plumes and feathers floting vpon the water. Goe down lower to the vales & plains: if a man chance to heare a buſtling there, he may make account that a tempeſt will follow. As for the rumbling in the aire, it is an vndoubted ſigne and token thereof.

Moreouer, the verie bruit and dumb creatures preſage and giue warning what weather there G
will be. To begin with the fiſhes of the ſea: the dolphins playing & diſporting themſelues in a calme water, doe certainely fore-ſhew wind comming from that coaſt whence they fetch theſe friskes and gambols: contrariwiſe, if they fling and daſh water this way and that way, the ſea at that time being rough and troubled, it is an infallible ſigne of a calm and of faire weather toward. The Cuttle or little Calamarie Loligo, launching it ſelfe and flying aboue the water; the Cockles & winkles cleauing and ſticking hard to the grauell, the Sea-vrchins thruſting themſelues into the owſe and mud, or otherwiſe balaiſed & couered with ſand, be all ſignes of tempeſts neare. The like may be ſaid of Froggs, when they crie more than their cuſtome is, and of Seamews alſo, when they gaggle in a morning betimes extraordinarily, ſemblably, the Cormorants, Gulls, Mallards, and Ducks, when they keep a proining of their feathers with their bills, H
foreſhew wind: and generally, when you ſee other water-foule to gather and aſſemble together and then combat one with another, or Cranes make haſt to flie into the midland parts of the maine. The Cormorants and Guls flying from the ſea and ſtanding lakes, and Cranes ſoaring aloft in the aire ſtill, without any noiſe, doe put in comfort of a faire and drie ſeaſon: ſo doth the Howlat alſo, when ſhe cries chuitt in rainie weather: but if it be then faire and drie, we ſhall be ſure to haue foule tempeſts for it afterwards: Rauens crying one to another as if they ſobbed or yexed therewith, and beſides clapping themſelues with their wings, if they continue this note, doe portend winds; but if they giue ouer between-whiles, & cut their crie ſhort as if they ſwallow it backe again, they preſage rain and wind both. Iacke-dawes, if it be late ere they returne from their reliefe abroad, foretoken cold and hard weather; ſo do the white-birds when they aſ- I
ſemble and flock together, as alſo when land-foule (and the crow eſpecially) keep a crying againſt the water, clapping their wings, waſhing alſo & bathing themſelues. If the Swallow flie low and ſo neere the water, that ſhe flap the ſame oftentimes with her wings, it is a ſign of rain and foule weather. Semblably, all other birds that neſtle in trees, if they ſeem to make many flights out, but returne again quickly to their neſts. Moreouer, if Geeſe hold on a continuall gagling out of all order vntunably, a man may gueſſe no better by them, no more than he can of the Heron which he ſeeth heauy and ſad vpon the ſands.

And no maruell that theſe riuer-foules, or generally any other birds of the aire whatſoeuer, ſhould haue a ſecret preſage and foreknowledge of the diſpoſition of the aire; for the very four-footed beaſts of the earth doe make ſhew thereof by their behauiour. The ſheep and ſuch ſmall K
cattaile, leaping and playing wantonly, dancing alſo as vntowardly without meaſure, doe teſtifie ſome change of weather: nay the dull and heauie oxen holding vp their noſe and muzles, ſnuffe and ſmell into the aire, yea and keep a licking againſt the haire [toward rain.] Alſo when you ſee the foule and filthie hogs, rend, teare, and fling about them bottles of hay, and yet they care not for it when they haue done, becauſe it is no meat for them: likewiſe if you perceiue the piſmires or ants either lying cloſe and idle, full againſt their nature (whoſe propertie is to be induſtrious and euer buſie) or encountring one another in battailewiſe, or elſe carying their egs abroad out of their holes. Finally, when the mads or earthwormes come forth and appeare, a man may be bold to foretel of a change in the weather.

What ſhould I ſay more? It is knowne for certaine, that Clauer-graſſe or hearbe-Trefoile L
will looke rough againſt a tempeſt, yea and the leaues thereof will ſtand ſtaring vp as if it were afraid thereof. And to conclude and make an end once of this diſcourſe, whenſoeuer you ſee at any feaſt the diſhes and platters wherein your meat is ſerued vp to the bourd, ſweat or ſtand of a dew, and leauing that ſweat which is reſolued ftom them either vpon dreſſer, cupbourd, or table, be aſſured that it is a token of terrible tempeſts approching.

THE HISTORIE OF THE WORLD.

Commonly called,

THE NATVRAL HISTORIE OF C. PLINIVS SECVNDVS.

Translated into English by PHILEMON HOLLAND, *Doctor of Physicke.*

The second Tombe.

LONDON,
Printed by Adam Islip.
1634.

THE HISTORIE OF THE WORLD

20030
copy 1

TO THE READER.

FOr as much as this ſecond Tome treateth moſt of Phyſicke, and the tearms belonging thereto (as wel concerning diſeaſes as medicines) be for the moſt part either borowed from the Greek, or, ſuch as the vnlearned be not acquainted with (which partly vpon neceſsity I was forced, and partly for varietie induced to vſe) I could not content my ſelfe to let them paſſe without ſome explanation: for ſince my purpoſe eſpecially is to profit and pleaſure the moſt ignorant (for whoſe ſake *Plinie* alſo himſelfe, as hee profeſſeth, compiled this worke) I would not be ſo iniurious vnto them as to interrupt their reading with obſcuritie of phraſe, when the matter otherwiſe is moſt familiar. In regard whereof, I thought good to prefix a briefe Catalogue of ſuch words of Art, as euer and anon ſhall offer themſelues in theſe diſcourſes that inſue, with the explanation thereto annexed, and the ſame deliuered as plainly as I could poſsibly deuiſe for the capacity of the meaneſt. In the handling whereof, ſo I may ſatisfie my countrymen that know no other Language but Engliſh, I ſhall thinke my paines and labour well beſtowed, and leſſe feare the cenſure of thoſe that haply expect ſome deeper learning; for euer ſtill

the verſe of that Comicall Poet reſoundeth from the ſtage in mine eares,

ἀμαθέστερον φρονῶν καὶ σοφώτερον. (id eſt)

Speake with leſſe ſhew of learning, ſo it be with more perſpecuitie. Vale.

20030
copy 1

A briefe Catalogue of the words of Art, with the Explanation thereof.

A

Abort, or *Abortiue fruit*, is an vntimely birth.

Abſterſiue, *i*. ſcouring, cleanſing, or wiping away, ſuch as the Greekes call Smectica, and they enter into ſope & waſhing balls.

Acceſſe, *i*. a fit, whether it be of an Ague, falling ſickneſſe, or any ſuch diſeaſes as returne at times.

Acetabulum, or *Acetable*, a meaſure among the Romans, of liquour eſpecially, but yet of dry things alſo, the ſame that oxybaphon in Greeke: and for that, as both words do import, they vſed to dip their meats in vinegre out of ſuch, it may wel go for a ſaucer with vs; for it contains, as ſome think, fifteen drams, which grow neere to two ounces, of which capacitie our ſmall ſaucers are: but as others ſuppoſe, it receiues two ounces and an halfe, the meaſure of ordinary ſaucers.

Acrimonie, *i*., Sharpeneſſe.

Actually, *i*. ſenſibly and preſently, as fire is actually hot.

Aditiales, or *Adÿciales epulæ*, were great and ſumptuous feaſts or ſuppers, held by the Pontifices or high Prieſts in teſtimony of publique ioy.

Almonds, ſee *Amygdals*.

Amphora, a meaſure in Rome of liquors only: it ſeemes to haue taken that name of the two ears which it had of either ſide one: it contained 8 Congios, which are much about 8 Wine gallons, or rather betweene ſeuen and eight: ſo as in round reckoning it may go for a ferkin, halfe kilderkin, or half feſtern with vs.

Amygdals be kernils at the root of the tongue ſubiect to inflammations & ſwellings, occaſioned by deflux or falling down of humors from the head: they be called Antiades, Pariſthmia, & Tonſillæ: the foreſaid infirmities alſo incident vnto them, doe likewiſe cary the ſame denominations.

A

Antidotes, *i*. countrepoyſons, properly, defenſatiues or preſeruatiues againſt poyſon, peſtilence, or any maladie whatſoeuer.

Antipathie, *i*. contrarietie, enmity, and repugnancie in nature, as between fire and water, the vine, and the Colewort, &c.

S. Anthonies fire is a riſing in the skin occaſioned by hot bloud mixt with abundance of choler, and ſuch be the ſhingles and other wild fires called in Greek Eryſipelas.

Aquoſities be wateriſh humors apt to engender the dropſies called Aſcites and Leucophlegmatia.

Aromatiſed, *i*. Spiced.

Arthriticall griefes, ſuch as poſſeſſe the ioints, as all the ſorts of gout.

Aſtrictiue or *Aſtringent*, be ſuch things as bind the body, or any part thereof.

Attractiue, *i*. drawing, as the loadſtone draweth iron, amber ſtraws or bents, Dictamnus arrow heads or ſpils out of the bodie, and cupping glaſſes (or ventoſes) humours and wind.

Auſtere, harſh or hard, as in fruits vnripe, and hard wines of hedge grapes.

Axinomantie, a kind of magicke diuination by an ax head red hot.

B

Baſis in a compound medicine is that drug or ſimple which is predominant, and carrieth the greateſt force in it, as the ground thereof, whereupon the whole taketh the name; as Poppy in Diacodion, Quinces in Diacydonium, &c.

Bole is the form of a medicine when it may be giuen in groſſe manner at a kniues point to the quantitie of a nutmeg at a time, vntill the whole receit be taken.

Browning, a term vſuall in the mouths of mariners and winnowers of corne, when they are calmed and do call for wind.

Bulbes, although *Pliny* ſeemed to giue that name vnto ſome one ſpeciall hearbe, yet it

ſignifieth generally all thoſe as haue round roots, as Onions, Squilla, Wake-robin, and ſuch like; whereupon theſe and other of that kind are ſaid to haue bulbous roots.

Cacochymie is that indiſpoſition of the body in which there is aboundance of humors.

Calcining, *i.* the burning of a minerall, or any thing, for to correct the malignitie of it, or reduce it into pouder, &c.

Calloſitie, thickneſſe and hardneſſe of skinne in maner ſenſleſſe, as in fiſtulaes, and vnder our heeles.

to *Carminat*, is to make more fine and thin the groſſe humours, by ſuch medicines as by their heat are apt to cut and diſſolue them; wherupon they likewiſe be called *Carminatiue*, a terme receiued by Apothecaries, and borrowed from thoſe that card wooll.

Cancer is a ſwelling or ſore comming of melancholy bloud, about which the veins appeare of a blacke or ſwert colour, ſpread in manner of a Creifiſh clees; whereupon it tooke that name in Latine, like as in Greek *Carcinoma*. And ſuch vlcers as in that ſort be maintained and fed with that humor, are called cancerous, and be vntoward to heal, worſe commonly for the handling.

Carnoſitie, *i.* fleſhly ſubſtance.

Cataplaſm, a pulteſſe or groſſe maner of plaſtre

Cartilage in man and beaſt is a griſtle, in roots and fruits, that ſubſtance which we obſerue in the radiſh root, and the outward part of a cucumber, as *Pliny* ſeems to take it; which thereupon be called Cartilagineous.

Cataract is a dimneſſe of ſight cauſed by an humor gathered and hardned betweene the tunicle of the eye, called Cornea, and the Cryſtalline humour; it is next couſine to blindneſſe.

Cauſtick, *i.* burning, bliſtering, or ſcalding.

to *Cauteriſe*, is to ſeare or burne by a Cauterie.

Cauterie actuall is fire it ſelf or ſcalding liquor: and ſo a ſearing iron, gold, or other mettall made red hot, is called an Actuall cauterie, which without the help of our natural heat doth work preſently.

Cauterie potentiall is that which will raiſe bliſters and burn in time, after it is once ſet on work by the heat of our body, as Canthorides, Spererwort, &c.

Ceres the firſt inuentreſſe of the ſowing & vſe of corne.

Cerote is of a middle nature betweene an ointment and a plaiſter, not ſo hard as the one, nor ſo ſoft as the other.

Cicatrices in eyes be whitiſh ſpots, otherwiſe called pearls: they be the skars alſo remaining after a ſore is healed vp: and ſo a place is ſaid to be cicatriſed, when it is newly skinned vp and healed.

Circulation is the deuiſe of ſubliming or extracting water or oile by a ſtillatorie, a lembick, or ſuch, becauſe the vapor before it be reſolued into water or oile, ſeemes to go round circlewiſe.

Clyſterized, *i.* conueyed vp by a clyſter into the guts.

Cæliaci be thoſe that through weakeneſſe of ſtomacke are troubled with a continuall flux of the belly.

Colature, a thin liquour that hath paſſed thorow a ſtrainer or colander.

Colliquation is a falling away and conſumpti- of the radicall humour or ſolid ſubſtance of the body.

Collyries, are properly medicines applied to the eies in liquid forme; whereas the dry kind be rather called Sief & Alcohol, eſpecially in pouder: howbeit *Pliny* attributeth this terme to all eye-ſalues whatſoeuer. Alſo it ſeemeth that hee meaneth thereby, tents to be put in a fiſtulous vlcer, as in *pag.* 509 *b.* 510 *k.*

Collution, a liquour properly to waſh the mouth, teeth, and gums withall.

Concocted, *i.* altred to that ſubſtance by natural heate, as either in health may ſerue to nouriſh, or in ſicknes is apt to be expelled

Conſolidat, to knit, vnite, & make ſound again that which was broken or burſt.

Concrete, *i.* hardned and grown thicke.

Condite, *i.* preſerued in ſome conuenient liquor.

to *Concorporate*, *i.* to mix and vnite together into one maſſe.

Conſiſtence, *i.* ſubſtance or thickneſſe.

Conſtipate, *i.* to harden and make more faſt and compact.

Contraction of ſinews, a ſhrinking or drawing of them in too ſhort.

Contuſions, *i.* Bruiſes.

Convulſions, painfull cramps.

Criticall daies be ſuch, as in ſhort diſeaſes & thoſe of quicke motion, do giue light vnto the phyſitian of life or death. *Pliny* obſerues the od daies to be moſt ſignificant, and thoſe vſually determinof health; and the euen days contrariwiſe: ſo that the ſeuenth is *Rex*, *i.* a gratious prince, the ſixth *Tyrannus*, *i.* a cruell tyrant.

20030
copy 1

Cruditie. See *Indigeſtion.*

Cyath, a ſmall meaſure both of liquid and drie things; the twelfth part of a ſetarius, which was twenty ounces: whereby it appeareth, that a cyath was one ounce, one half ounce, one dram, and one ſcruple: it may goe with vs for foure ordinarie ſpoonfulls.

Cubit, a meaſure from the elbow to the middle finger ſtretched out at length, which went ordinarily for 24 fingers bredth, or 18 inches, which is one foot and a halfe: yet *Pliny* in one place maketh mention of a ſhorter cubit, namely from the elbow to the end of the fiſt or knuckles, when the fingers be drawn in cloſe to the hand.

Cutanean eruptions be ſuch wheales, puſhes, or ſcabs as do breake out of the skin and diſfigure it.

D

Debilitie, i. weakneſſe or feebleneſſe.

Decoction, a liquor wherin things haue bin ſodden.

Decretorie daies, be ſuch as in a ſickneſſe ſhew ſome chaunge or alteration in the patient, either for good or bad.

Defenſatiue, in medicines taken inwardly, are ſuch as reſiſt venom or peſtilent humor: in outward applications, ſuch as defend the ſore or place affected from the flux or fall of humors thither.

Denarius, a coin of ſiluer in Rome, and in other countries of gold, the ſame that Drachma Attica, *i.* a dram in weight, which is *vij. d. ob.* of our mony; and the piece in gold anſwereth neere to a full French Crowne; in poiſe it goeth for a dram.

Dentifrices, are meanes in Phyſicke to preſerue the teeth, and make them white and faire.

Depilatorie are thoſe medicines which either fetch off the haire, or hinder it from comming vp againe at all, or at leaſtwiſe from growing thicke. They were called in Greek and Latine both, *Pſilothra.*

Deſiccatiue, i. drying.

Digeſtiues be thoſe medicines which taken inwardly, helpe concoction of meate or humors; or applied without vnto a ſore, doe comfort the place, and make way for ſpeedie healing.

Diſlocations, when the bones be either out of ioynt, or elſe diſplaced.

to *Diſopilate, i.* to open.

to *Diſsipate, i.* to ſcatter and diſpatch.

Diſtortion, crookedneſſe or turning awry vnnaturally.

Diuretickall, ſuch things as prouoke vrine.

Doſe, i. that weight or quantitie of any medicine that may be giuen either conuenientlie or without danger to the patient.

Dram, the eight part of an ounce, which is the weight of a Roman denier, or Denarius.

Dyſenterie, is properly the exulceration or ſore in the guts, whereupon enſueth beſides the painefull wrings of the belly, a flux alſo of bloud at the ſiege, and therefore it is vſually taken for the bloudy flix.

E

Eclogues. See *Eidyls.*

Electuaries, be medicinable compoſitions or confections to be taken inwardly, made of choiſe drugs, either to purge humors, to ſtrengthen the principall parts, or to withſtand any infirmitie for which they are made. The ſubſtance is betweene a ſyrrup and a Conſerue, but more inclining to the conſiſtence of conſerues.

Eidylls, or *Eidyllia*, be ſmall poemes or pamphlets written by Poets, ſuch as *Theocritus* in Greeke compiled, and much like vnto the Paſtorals or Eclogues of *Virgill* in Latine.

Embrochation is a deuiſe that phyſitians haue for to foment the head or any other part, with a liquor falling from aloft vpon it, in maner of rain, whereupon it took the name in Greeke Embroche, and hath found none yet in Latine, vnleſſe we ſhould vſe Superfuſio.

Emollitiues, medicines that do ſoften any hard ſwelling.

Empiricks were thoſe phyſitians, who without any regard either of the cauſe in a diſeaſe, or the conſtitution and nature of the Patient, went to worke with thoſe medicines whereof they had experience in others, fall it out as it would.

Empirick books of *Diodorus* contained receits approoued and found effectuall by experience.

Emunctories be thoſe kernelly places in the body, by which the principall and noble parts doe void their ſuperfluities, or ſuch things as offend; to wit, vnder the ears for the brain, the arm-pits for the heart, and the ſhare for the liuer, &c.

Empla-

Emplaſtration in the Hortyard, is grafting by inocelation with a ſcutcheon in Phyſicke, the applying of a ſalue or plaſtre.

Epilepſie, i. the falling ſickneſſe.

Errhines be deuiſes made like tents, ſharper at one end than the other, to bee put vp into the noſe, either to cure ſome vlcer there, or to draw downe and void humors out of the head, or to prouoke ſneeſing, &c.

Eſchare, is that cruſt which ariſeth vpon a cauterie, either actuall or potentiall, as alſo the roufe or ſcab that groweth vpon a ſore.

Euacuation, i. Voidance and riddance of any thing out of the bodie by vomite, purging, bleeding, ſweating, &c.

Excalfactorie, i. Heating or chauſing.

Excoriation, i. fretting the skin off, when a part is made raw: a way to exulceration.

Excreſence, i. ouergrowing vnnaturally of any thing in mans bodie.

Exoticall, i. forraine, and brought from other countries.

Exorciſmes, i. coniurations by certain charmes and ſpels.

Exorciſts, they that practiſed ſuch Exorciſms.

To *Expectorat, i.* to rid and diſcharge out of the breaſt by coughing or reaching.

Expiatorie, were ſacrifices or oblations for to make ſatisfaction and atonement.

Exiccatiue. See *Deſiccatiue.*

Extenuat, i. to make thin.

Exulceration, i. a ſoreneſſe of any part inward or outward, when not onely the skin is off, but the humor doth fret deeper ſtill.

Exulceratiue, be ſuch things as are apt to eat into the fleſh and make an vlcer.

F

Fermentation, i. an equall mixture of things working as it were together: a tearme borrowed from the leuaine, which diſperſeth it ſelfe into the whole maſſe or lumpe of dough.

Filaments bee the ſmall ſtrings that hang to a root like threads or haires, which ſome call the beard of the root: and in reſemblance thereof, other things growing likewiſe, bee ſo called.

Fiſſures, clifts or chaps, whether it bee in the hands, feet, lips, or fundament.

Flatuoſities, i. windineſſe gathered within the bodie.

Flora, the goddeſſe of floures among the Painims.

Fomentations properly be deuiſes for to be applied vnto any affected part, either to comfort and cheriſh it, or allay the paine, or els to open the poores to make way for ointments and plaſtres. If they be liquid things they are laid too by the means of bladders, ſpunges, or ſuch like: if drie, within bags or quilts.

Fractures, i. bones broken.

Friction or *Frications*, rubbbings of the bodie vpward or downeward gently or otherwiſe, as the cauſe requireth.

Frontall, the forme of an outward medicine applied vnto the forehead, to allay paine, to procure ſleepe, &c.

Fukes, i. paintings, to beautify the face in outward appearance. They are called at this day complexions, whereas they bee cleane contrarie: for the complexion is naturall, and theſe altogether artificiall.

Fumoſities bee vapours ſteaming vp into the head, troubling the braine.

Fungous, i. of an hollow and light ſubſtance like to Fuſſes or Muſhromes.

G

Garga riſmes bee collutions of the mouth, and parts toward the throat, either to draw downe and purge humours out of the head, or to repreſſe and reſtraine their flux, or to mundifie and heale any ſore there growing.

Gargariſing or *Gargling* is the action of vſing a liquor to the ſaid purpoſe.

Geſtation, an exerciſe of the bodie, by beeing carried in coach, litter, vpon horſebacke, or in a veſſell on the water.

Glandulous ſwellings. See *Kings* euill.

Gleir, i. the white of an egge.

Gymnicke exerciſes, were thoſe that were performed by men naked, and the place for ſuch exerciſes, was thereupon called Gymnaſium.

H

Habit of the bodie, is taken for the outward parts thereof, oppoſit vnto the bowels and principall within; which being comforted and fortified, do thruſt forth offenſiue matters to the habit and exterior skin.

Hemine, a meaſure in Rome, as well of liquors as drie things: ſo called, becauſe it was half Sextarius: it contained ten ounces, and is

ſomewhat

20030
copy 1

ſomwhat vnder out wine pint, it is the ſame that Cotyla in Greeke.

Humiditie, i. moiſture.

Hydromantia, a kinde of magicall diuination or foreknowledge of things to come, by obſeruation of the water.

Hydrophobie, is a ſymptome or accident befalling to them that are bitten by a mad dog, whereby they are afraid of water.

Hypochondriall parts, be the flanks or ſoft parts vnder the ſhort ribs.

I

Iliacke paſſion, the wrings and torments of the vpper ſmall guts, occaſioned by wind or ſharp humors. Some improperly cal it the collicke of the ſtomacke.

Imbibition, a drinking or receiuing of any liquor into a thing: as when drougs lie ſteeped therein vntill they be throughly ſoaked therewith.

Impoſthumes properly be collections or gatherings of winde and humours eſpecially betweene parts of the body, whereupon there appeareth a riſing or ſwelling, and in time they become corrupt and do rankle, vnleſſe by ſome meanes they be either drawn away or diſperſed. Some terme them wens, howbeit, the word is taken for inflammations and biles.

To *Incorporate*, is to mixe and vnite well together.

To *Incraſſate*, is to make thicke.

Indigeſtion, i. want of concoction and digeſtion, by which means many crudities & raw humors are ingendered, & by conſequence abundance of rheumes.

Inflation, i. ſwelling or puffing vp with winde.

Infrangible, i. that cannot be broken.

Infuſion ſignifieth the conueiance of ſome medicinable liquour into the body by clyſtre or other inſtrument. It importeth alſo the ſteeping of drougs in a conuenient liquor: and the liquor it ſelfe, when it is ſtrained from the reſt.

Ingredients, be thoſe ſimples that goe vnto the making of any medicine compound.

Iniection, is the conueiance of any liquid medicine by ſyringe or ſuch like inſtrument into any part of the body or hollow and fiſtulous vlcer.

Inſects, little vermine or ſmal creatures, which haue (as it were) a cut or diuiſion betweene their heads and bodies, as Piſmires, Flies, Graſhoppers, vnder which are comprehended Earth-wormes, Caterpillers, &c.

Inſeſſions be bathing tubs or veſſels halfe full, wherein the patient may ſit vp to the middle or aboue in ſome conuenient decoction

Intermittent feauer, are thoſe which come by fits, and yeeld ſome reſt betweene whiles.

Iniunction, i. annointing.

Iulebs or *Iuleps*, be drinkes giuen commonly as preparatiues for to open the paſſages of the inward parts, and to prepare the humours for a purgation, made either of ſome ſtilled waters and ſyrrups mixed together, or of a decoction ſweetened with hony or ſugar, or els mingled with ſyrrups.

K

Kings euil, is the hard ſwelling of the Glandules or Kernels commonly about the necke: they be called alſo Scrophules.

L

Lachrymal, is the corner of the eie wherein the teares appeare firſt, and thereof it taketh the name.

Laßitude, is wearineſſe or vnluſtineſſe.

Lauature, *Lotion*, or *Loture*, is a liquor to bathe or waſh withal: likewiſe to clenſe and mundifie any part.

Ligula, *Lingua*, or *Lingula*, a ſmall meaſure among the Romanes, both of liquour and drie things, containing the fourth part of Cyathus, to wit, three drams & one ſcriptule or ſcruple, ſomewhat vnder halfe an ounce, and may goe well for our Spoonefull.

A *Liniment* is thicker than oyle, and thinner than an ointment, it may be taken for a thinner kind of ointment.

Lobes and fibres are the lappets and extreame parts of the liuer, with the maſter veines growing thereto.

Locall medicines, be thoſe that are appropriat for the forehead, *Errhine* or *Naſal* for the noſthrils, &c. or to be applied outwardly, ointments, which are not to be vſed before general or vniuerſal means by euacuation.

Loch or *Lohoch*, is a medicin more liquid than an electuary, appropriat for the lungs and windpipe, and is to be licked and let goe downe leiſurely.

Longaon, is the nethermoſt gut reaching vnto the very ſeat or the fundament.

Luted,

Luted, i. close stopped with clay, dough, or such like.

M

Maturatiues be medicins that help to ripen any swelling impostume, bile, or botch
Maturity, is the ripenesse thereof.
Membranes, be fine skins which inwrap other parts, as the brains, eies, and muscles of the flesh.
Metrenchyte, an instrument seruing to infuse or iniect a liquid medicine into the matrice of a woman, in manner of clystre.
Mitigatiues, be such remedies as do asswage paine.
Mna, or *Mina*, was a Roman weight, which poised twentie ounces, that is to say, the ordinary pound, called Libra or Pondo, & two third parts: for the common Libra called Medica, weighed twelue ounces, so that Mina seemed to answer vnto the measure Sextarius.
Mollitiue. See *Emollitiues*.
Mordicatiue, is biting and stinging, as Senuy seed.
Mucilage, is a slimy liquor drawne from some roots or seeds, as from the marsh Mallow or Althea root, the seed of Psillium or Flewort and others.
Muscles be the fleshie parts of the bodie, contained within their seuerall membranes or skinnes.

N

Narcoticke medicines, be those that benum and stupifie with their coldnesse, as Opium, Hemlocke, and such like.
Nasals be Nose-tents. See *Errhina*.
Nerues, i. Sinewes.
Nodosities, hard knubs & knots growing vpon the ioynts in old gouts, and in other parts.

O

Obolus, halfe a scriptule, or the sixt part of a dram.
Obstructions, i. Stoppings.
Opiats, were properly at the first such electuaries or confections, which had a good quantitie of Opium, *i.* the iuice of Poppie in them, such as Philonium and Requies, that were deuised to mitigate intollerable paine, and to bring the patient to sleepe: howbeit, in these daies all electuaries, euen cordials, in a liquid form be called Opiats, although there be not one grain of Opium in them.
Opilation. See *Obstruction*.
Orthopnoicke, are those that haue the disease Orthopnœa, which is a difficulty of drawing their wind, vnlesse they sit vpright.
Osses, be words cast forth at vnawares, presaging somewhat.
Otenchyte, an instrument, deuised for to infuse or poure some medicinable liquor into the eares,
Oxycrate, a mixture of water and vineger together.

P

To *Palliat, i.* to couer: & such cures be called Palliatiue, which search not to the root and cause, but giue a shew only of cure; as when a sore is healed vp aloft, and yet festereth vnderneath: and so sweet Pomanders do palliat a stinking breath, occasioned by a corrupt stomacke or diseased lungs, and such like.
Paradoxes, strange opinions.
Pectorals, i. such medicines as bee fit for the breast and lungs.
Pellicles. See *Membranes*.
Penetratiue, i. Percing.
Periodicall, such agues be called, as return at their iust course from day to day, euery third fourth, or fifth day, &c.
Peripneumony, is the inflammation of the lungs.
Pessary, is a deuise made like a finger or suppository, to be put vp into the natural parts of a woman.
Phlebotomie, i. bloud-letting, or opening of a veine by incision or pricke.
Phthysicke, to speak properly, is the consumption of the body occasioned by the fault of exulcerat and putrified lungs. But *Pliny* otherwhiles seemeth to take it for any other consumption.
Pomona, a deuised goddesse amongst the Painims, of apples and such fruits.
Prodigies bee strange sights and wonderfull tokens, presaging some fearefull thing to come.
Propinquitie, nearnesse or affinitie.
Proscription, was a kind of outlawing and depriuing a man of the protection of the state, with

20030
copy 1

with confiscation of his lands and goods.

Propagat, to grow and increase, after the manner of Vine branches, which being drawne along in the ground from the mother stock do take root.

Propitius, *i*. gracious and mercifull.

Proximitie, neere neighbour-hood or resemblance.

Ptisane, the decoction of husked Barley: a grewell made therewith, or the creame thereof.

Pulpous, *i*. full of pulpe, or resembling pulpe, which is the soft substance in Apples or such fruits, answerable to the flesh in liuing bodies.

Purulent, yeelding filth and Attyr.

Putrefactiue, such venomous medicines or humors, as do corrupt and putrifie the part of the body, which they possesse.

Q

Qvindecemvirs, were certain officers, fifteen in number, ioined in one commission.

R

Receptorie, a vessell standing vnderneath, ready to receiue that which droppeth and distilleth from something aboue it.

Reciproeall, going and comming, as the tides of the sea ebbing and flowing.

To *Rectifie*, *i*. to set streight, to reforme, or amend.

Repercussiue, *i*. driuing or smiting backe.

Residence, *i*. the setling toward the bottome, as in vrine.

Retentiue facultie, *i*. the naturall power that each part or member of the body hath to hold that which is committed vnto it, the due time, as the stomacke, meat, the bladder, vrine, &c.

Reuerberation, *i*. rebounding or striking backe.

Rhagadies, bee properly the chaps in the fundament or seat.

Rubified, *i*. made red, as when by application of mustard plastres, called Sinapismes; or beating a part that is benummed with nettles, it recouereth a fresh colour againe, whereupon such plastres be called Rubificatiue, and the operation is named by the Greekes Phœnigmos.

Rupture, the disease of bursting, as when the guts or other parts fall downe into the bag of the cods.

S

Salivation, is a drawing of humours to the mouth, and a deliuerie of them from thence in manner of spittle.

Sarcling is the baring of roots, by ridding away the earth and weeds from about them, that did clog them.

Scarification, is a kind of pouncing or opening of the skin by way of incision slightly, with the fleame or launcet, either to giue some issue for the bloud and humours to passe forth, or prepare a place for the cupping-glasse to extract more.

Schirre, is a hard swelling almost senceless.

Scriptule, or *Scruple* is foure and twenty grains weight, or the third part of a dram.

Scrophules. See *Kings euill*.

Seat, is the circumference or compasse about the tuill or fundament.

Secundine, *i*. the afterbirth that infolded the infant within the mothers wombe.

Sege, a stoole of easement, whereupon wee sit to discharge the order and excrements of the guts.

Serosities, or *Serous humors*, be the thinner parts of the masse of bloud, answering to the whey in milke, such as we see to float vpon bloud that hath run out of a veine

Sextarius, a measure among the Romanes, whereof six goe to their Congius, whereupon it tooke that name: it containes two hemines, and is somewhat lesse than a wine quart with vs, it beareth twentie ounces.

Sinapisme, a practise by a plaster of mustard seed, and such like, to reuiue a place in manner mortified, and to draw fresh humors & colour to it.

Solstice, *i*. the Sunnestead, as well in winter as Summer, when hee is come to his vtermost points North and South, but vsually it is put for Mid-summer onely.

Sophisticated, *i*. falsified & made corrupt, howbeit, going for the right. Thus drougs and gems are many times thrust vpon vs.

Spasmes, be paine full crampes or pluckings of the sinewes and cords of the Muscles.

Spasmaticke, are such as be thus plucked.

Species, be either the simple ingredients into a composition, or else the bare pouders mingled together, ready to be reduced into an electuarie liquid, or Tables.

Speculatiue knowledge, or *Speculation*, is the insight into a thing by reading only & contemplation

templation, without practise & experience.
Sperme, is naturall seed.
Spondyles, be the turning ioints of the chine or backbone.
Stomachicall fluxe, is the same that Cœliaca passio. See *Cœliaci*.
Stomaticall medicines, be such as are appropriat for the diseases incident to the mouth, and the parts adioining.
Stypticke, be such things as by a certain harsh tast, doe shew that they bee astringent, as medlars and alumne, which thereupon is named *Stypteria*, and such like.
Succedan, that drug which may be vsed for default of another. The Apothecaries call such, *Quid pro quo*.
Suffusion. See *Cataract*.
Suffumigation, is the smoke that is receiued in to the body from vnder a stool, for the diseases of the guts, fundament or matrice.
Suppuration, is when a bile or impostume gathereth to an head and must be broken.
Sympathie, *i*. a fellow-feeling, vsed in *Pliny*, for the agreement or amitie naturall in diuers senceleſſe things, as betweene yron and the loadstone.
Symptome, an accident accompanying sicknes, as head-ach the ague, stitch, shortnesse of wind, spitting bloud, cough, and ague, the pleurisie.
Syringe, an instrument in manner of a pipe to iniect a medicinable liquor into the blader.

T

TEllus, the earth.
Tenacitie, clammineſſe, such as is in glew, birdlime, and Bitumen.
Theoricke, or *Theoretique*, contemplatiue knowledge without action and practise.
Tineſme, an inordinat desire to the stool without doing any thing to the purpose.
Tonsils. See *Amygdals*.
Transparent, *i*. cleare and bright throughout; as crystall, amber, aire and water.
Transvasation, *i*. the pouring of liquor out of one vessell into another.
Triuial, *i*. vulgar, common, and of base reckoning.
Triumvirat, the Tripartite dominion of *Antonie*, *Octavius*, and *Lepidus*, when they held all the world in their hands, each one their third part.
Trochisques, or *Troſques*, be litle cakes or roundles, into which diuers things medicinable are reduced for to be kept the better, & to be ready at hand when they shall be vsed.
Tuil, the same that the Fundament or nethermost gut.

V

VEgetatiue, that power in nature which God hath giuen to creatures, whereby they liue, are nourished, and grow.
Ventositie, windineſſe.
Vicinitie, neerneſſe, or neighborhood.
Victoriat, a siluer coine in Rome, Halfe a denarius, so called becauſe it had the image of victory stamped on the one side: it is somwhat vnder our groat.
Vnction, annointing.
Vnguent, an ointment.
Vreters, be the passages or conduits whereby the water or vrine passeth from the kidnies into the bladder.
Vulnerarie, *i*. belonging to a wound; as Sanicle is a vulnerary herbe, and *Machaon* was a vulnerarie Physitian.

20030
copy 1

THE NINETEENTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

C TReated we haue in the former booke, of the ſtars and ſignes aboue, which giue vs intelligence as well of the ſeaſons, as the diſpoſition of the weather to come: and that in plaine and eaſie maner, by ſo evident and vndoubted demonſtrations alſo, as may content the meane capacitie of the vnskilfull and ignorant. And verily, if we will rightly weigh and conſider the thing, we ſhal find and vnderſtand, that our countrey farmes and villages ſtand vs in good ſtead to know the inclination of the heauens and ſtars, as the skill of Aſtronomy ſerueth our turnes for good husbandry. Theſe points now being well and throughly learned, many haue bin of opinion, That the knowledge of gardens and the care thereto belonging, ſhould by good right follow next. Howbeit, I for my part am of this mind, that there be other matters concerning Agriculture, deſerue to be handled, before we leape thus ſoon to gardening. And here I cannot chuſe but maruell much at ſome men, who making ſuch profeſſion of learning, and namely, in the skill and ſcience of Agriculture, as they haue done; yea, and ſeeking thereby to win all their credit and name of erudition and literature; haue notwithſtanding omitted many things requiſit thereunto, without any mentiD on made, or one word ſpoken of ſo many herbes and ſimples which either come vp of themſelues, or grow by meanes of mans hand: conſidering that the moſt part of them are in greater price and reputation, yea, and in more vſe and requeſt far, for the maintenance of this our life, than either corne or Pulſe, or any fruits of the earth whatſoeuer.

And to begin firſt at thoſe that are known commodities, and ſo notorious, as that the vſe thereof not only reacheth all ouer the maine and continent, but extendeth alſo to the very ſeas, and ouerſpreadeth them: What ſay we to Line or Flax, ſo commonly ſowed as it is? yet may it not be ranged either among the fruits of the field, or herbs of the garden. But what region (I pray you) or part of the earth is without it; and what is there ſo neceſſary for this life of ours in all reſpects? Againe, is there any thing in the whole world more wonderfull and miraculous, than that there ſhould be an herb found of this vertue and property, as to bring E Egypt and Italy together? inſomuch, as Galerius, Lord Deputy in Egypt vnder the Romans, was knowne to ſet ſaile from the firth of Meſſina in the ſtraits of Sicily, and in ſeuen daies to arriue at Alexandria: Babilius alſo Gouernor there likewiſe, in ſix; and that by the means of the ſaid herb? Moreouer, what ſay you to this, which was ſeen no longer ſince than the ſummer paſt; when Valerius Marianus, a Senator of Rome, & late Lord Pretour, embarked and tooke ſhip at Puteoli, and in nine daies ſailed to the ſaid Alexandria, and yet he had but a very mild and ſtill wind to helpe him in that voiage? Is not this a ſtrange and ſoueraigne herb think you, that in a ſeuen-nights ſpace can fetch Gades from as far as the ſtraits of Gilbretar or Hercules pillars, into the harbor of Oſtia in Italy? can ſhew (I ſay) the kingdome of Catalogne in Spaine before the ſaid port-towne in foure daies; Prouince in three, and Barbary in two? for C. Flaccus, lieutenant vnder Vibius Criſpus the Pro-conſull, did as much I ſpeake of, and that with no great forewind, but a moſt gentle F and milde gale. Oh the audacious boldneſſe of this world, ſo raſh, ſo full of ſin and wickedneſſe, that a man ſhould ſow and cheriſh any ſuch thing, as might receiue and ſwallow the Windes, ſtormes, and tempeſts; as if the float and tide alone were not ſufficient to carrie ſo proud a creature! But now are wee growne moreouer to this paſſe, that ſailes bigger than the Shippes themſelues, will not ſerue our turnes. For albeit one maſt be ſufficient to carrie the biggeſt croſſe-yard that can be deuiſed, yet are not wee content with a ſingle

maine ſaile thereupon, vnleſſe we ſet vp Saile vpon Saile, top and top-gallant: vnleſſe (I ſay) we haue for e- G
ſailes and ſprit-ſailes in the Prow, miſnes alſo hoiſed vp and diſplaied in the Poupe; beſides other trinkets and more cloath ſtill; and all to ſet vs more forward vpon our death, and to haſten our end. Finally, is there ought againe ſo admirable, as that of ſo ſmall a graine as is the Line-ſeed, there ſhould grow that which is able to carry to and fro in a moment, this round globe of the earth, the ſame being ſo ſlender a ſtalke as it is, and not growing high from the ground? conſidering withall, that twiſted it is not entire and whole in the ſtem; but before it can be occupied, it muſt be watered, dried, braked, tew-tawed, and with much labor driuen and reduced in the end to be as ſoft and tender as wooll: and all to do violence to Nature and Mankinde moſt audaciouſly euen in the higheſt degree, in ſuch ſort, as a man is not able to proceed ſo far in execration, as is due vnto this inuention. The firſt deuiſer whereof I haue inucighed againſt in conuenient place elſe-
where, and not without deſert; as who could not be content, that a man ſhould die vpon the land, but hee H
muſt periſh vpon the ſea, to feed Haddocks there, without the honour of ſepulture. In the booke but next before this, I gaue warning and aduertiſed men, That for to enioy corne and other victuals neceſſarie for this life, in ſuffiſance and plenty, we ſhould beware of winde and raine: and now behold, man is ſo wicked and vngratious, his wit ſo inuentiue, that he will be ſowing, tending, and plucking that with his own hand, that calls for nothing elſe at ſea but winde; and neuer reſts till Browning be come. See moreouer, how well this vnhappy hand of his ſpeeds: for there is not a plant againe commeth vp ſooner, or thriueth faſter than this Flax. And to conclude, that we may know how Nature her ſelf is nothing wel pleaſing therwith, and that it groweth maugre her will, it burnes the field wherein it is ſowed, it eateth out the heart of the ground, and maketh it worſe where-euer it comes: this is all the good it doth vpon a land.

I

Chap. I.

¶ *The maner of ſowing Line or Flax: the ſundry kindes thereof: the order how to dreſſe it. Alſo of Napkins and other Naperie. Of Flax and Linnen that will not burne in the fire. And when the Theatres or Shew-places at Rome were firſt encourtained.*

LIne-ſeed loueth grauelly or ſandie grounds paſſing wel, and commonly is ſowed with one tilth and no more: yet is there nothing maketh more haſte to be aboue ground, K
or ſooner commeth to maturitie. Being ſowne in Spring, it is pluckt in Summer. See how * injurious it is ſtil to the earth euen this way alſo! Wel, ſay that the Ægyptians in ſome ſort may be excuſed, for ſowing it as they doe, and making ſaile-cloath thereof; in regard of the neceſſarie traffique they haue into Arabia and India, for to fetch in the commodities of thoſe countries; what need or reaſon, I pray you, hath France ſo to do? Can the Gauls be ſorted in the ſame range with the Egyptians? Whether would they go? Is it not ſufficient that they ſee the mightie mountaines ſtanding iuſt between them and the Miditerranean ſea? Will not this ſerue to keepe them from Nauigation, that on the huge Ocean ſide they can diſcouer nothing but the vaſt Elements of Water and Aire together? Howbeit, for all this reſtraint, the Cadurci, Caletes, Rutene, and Bituriges; the Morini alſo, who are ſuppoſed to be L
the fartheſt people inhabiting our Continent; yea and thoroughout all parts of Fraunce they weaue Line and make Sailes thereof. And now adayes alſo the Flemmings and Hollanders dwelling beyond the Rhene (I meane thoſe antient Enemies to the State of our Empire) doe the like*: inſomuch as the women there cannot deuiſe to go more rich and coſtly in their apparell, than to weare fine Linnen. The obſeruation whereof putteth me in mind of a thing that *M. Varro* doth report of the whole Race and Familie of the Serrani: in which Houſe this Order was preciſely kept, That there was not a woman amongſt them knowne to weare any Linnen about her, no not ſo much as in a ſmocke next her bare skinne. Now in Germanie, the ſpinners and weauers of Linnen doe all their worke in ſhrouds, caues, and vaults, buried, as it were, vnder the ground: ſo do they alſo in Italy and that part of Lombardie that lieth between M
the Po and Ticinus, to wit, in the * Countrey Aliana; where (after the Setabines in Caſtile, which is the beſt) there is very fine workemanſhip of Linnen cloath, and may deſerue the third place for goodneſſe thoroughout all Europe. For the Retovines, bordering hard vpon the foreſaid Allianes, and the Faventines, who inhabit the broad port-way Æmilia, are to be ranged

* For that ſo quickely it robbeth her of moiſture.

* It ſeems that fine Holland cloth & Cambricke was in requeſt by *Plinies* time.

* *Regione Aliana.* Turneb.

copy 1

A ged in a ſecond degree and next to the Setabines for the fine Linnen which they make. And *in* very truth, this Fauentine cloth is alwaies far whiter than the Allian, which is ordinarily brown when it is new wouen, and before it be bleached. Like as the Retovine is exceeding fine & thick wouen withall, and beſides, not inferior in whiteneſſe to the Fauentine; howbeit, no nap or down it carieth, a thing which as there be ſome who do greatly praiſe and like, ſo there be others again diſcommend and diſlike as much. As touching the thred it ſelfe that they make of their Flax, it is more euen (if euener may be) than that which the Spider ſpinneth; ſo neruous alſo and ſtrong withall, that if a man liſt to make triall thereof with his teeth, it will giue a twang and ring a-
B gain like a Lute-ſtring: and therefore it carrieth a double price to other. As touching the Spaniſh Flax, and namely, that which Aragon and Cartalogna doth yeeld, it is paſſing faire and white, by reaſon of a certain brook or running water paſſing vnder Tarracon, wherein it is watered: the nature whereof is to giue it a ſingular brightneſſe aboue the reſt. Wonderous fine it is, and runneth into a dainty ſmall thred: for there firſt was deuiſed the fine Cypres or Lawne, and the curtains thereof. It is not long ago, ſince out of the ſame parts of high Spaine, there was brought into Italy the flax of Zoela, moſt commodious & meet for hunters to make great nets and toile. A maritime city this Zoela is, in Gallitia, ſcituat neere the ocean. There is excellent good Line alſo to be found at Cumes in Campaine within Italy, which ſerueth very well for ſnares and ſmall nets to take fiſhes, and to catch birds with. The ſame alſo yeeldeth matter and ſtuffe for the great cord-nets aboueſaid: for wote wel this, that Flax fitteth our turns, as well to
C ſnare and intrap all other beaſts, as it doth to indanger our own ſelues, [vpon the ſea.] But of all others, the toile made of Cumes flaxen cords, are ſo ſtrong, that the wild bore falling into it, wil be caught: and no maruell, for theſe kind of nets will checke the very edge of a ſword or ſuch like weapon. I my ſelfe haue ſeene ſo fine and ſmall a thred, that a whole net knit thereof, together with the cords and ſtrings called Courants, running along the edges to draw it in and let it out, would paſſe all through the ring of a mans finger. I haue known one man alſo carry ſo many of them (eaſily) as would go about & compaſſe a whole foreſt. But this is not the greateſt wonder of them; for more than ſo, euery one of theſe threds that went to the making of the maſhes, was twiſted 150 double: and euen of late daies, *Iulius Lupus*, who died Lord Deputy or Gouernor of Egypt, had ſuch. This may well ſeem a maruell incredible to thoſe who neither knew nor ſaw the net-worke Habergeon, or Curet of *Amaſis*, a king ſomtime of Egypt, which was ſhewed
D of late daies within the temple of *Mincrua*, in the Iſle of the Rhodians; euery thred whereof carried a twiſt * 365 double. Certes, *Mutianus* a man of good credit (as who had bin thrice conſull of Rome) hath related ſo much at Rome vpon his owne knowledge: for wheras there remained yet certaine ſmall reliques and little pieces therof, it was his hap of late to meet with ſome of them and by his owne triall to find that true, which hac bin reported by others. And verily, great pittie it is, that ſuch an excellent, rich, and rare peece of work (as it was) ſhould thus come to nothing, by mens iniurious handling of it, raueling out the threds as they haue don, for to ſee the proofe of the thing.

* According to the daies of the yeare.

But to returne againe to our flax of Italy. That which groweth in the Pelignians countrey is at this day in great account and requeſt: howbeit, none vſe it but the Fullers. There is not a
E whiter flax to be found, & indeed reſembling wool nearer than this flax. Like as, for quilts, ticks and mattraſſes, the flax of the Cadurci in France had no fellow: for ſurely the inuention therof, as alſo of flox to ſtuffe them with, came out of France. As for vs here in Italy, euen as our maner was in old time te lie and ſleep vpon ſtraw-beds & chaffy couches, ſo at this day wee vſe to call our pailers ſtill by the name of Stramenta. The Line or flax of Egypt is nothing ſtrong, howbeit the people there do raiſe exceeding great gaine and profit thereof. And foure diſtinct kinds thereof are knowne, according to the names of the ſundry countries where they grow, to wit, Taniticum, Peluſiacum, Buticum, and Tentyriticum.

Moreouer, in the higher parts of Egypt which bend toward Arabia, there groweth a certaine ſhrub or buſh carrying cotton, which ſome call Goſſypium, others * Xylon, and the linnen ther-
F of made they therefore cal * Xylina. This plant is but ſmall, and bringeth forth a fruit reſembling the bearded nut or filberd; out of the inner ſhell or huske wherof [called * Bombyx] there breaks forth a cotton like vnto downe, ſo eaſie to be ſpun: and there is no flax in the world comparable to it for whiteneſſe & ſoftneſſe. Of this cotton, the Egyptian prieſts were wont to wear their fine ſurpleſſes, and they tooke a ſingular delight therein. A fourth kind of linnen there is, called

* Coton or Bombace.
* Linſy-wolſey, or our Fuſtians rather.
* Hereupon cotton is called Bombac

called Orchomenium; it commeth from a certaine fennie reed growing in mariſhes, I meane the G
tender muchets or chats thereof.

In Aſia they haue a certaine kind of broome, the ſtalke and branches whereof they water and leaue in ſteepe ten daies together, and thereof make thread, paſſing good for to be twiſted and knit into fiſher nets, for they will abide the water very well, and indure without rotting. The Ethiopians and Indians both, find a ſtuffe in manner of Line or cotton in ſome apples or ſuch like fruit: and the Arabians meet with the like in gourds, growing as I haue beforeſaid vpon trees.

To come againe to our countrey Line or Flax within Italy, we go by two ſignes, and know thereby when it is ripe and ready to be gathered; to wit, either by the ſwelling of the ſeed, or the colour of the plant it ſelfe, leafe and ſtalk inclining to yellow. Then is it plucked vp and bound H
into certaine bunches as much as handfuls: which done, they are hung vp to drie in the ſun one day, with their heels or roots vpward: the morrow after, they be turned quite contrary, and ſo for fiue daies after, they hang with the foreſaid roots downward, that the ſeed may fall downe from their heads into the mids of euery bunch or bundle aforeſaid; for the ſeed therof is medicinable, and of effectuall operation in Phyſicke: yea and the rurall Peaſants in Lombardie and Piemont beyond the Po, vſe to make therof a good country meat of a moſt ſweet and pleaſant taſt; but now for this good while, that kind of meat or bread is made onely for to be imployed in their ſacrifices to the gods. Then after wheat harueſt, the ſtems or ſtalks thereof are laied in ſome water that is warme with the Suns heat, charged with ſtones or other weights thereupon, that they may be borne downe and ſinke to the bottom: for there is not a thing beſides lighter I
than Line, or loueth better to ſwim. When they be ſufficiently watered (which you ſhall know by the skin or rind therof if it be looſe and ready to depart from the towy ſubſtance of the ſtem) then muſt the foreſaid jauils or ſtalkes bee hung out a ſecond time to be dried in the ſun, with their heads and heels one while vp and another while downe, as before. After they be wel dried, they are to be beaten and punned in a great ſtone mortar, or vpon a ſtone floore, with an hurden mallet or tow-beetle made for the purpoſe. Now that part therof which is vtmoſt & next to the pill or rind, is called Tow or Hurds, and it is the worſt of the Line or Flax, good for little or nothing but to make lampe-match or candle-wick; and yet the ſame muſt be better kembed with hetchell teeth of yron, vntill it be clenſed from all the groſſe barke and rind among. As for the
good Flax indeed, which is the teere or marrow as it were within of the Line, there be diuers and K
ſundry ſorts and degrees of it, diſtinct according either to the whiteneſſe or ſoftneſſe thereof. And the ſpinning of this fine Flax (I may tell you) is ſo cleane a worke, that it will become a man ywis to lay his fingers to it. But what ſhall be done with all the hard refuſe, the long buns, the ſtalks, the ſhort ſhuds or ſhiues that are either driuen from the reſt in the knocking, or parted in the hetchelling? mary they will ſerue very well to heat ouens and furnaces, or to mainetaine fire vnder kills and leads. And here there is a prettie cunning and skill in the hetchelling and diſpenſing of Flax to the proofe: for if the Line bee good and well ordered, euerie fiftie pounds of it in bunches or bundles aforeſaid, muſt yeeld fifteene ordinarily of tried and carded Flax. Moreouer, when it is ſpunne into thread, it muſt be poliſhed againe and whitened in water, with much punning and knocking vpon a ſtone together with the water. And yet there is L
no end, for after it is wouen to cloath, it ought to bee followed and beaten a third time with good clubbe-headed cudgels: in ſuch ſort, as the more iniurie that is done vnto it, the better it is.

Furthermore, there is a kind of Line found out which will not conſume in the fire: this in Italy they call Quick-line, and I my ſelf haue ſeen table-clothes, towels, & napkins therof, which being taken foule from the bourd at a great feaſt, haue been caſt into the fire, and there they burned before our face vpon the hearth; by which meanes they became better ſcoured, and looked fairer and brighter a hundred times, than if they had bin rinſed and waſhed in water; and yet no part of their ſubſtance, but the filth only, was burnt away. At the roiall obſequies and funeralls of KK. the manner was to wind and lap the corps within a ſheet of this cloth, of purpoſe to ſepa- M
rate the cinders comming of the body, from other aſhes [of the ſweet wood that was burnt therewith.] This manner of Line groweth in the deſerts of India, where no rain falls, where the countrey is all parched and burnt with the Sunne, amongſt the fell dragons and hideous Serpents: thus it is inured there to liue burning; which is the reaſon, that euer after it wil abide the fire.

20030
copy 1

A fire. Geaſon it is to be found, and as hard to be wouen, ſo ſhort and ſmall it is. How ſoeuer otherwiſe it be naturally of colour reddiſh, yet by the fire it getteth a ſhining gloſſe and bright hew. They that can come by it and meet withall, eſteeme it as precious as the beſt orient pearles. In Greeke they call this Line, Asbeſtinum, according to the nature and propertie that it hath, not to conſume with burning. Ouer and beſides, *Anaxilaus* ſaith, That if a man would cut downe or fall a tree by ſtealth and in ſecret, let him compaſſe the body thereof with a ſheet of this linnen, he may hew as long as he will at it, and all the ſtrokes that he giueth wil be ſo drowned, that they ſhall not be heard againe. To conclude, in all theſe reſpects aboue ſaid, this Line may well be counted for the principall and beſt that is in the whole world.

The next to it in goodneſſe, is the Line called Byſſus: the fine Lawn or Tiffany whereof our
B wiues and dames at home ſet ſo much ſtore by for to trim and deck themſelues: it groweth in Achaia within the territorie about Elis: and I find, that in old time it was ſold as deare as gold, for a * ſcruple thereof was commonly exchanged for * foure deniers Roman.

The lint or nappie downe which linnen cloth beareth in manner of a ſoft cotton, eſpecially ſuch as commeth of ſhip ſailes that haue lien at ſea, is of great vſe in Phyſicke.* The aſhes alſo made thereof, be counted a good Succedane of Spodium, and for their efficacie may go for it. Moreouer, there is a kind of Poppies much ſought after for blanching and bleaching of linnen clothes; for being skoured therewith, it is wonderfull how white and pure they will look: & yet for all the beautie that conſiſteth in that colour, people are grown to this diſorder & vain enor-
C mity, that they haue aſſaied to ſtain and die their linnen and naperie into other colours, as well as their woollen cloth. Which practiſe was firſt ſeen in the Armada or fleet of K. *Alexander* the Great, vpon the great riuer Indus, at what time as his captaines and Admiralls in a certaine skirmiſh that they made with the Indians, changed the armes and enſignes of their ſhips: wherat the inhabitants (being vpon the ſhore and ſtrond) were aſtonied to ſee their ſailes and ſtreamers painted with diuers colours wauing in the wind. Semblably, the ſailes of that ſhip were died purple, wherein *M. Antonius* together with *Cleopatra* came to Actium, and in which they fled both from thence and eſcaped. And indeed heretofore a red purple banner erected on the top of the maſt, was the badge or enſigne of the royall Admirall ſhip: but afterwards they be-
D gan at Rome to incourtaine their Theatre with ſuch vailes dyed in colours, onely for ſhade: an inuention deuiſed by *Q. Catulus* at what time as he dedicated the temple of the Capitoll. In proceſſe of time, *Lentulus Spinter* (by report) was the firſt man that in the ſolemnity of the games and plaies Appollinate, drew fine curtaines ouer the great Amphitheatre at Rome: howbeit not long after, *Cæſar* Dictator cauſed the grand Forum or Common place at Rome to be couered all ouer with ſuch rich Courtains; yea and the high faire ſtreet called Sacra, to bee hanged on both ſides from his owne dwelling houſe to the very Capitoll cliffe: which magnificent and ſumptuous ſight, was more wondered at and ſeene with greater admiration, than the braue ſhew and Tourney that he ſet out at the ſame time of Sword-plaiers at ſharpe and to the vtterance. Then followed *Marcellus* alſo the ſon of *Octauia*, ſiſter to the Emperour *Auguſtus*, who in his own Ædileſhip and in the tenth Conſulſhip of his vncle *Auguſtus* beforeſaid, vpon the Calends or
F firſt day of Auguſt that yeare, cauſed the Romane Forum to be drawne all ouer and ſhadowed with the like courtains, although he repreſented at that time no ſolemnitie at all of games and plaies: and this he did only, that they who came to plead at the barre, might ſtand vnder ſhade more wholeſomely. Lord, what a change was here at Rome ſince the daies of *Cato* the Cenſor, who thought it meet and requiſit, yea and gaue aduiſe that the ſaid Forum or great Hal of common Pleas ſhould be paued and laid all ouer with caltraps vnder foot, To keep our Lawyers and buſie pleaders from thence. Of late daies there were ſeene in the Amphitheatres of Emperour *Nero*, trauerſes drawne vpon cords and ropes, with fine courtains of b lew azure colour like the skie, and thoſe beſet with ſtars; where the very floore of the ground vnder mens feet, was coloured red. And wherefore ſerue theſe in cloiſter courts and walks now, but to keepe the moſſe forſooth vpon the ground, or rather the fine fret-worke in pauements, from ſun-burning? But for
F all theſe paintings and rich dyes, yet when all is done, the white linnen held the own ſtill & was highly eſteemed aboue al colors. And no doubt in great price ſuch cloth was in the time of the Trojan war: and in good faith I ſee no reaſon why it ſhould not be as well in bloudy battails as at broken ſhipwracks: howbeit *Homer* teſtifies, that few there were who went to the wars with linnen habergeons or curets: but it ſhould ſeem that the Poet (as the better learned expoſitors doe interpret)

* 24 graines, * i about three hal e-pence the grain, and better.

* Hereof were m de ξυσὸς μίτινος, whereof *Galen* writes, 3. περὶ τ. with which lint her cured *Heraclides* and ſtanched his bleeding.

terpret) meant, That ſhip-tackling, ſailes, cords, and ropes, were made of this Line, ſpeaking as G
he doth of * Sparta, whereby he vnderſtandeth indeed Sata, *i.* cordage of ſowne Line or garden Flaxe.

*Called by *Pacuvius*, *Serilia*, as *Feſtus* noteth.

Chap. II.

¶ *The nature of Spart or Spaniſh broome: the manner of handling and dreſſing it: when it was firſt vſed in cordage: what Plants there be that line and grow without root.*

SPart verily was not in vſe and requeſt for many hundred yeares after, neither was it knowne before the firſt voiage and expedition that the Carthaginians made in warlike manner in- H
to Spaine. An herb this is alſo, growing of it ſelfe without ſetting or ſowing (which indeed it cannot abide.) Full well and properly it might be called, the ruſh of a dry and leane ground, and a very defect or imperfection appropriate to that countrey alone of Spaine: for, to ſay a truth, it is the fault and badneſſe of the ſoile in the higheſt degree, that breedeth it; and where it commeth vp, nothing elſe can be ſowed and ſet, or will grow at all. That in Affricke or Barbary is very ſmall, and good for nothing. In the territory of new Carthage or Cartagena (which is in the higher part of Spaine) it groweth much: howbeit all that tract is not giuen to breed it, but look where it commeth vp, you ſhall ſee whole mountaines all ouer-ſpread and couered with it. Hereof the ruſticall peaſants make their mattraces and beds; this is their fewel wherewith they keep fires; of it they make their torches and links to giue them light; with it they are common- I
monly ſhod; and the poore ſheepheards cloath themſelues therewith. Howbeit, hurtfull is this plant to cattell, vnleſſe it be the tender tops and crops of the branches; which they may brouſe and eat without harme. For other vſes, when the Spaniards would plucke it vp they haue much adoe withall, and a great toile about it; for their legs muſt be wel booted as it were with griues; their hands couered with thick hedging-gloues, as gantlets: and being thus armed at all points, yet they lie tugging at it, pulling, writhing, and wreſting the ſame with hooks and crooks either of bone or wood, vntill they haue their will of it. Come they about this work in winter time, it is in manner vnpoſſible to get it vp: but from the Ides [*i.* the mids] of May vnto mid-Iune, it is very tractable: for this is the time and ſeaſon when it is ripe, and then commonly they gather it for their ordinary vſes before named. Being once pulled and ſorted, the good from the bad, it is K
made vp into bundles and faggots with the life ſtill in it, and ſo piled on a heap for the firſt two daies; the third day they vnbind it, lay it looſe and ſcattering in the Sun for to be dried: which done, they make it vp againe into fagots, and ſo bring it in and lay it vp within houſe. After all this, they ſteep it in ſea water (for that is beſt) or els in freſh, for want of the other. After this watering, it muſt be dried in the Sun, and then ſteeped in water a ſecond time: but if a man haue vrgent occaſion to vſe it preſently out of hand, he muſt put it in a great tub or bathing veſſel, & let it ſoke there in hot water a time. Now if when it is dried againe, it be ſtiffe and will ſtand alone, they take it for a ſure ſigne that it is ſufficiently watered, and hath that which it ſhould haue. This is a very neere and ready way, & ſaueth them much labour. Thus being prepared one of theſe two waies, it ought to be brayed and beaten before it will ſerue the turne; and then no L
cordage in the world is better than that which is made of it, nor laſteth ſo well within the water and the ſea eſpecially, for it will neuer be done. For drie worke, I confeſſe, and out of the water, the gables & ropes wrought of hemp are better; but Spart made into cordage will liue & receiue nouriſhment within the water, drinking now the full as it were to make amends for that thirſt which it had in the natiue place where it firſt grew. Of this nature is Spart beſides, that if the ropes made thereof be worne, and (with much occupying) out of repaire, a little thing will mend and refreſh them, yea and make them as good as euer they were; for how old ſoeuer it be, yet will it be wrought very well again with ſome new among. A wonderfull thing it is to conſider and look into the nature of this herb, and namely, how much it is vſed in all countries, what in cables and other ſhip-tacking, what in ropes for Maſons and Carpenters, and in a thouſand M
neceſſities of this our life. And yet lee! the place which furniſheth all this ſtore, lying along the coaſt of new Carthage, we ſhal find to be within the compaſſe of thirty miles in bredth, & leſſe ſomewhat in length. And verily, if it were fetched farther off within the main, the cariage would not quit for the coſt and expences.

The

20030
copy 1

A The Greekes in old time emploied their riſhes in drawing of ropes : as may appeare by the very word σπαρτος, which ſignifieth with them a riſh, and a rope. But afterwards they vſe their cordage of Date tree leaues, & the thin barks of the Linden or Tillet tree: from whence verily, like and probable it is, That the Carthaginians borowed both their vſe of Spartum, and maner alſo of dreſſing it.

* Sic Spartum nunc reſtem nunc plantam equa reſtes fiunt, ſignificant.

Theophraſtus writeth, That there is a bulbous plant, with a root like an Onion-head growing about the banks of riuers; between the vtmoſt rind whereof, and that part within, which is good to be eaten, there is a certain cotton or woolly ſubſtance, whereof folke vſe to make * woollen ſockes and ſome ſuch ſlight peeces of apparell. But he neither named the countrey where they be made, nor ſets downe any other particularities more than this, That the ſaid plant they cal-

* Impilia. vidua vdones.

B led Eriophoron [*i.* Bearing wooll :] ſo far as euer I could find in any copies comming to my hand. And albeit *Theophraſtus* was otherwiſe a diligent and curious writer of plants, and ſearched deep into the nature of ſimples, foure hundred and ninety yeres before my time, yet hath he made no mention at all of Spart, a thing that I haue obſerued and noted in him once already before now. Whereby euident it is, that the manner of dreſſing and vſing Spart, came vp after his daies.

And ſince we are entred into a diſcourſe of the wonders of Nature, I will follow on ſtill and continue the ſame, wherein this may be one of the greateſt, That a thing ſhould liue and grow as a plant without root. Looke but to thoſe Muſhroomes or Toad-ſtooles, which are called in Latin Tubera: out of the ground they grow, compaſſed about on euery ſide with the earth, with-

C out root, without any filaments, or ſo much as ſmall ſtrings & beards reſembling a root whereupon they ſhould reſt: the place where they breed doth not ſwel or bear vp one jot, nay, it ſhews no chink or creuaſſe at all out of which they ſhould iſſue: and to conclude, they ſeem not once to ſtick and cleaue to the ground whereupon they ſtand. A certaine barke or pill they ſeem to haue, which encloſeth them, ſuch as (to ſpeake plainely) we cannot ſay is earth indeed, nor any thing elſe but a very brawnie skin or calloſitie of the earth. Theſe breed commonly in drie and ſandie grounds, in rough places full of ſhrubs and buſhes, and lightly in none elſe. Oftentimes they exceed the quantity of good big Quinces, euen ſuch as weigh a pound. Two ſorts there be of them. Some be full of ſand and grit, and ſuch plague folkes teeth in the eating : others bee clean, and their meat is pure, without any ſuch thing among. They differ alſo in color, for there

D be of them that are red: ye ſhall haue thoſe alſo that ſeem blacke, and yet are white within. But the beſt ſimply are thoſe that come out of Africk or Barbarie. To determin reſolutely whether they grow ſtill from day to day, as other plants ; or whether this imperfection of the earth (for better I know not how to call it) commeth at one inſtant to that full growth that euer it will haue ; alſo, whether they liue or no, I ſuppoſe it is a difficult and hard matter: ſurely this is certaine, that their putrifaction is much after the manner of wood, and they rot both alike. Many yeres paſt there are not, ſince *Lartius Licinius*, ſometimes lord Pretor and gouernour vnder the Romans in the prouince of Spain, chanced (of my knowledge) while he was there at Carthage, in biting one of theſe Muſhroms, to meet with a ſiluer Roman denier within it, that turned the edge againe of ſome of his fore teeth, and ſet them awry. Whereby a man may perceiue mani-

E feſtly, that they be a certaine excreſence of the very earth, gathering into a round forme, as all other things that grow naturally of themſelues, and come neither by ſetting nor ſowing.

Chap. III.

¶ *Of the excreſcence named * Miſy : and of other ſuch like Puffes and Muſhroms. Of thoſe flat Fuſſes and broad Toad-ſtooles, called * Pezici. Of the plant or hearbe * Laſerpitium. Of Magydaris. Of Madder. Of Sope-weed, or the Fullers hearbe Radicula.*

* or, Miſon.

* or, Pezitæ.

* Laſer-wort.

W Ithin the prouince of Cyrenaica in Affricke, there is found the like excreſcence called Miſy, paſſing ſweet & pleaſant, as well in regard of the ſmell as the taſt, more pul-

* or Miſon, rather, according to *Turneb.*

F pous alſo & fuller of carnoſitie than the reſt: likewiſe, another of that nature in Thracia, called Ceraunium. As touching al the ſorts of Muſhroms, Toad-ſtooles, Puffes, Fusbals or Fuſſes, theſe particulars following are obſerued, Firſt it is known for certain, that if the autumn be much diſpoſed to rain, and withal, the aire be troubled and diſquieted with many thunders, during that ſeaſon, there wil be good ſtore of ſuch Muſhromes, &c. eſpeciall, (I ſay) if it thunder

der much. Secondly, they wil not laſt aboue one yere. *Item*, The tendereſt & daintieſt be thoſe G
that breed in the Spring, and that indeed is the beſt time for them. *Item*, In ſome countries the
ouerflow of riuers engender Muſhromes, and namely, at Mitylene, where (by report) they will
not otherwiſe grow but vpon floten grounds, and namely, in ſuch places whither the water hath
brought from Tiara, a certain vegetatiue ſeed to breed them. And verily, That Tiara is wonder-
fully ſtored & repleniſhed with ſuch. As touching the Truffles or Muſhroms of Aſia, the moſt
excellent of all others be neer vnto Lampſacum and Alopeconneſus: but the beſt that Greece
yeeldeth are in the territorie about the citie Elis. In this Toad-ſtoole or Muſhrome kind are
* or Pezici thoſe flat Fuſſes and Puffes to be reckoned, which the Greekes name * Pezitæ: as they haue no
root at all, ſo they be altogether without either ſtele or taile.

In the next place to theſe I muſt needs ſpeake of the moſt noble and famous plant Laſerpi- H
tium, which the Greeks name Silphium, diſcouered and found firſt in the abouеſaid prouince
* Some take it for *Benioin*, or *Aſa dulcis*. of Barbarie Cyrenaica. The juice or liquor drawne out of this hearb they cal * Laſer; a drug ſo
magnified, of ſuch ſingularitie and vſe in Phyſicke eſpecially, that it was ſold by weight, and a
* Which is equiuolent in weight to a dram, *i.* 7. *d.ob* Engliſh. dram thereof coſt commonly * Romane denier. For theſe many yeares of late, there is none of
this plant to be found in that country of Cyrenaica beforeſaid: for that the Publicans and Far-
mers of the paſtures and grounds there, (vnder the people of Rome) doe put in their cattell a-
mong theſe plants, and eat al downe by that means: finding thereby a greater gaine or commo-
dity, than by letting them ſtand for the juice or liquor aforeſaid. One only ſtalk or ſtem thereof
hath bin found in our days, which was ſent vnto Emperor *Nero* as a preſent, for a great nouelty.
If it chance at any time, that either ſheepe or goat (which commonly bite neer to the ground) I
do light vpon a yong plant thereof, newly peeping forth and not euident to be ſeene, you ſhall
know it by theſe ſignes, The ſheepe preſently ſo ſoone as ſhe hath taſted it will drop aſleep, and
the goat fal a neeſing. For theſe many yeres the merchants haue brought vs into Italy no other
* Thought to be *Aſa fœtida*. * Laſer, than that which grows abundantly in Perſis or Media, and in Armenia: but it is far in-
ferior to this of Cyrenaica, and commeth ſhort of it for goodnes. And this that we haue is no
better than it ſhould be, for they ſophiſticate and corrupt it with gum, with Sagapeum, or elſe
with bruiſed Beans. In regard of which ſcarſity, I canot chuſe but remember that which befell
at Rome in that yere wherin *C. Valerius* and *M. Herennius* were conſuls, when by great good for-
tune there was brought from Cyrenæ thirtie pound weight of the beſt Laſer, and ſet abroad to
be ſeene in open place, of all commers. As alſo I may not let paſſe another occurrent, namely, K
how *Cæſar* Dictatour at the beginning of the ciuile war, tooke forth openly out of the chamber
of the citie, with other treaſure both of gold and ſiluer, an hundred and eleuen pounds of the
beſt Laſer. Moreouer, this one thing more I canot forget: the beſt and moſt renowned Greeke
Authors haue left in writing, That 7 years before the foundation of the citie Cyrenæ, which
was built 143 yeres after our citie of Rome, this plant Laſerpitium that beareth the ſaid Laſer
was engendered at one inſtant, by occaſion of a certain thicke, groſſe, and black ſhewer of raine,
in manner of pitch, which ſodainely fell and drenched the ground, about the hortyards or gar-
dens of the Heſperides, & the greater Syrtis: The which rain was effectual, and left the ſtrength
* 500 miles. thereof, for the compaſſe of * foure thouſand ſtadia within Affricke or Barbarie. They affirme
moreouer, That the herb Laſerpitium, there growing, is of ſo ſauage and churliſh a nature, that L
it canot abide any culture or good ordering by mans hand: but if one ſhould goe about to tend
and cheriſh it, it would rather chuſe to be gon into the deſart and vnpeopled parts of the coun-
trey, or elſe winder away and die. Moreouer, they ſet downe this deſcription of it, That it hath
many roots, and thoſe bigge and thicke, a ſtemme or ſtalke, reſembling the hearb Sagapeum or
Fennell-geant, howbeit, not altogether ſo great: the leaues of this plant, which they termed by
the name of Maſpetum, come very near in all reſpects to thoſe of Smallach or Perſely. As tou-
ching the ſeed that it beareth, flat and thin it is in maner of leaues: but the leafe it ſelfe therof,
ſheddeth in the Spring time. The cattell that vſe to feed thereupon (and whereof they be very
greedy) firſt fall a ſcouring: but afterwards, when they be clenſed and rid of ill humors, begin to
wax fat: and their fleſh by this means becommeth wonderfull ſweet and pleaſant. They report M
moreouer, that after the leaues be fallen, men alſo were wont in old time to eat the ſtem or ſtalk
thereof, either roſted and baked vnder the cindres, or elſe boiled and ſodden in water: and their
bodies likewiſe for the firſt 40 daies enſuing, did nothing but purge til they were cleared of al
diſeaſes, breeding by occaſion of any Cacochymie or collection of ill humours within them.

Now

20030
copy 1

A Now concerning the juice or ſoueraigne liquor beforeſaid, the manner was to draw it after two ſorts; to wit, by ſcarification, either out of the root, or forth of the ſtem and maiſter ſtalke. And hereof it came to haue two names, Rhizias and Caulias. But the later of theſe two, to wit, that which came of the ſtem, was counted the worſt, ſubiect to putrifaction, and ſold cheaper than the other. To come now to the root of Laſerpitium, it hath a blacke rind or barke vpon it, wherewith the merchants vſe to ſophiſticat many of their drugs. As for the manner of dreſſing and ordering the juice thereof, it was no ſooner drawne, but they put it into certaine veſſells, together with brans among; then euer and anone they plied it with ſtirring and ſhogging, vntil it had loſt the cruditie and verdure thereof, and by that working, came to the maturity and perfection: for if it were not thus well followed, ſoon would it catch a vinew, begin to putrifie, and ſo
B continue but a while. In this worke of theirs they had an eye vnto the color how it changed: for when they perceiued it to be high, & that they ſaw it once drie and haue don ſweating & breathing out the raw humidity and vapor within, then they knew therby that it was wrought ſufficiently, and come to the full ripeneſſe. Others there be who ſay, that the root of Laſerpitium beareth more than a cubit in bigneſſe, and that out of it there ſwelleth an excreſence, aboue the ground, out of which there was wont by way of inciſion to iſſue forth a certaine white juice in manner of milke: vpon which grew the ſtalke or ſtem which they called Magydaris. And they affirme beſides, that it beareth leafy flat graines for the ſeed, in color like gold, which ſhed preſently vpon the riſing of the Dog-ſtar, eſpecially if the wind be ſouth. Of which grains or ſeeds fallen to the ground, young plants of Laſerpitium vſe to grow vp vnderneath, that within the
C compaſſe of one yere wil thriue both in root and ſtem to the juſt and full perfection: they haue writen moreouer, that the vſe was to dig about their roots, and to lay them bare at certain times of the yeare. Alſo, that they ſerued not to purge cattell as is aforeſaid, but to cure them if they were diſeaſed: for vpon the eating thereof either they mended preſently, or elſe ended and died out of hand; but few they were that miſcaried in this ſort. As touching the former opinion of purging and ſcouring, true it is, that it agreeth well to the other Silphium or Laſerpitium of Perſia, aforeſaid. Another kind there is of it named Magydaris, more tender and leſſe forcible and ſtrong in operation than the former; and affourdeth no ſuch juice or liquor at all, it grows about Syria, and commeth not vp in all the region about Cyrenæ.

Moreouer, vpon the mount Pernaſſus there is great plentie found of a certaine hearbe, which
D the inhabitants would needs haue to be Laſerpitium, and ſo they cal it: wherewith indeed they are wont to abuſe and ſophiſticat that ſingular and diuine plant, the true Laſerpitium, ſo highly commended, and of ſo great account and regard. The principall and beſt triall of the true and ſincere Laſer, is taken from the colour, ſomewhat enclining to redneſſe without: breake it, you ſhall haue it appeare white within: and anone tranſparent. If you drop water vpon it, or otherwiſe thin ſpittle, it will reſolue and melt. Much vſe there is of it in many medicines, for to cure mens maladies.

Two plants more there be well knowne to the common ſort and baſe multitude, and to ſay a truth, few e's are acquainted with them, notwithſtanding they be commodities of much gaine, and many a peny is gotten thereby. The firſt is Madder, in great requeſt among diers and curri-
E ers: and for to ſet a color vpon their wooll and leather, right neceſſarie. The beſt of all and moſt commended is our Madder of Italie, principally that which groweth about villages neere vnto our citie of Rome. And yet, there is no country or prouince lightly but is full of it. It commeth vp of the owne accord, and is ſowed beſides of ſeed, and ſet of ſlips in manner of Eruile. Howbeit, a prickie ſtalke it hath of the owne: the ſame is alſo full of joints and knots, and commonly about euery one of them it hath fiue leaues growing round in a circle. The ſeed is red. What medicinable vertues it hath, and to what purpoſe it ſerueth in Phyſicke, I will declare in place conuenient.

The ſecond is that which is called in Latin Radicula, [i. Sope-wort] an hearb, the juice wher-
of Fullers vſe ſo much to ſcoure their wooll withall: and wonderfull it is to ſee how white, how
F pure, how neat and ſoft it will make it. Being ſet, it will come vp and grow in any place: but of it ſelfe without mans hand, it groweth moſt in Aſia and Syria, among rough, craggie, and ſtony grounds. The beſt is that which is found beyond the riuer Euphrates, and that bears a ſtem like tall Fennell, howbeit ſmall and ſlender, and whereof the inhabitants of the countrey there doe make a delicate diſh; for beſides, that it hath a commendable taſt and much deſired, it giueth a

pleaſant

pleaſant colour to what meat ſoeuer is ſodden in the pot with it. It beareth a leaſe like the Oliue: the Greeks cal it Strution: it floureth in Summer: louely it is to the eie, but no ſmel at all it hath to content the noſe: prickie moreouer it is like a thorne, and the ſtalke notwithſtanding couered with a ſoft down: ſeed hath it none; but a big root, which they vſe to cut, ſhred, & mince ſmall for the purpoſes aforeſaid. G

Chap. IV.

¶ *The manner of trimming and ordering Gardens: the ſorting of all thoſe things that grow out of the Earth, into their due places, beſides corne and plants bearing fruit.* H

IT remaineth now to treat of Gardens, and the carefull diligence thereto belonging: a commendable thing in it ſelfe, and recommended vnto vs beſides by our fore-fathers and auncient writers, who had nothing (to ſpeake of) in more account and admiration in old time, than the gardens of the Heſperides, of *Adonis*, and *Alcionoüs*: as alſo thoſe pendant gardens vpon tarraces and leads of houſes, whether they were thoſe that *Semyramus* Queene of Babylon, or *Cyrus* K. of Aſſyria, deuiſed and cauſed to be made. Of which, and of their workmanſhip, my intent is to make a diſcourſe in ſome other booke. Now for this preſent (to goe no farther than Rome) the Romane KK. verily themſelues made great ſtore of gardens, and ſet their minds vpon them: for ſo we read, that *Tarquin* ſurnamed the Proud (the laſt king of Rome, was in his garden when he gaue diſpatch vnto that meſſenger that was ſent from his ſonne about a cruell and bloudie errand, for to know his fathers aduiſe and pleaſure as touching the citizens of Gabij. In all the twelue tables throughout which contain our ancient lawes of Rome, there is no mention made ſo much as once of a Grange or Ferm-houſe, but euermore a garden is taken in that ſignification, and vnder the name of Hortus [*i.* a Garden] is compriſed Hæredium, that is to ſay, an Heritage or Domain: and herupon grew by conſequence, a certain religious or rediculous ſuperſtition, rather of ſome whom we ceremoniouſly to ſacre and bleſſe their garden and hortyard dores only, for to preſerue them againſt the witchcraft; and ſorcerie of ſpightful and enuious perſons. And therefore they vſe to ſet vp in gardens, ridiculous and fooliſh images of Satyres, Antiques and * ſuch like, as good keepers and remedies againſt enuy and witchcraft, howſoeuer *Plautus* aſſigneth the cuſtodie of gardens to the protection of the goddeſſe *Venus*. And euen in theſe our daies, vnder the name of Gardens and Hortyards, there goe many daintie places of pleaſure within the very citie, vnder the color alſo and title of them, men are poſſeſſed of faire cloſes and pleaſant fields, yea and of proper houſes with a good circuit of ground lying to them, like pretie farmes and graunges in the countrey: all which, they tearme by the name of Gardens. The inuention to haue gardens within a citie, came vp firſt by *Epicurus* the doctor and maſter of all voluptuous idleneſſe, who deuiſed ſuch gardens of pleaſance in Athens: for before his time, the manner was not in any citie, to dwell (as it were) in the countrey, and ſo to make citie and countrey al one, but all their gardens were in the villages without. Certes at Rome, a good garden and no more, was thought a poore mans cheiuance; it went (I ſay) for land and liuing. The Garden was the poor commoners ſhambles, it was all the market place he had for to prouide himſelf of victualls. O what a bleſſed, what a ſecure, and harmleſſe life was that, ſo long as men could be content to take vp with ſuch a pittance, and ſtay themſelues ſo! but better it is I trow, for to ſatisfie the appetit of our wanton gluttons and belli gods, to ſearch into the bottom of the deepe ſea: for to get (I ſay) oiſters of al ſorts, to feare no tempeſt nor ſhipwrack: for to meet with daintie foule, to ſend out one way as far as beyond the riuer Phaſis for thoſe birds, which a man would thinke were ſure ynough and ſecured from the fouler, by reaſon of the fearefull tales that goe of them, and of the daunger of thoſe that approach neere vnto them (and yet why ſay I ſo, conſidering they are the better eſteemed and more precious the farther they bee fet and dearer bought:) to haue purueyours another way in Numidia and Æthiopia, for the rare birds there about the ſepulchres; among thoſe ſepulchres (I ſay) where in ſtead of meeting with game, they ſtumble otherwhiles vpon their owne graues and neuer come home again: and laſtly, to haue others to chaſe the wild and ſauage beaſts of the forreſts, yea and to maintain fight with them, in daunger to be deuoured as a prey, by thoſe which ſoon after muſt ſerue as veniſon for other men to eat. But to come againe to theſe commodities of the Garden, and the cates which I K L M

* as *Priapus*, *Phalli*, and *Ithyphalli*.

20030
copy 1

A which they affourd: how cheape be they? how ready at hand? how fitted are they not only to fil the belly and ſatisfie hunger, but alſo to pleaſe the tooth and content the appetite, were it not that wealth and fulneſſe ſtand in the way: the ſame that loath all things els beſide, and diſdain (no maruell) theſe ordinarie viands. Wel might it be borne with and ſuffered, that Apples and other fruits of the trees, ſuch as are more exquiſite and ſingular than the reſt, in regard of their beauty, bigneſſe, pleaſant ſauour, or ſtrange and monſtrous maner of growing, euen againſt the courſe of Nature; that theſe dainties (I ſay) ſhould be reſerued for our rich and mighty men of the world; that poore men ſhould be debarred and forbidden once to taſte thereof. In ſome ſort tolerable alſo it is, that great States and wealthy perſonages ſhould be ſerued at their table with old wines, fined and refined, with Wines delaied, neatified, and guelded, as it were, by
B paſſing thorow an Ipocras bag; that ſuch ſhould drink no other but that which was wine before they were born, how aged ſoeuer they be and far ſtept in yeares. We may abide moreouer, that our grand-panches and riotous perſons haue deuiſed for themſelues a delicat kind of meat out of corn and grain (which ſhould ſerue for bread only) and the ſame made of the fineſt and pureſt floure, bolted and ſearſed from the reſt, and none but that: to ſay nothing of the curious work in paſtrie, the fine cakes, wafers, and marchpanes, artificially carued, ingraued, and painted in imagerie, as if theſe wantons could not liue, forſooth, but of ſuch deuiſes. That there ſhould be a difference alſo in bread, anſwerable to the diſtinction of States in the city, one ſort for noble Senators, another for the worſhipful knights and gentlemen, and a third for the mean commoners and multitude. Finally, that in other victuals there ſhould be a deſcent by ſo many de-
C grees, from the higheſt to the loweſt, many cary ſome apparance of reaſon, & be allowed. How then? muſt there be a diſtinction therefore inuented in worts and garden pot-herbs? Muſt the difference of perſons according to their purſe appeare alſo in a diſh of * three farthings price, and no better? Surely I ſee no ſenſe nor congruitie at all in this. And yet forſooth ſuch herbes there be, that the tribes of Rome (the greater part I mean of the Roman citiſens) may not preſume to eat; as if the earth had brought them forth for rich men onely, being no meat ywis for poore people. Why (ſay they in ſcorne and contempt of pouertie) here is the ſtem of a Wort ſo well growne, here is a cabbage ſo thriuen and fed, that a poore mans boord will not hold it. Certes dame Nature ordained at the firſt, That Sperage ſhould grow wilde and commonly in all places of the field, as if ſhe meant therby, that euery man that would might gather them for
D to eat: and now behold they are cheriſhed carefully in gardens; and from Rauenna you ſhall haue of theſe garden Sperages ſo fair and big, as three of their crops or heads wil weigh a good pound, and are ſold after three a Roman As. O the monſtrous bellies that be now adaies! O the exceſſiue gluttonie and gourmandiſe which now reigneth in the world! Is it any maruell, that poore Aſſes and ſuch dum beaſts may not feed vpon * Thiſtles, when the Commons of Rome are reſtrained and forbidden to eat * Thiſtles, and dare not once touch them? And yet here is not all: our waters alſo be diſtinguiſhed and ſet apart for ſome perſons; euen the very elements whereof this world conſiſteth, are diſtinct, ſeuered, and raunged into ſundry degrees, and all at the pleaſure of monied men: for ſome you ſhall haue to drinke ſnow, others ice: and will you ſee in one word their folly and vanity? the very miſerie that high mountains are puniſhed and
F plagued with, they make their pleaſure of, and therewith content and delight the throat. Theſe men lay for to be prouided of chilling cold againſt the heat of ſummer, and ſeeke by all means that they can poſſible, to haue ſnow remain white ſtill and frozen (as it firſt was) out of Winter ſeaſon, euen in the hotteſt months in the yere, which are moſt oppoſite vnto the nature of ſnow. Some there be who firſt ſeeth their water, & anon let it congeale again to ice, after it was once ſcalding hot. Whereby we may ſee, how man neuer contenteth himſelfe in natures workes, but croſſe he will be alwaies and peeuiſh; and look what pleaſeth her, ſhall diſpleaſe him: for who euer would haue thought, that any one herb ſhould haue grown for the rich, and not as well for the poore? Well, let no man for all this caſt about and look toward mount Sacer, or Auentine hill, that the Commoners againe ſhould by way of inſurrection riſe, and in the heate of their
F bloud depart aſide thither, as ſomtimes they did in a mutinous fit of theirs, in high diſcontentment with the Nobilitie. For what needs that, ſince they may be ſure that death very ſhortly will bring them together, and make equall, betweene whom now for a while Riches hath put a bar, and made diſtinction of place and degree.

But now it is time to returne againe vnto our gardening, from which we were digreſſed. Certaine

* *Etiam vno eſſe venali.*

* *carduus:* * Artichokes, which are no better than *Cardui altiles*, i. Garden-Thiſtles.

tain it is, that in old time there was no market place at Rome yeelded greater impoſt vn to the State than the Herberie, in ſuch requeſt and ſo much called for were worts and pot-herbs. In regard of which exactions and paiments, euermore going out of their purſes, the Commons in the end complained, laid open their griefes, and made their mone to the Senate, of this burden and heauy load; and neuer gaue they ouer crying ſtill vnto them with open mouth, for redreſſe, til they obtained a full releaſe of rent and cuſtome, raiſed before from the tallage and portage of this kind of ware and commoditie. Whereby it was well knowne and found by long experience, that there was no one thing of greater reuenue and more aſſured gain; none that ſtood ſo ſafe and certaine; none leſſe ſubiect to the will and pleaſure of Fortune & Caſualtie, than gardenage: as being taken for no leſſe than a yerely fee, that poore men might make account of as ſure as if it were in their purſe. Again, for the rent thereof paid to the land-lord, there was euer good ſecuritie: the ground or ſoile was a ſufficient ſurety; the profits thereof were alwaies ſeen and expoſed openly to the eye; and lightly no weather whatſoeuer hindred the crop & gathering thereof. *Cato* highly commends the garden Couls or cabbages; whereby we may know, that in his daies gardens were in ſome reſpect. Alſo in times paſt, as husbandmen in the country were known eſpecially, & their wealth valued by their gardens, ſo when there was a garden plot ſeen lying out of order, and not wel kept, men iudged ſtraitway, that the miſtreſſe or dame there dwelling (for commonly this charge lay vpon women) was but an ill huſwife, and thriftleſſe in her houſe: for in default of gardinage what remedy was there then, but to draw the purſe ſtrings, and go for euery thing either to the Butchery or the herbe-market, and ſo to liue vpon the penny. Neither were in thoſe daies Coules or cabbages ſo well eſteemed as now they be: for why, they could not away with double meats one vpon another, but condemned all diſhes that required ſome addition, as help of ſauce, broth, or ſuch like to draw them downe. This was to ſpare coſt, and by this means they ſaued oile. For as touching the pickle ſauce * Garum, all thoſe were reproched for gourmandiſe and gluttony, who could not eat fiſh or fleſh without it. And therefore men tooke greateſt contentment in their gardens & garden herbs: thoſe were at hand and ready at all times, no great cookerie was required to dreſſe ſuch diſhes, no need of fire, no expence of wood and fewel. And hereupon it came, that ſalads of herbs were called * Acedaria, ſo little care and trouble went to the prouiſion and making of them. Beſide, light they are of digeſtion, they breed no heauineſſe in the head, they offend not the braine nor any of the ſenſes; and leaſt of any thing make quarrell to the loafe and ſpend little bread. That quarter of the garden which ſerueth an houſe with poignant herbs in ſtead of ſauce, to giue a commendable taſt and ſeaſoning to our meat, ſheweth plainly, that the maſter and miſtreſſe therof were not wont to run in the merchants books for ſpicerie, but changed the Groſſer or Apothecaries ſhop for the garden; for the ſame contentment they had out of it, as from thence: alſo that they ſought not either for pepper out of India, or for any kitchen ſpices tranſported from beyond the ſeas out of far countries. And as for the other quarters, ſet out with beds of floures, & ſweet ſmelling hearbes, what reckoning was made of them in old time may appeare by this, That a man could not heretofore come by a Commoners houſe within the city, but he ſhould ſee the windowes beautified with green quiſhins, wrought and tapiſſed with floures of all colours, reſembling daily to their view the gardens indeed which were in out villages: inſomuch, as being in the very heart of the city, they might think themſelues in the country; till ſuch time as theſe ſly theeues and night-hookers, the wicked rabble (I ſay) and off-ſcouring of the baſe multitude (not to be reckoned) committed ſuch felonious outrages, as forced men to naile vp couers and caſes before theſe faire lights and beautifull proſpects. Let vs giue therefore to gardens their due honour: let vs not (I ſay) depriue things of their credit and authoritie, becauſe they are common and nothing coſtly: for I may tell you, ſome of our nobilitie, yea the beſt of the city, haue not diſdained to take their ſir-names from thence, nay they ſuppoſed themſelues highly credited and honored thereby. Thus we ſee, that in the Noble houſe and linage of the *Valerij*, ſome were not abaſhed nor aſhamed to be called *Lactucini*, in regard of the beſt kind of Lectuce that they either had in their gardens, or affected moſt. And here I cannot chuſe but mention by the way, the grace that hath growne to our name, by occaſion of ſome diligence imploied and paines taken this way; whereby certaine Cherries beare our Name, and are called *Pliniana*, in teſtimonie of our affection and loue to that fruit. Which I remember the rather, for that *Virgil* confeſſeth how hard a thing it is, that ſo ſmall matters as theſe be ſhould

grow

* Much like to our Anchoues.

* ἀβὶ ὃ κνδῆς.

20030
copy 1

A grow into the name and reputation of honor any way. And now to the purpoſe. No man doubteth, but that a garden ſhould lie to a graunge or ferme-houſe, and joine cloſe vnto it: as alſo, that aboue all things there ſhould be water at commaund, from ſome riuer or brooke running vnder, yea, and through it, if it were poſſible: if not ſo, yet that they are to be watered with pit water fed with Spring, either drawne vp by plaine poles, hookes, and buckets; or forced by pumpes and ſuch like, going with the ſtrength of wind within encloſed, or elſe weighed with Swipes and Cranes. Moreouer, that a garden-plot ſhould be broken vp and haue the firſt digging preſently vpon the comming of the weſt wind Fauonius in the beginning of the Spring: and for any thing that muſt be ſet or ſown there, againſt Autumne, it ought to be prepared and dreſſed readie for to receiue ſeeds and ſets, 14 daies after: but for Winter ſtuffe, it ſhould haue
B a ſtirring or ſecond tilth and deluing before the Winter Sunſtead or ſhorteſt day of the yeare. Alſo, this is to be noted, that there would not be a greater plot of ground taken in, empaled and fenced about for a garden, than of 8 acres or Iugera at the moſt. Now for the manuring and ordering thereof: firſt, for three foot deep the dung would be tempered and mingled with the mould. *Item*, It ought to be diuided in principal quarters: the ſame alſo muſt be ſet out into ſeuerall beds, raiſed ſomwhae high and lying vpward. *Item*, Requiſit it is, that euery quarter haue as welcertaine open gutters or furrowes drawne about them, as conuenient allies betweene to giue both paſſage for men to come and goe gainely; and alſo a currant to the courſe of water that ſhall be let in, when the ſprings be ſet open or ſluces drawne.

Garden plants and hearbs be not all commendable in one and the ſame reſpect. For of ſome
C the goodneſſe lieth only in their bulbous and round root: of others contrariwiſe in their head aloft. There be of them that haue no part good but their ſtem or maiſter ſtalk: and there are for them againe, the leaues wherof be only eaten. Now a man ſhall haue amongſt them thoſe that are wholeſome meat, both leafe and ſtalke. In ſome the ſeed or graine, in other the outward pil or rind alone of the root is in requeſt. And as there be that taſt well in the skin or cartilage and griſtly ſubſtance without-forth, ſo there are that haue either their pulpous carnoſity within, or elſe their fleſhy coat aboue, as daintie. All the goodnes of many of them lieth hidden within the earth: and of as many again aboue the ground: and yet ſome there be that are al one, as good within as without. Some traine along and run by the ground, growing on end ſtil as they creep, as Gourds and Cucumbers. And yet the ſame, as well as they loue to be neere the earth, yet are
D led lpon trailes, and hang thereon, yea, and be knowne for to rampe vpon trees: Howbeit, much weightier and better nouriſhed be they that keepe beneath. As for the Cucumber, it is the cartilage ſubſtance of the fruit thereof, that delighteth and pleaſeth our taſt: for of all fruits this propertie it alone hath, that the vtmoſt rind which it beareth, groweth to a very wood when it is once ripe. Within the earth lie hidden and are kept all Winter, Raddiſhes, Nauews, Turneps or Rapes, Elecampane alſo after another ſort; ſo doe Skirworts, and Parſeneps or Wypes.

Moreouer, this I would aduertiſe the Reader, that when I tearme ſome hearbes Ferulacea, I meane ſuch as reſemble in ſtalke Dil or the great Mallowes. For ſome writers doe report, That in Arabia there be a kind of Mallowes, which after they haue grown ſix or ſeuen months, come to be in the nature of pretie trees: inſomuch, as their ſtalks ſtreightwaies ſerue in ſtead of wal-
F king ſtaues. But what ſhould I ſtand vpon this? In Mauritania, by report of trauellers, neer the frith or arme of the ſea adjoining to Lixos, the head citie of Fez, where ſomtimes (as folke ſay) were the hort-yards and gardens of the Heſperides, not aboue halfe a quarter of a mile from the maine ocean, hard vnto the chappell of *Hercules* (farre more ancient than that temple of his, which is in the Iſland Calis) there groweth a Mallow, that is a very tree indeed: in height it is twentie foot, and in bodie bigger and thicker than any man can fadome. In this kind I meane for to raunge the Hempe likewiſe. And as I purpoſe to tearme ſuch Ferulacea; ſo there bee ſome others, that I will call Carnoſa, ſuch as reſemble the riuer or freſh-water Spunges, which commonly are ſeene vpon ouer-floten medowes, where the water ſtandeth. For as touching the fungous ſubſtance or calliſitie of ſome plants, I haue alreadie ſpoken thereof in the Treatiſe
F of Wood and Trees, and of their nature: Likewiſe in our late diſcourſe of another ſort of Muſhroomes and Toad-ſtooles.

G

Chap. V.

¶ *Garden plants, their natures, kinds, and ſeuerall hiſtories.*

OF the cartilage and pulpous kind (ſuch I meane onely, wherof there is nothing good but that which is aboue the ground) I reckon the Cucumber: a fruit that *Tiberius* the Emperor much loued and affected: for he tooke ſuch a wondrous delight and pleaſure therein, that there was not a day went ouer his head, but he had them ſerued vp to his table. The beds and gardens wherein they grew were ſuch as went vpon frames to be remooued euery way with wheeles: and in winter, during the cold and frоſty daies, they could draw them backe into certaine high couert buildings expoſed to the Sun, and there houſe them vnder roufe. Moreouer, H
I find in ſome ancient Greek writers, that their ſeed ought to lie 2 daies in ſteepe, or infuſed in honied milke, before they be prickt or ſet into the ground: for by that meanes the Cucumbers will be the ſweeter and more pleaſant. The nature of them is to grow in what forme and faſhion ſoeuer that a man would haue them. Throughout all Italy, green they be of colour, and leaſt of any others: in the out-prouinces they be as fair and great, and thoſe either of a yellow color, like wax and citrons, or els blacke. In Affrick or Barbary men take delight to haue the greateſt plenty of them; wheras in Mœſia they lay for to haue them paſſing big and huge. Now when they exceed in greatnes they be called Pepones, is Melons or Pompons. Let a man eat them alone, they will lie raw and greene in the ſtomacke a whole day, and neuer be digeſted: howbeit, with meats they are not vnwholſom, and yet for the moſt part ſwim they will aloft, and ride vp- I
on a mans ſtomacke. A wonderfull thing in their nature: they cannot abide oile in any wiſe, but water they loue well; inſomuch, as if they be cut off, or fallen from the place where they grew, they wind and creep therinto, if it be but a little way off: contrariwiſe, flie they will as faſt from oile, if a man ſet it by them; and in caſe any thing be in their way to let them, or that they hang ſtill vpon their plant, a man ſhall perceiue how they wil turn vp and crook, to ſhun & auoid it. This amitie to the one, and enmity to the other, may be ſeene euen in one nights ſpace: for if a man ſet vnder them, 4 fingers off where they grow, a veſſel with water ouer-night, he ſhal ſee by the morning that they wil come downe to it: contrariwiſe, let oile ſtand the like diſtance from them, ſhrink they wil from it, and hook vpward. Marke another experiment in the cucumber. If when it hath don flouring, you enter the knot of the fruit into a long cane or trunk, it will grow K
vo a wonderfull length. But behold a very ſtraunge and new faſhion of them in Campaine, for there you ſhall haue abundance of them come vp in forme of a Quince. And as I heare ſay, one of them chanced ſo to grow firſt at a very venture: but after from the ſeed of it came a whol race and progeny of the like, which therupon they cal Melopepones, as a man would ſay, the quince pompions or Cucumbers. Theſe neuer hang on high, but go low by the ground, and gather round in form of a globe. A ſtrange caſe it is of this kind: for, ouer and beſides their ſhape, their color, and ſauor different from the reſt; they are no ſooner ripe, but preſently they fall from the ſtele or taile wherto they grew, notwithſtanding they hang not hollow from the ground, where their owne poiſe might weigh them downe. *Columella* tells of a pretie deuiſe that he hath of his own, how to keep of them freſh all the yere long: chuſe (quoth he) the biggeſt bramble you can L
meet with among a thouſand, tranſlate it into a warm ſun-ſhine bank, and there replant it: then cut it off, leauing not aboue 2 fingers breadth from the root aboue the ground [but this muſt be don about the Spring Æquinox in mid-March:] then take a Cucumber ſeed, & ſet it within the ſoft pith of the ſaid bramble, bank it will round about with fine freſh mould & dung blended together: This is the way, he aſſureth vs, to make that the roots therof bearing ſuch cucumbers or Melons, will abide the greateſt cold in Winter, and neuer ſhrink at it: of cucumbers, the Greeks haue ſet down 3 kinds, to wit, the Laconick, the Scytalick & the Bœotick. Of which as they ſay, the firſt ſort only they be that loue waters ſo wel: ſome there be who preſcribe to take the ſeed of Cucumber or Melon & to temper it in the juice of a certain hearb ſtamped, which
* Some take it for *Coniza*, i. Fleabane Mullet. they cal *Culix, & then to ſow it, perſuading vs that we ſhal haue fruit therof without any ſeed. M

Of the like nature (I meane for their manner of growing) be the Gourds. Winter and al cold weather they canot endure: they loue alſo places wel watered & dunged. As wel Gourds, as the cucumbers or Melons aboueſaid, are commonly ſowed between the Æquinox in March, & the Sunſtead in Iune; prouided alwaies, that their ſeed ly in a trench within the ground, a foot & a

halfe

20030
copy 1

A halfe deepe. But in very deed, the beſt and meeteſt time to ſow them is about the feaſt Patilia, howſoeuer there be ſome would haue the ſeed of gourds to be put into the ground preſently after the Calends or firſt day of March: but of cucumbers about the Nones, *i.* the 7 day thereof, or at fartheſt, by the feaſt or holy-daies of *Minerua*, named Quinquatrus. They loue both alike to creep and crawle with their winding top branches or tendrels, and gladly they would be clambering vpon walls, and climbing vp to the houſe roofe, if they can meet with any rough places to take hold by; for naturally they are giuen to mount on high. Howbeit, their ſtrength is not anſwerable to their will and deſire: for ſtand they canot alone without the help of ſome props, forks, or railes, to ſtay them vpright. Exceeding forward and ſwift they be in growth. They run on end when they are ſet on it: and if they may be born vp & ſuſtained in maner aforeſaid, they
B will gently ouerſhade galleries, walking places, arbors, frames, & allies vnder them in a garden, and that right quickly. In regard of which nature and behauior of theirs, two principall kindes there be of them; the one Camerarium, as one would ſay, the frame or trail-Gourd, and cucumber, which climbeth aloft; the other Plebeium, *i.* the vulgar and common, which creepeth along the ground beneath. In the former kind it is worth the noting, to ſee how the fruit (heauy as it is) hangeth ſtiffe poiſed as it were in the wind, and will not ſtir, notwithſtanding the ſtele wherto it groweth be wondrous fine and ſmal. Moreouer, Gourds alſo may be faſhioned in the head euery way as a man will, like as the Cucumbers or Melons before named: and ſpecially within wicker caſes made of pliable oiſiers, into which they are put for to grow & to take their form, ſo ſoon as they haue caſt their bloſſom. The nature of them (I ſay) is to receiue what figure a
C man will force and put them to: but commonly ſhaped they are in their growth like to a Serpent, winding and turning euery way. There haue bin known of them (ſuch I meane as were of the traile kind) being led vpon a frame from the ground, and permitted to run at libertie, which grew to an incredible length, for one of them hath bin ſeen 9 foot long. As for cucumbers, they bloom not all at once, but by piece-meale, floure after floure, now one and then another: yea, and floure vpon floure, one vpon the head of another. Howſoeuer the Cucumber loueth wateriſh grounds, yet can he abide drier places alſo. Couered al ouer this plant and fruit is with a white down, euen at the firſt: but eſpecially all the while he is in his growth.

Gourds are imploied ſundry waies, and to many more vſes than Cucumbers. For firſt, their yong and tender ſtalks be very good meat, and being dreſſed, are ſerued vp as a diſh to the ta-
D ble: but the rind is of a cleane contrary nature. Gourds of late time came to be vſed in ſtouves and baines for pots and pitchers: but long before that, they ſtood in ſtead of rundlets or ſmall barrels to keep wine in. The green of this kind hath a tender rind, which muſt be ſcraped notwithſtanding before a diſh of meat can be made thereof. And certes, albeit Gourds be of digeſtion hard, and ſuch as will not throughly be concocted in a mans ſtomacke, yet they are taken to be a light, mild, and wholſom meat, as they be handled and dreſſed diuers waies, for that they make not a mans belly to ſwel, as ſome meats doe. Of thoſe ſeeds which be found within the gourd next to the neck therof, if they be ſet, come the long gourds commonly: & ſuch lightly you ſhall haue ingendred of thoſe alſo that are in the bottom, howbeit nothing comparable to the other. Thoſe that lie in the midſt bring forth round ones: but from the ſeeds that are taken
E out of the ſides, ordinarily there grow the ſhorter ſort of Gourds, ſuch as be thicke and broad. Theſe grains or ſeeds would be handled in this manner. Firſt they are dried in the ſhadow, and afterwards when a man liſt to ſow them, they ought to be ſteeped in water. The longer & ſlenderer that a Gourd is, the better meat it yeelds, and more pleaſant to be eaten: and therefore it is, that they be thought more wholeſome which grew hanging vpon trailes; ſuch indeed haue leaſt ſtore of ſeed within them. Howbeit, wax they once hard, away with them out of the kitchen, for then they haue loſt all their grace and goodnes which commended them to the cooks dreſſer. Such as are to be kept for ſeed, the manner is not to cut vp before winter: and then are they to hang or ſtand a drying in the ſmoake, as proper ſtuffe and implements to be ſeen in a country houſe, to keep, as good chaffer, ſeeds for the gardner againſt the time. Moreouer, there
F is a means deuiſed, how to preſerue them and cucumbers too, for meat, ſound and good, almoſt til new come; & that is, by laying both the one and the other in a kind of brine or pickle. Some ſay alſo, that they may be kept freſh and greene, interred in a caue or ditch vnder the ground in ſome darke and ſhady place, with a good courſe or bed of ſand laid vnder them, and well couered afterward with dry hay, and earth vpon the ſame in the end. Ouer & beſides, as in all plants

and herbs in maner of the garden, there be both wild and tame: ſo is there of Gourds and Cucumbers both a certain * ſauage kinde. Such are not for the kitchen, but for the Apothecaries ſhop, and good only in Phyſick: and therefore I will put off for this preſent the diſcourſe of them & their nature, reſeruing them for their ſeueral treatiſes in other books concerning ſuch medicinable ſimples. G

* *Cucumis ſyluestris.* * *Colocynthis*, or, *Coloquintida.*

As touching the reſt of garden plants, which are of the like cartilage and pulpous ſubſtance, they be all the ſort of them roots growing hidden within the ground: amongſt which, I might ſeem to haue written already fully and ſufficiently of Rapes and Turneps, but that the Phyſitians haue obſerued in them both ſexes, to wit, maſculine & fœminin; for the rounder kind they wil haue to be the male, but the broader and flatter ſort, which alſo are ſomewhat hollow, they account the female: and theſe laſt they hold to be the better far, and more pleaſant, as being eaſier to be kept and condite; which alſo, if they be often remoued and replanted, will turn to be males. Phyſitians likewiſe haue ſet down fiue kinds of Nauewes, namely, the Corinthian, the Cleonæan, the Liothaſian, the Bœotian, and that which ſimply by it ſelf they called the green Nauew. Of all theſe, the Corinthian Nauews grow to a great bignes, and in maner all the root is ſeen naked aboue ground: for this is the only kind that coueteth to be aloft, and groweth not downward into the earth as the reſt do. As for the Liothaſian (ſome call it alſo the Thracian) of all others it will abide and endure froſt and cold weather beſt. Next to it is the Bœotian nauew, ſweet in taſt, differing from the reſt in the notable ſhortneſſe and roundneſſe withall that the root carieth; nothing at all like to the Cleonæan, which is paſſing long. Generally this is obſerued as a rule, that all Nauews, the ſlenderer, ſmaller, and ſmoother leaues that they beare, the more pleaſant is their root to the taſt: and contrariwiſe, the rougher that they be, the more cornered alſo and pricky, the bitterer they are. There is a wild kind of them beſides, the leaues wherof reſemble Rocket. The beſt Nauews that are ſold at Rome, be thoſe that come from Amiternum in Bruzze. The next to them in goodnes are thoſe of Nurſium. In the third place are they to be ranged which our country * about Verona yeelds. As concerning all things els, and namely the maner of ſowing them, I haue ſaid enough in the treatiſe of Rapes or Turneps. H I

* or rather Italie.

As for Radiſhes, their roots do conſiſt of a rind without, & a cartilage or pulpous ſubſtance within: and verily many of them are known to haue a thicker skin or rinde than the barke is of ſome trees: bitter ſuch are, more or leſſe, according to the thicknes of the ſaid rind: otherwhile alſo the reſt is all pith, and as hard as wood. All Radiſhes breed wind wonderfull much, & prouoke a man that eateth of them, to belch. A baſe and homely meat therefore it is, and not for a gentlemans table, eſpecially if it be eaten with other worts, as Beets: mary if a man take them with vnripe oliues condite, he ſhall neither belch or rift wind ſo much, ne yet ſo foure and ſtinking will his breath be afterwards. The Egyptians make maruellous great account of radiſhes, for the plenty of oile that they draw out of the ſeed: and therefore a great deſire they haue to ſow them if they may: for as they find it more gainful than corn, ſo they pay leſſe tribute & cuſtom in regard of that commoditie, and yet there is nothing yeeldeth more abundance of oile. K

* *Theophraſtus* writeth all this of *Braſſica.* I. Colewoort. See how *Pliny* is ouerſeene: but that is no newes with him.

* The Greeks haue made three ſorts of Radiſhes, differing all in leafe: the firſt criſped and curled like a ruffe, the ſecond ſmooth and plain, the third wild and ſauage; and theſe wild ones verily haue ſmooth leaues, but ſhort and round: plentiful alſo they be, and otherwiſe ful of branches: a rough and harſh taſt they haue, howbeit medicinable they be, and as good as a purgation to looſen the belly and make it laxatiue. As for the other two former kindes, a difference there is in the ſeed; for in ſome it is very fair & good, in others as ſmall and bad: howbeit theſe imperfections light vpon none but ſuch as haue the criſped and frizled leaues. * Our countrymen here in Italy haue made other kinds therof; to wit, Algiclenſe, ſo called of the place: long they be, tranſparent and cleare, that a man may ſee through them. A ſecond ſort there be faſhioned in maner of a Rape root, and thoſe they call Syriaca, the ſweeteſt for the moſt part of all others, and tendereſt, ſuch alſo as will hold out beſt againſt froſt and winter weather. Yet the principal and very beſt indeed are thoſe, which as it ſhould ſeem were but lately brought out of Syria (at leaſtwiſe the ſeed of them) for that in no writers there is found any mention made of them: and they wil continue all winter long. Ouer and beſides all theſe, there is one ſauage kind of them more, which the Greeks name Agrion: the inhabitants of Pontus, Armon; others, Leuce; and our countrymen giue it the name of Armoracia: more ſhew it maketh in leafe than in the root or all the body beſides. Moreouer, the beſt token to know good Radiſhes by, is their L

* Here he ſeemeth to come againe to the radiſh indeed. M

ſtem

20030
copy 1

A ſtem or ſtalk: for ſuch as bite at the tongues end, haue rounder and longer ſtems than the other that be mild: they haue long and hollow gutters alſo: the leaues beſides are more bitter and vnſauorie, cornered, more rough, and vntoward to be handled. Radiſh ſeed would willingly be ſowne in a looſe or light ground, and natheleſſe moiſt enough: it cannot abide rank mucke, but contenteth it ſelfe with rotten chaffe or pugs, and ſuch like plain mullock. It likes and thriues ſo well in cold countries, that in Germanie a man ſhall haue their roots as big as prety babes. To haue Radiſh roots in the ſpring, the ſeed would be ſowed preſently after the Ides or 13 day of Februarie: and a ſecond time again about the feaſt of * *Vulcan*, which is indeed the better ſeaſon for Seednes. Mary there be that put the ſeeds into the ground in March, Aprill, and September. When they are come vp and begin to grow to ſome bigneſſe, it is very good to enterre
B and couer with mould round about the leaues, now one, and then another; but in any caſe to banke the roots well with earth: for looke how much appeareth bare aboue ground, prooues either to be hard, or els fungous and hollow like a Kex, and nothing good to be eaten. *Ariſtomachus* would haue them to be ſtript from their leaues in winter, & in any hand to be banked well about, that the water ſtand not there in any hollow furrow or hole lower than the other ground; promiſing vs by this meanes, that they will proue faire and big againſt Summer. Some haue reported, that if a man make a hole in the ground with as big a ſtake as he wil, and ſtrew or lay it in the bottom with a bed of chaffe ſix fingers deepe, and on it beſtow his ſeed, with muck and mould heaped thereupon, the roots will grow ſo big as to fill vp the ſaid hole full. Howbeit, in briefe, Radiſhes are beſt nouriſhed and maintained in ſalt grounds: and therfore with ſuch kind
C of brakiſh waters they vſe to be watered, which is the reaſon, that in Ægypt there are the ſweeteſt and daintieſt Radiſhes in the world, for that they are bedewed and ſprinckled with Nitre. And verily it is thought, that they will loſe all their bitternes whatſoeuer if they be corned or ſeaſoned with ſalt, yea and become as if they were ſodden and condite: for be they boiled once, they proue ſweet and ſerue to be eaten in ſtead of Nauewes. And yet Phiſicians giue counſell and preſcribe, That they ſhould be eaten raw in a morning with ſalt, when a man is faſting, for to gather into the ſtomack the ſharp humors and excrements that charge the belly & entrails: and thus taken, they are of opinion, that it is a good preparatiue to vomit, and to open the paſſages well for to auoid thoſe ſuperfluities. They giue out alſo, That the juice of Radiſh roots is ſingular good and neceſſarie for the midriffe, and the præcordiall parts about the heart; and
D namely, that nothing elſe but it, was able to cure a Phtiſicke or vlcer of the lungs, wich had ſetled deep and taken to the heart: The experiment and proofe whereof was found and ſeen in Ægypt, by occaſion that KK. there, cauſed dead bodies to be cut vp, and anotomies to be made, for to ſearch out the maladies whereof men died. It is reported, that the Greeks (as they be otherwiſe vaine in al their actions) ſo highly preferred the Radiſhes before other meats, in regard of the igo od nouriſhment, that wheras in an oblation out of the garden-fruits to be offered vnto *Apollo* in his temple at Delphos, they dedicated the Beet in ſiluer, and the Rape or Turnep in lead, they preſented a Radiſh in beaten gold. A man may know hereby, that *Manius Curius* the great General of the Romane armie, was not that countreyman borne; whom the Samnite Embaſſadors (when they brought to him a great preſent of gold [vpon condition to ſurceaſe arms]
E which he meant to refuſe and not accept at their hands) found roſting of a Rape or Turnep root at the chimney fire; according as we find in the Annals and Chronicles of the Roman hiſtory. To come again vnto our Radiſhes, *Moſchian* the Greek writer ſo highly eſteemed this root, that he compiled one whole booke of the Radiſh, and nothing els. Indeed Radiſhes are thought excellent good with meats in Winter time: howbeit they alwaies wear and marre their teeth who eat of them: and yet I aſſure you they wil poliſh Iuorie, which is nothing els but the Elephants tooth. * Between a Vine and a Radiſh, there is by nature a ſecret enmitie and exceeding great hatred, inſomuch as if Radiſhes be ſowed neere vnto her, ſhe will writh and turne away ſenſibly from them.

Touching other ſorts of cartilage or pulpous plants in the garden, wherof I haue before ſpo-
F ken, they be all giuen to run much to pith, and to be of a more woodie ſubſtance. A man would maruell therefore that they ſhould all taſt ſo ſtrong and ſharpe as they doe. Of which there is one kind of wild Parſnep growing of it ſelfe, which in Greek is * called Staphylinas. A ſecond ſort is ſet of a plant with the root and ſowed of ſeed, either in the prime of ſpring, or els in Autumne: howſoeuer *Hyginus* would haue them to be put into the ground in Februarie, Auguſt, September,

* 11 Cal. Iun. or as ſome think, 13 Cal. Iun, i. the 20 or 22 day of May. This feaſt was named alſo *Lustria*.

*Here *Plinie* forgetteth himſelfe againe: for this is verified of the Colewort, and not of the Radiſh.

* Some call theſe Madnips.

September,and October; and that the plot where they are to grow, ſhould be digged and delued very deep. This root beginneth to be good at the firſt yeres end,but better it is if it be two yeres old: howbeit both the one and the other, is counted wholſommer in Autumn than at any other ſeaſon of the yeare, eſpecially boiled and ſerued vp betweene two platters, and yet dreſſe them ſo well as you can, they will not be rid of that ſtrong, ranke,and churliſh ſmacke which it hath. As for * Hibiſcum, it differeth from the Parſnip aforeſaid onely in this, That it is more ſlender and ſmaller,rejected altogether from the table,and condemned for no good meat; howbeit medicinable,and vſed much by the Phyſitian. A fourth kind there is beſide,reſembling alſo the Parſnip, which our countreymen the Latines name the French Parſnip, but the Greekes Daucus,[*i.* the yellow Douke or Carot] which they haue ſubdiuided into foure ſpeciall ſorts. The * Skirwirt root or white Parſnip, (which indeed would be written among other Phyſicke plants) was likewiſe in great name and credit by the meane of the foreſaid Emperour *Tyberius* who was very earneſt ro haue them yearely brought out of Germanie,and euer he would cal for them at his own table. And indeed about Gelduba (a caſtle ſituat vpon the riuer Rhene in Germanie) there was an excellent kind of them that grew to be paſſing faire, from whence he was ſerued: whereby it appeareth,that this plant loueth cold regions well. Theſe roots haue a ſtring in manner of a pith or ſinew,running all the length thereof,which the cooke vſeth to take forth after they be ſodden; yet for all that there remaineth ſtill in them a great deale of bitterneſſe: howbeit being wel tempered & delaied with a ſauce of mead or honyed wine,and ſo eaten with it,euen the ſame bitterneſſe turneth to a good and pleaſant taſt. The greater Parſnip Paſtinaca, hath the like nerue or ſtring aforeſaid (ſuch only I mean as are a yere old.) The right ſeaſon to ſow the Skirwirt or Parſnip Siſer, is in theſe moneths,to wit, Februarie, March, Aprill, Aeguſt, September,and October.

The * Elecampane hath a root ſhorter than the Skirwirts or Parſnips aforeſaid, but more muſculous and fuller as it were of brawn; bitterer alſo: in which regards,if it be taken ſimply alone,it is aduerſe and contrarie to the ſtomack; but joined & confected with ſome ſweet things among,it is very holſom. And many deuiſes haue bin practiſed with it to take away that harſh and vntoward bitterneſſe which it hath, wherby it is become toothſome and pleaſant enough: for ſome there be who ſtamp it drie and ſo reduce it into a pouder: then they mix it with ſome ſweet liquid ſyrrup, and being thus tempered,ſerue it vp. Others ſeeth it in water and vinegre mingled together,and ſo keepe it condite. Infuſed alſo it is many waies,and afterwards either preſerued in cuit,or incorporat with hony in manner of a conſerue, or els with dried Raiſons of the Sun,or laſt of all with faire and fat Dates. Moreouer,diuers there be,who after anorher ſort make a confection therof,namely with Quinces,with Soruiſes,or Plums,mixing therwith one while Pepper,another while Thym. And I aſſure you this root thus confected (as is aforeſaid) is ſingular good for faintings; and eſpecially quickneth the dulnes and defect of the ſtomack. The Empreſſe *Iulia Auguſta* paſſed not a day without eating the Elecampane root thus confected and condite: and therupon came it to be in ſo great name and bruit as it is. The ſeed therof is needleſſe and good for nothing: therefore to maintaine and increaſe this plant,gardeners vſe commonly to ſet the joints cut from the root,after the order as they doe Reeds and Canes. The manner is to plant them as well as Parſnips, Skirwirts,and Carrots,at both times of ſeednes,to wit,the Spring and the Fall: but there would be a good diſtance betweene euery ſeed or plant,at leaſt three foot, becauſe they ſpread and braunch very much, and therewith take vp a deale of ground. As for the Skirwirt or Parſnip Siſer, it will do the better if it be remoued and replanted.

It remaineth now to ſpeak in the next place of plants, with bulbous or onion roots and their nature, which *Cato* recommendeth to Gardeners, and he would haue them to be ſet and ſowed aboue all others: among which,he moſt eſteemeth them of Megara. Howbeit, of all this bulbous kind,the Sea-onyon Squilla is reputed chiefe and principall,notwithſtanding there is no vſe of it but in Phyſick,and for to quicken vinegre. As there is none that groweth with a bigger head at the root, ſo there is not any more ægre and biting than it. Of theſe Sea-onyons, there be two kinds medicinable; the male,with the white leafe; the female,with the blacke. There is a third ſort alſo of Squillæ, which is good for to be eaten: the leaues whereof be narrower,and not ſo rough and ſharp as the other,and this they cal Epimenidium. All the ſort of theſe ſquilles are plentifull in ſeed: howbeit they come vp ſooner if they be ſet of cloues or bulbes which grow

* Some take it for *Althæa* or the mariſh Mallow.

* *Siſer.*

* *Inula.*

G H I K L M

20030
copy 1

A grow about their ſides. And if a man would haue the head of the root wax big, the leaues which vſually be broad and large, ought to be bended downe into the earth round about, and ſo couered with mould; for by this means all the ſap and nouriſhment is diuerted from the leafe and runneth backe into the root. Theſe Squils or ſea-onions grow in exceeding great abundance within the Baleare Iſlands and Ebuſus, as alſo throughout all Spaine. *Pythagoras* the Philoſopher wrote one entire volumne of theſe onions, wherein he collected their medicinable vertues and properties, which I meane to deliuer in the next booke.

As touching other bulbous plants, there be ſundry kinds of them, differing all in colour, quantity, and ſweetneſſe of taſt: for ſome there bee of them good to be eaten raw, as thoſe of Cherrhoneſus Taurica. Next vnto them, are they of Barbary, and moſt commended for good-
B neſſe; and then thoſe that grow in Apulia. The Greeks haue ſet downe their diſtinct kindes in theſe terms, Bulbine, Setanios, Pythios, Acrocorios, *Ægylops, and Siſyrinchios. But ſtrange it is of this Siſyrinchios laſt named, how the foot and bottom of the root wil grow down ſtil in winter; but in the Spring when the Violets appeare, the ſame diminiſheth and gathereth ſhort vpward; by which meanes the head indeed of the root feedeth and thriueth the better. In this rank of bulbous plants, is to be ſet that, which in Egypt they call Aron, [*i.* Wake-Robin:] for bigneſſe of the head it commeth next to Squilla beforeſaid: the leaues reſemble the herb Patience or garden Dock: it riſeth vp with a ſtreight ſtem or ſtalke two cubits high, as thicke as a good round cudgell. As touching the root, it is of a ſoft and tender ſubſtance, and may be eaten raw. If you would haue good of theſe bulbous roots, you had need to dig them out of the ground
C before the ſpring; for if you paſſe that time, they will preſently be the worſe. You ſhall know when they be ripe and in their perfection by the leaues; for they will begin to wither at the bottom. If they be elder, or if their roots grow ſmall and long, they are reiected as nothing worth. Contrariwiſe, the ruddy root, the rounder and the biggeſt withall, are moſt commended: know this moreouer, That the bitterneſſe of the root in moſt of them, lyeth in the crowne (as it were) or top of the head; for the middle parts be ſweet. The antient writers held opinion, That none of theſe bulbous plants would grow, but of ſeed only: howbeit, both in the paſtures and fields about Preneſte, they come vp of themſelues: and alſo among the corn lands and arable grounds of the Rhenians, they grow beyond all meaſure.

*rather, Hemerocalles.

D

Chap. VI.

¶ *Of the roots, leaues, flours, and colours of Garden-herbes.*

ALl Garden plants ordinarily, put out but one ſingle root apiece; as for example, the Radiſh, Beet, Parſley, and Mallow: howbeit the greateſt and largeſt of all others is the root of the herb Patience or garden Docke, which is knowne to run downe into the ground three cubits deep. In the wild of this kind (which is the common docke) the roots be ſmaller, yet plumpe and ſwelled; whereby, after they be digged vp and laied aboue ground, they wil liue a long time. Some there be of them that haue hairy ſtrings or beards hanging to the roots, as namely Parſley or Ach, and Mallows. Others there be againe, which haue branching roots, as
E the Baſill. As the roots of ſome be carnous and fleſhie altogether, and namely of the Beet, but eſpecially of Saffron; ſo in others they conſiſt of rind and carnoſitie both, as we may ſee in Radiſhes and Rapes or Turneps. And ye ſhall haue of them that be knotty and full of ioints, as for example, the root of the Quoich graſſe or Dent-de-chien. Such hearbs as haue no ſtreight and direct root, run immediatly into hairie threds, as we may ſee plainly in the Orach and Bleet: as for the ſea Onion Squilla, and ſuch bulbous plants, the garden Onions alſo and Garlicke, they put forth their roots ſtreight, and neuer otherwiſe. Many hearbes there be, which ſpring of their own accord without ſetting or ſowing, and of ſuch many there be that branch more & cloue in root than in leafe, as we may ſee in Aſpalax, * Parietarie of the wall, and Saffron. Moreouer, a man ſhall ſee theſe hearbes floure at once together with the Aſh, namely, the running or creeping Thyme, Southernewood, Naphewes, Radiſhes, Mints, and Rue; and by that time as others
F begin to blow, they are ready to ſhed their floures: whereas Baſill putteth forth floures by parcels one after another, beginning firſt beneath and ſo going vpward by leiſure: which is the cauſe that of all others it is longeſt in the floure. The ſame is to be ſeene in the herb Heliotropium (*i.* Ruds or Turnſol.) In ſome the floures be white, in others yellow, and in others purple.

*Perdicium.

As

As touching the leaues of herbes, ſome are apt to fall from their heads or tops, as in Origan and Elecampane, yea, and otherwhiles in Rue, if ſome iniurie be done vnto it. Of all other herbes, the blades of Onions and * Chibbols be moſt hollow. Where by the way I cannot ouerpaſſe the fooliſh ſuperſtition of the Ægyptians, who vſe to ſweare by Garlicke and Onions, calling them to witneſſe in taking their othes, as if they were no leſſe than ſome gods. Of Onions the Greeks haue deuiſed ſundry kinds, to wit, the Sardian, Samothracian, Alſiden, Setanian, Schiſta [*i.* the clouen Onion] and Aſcalonia [*i.* little onions or Scalions] taking that name of Aſcalon a city in Iury. They haue all of them this propertie beſides, to make ones eyes water, and to fetch out teares, being ſmelled to, eſpecially they of Cypros: but the Gnidian onions leaſt of all others cauſe one to weep. In all kinds of them the body of the root conſiſteth of a certaine fatty pulp or cartilage. For quantity the Setanian be leaſt, except the Tuſculane: howbeit ſuch are ſweet. The clouen onions & the ſcalions aforeſaid are proper for to make ſauce of. As touching that kind of them called Schiſta, gardners leaue them al winter in the ground with their leaues or head ſtanding: in the ſpring they pluck off the ſaid leaues, and then ſhal you ſee ſpring forth others vnderneath, according to the ſame clifts and diuiſions, whereupon they tooke the name Schiſta. After which example, the like practiſe in all other kindes is preſcribed, namely, to pull the leaues off, that they ſhould grow rather big in root, than run vp to ſeed. The Aſcalonian onions haue a proper nature & qualitie by themſelues; for they be barren as it were, from the root, and therefore the Greeks would haue them to be ſowed of ſeed, and not otherwiſe to be ſet of heads. Beſides, that they ſhould be tranſlated & replanted again late, about the ſpring, at what time as they put forth blade: for by this vſage (ſay they) you ſhall haue them burniſh and grow thicke, yea, and then make haſt for amends of the former time foreſlipt. Theſe muſt be gathered betimes, for after they be once ripe, quickly will they rot in the earth, if you make not the better haſt to pluck them vp. If you ſet or plant their heads, a ſtalke they wil put forth and ſeed vpon it, but the onion it ſelfe will conſume and come to nothing. Moreouer, there is a difference obſerued in the colour of onions; for they that grow in Samos and Sardis, be moſt white: thoſe alſo of Candy be much eſteemed; and ſome there be who doubt whether they be the ſame that the Aſcalonian, or no: for that if they be ſowed of ſeed, their heads or roots will grow big: ſet them, they will be all ſtem and ſeed, and no head at all. As for the relliſh or taſte that onions haue there is no great diuerſitie, but that ſome are ſweeter than other. Our onions here in Italy be all of two ſorts principally: the one which ſerue for ſauce to ſeaſon our meats, which the Greeks call Gethyon Chibbols; but our countrymen the Latines, Pallacana: theſe are ſowne commonly in March, April, and May: the other is the great headed onion; and theſe be put into the ground either after the Æquinox in Autumne, or els after mid-February, when the Weſt wind Fauonius is aloft. Moreouer, onions are diuided into ſundry ſorts, according to the degrees of their pleaſant or vnpleaſant and harſh taſt; to wit, the African, French, Tuſculan, and Amiternium. But euermore the beſt are the roundeſt. *Item*, the red onion is more keen and angry than the white: the dry, and that which hath lien, is more eagre and ſharp than the green newly drawn: the raw alſo more than the ſodden: and finally, the dry by it ſelfe more than that which is condite and preſerued in ſome liquor for ſauce. The Amiternium onion is planted in cold & moiſt grounds: and this alone would be ſet of a head in maner of garlick cloues, whereas the reſt will come of ſeed. Onions, the next ſummer following after they be ſowne, put forth no ſeed, but head only, which groweth, and the leafe or ſtem drieth and dieth. But the next yere after, by way of interchange, it bringeth forth ſeed, and then the head rotteth. And therefore euery yeare they vſe to ſow onion ſeed apart in one bed by it ſelfe, for to haue onions: & ſet onions for ſeed in other, by themſelues. The beſt way to keep onions, is in corn, chaf, and ſuch like pugs. As for the Chibbol, it hath in maner no diſtinct head at all, but only a long neck, & therfore it runs in maner all to a green blade; the order is to cut and ſheare it often in manner of porret or leeks; which is the cauſe that they ſow it alſo of ſeed, and do not ſet it. Ouer and beſides, before we ſow onion ſeed, the plot, by mens ſaying, ought to haue three diggings, for to kil and rid out of the ground the roots of hurtful weeds: and ten pound of ſeed ordinarily wil ſow an acre. Here and there amongſt would be Saverie ſowne, for the better will the Onions like and proſper with the companie of that hearbe. Alſo, after the ground is ſowne, it requireth weeding, farcling, or raking, foure times at the leaſt, if not oftner. Our neighbours in Italie ſow the Aſcalonian Onion in the moneth of Februarie: whoſe manner is alſo to gather Onion

ſeed

* Gethyum.

20030
copy 1

A ſeed when it beginneth once to wax black, before it fall to wither.

Seeing now that I am entred thus far into a diſcourſe of Onions, I ſhal not do amiſſe to treat of Leeks alſo, in regard of the neare affinitie betweene them: and the rather, for that it is not long ſince, that the Porret kind which is often kept downe with clipping and cutting, came into great name and credit, by occaſion of the Emperor *Nero*; who vſed for certaine daies in euery moneth for to ſcoure his throat, and cleare his voice, and to take it with oile; on which daies he did eat nothing els, not ſo much as bread. Wee vſe to ſow them of ſeed, after the Æquinox in September: and if we meane to make cut Leeks thereof, the ſeed would be ſowed the thicker. Theſe Leeks are kept downe with clipping and ſhearing ſtill vntill the root faile, without remouing them out of the ſame bed where they were ſown: and alwaies they muſt be plied with
B dung. But before they be cut, nouriſhed they ought to be, vntill they haue gotten a good head. When they are wel grown, they are to be tranſlated into another bed or quarter, & there replanted: hauing their vppermoſt leaues lightly ſhriged off, without comming to the heart or marow which is their body next to their roots: and their heads ſet deeper downward; yea, and their vtmoſt pellicles and skins ſliued from them. In old time they vſed to put vnder their root a broad flint-ſtone, or els a tile, which did dilate their heads within the ground, and make them ſpread the better. This they practiſed alſo in other bulbous plants, as Onions, &c. thereby to haue the fairer heads. But now in theſe daies the maner is, lightly to barbe & pluck off with a ſarcling hook, the beards or ſtrings of the root; that being thus nipped and lipped (as it were) they might nouriſh the body of the plant, & not diſtract and ſuck away the humor, which is the nutriment
C of the whole. This is notable and wonderfull in the Porret, that ioying & liking as it doth in muck and fat ground, yet it cannot abide watery places. Howbeit, in theſe we muſt be ruled by the property of the ground, which is al in all: the principal leeks be in Egypt: the next are thoſe of Ortia & Aricia. Of the cut Porret or vnſet Leeks be two kinds: the one runneth mightily into a green blade, and the leafe thereof hath very conſpicuous & euident cuts; & this is that the Apothecaries vſe ſo much: the other hath a more pleaſant and yellowiſh leafe, and the ſame rounder, the gaſhes or cuts wherof are ſmaller, & not ſo apparent to the eie. The voice goeth, & generally it is reported, That *Mela* a knight or gentleman of Rome by his place, & Procuratour vnder *Tiberius* the Emperor, being for ſome miſgouernment in that office, brought into queſtion and accuſed, & thereupon ſent for peremptorily to make his perſonal apparance, diſpairing
D vtterly of life, tooke the weight of three Roman ſiluer deniers in the iuice of Leeks, and dranke it off: whereupon he died incontinently without any paine or torment at all. It is commonly ſaid, That if a man take a greater doſe or receit thereof, it will do no harm, nor any danger will inſue thereupon.

As touching Garlick, it is held for certain, That it is a ſoueraigne medicine for many griefs and maladies; eſpecially ſuch as are incident to the country peaſants and ruſticall people, who hold it to be as good as a Treacle. The Garlike head is couered and clad all ouer with certaine very fine and thin pellicles or membranes, which may be parted and diuided one from another; vnder which you ſhall ſee it compact and ioined (as it were) together of many cloues in maner of kernels, and thoſe alſo incloſed each one apart within their ſeuerall skins. Of a ſharp and bi-
E ting taſt it is. The more keen and eager alſo you ſhall find it, as it hath more of thoſe cloues aforeſaid in one head. The aire that comes from it, is as offenſiue as that of the onion, & maketh their breath as ſtrong who eat it: howbeit, ſodden if it be, it is euery way harmles: the difference and diuerſity of Garlick ariſeth firſt, from the circumſtance of the time, whereby you ſhall ſee a kind of haſty Garlick, that in 60 daies will be ripe and come to perfection: then, in quantity; for ſome grow bigger in the head than other. And of this ſort is that which wee call in Latine Vlpicum: and the Greeks, ſome the Cyprian Garlick; others, * Aphroſcorodon: ſo much commended in Africke, that it is held for the moſt principall diſh of meat that a Husbandman of the countrey can eat: and bigger it is than our common Garlick. Being bruſed and braied in a morter together with oile and vineger, it is wonderfull to ſee what a ſome and froth will ariſe
F therof, and to what an height it wil ſwell thereby. Some gardeners there are, who forbid to ſet either this Vlpicum, or the common Garlick in any euen, flat, and leuell bed; but to put them in little hillocks [in maner of hop hils] raiſed in forme of caſtles or turrets, three foot diſtant one fro another. Now, whereſoeuer theſe cloues be ſet in hill or plain, they ought to lie foure fingersbreadth aſunder. And this would not be forgotten, That ſo ſoon as they ſhew three leaues

* or, *Antiſcorodon.*

once,

once, they would be ſarcled, and the mould raiſed from about them: for the oftner they be thus ſerued and laid bare, the fairer heads they will bring. When they begin to grow big and come to their full maturity, the ſtalks that they run vp vnto, muſt be troden downe and moulded ouer: and this is to preuent, that they ſhould not be ouer-rank in blade. In cold countries it is thought better and more profitable to ſet them during the ſpring, than at the fall of the leafe. Moreouer, if you would haue Garlicke, Onions, and ſuch like, not to ſmel ſtrong and ſtink ſo as they do, the common opinion & rule is, that they ſhould not be ſet or ſown, but when the moon is vnder the earth, nor yet be gathered and taken vp but in her coniunction with the Sun, which is the change. But *Menander*, a Greeke writer ſaith, That there needs none of all theſe ceremonies for the matter: for if a man would not haue his breath ſtink with eating of Garlick, let him, do no more (quoth he) but take a Beet root roſted in the embers, and eat it after, it ſhall extinguiſh that hot and ſtrong ſauor, and cauſe the breath to continue ſweet. There be who thinke that the fitteſt time of ſetting both the common Garlick, & alſo the greater kind named Vlpicum, is between the two ſet and ordinary feaſts * Compitalia & * Saturnalia. As for the vulgar Garlick, it commeth vp alſo of ſeed, but ſlowly, and late it will be firſt ere it attaine to the full proofe: for the firſt yere it getteth a head no thicker than Leeks; the next yeare after, it begins to diuide into cloues; and in the third it is conſummate and grown to perfection: and ſuch vnſet Garlick, ſome are of opinion to be fairer and better than the reſt. Howbeit, Garlicke indeed ſhould not be ſuffered to bol and run vp to ſeed, and therfore the blade therof ought to be wreathed, that it may gather more and ſtronger in the head, and that the cloues afterwards might be ſet in ſtead of ſeed for increaſe. Now if a man haue a deſire that both Garlick and Onions may be kept long for his prouiſion, their heads muſt be dipped and wel plunged in ſalt water, warm; by this means indeed laſt they will longer without ſpurting, and be better for any vſe wee ſhall put them to, ſaue only to be ſet and replanted in the ground; for barren will they be, and neuer proſper. And yet diuers there are, who thinke it ſufficient at the firſt to hang them in the ſmoke ouer quick and burning coles; as being perſuaded, that this will ſerue wel enough to keep them from growing; for certaine it is, that both Garlicke and Onions will put foorth blade aboue ground, and when they haue ſo done, come to nought themſelues, as hauing ſpent all their ſubſtance and vertue. Some are of this mind, that the beſt preſeruing of Garlick as well as of Onions, is within chaffe.

* 11. *Calend. Ianuar.*
* 14. *Calend. Ianuar.* Betweene the 18. & 21 of December.

There is a kind of Garlicke growing wild in the fields of the own accord, which they call in Latine Alum [*i.* Crow Garlicke] which being boiled that it ſhould not grow, they commonly throw forth in corn fields for the ſhrewd and vnhappy foules which lie vpon the lands, and eat vp the ſeed new ſown: for preſently as any of thoſe birds taſt thereof, they wil be ſo drunke and aſtonied therewith, that a man may eaſily take them with his hand: yea, and if one ſtay a little, he ſhall ſee them fall aſleep therewith. Finally, there is another kind of ſauage or wild Garlick called Vrſinum (*i.* Beare Garlicke) the head whereof is very ſmall, the blade or leaues great and large, and the ſauor or ſent mild and gentle, in compariſon of the reſt.

Or rather *Anguinum.*

Chap. VII.

¶ *In how many daies euery herbe that is ſowed will come vp and appeare aboue ground. The nature of ſeedes. The manner of ſowing any of them. Which they be, whereof there is but one ſingle kind: and which haue many ſorts.*

AMong all the herbes ſowne in a garden, theſe come vp ſooneſt; to wit, Baſill, Beets, Navews or Turneps, and Rocket: for by the third day the ſeed will breake and ſpurt. Dill ſeed will chit within foure daies, Lectuce in fiue, Radiſh in ſixe, Cucumbers and gourds in a ſeuennight, but the Cucumber firſt. Creſſes and Muſtard ſeed in fiue daies, Beets in ſix by Summer time, and by winter in ten. Orach in eight daies, Onions in 19 or 20 at the fartheſt, Chibols in ten or twelue at the moſt. Coriander ſeed is more ſtubborne, and will not ſhew ſo ſoone. Sauerie and Origan ſeed lieth thirty daies ere it come: but of all others Parſley ſeed is lateſt ere it ſpring; for when it commeth vp ſooneſt, it is forty daies firſt: but for the moſt part it lieth fifty daies before it appeare. Something there is alſo in the age of the ſeed: for the newer that the ſeed is either of Leeks, or Chibols, Cucumbers & gourds, the more haſt it maketh to be aboue ground: contrariwiſe, Parſely, Beets, garden Creſſes, Sauery, Origan, and Coriander, grow ſooner

20030
copy 1

A ner of old ſeed. But the Beet ſeed hath a ſtrange and wonderful quality aboue the reſt: for it wil not come vp all in one and the ſame yeare. But ſome in the firſt, others in the ſecond, and the reſt in the third. And therfore ſow as much ſeed as you will, yet ſhall you haue it grow but indifferently. There be herbs which wil grow and beare but one yere and no more: and there be other aga in which will continue many yeares together, as for example, Parſely, Porret, & Chibbols. For, ſow theſe but once in a garden, they will beare from yere to yere from the ſame roor, or els ſow themſelues. The moſt part of herbs do beare round ſeed, in ſome the ſeeds are long; in few, broad and flat in manner of a leafe, as in Orach. You ſhall haue ſeed alſo narrow & chamfered, like a gutter tile, as that of Cumin. Moreouer, there is a difference in colour, for ſome ſeeds be white, others black: in hardneſſe alſo and ſoftneſſe; for ſome be harder or ſofter than others.

B Some ſeeds at euery branch of the plant, are contained within cods or bladders, as we may ſee in Raddiſh, Senuie, and Turneps or Rapes. The ſeeds of Parſely, Coriander, Dill, Fenell, & Cumen, grow naked & bare. But that of the Bleet, the Beet, Orach and Baſil, is incloſed in a huske or hull. Lectuce ſeed lieth within a downe. As touching Baſill aforeſaid, nothing fructifieth more than it: & to the end that it may come vp in more plenty & abundance, they ſay it ſhould be ſowed with maledictions and ill words; for the more that it is curſed, the better it wil ſpeed and proſper: yea, and when it is ſowed, the mould of the bed muſt be parted and rammed down in manner of a pauement. And more particularly, they that ſow Cumin, pray to God that it may neuer come vp. Such ſeeds as lie within an husk, hardly come to be dry and ripe therin: but Baſil ſeed eſpecially, and Gith or Nigella Romana. But they muſt be all throughly dried be-

C fore they be ſeedow and fruitfull. This is generall in all herbs throughout, that they wil thriue and grow the better, if their ſeede bee ſowed by heapes one vpon another, than ſcattering. And certainly both Leeks ſeed is ſown & Garlick cloues ſet in that wiſe, namely, bound vp & tied together in ſome clouts or ragges wherein they be lapped. As for Parſely ſeed, againſt it ſhould be ſown, there would be an hole made with a little wooden dibil or pin, & therin it muſt be put with ſome dung after it. Furthermore, all garden herbs come vp either of ſeed and cloues ſet; or els of ſlips pulled from the mother-plant. Some grow of ſeeds and ſprigs both, as Rue, Origan, & Baſil; for euen this herb alſo laſt named will abide cutting when it is come to be one handbreadth, or a ſpan high; and thoſe cuttings will grow if they be planted. There be that are maintained by root and ſeed both, as Onions, garlick, and thoſe which haue bulbous roots: like-

D wiſe, all ſuch as when they haue born yerely, leaue a root behind them ſtil in ſtrength & vertue. Of ſuch as grow of roots replanted, their roots continue long & branch much, as we may ſee in the bulbs, in Chibbols, & ſea onions. Others put out branches ſufficient, but not from the head or root, as Parſely and Beets. All herbs for the moſt part, do ſpring & ſhute again, if their ſtalke be cut off; vnleſſe it be thoſe that haue a ſmooth ſtem. And this is moſt ſeen in Baſil, Raddiſh, & Lectuce, the ſtems wherof are cut for many purpoſes. And as for Lectuce, men hold, that the later ſpring thereof, when the firſt is gon, is the ſweeter. Certainly, Raddiſhes eat the more pleaſantly, if their leaues be ctopt off before the maſter ſtem or ſpire be growne big. And this alſo we obſerue in Rapes or Turneps; for if you ſtrip them alſo from their leaues & couer them ouer head with earth, yet will they grow all winter and continue till Summer following. Touching

E Baſill, Sorrel, red Porret or Bleets, garden Creſſes, Rocket, Orach, Coriander, they are all of one ſort, & ſingular in their kind: for ſow them where you wil, they be the ſame ſtil, neither are they better in one place than in another. It is a common receiued opinion, that Rue wil grow the better if it be filched out of another mans garden: and it is as ordinary a ſaying, that ſtollen Bees wil thriue worſt. Some hearbes there be which come without ſowing or ſetting, as wild Mint, Nep, Endiue, and Peniroial. But how ſoeuer there be but one ſingle kind of thoſe before rehearſed, yet on the contrary ſide, there be many ſorts of others, which wee haue already ſpoken of, and will write more hereafter, and principally of Ach or Parſely.

Chap. VIII.

F ¶ *Of Garden herbes which ſerue for to ſeaſon our meats: their diuers natures, their ſundry kinds and ſeuerall hiſtories related, to the number of 36.*

FOr, that kind of Ach which groweth of it ſelfe in moiſt grounds with * one leafe, and is not rough, but ſmooth and plaine, is called in Greeke Heleoſelinon, *i.* Smallach. Again, there is ano-

* μονόφυλλον? for ſo it ſhould ſeem that *Plinie* read it in *Theophraſtus*: wheras indeed it is μανόφυλλον, *i.* with leaues growing thin

another ſort, with more leaues, reſembling Smallach aforeſaid, but that it commeth vp in drie G
places, and this the Greeks named Hippoſelinon, *i.* Aliſanders. A third there is beſides found in mountains, named by them thereupon Oreoſelinum, *i.* Mountain Ach, or Parſely of the hils: it beareth leaues like Hemlocke, and a little ſlender root: the ſeed reſembleth Dill ſeed verie much, but only that it is ſmaller. And as for the garden Ach, commonly called Parſely, there be many kinds thereof, differing one from another: firſt in leafe, whereby you ſhall haue ſome leafed thick and ful, and the ſame jagged and curled: others thinner, and thoſe alſo more plain, ſmooth, and broad. *Item*, in ſtalk, which in ſome is more groſſe or thin than in other: in one kind white, in another purple, and in a third of ſundry colours.

Of Lectuce, the Greeks haue ſet downe three kinds: whereof the firſt riſeth vp with ſo large and broad a ſtalke, that by their report, little garden wickets were commonly made thereof, in H
partitions between quarter and quarter. And yet the leafe of this Lectuce is not much bigger than others that be common and ſerue for pot-herbes: the ſame alſo paſſing narrow, by reaſon that all the nutriment is otherwiſe ſpent in the maine ſtem. The ſecond hath a round ſtalk: the third is the broad flat Lectuce which ſettles neer the ground, called Laconicon, or the Lectuce of Lacedæmon. But other writers haue deſcribed the diſtinct kinds therof, by their colour and the ſundry ſeaſons wherein they be ſet: for (ſay they) there be black Lectuces, the ſeed whereof ought to be ſowed in Ianuary: there be white alſo, and ſuch would be ſowed in March: & there are a third ſort which be red, and the fit time of their ſeedneſſe is the moneth of April: and according to thoſe authors, all the ſort of them are to be remoued in yong plants, when they haue growne two moneths. Howbeit, thoſe Herbariſts who haue looked farther into the knowledge I
of Simples, adde more kinds yet vnto the other; to wit, the purple, the criſp, or curled, the Cappadocian, & the Greekiſh Lectuce. As for theſe of Greece, they are taller in ſtem than the reſt, and broader withall; beſides, their leaues be long and narrow, like to thoſe of Endiue or Cichorie. The worſt kind of all is that which the Greeks by way of reproofe and reproch for their bitterneſſe, terme Picris. Yet is there another diſtinct kind of the black Lectuce, which for the plenty that it yeeldeth of a milky white iuice procuring drowſineſſe, is termed Meconis; although all of them are thought to cauſe ſleep. In old time, our anceſtors knew no other Lectuce in Italy but this alone, and thereupon it tooke the name in Latine of Lactuca. The purple Lectuce which hath the biggeſt root, they name Cæciliana: but the round kinde with ſmalleſt
* See *Celius Rhodiginus* 27 booke and laſt chap. *antiq. Lectionum*: & let him tell you, why women call this Lectuce, *Aſtylis* root and broad leaues, is called * Aſtylis [*i.* the chaſte Lectuce, or the ciuil Lectuce:] howbeit, K
ſome giue it the name of Eunuchij, becauſe of all others it cooleth luſt moſt, and is an enemy to the ſports of *Venus*. And to ſay a truth, all Lectuces are by nature refrigeratiue, and do coole the body; and therfore be they eaten ordinarily in Summer; for they pleaſe the ſtomacke when it is inclined to loath meat, and procureth good appetite. Certes, reported it is of *Auguſtus Cæſar* late Emperour of famous memorie, that he eſcaped a dangerous diſeaſe, and was recouered by the meanes of Lectuce, whereunto he was directed by the diſcreet counſell of *Muſa* his Phyſician. And whereas in times paſt, folke preciſely forbare to eat Lectuce, now there is no doubt or ſcruple at all made thereof; nay they are ſo far from abſtinence that way, that it is a meat generally receiued and commended; inſomuch as they haue deuiſed to keepe it in the ſyrrup of Oxymel, all winter long, for to haue it ready and euer at hand: yea and more than ſo, men are L
verily perſuaded, that Lectuce will increaſe good bloud. Ouer and beſides all the ſorts of Lettuce before ſpecified, there is yet another kind named in Latine Caprina, as one would ſay, the Goats Lectuce, whereof I purpoſe to ſpeake more at large among other medicinable herbs. As touching the wild Lectuce called Cilician, ſee how it is crept apace into the garden after it came once to be knowne, and is commended as exceeding good among other herbs there ſown and planted: the leafe reſembleth the Cappadocian Lectuce, but that it is jagged & broader than it. As for Endiues and Cichories, I cannot tell what to make of them; for neither can they be truly ſaid a kind of Lectuce, nor yet ranged well amongſt other herbs. More vnpatient they are and fearfull of winter, than Lectuces, and withall carry vnpleaſant ſtrong taſt: howbeit their ſtalks are no leſſe acceptable than they. Their yong plants vſe to be ſet in the beginning of the M
ſpring, but tranſlated afterwards and replanted in the later end thereof. There is a certain wild and wandring Endiue, which the Ægyptians call Cichorie, whereof I meane to diſcourſe more amply in another place. There hath bin a deuiſe lately come vp to condite and preſerue as well the ſtems as the leaues of all Lectuces for the winter time, in pitchers & pots, within ſome ap-

propriat

20030
copy 1

A propriate liquor; as alſo to dreſſe and ſeeth them yong, freſh, and greene, in a kinde of broth or broweſſe, and ſo ſerue them vp between two platters. And yet where the ground is rich & good, well watered and holpen with doung, Lectuce may be ſowed at all times of the yere: for within two months they will grow to be good big plants, and in as little ſpace come to their ful maturity and perfection. Howbeit, the true time and ordinary ſeaſon, is to ſow their ſeeds about the mids of December, when the daies begin to lengthen, and then to remooue their plants at the comming of the Weſtern wind Fauonius in February; or els to ſow in that wind, and to replant in March about the Spring Æquinox. White Lectuce of all other, can beſt away with the winter. All Garden-herbs loue moiſture, and muck they loue as well, Lectuce eſpecially; & yet I muſt needs ſay, that Endiue more than it. Some gardiners there be, that thinke it a great point
B of cunning to beſmere the roots of Lectuce plants and other ſuch herbs with dung, when they are ſet, or after they be bared at the root within the ground, to caſt in the mould againe and fill vp the place ſo ſoon as they be greaſed (as it were) with muck at the root. Others there be, who practiſe another feat with them, to make them cabbage the better and grow faire & big, by cutting them vp cloſe to the ground when they are come once to be halfe a foot high, and then bedaubing them with green ſwines dung. It is thought, that white Lectuce come onely of white ſeed; and yet that is not ſufficient, vnleſſe there be ſome ſea ſand taken freſh from the ſhore and laid about the heart of the plant where the leaues put forth firſt, and ſo reared and heaped vp to the mids; and then to take order that the leaues growing ouer them afterwards, be tied faſt vnto them.

C Of all Garden-hearbs, Beets are the lighteſt. The Greeke writers make two kinds thereof, in regard of the colour; to wit, the black Beets, and the whiter, which they prefer before the other, although it be very ſcant and ſparie of ſeed; theſe alſo they cal the Sicilian Beets, and for their beautifull white hew and nothing elſe they eſteeme them aboue Lectuce. But our countreymen here in Italy put no other difference between Beets, but in reſpect of the two ſeaſons when they be ſowed, namely in the Spring and Autumne; whereof we haue theſe two ſorts, the ſpring Beets, and the Autumnall; and yet they be vſually ſowne in Iune alſo. This herbe likewiſe is ordinarily remooued in the plant, and ſo replanted or ſet againe; it loueth beſides to haue the roots medicined with muck, as well as the other aboueſaid, yea and it is very wel content with a moiſt and wateriſh ground. The roots as well as the leaues or herbage thereof, vſe to be eaten
D with Lentils & Beans; but the beſt way to eat them, is with Senuie or Muſtard, for to giue a taſt and edge as it were to that dull and wallowiſh flatneſſe that it hath. Phyſitians haue ſet downe their iudgement of this herb, That the roots be more hurtfull than the leaſe: and therefore being ſet vpon the bourd before all perſons indifferently, as well the ſound as the ſick and craſie, yet many a one maketh it nice and ſcrupulous once to taſt therof; and if they do, it is but ſlightly for faſhion only, leauing the hearty feeding thereupon to thoſe rather that be in health and of ſtrong conſtitutions. The Beet is of two diuers natures and qualities: for * the herbage or leaſe hath one, and the bulbs comming from the head of the ſtem, another: but their principall grace and beautie lieth in their ſpreading and breadth that they beare as they cabbage. And this they come vnto (as the manner is of Lectuces alſo) by laying ſome light weight vpon the
E leaues, when they begin once to gather into a ſtalke and ſhew their colour. And there is not an hearbe throughout the Garden, that taketh vp greater compaſſe, with fuellage than doth the Beet: for otherwhiles you ſhal ſee it to ſpread it ſelfe two foot euery way; whereunto the goodneſſe and nature of the ſoile is a great help. The largeſt that be knowne of theſe Beets are thoſe which grow in the territory about Circij. Some hold opinion, that the only time to ſow Beets, is when the Pomegranat doth bloſſome: and to tranſplant them ſo ſoon as they haue 5 leaues. A wonderfull thing to ſee the diuerſitie in Nature of theſe Beets, if it be true; namely, that the white ſhould gently looſen the belly and make one ſoluble, whereas contrariwiſe the black doe ſtay a flux and knit the body. It is as ſtrange alſo to obſerue another effect thereof; for when the Colewort hath marred the taſte of wine within the tun or ſuch like veſſell, the only ſauour and
F ſmell of Beet leaues ſteeped therein, will reſtore and fetch it againe.

As touching the Beets, as alſo Colewoorts, which now beare all the ſway and none but they in Gardens, I do not find that the Greeks made any great account of them; & yet *Cato* highly extolleth Coules, and reporteth great wonders of their vertues and properties, which I meane to relate in my treatiſe of Phyſick. For this preſent you ſhall vnderſtand, that he putteth downe

* *Olus*, which word *Plin.* vſeth much for Beets.

three kinds of them: the firſt, that ſtretcheth out broad leaues at ful, and carieth a big ſtem: the G
ſecond, with a criſped and frizled leafe, the which he calleth* Apiana: the third is ſmooth, plain,
and tender in leafe, and hath but a little ſtalke; and theſe are of no reckoning at all with *Cato*.
Moreouer, like as Coleworts may be cut at all times of the yeare for our vſe, ſo may they be
ſown & ſet al the yere long: & yet the moſt appropriat ſeaſon is after the Æquinox in Autumn.
Tranſplanted they be when they haue once gotten fiue leaues. The tender crops called Cymæ
after the firſt cutting, they yeeld the Spring next following: now are theſe Cymæ nothing elſe
but the yong delicat tops or daintier tendrils of the maine ſtem. And as pleaſant and ſweet as
theſe crops were thought to other men, yet *Apicius* (that notable glutton) tooke a loathing of
them; and by his example *Druſus Cæſar* alſo careth not for them, but thought them a baſe and
homely meat; for which nice and dainty tooth of his, he was well checked and ſhent by his fa- H
ther *Tiberius* the Emperor: after this firſt crop or head is gone, there grow out of the ſame cole-
wort other fine colliflories (if I may ſo ſay) or tendrils, in Summer, in the fall of the leafe; and
after them, in winter: and then a ſecond ſpring of the foreſaid Cymæ or tops againſt the ſpring
following, as the yeare before; ſo as there is no herb, in that regard, ſo fruitfull, vntill in the end
her owne fertility is her death; for in this manner of bearing ſhe ſpends her heart, her ſelfe and
all. There is a third top-ſpring alſo at mid-ſummer about the Sunſtead, (which if the place bee
any thing moiſt) affoordeth yong plants to be ſet in ſummer time; but in caſe it be ouer-drie,
againſt Autumne. If there be want of moiſture and skant of muck, the better taſte Colewoorts
haue: if there be plenty and to ſpare of both, the more fruitfull and ranke they are. The onely
muck & that which agreeth beſt with Coleworts or Cabbages, is Aſſes dung. I am content to I
ſtand the longer vpon this Garden-wort, becauſe it is in ſo great requeſt in the kitchin, and a-
mong our riotous gluttons. Would you haue ſpeciall and principal Coleworts, both for ſweet
taſt and alſo for great and faire cabbage? firſt and foremoſt, let the ſeed be ſowne in a ground
throughly digged more than once or twice, and wel manured; ſecondly, ſee you cut off the ten-
der ſprings and yong ſtalkes that ſeem to put out far from the ground; or ſuch as you perceiue
mounting too ranke and ouer-high from the earth: thirdly, be ſure to raiſe other mould in ma-
ner of a bank vp to them, ſo as there peep no more without the ground, than the very top: theſe
kind of Coleworts be fitly called Tritiana, for the threefold hand and trauell about them; but
ſurely the gaine will pay double for all the coſt and toile both. Many more kindes there be of
them, to wit, that of Cumes, which beareth leaues ſpreading flat along the ground, and opening K
in the head. Thoſe of Aricia, be for heigth no taller than they, but rather more in number than
for ſubſtance thinner and ſmaller: this kind is taken for the beſt and moſt gainfull, becauſe vn-
der euery main leafe in maner, it puts forth other yong tendrils or buds by themſelues, which
are good to be eaten. The Colewort Pompeianum (ſo called of the towne Pompeij) is taller
than the reſt, riſing vp with a ſmal ſtem from the root; howbeit among the leaues it groweth to
more thickneſſe. Theſe leaues branch out but here and there, and are in compariſon of others
narrower; howbeit much ſet by for their ſpeciall tenderneſſe, wherby they are ſoon ſodden and
dreſſed; and yet cold weather they cannot indure; whereas on the other ſide, the Coleworts of
Bruzze or Calabria, like the beſt in winter, and be nouriſhed with the hard ſeaſon: leaues they
haue exceeding great and large, but their ſtalks are but ſmall; and as for taſt, they be ſharp and L
ſower. The Sabellian Coles, what curled and ruffed leaues they carry, it is a wonder to ſee: ſo
thick they are beſides, that they rob the very ſtem of their nutriment, which therby is the ſma-
ler: howbeit of al others they be reputed the ſweeteſt. Long it is not ſince there came from out
of the vale of Aricia (where ſomtimes there was a lake, and a tower ſtanding vpon it, remaining
yet at this day to be ſeene) a kind of Cabbage-cole, with a mightie great head and an infinite
number of leaues, which gather and cloſe round together, and theſe Coles we in Latin call La-
cuturres, of the place from whence they come. Some Coleworts there be, which ſtretch out in-
to a roundle; others againe extend in breadth, and be very full of fleſhy brawns. None, cabbage,
more than theſe, fettting aſide the Tritian Coleworts beforenamed; that are known otherwiles M
to bear a head a foot thick, and yet none put forth their Cymes or tender buds more than they.
Moreouer, this would be noted, That howſoeuer all kinds of Coleworts eat much ſweeter for
being bitten with the froſt, yet if there be not good heed taken in cutting off their head or ten-
der crops and buds, ſo that the wound come not neere the heart and pith, (and namely, by cut-
ting them aſlope and byas in manner of a Goats foot) they will take much harme thereby.

Such

* For ſome reſemblance of Parſley.

copy 1

A Such as be reſerued to beare ſeed, ought not to be cut at all. They alſo are not without their grace and commendation, which neuer paſſe the bigneſſe of a green and ordinary plant, & ſuch ſmall coles are called Halmyridia, for that they grow not elſewhere but vpon the ſea coaſts: and becauſe they wil keep greene, prouiſion is made of ſuch for to ſerue in long voiages at ſea: for ſo ſoon as they be cut vp, before they touch the ground, they be put vp into barrels where lately oile hath been, and thoſe newly dried againſt the time, and ſtopped vp cloſe that no aire at all may enter in, and therein be they preſerued. Some there be, who in remouing the young plants, lay vnder their roots, Riek and Sea-weeds, or els bruiſed and powdred nitre, as much as a man may take vp with three fingers, imagining thereby that they will the ſooner come to maturity. Others againe take the ſeed of Trifolie and Nitre ſtamped together, which they ſtrew
B vpon the leaues for the ſame purpoſe. [And as for Nitre, it is of this nature, to make them look green ſtill although they were ſodden;] or els they vſe to boile them after *Apicius* his faſhion, namely, to ſteep them wel in oile and ſalt mingled together, before they be ſet vpon the fire for to be ſodden.

Moreouer, there is a way to graffe herbs alſo as well as trees, namely, by cutting off the yong ſions that ſpring out of the ſtalk, and therein to inoculate as it were the ſeed of another plant, within the pith or marow thereof. This alſo may be practiſed vpon wild Cucumbers. Ouer and beſides, there is a kind of wild Woorts growing in the fields, called Lapſana, much named and renowned by occaſion of the ſonets & carols chanted in the ſolemnitie of *Iulius Cæſar* the Emperors triumph, and eſpecially of the merry rimes and licentious broad jeaſts toſſed by his ſol-
C diers, who at euery ſecond verſe caſt in his teeth, that in Dyrrhachium they liued of nothing els but of thoſe Woorts: noting indeed by way of cauill and reproch, his niggardiſe in rewarding them ſo ſleightly for their good ſeruice: now was this Lapſana a kind of wild Colewort, which they did eat of inſtead of the fine and dainty tendrils and buds of the garden Coles.

As touching Sperages, there is not an herb in the garden, whereof there is ſo great regard and care taken, as of them. Concerning their firſt original & beginning, I haue ſpoken at large in the treatiſe, Of the maner how to order the *wild of that kind, and to entertain them in our gardens: as alſo how *Cato* willed vs to ſow and plant them in plots of Reeds and Canes. Now there is a middle ſort of theſe Sperages, not ſo ciuill and gentle as the Aſparagi of the garden, and yet more kind and mild than the Corrudæ of the field: theſe grow euery where abroad e-
D uen vpon the mountains; and the champion countrey of high Almain is ouerſpred and full of them: wherof there goes a pleaſant ſpeech and merry conceit of *Tyberius Cæſar* the Emperour, namely, that there grew an herb in Almain very like to the garden Sperage: for as touching that which commeth vp of it ſelfe in Neſis, an Iſland of Campaine, it is thought the beſt ſimply of all others, without compariſon. The garden Sperages be planted from the knots bunching together within the ground, named Spongiæ, which eaſily may be replanted; for ſurely an herb it is that carrieth a mighty head or cluſter as it were of roots, and the ſame putteth forth ſpurns euery way from it of a great depth into the ground. They ſend out at firſt certaine greene ſpurts or buds peeping forth of the ground, which growing to a ſtem in proceſſe of time riſe ſharpe in the top, and then are they chamfered & diuided into certaine muſculous branches that ſpread
F abroad. This herbe may be ſowne alſo of ſeed. *Cato* tooke not more paines about any other herbe, nor imploied greater diligence in the deſcription thereof, than he did in it. It is the very laſt thing that he treateth of in his booke, whereby it may appeare, that the man came all vpon a ſudden and newly to the knowledge of that herbe, and the ordering of it. He giueth order, *Imprimis*, That the plot wherein they are to ſowne, be moiſt, fat, and well digged. *Item*, That they be ſet half a foot euery way aſunder one from another, & in no wiſe the place troden down with ones foot; moreouer, that two or three ſeeds be put together in a hole, made before with a dibble directly by a line: for in thoſe daies they ſet them onely of ſeed. *Item*, That this would be done about mid-March, which is the proper ſeaſon therefore. *Item*, That they haue their fill of dung; That they be kept cleane with often weeding: but in any caſe, That great heed be ta-
F ken in plucking vp the weeds, that the tender buds or croppes new knit and appearing aboue ground, be not knapt off. For the firſt yeare, hee would haue them in winter time to be couered with ſtraw and litter, and ſo defended againſt the froſt and cold weather: alſo during the ſpring inſuing, to be opened at the root, farcled and well weeded. In the third yeare, by his rule, they ought to be burned in the ſpring time; and the ſooner that the ground is thus burned, the better

*Corrudæ.

wil they come vp again and in greater plenty: which is the cauſe, that they like and proſper beſt G
in plots ſet with Canes and Reeds: for ſuch deſire to be burnt betimes in the yere. Moreouer, he
giueth another precept, that they muſt not be ſarcled, nor haue the earth opened & laid hollow
about them, before their buds or tops be aboue ground to be ſeen, for feare leaſt in the ſarcling,
the roots take harm thereby, either by raſing or ſhaking them vntill they be looſe. From which
time forward, if a man would gather any of the ſaid buds or yong ſprings, for ſalad or other vſe,
they ought to be plucked and ſlipped from the root; for otherwiſe, if they be broken and knapt
off in the mids, the root wil preſently put forth many vnprofitable ſprouts, which wil ſuck away
all the heart and kill it in the end. Sliue and pluck it you may in manner aforeſaid, vntil it ſpin-
dle and run to ſeed, which commonly beginneth to be ripe in the Spring, & then it muſt be ſet
on fire, as is beforeſaid: and then once again, ſo ſoon as new buds and tendrons appeare aboue H
ground from the root, they muſt be ſarcled, bared, and dunged afreſh. Now after it hath grown
in this manner nine yeres, ſo as by this time it is waxen old, the roots muſt be taken vp, and then
replanted again in a piece of ground well digged and as throughly dunged. Then (I ſay) ought
the ſmal roots called Spongiæ in Latine, to be ſet again, a foot diſtant one from another. Fur-
thermore, *Cato* ordaineth expreſſely by name, That ſheeps dung ſhould be vſed for that purpoſe,
becauſe any other would breed ſtore of weeds. And verily there was neuer knowne any other
thing practiſed or aſſaied afterwards, to more gain and benefit about this Garden-herb, vnleſſe
it were this, That about the Ides or mids of February, ſome haue let the ſeeds of Sperage lie
well ſoked in dung, and then ſowed the ſame by heaps in little trenches or holes made for the
purpoſe: after which, when the roots are wouen and knit one within another into a knot, the
ſpurns ſhooting from them they plant after the Æquinox in Autumne following, a foot aſun- I
der: by which means they wil continue bearing plenteouſly for ten yeres together. For to breed
and maintaine theſe garden Sperages, there is no better ſoile than the gardens of Rauenna, from
whence we haue the faireſt of all other. As for the herb named in Latine Corruda, I haue writ-
ten heretofore of it: and I vnderſtand thereby, the wild Sperage, which the Greekes call Ormi-
num and Myacanthon: howbeit there be, who giue it other names. Finally, I reade of certaine
Sperages which will engender and grow of Rams hornes beaten or ſtamped, and then put into
the ground.

A man would thinke that I had diſcourſed already of all ſuch Garden herbes as were of any
price and regard: but that there remaineth one thing yet behind, whereof the greateſt gaine of
all other is raiſed, and yet me thinks I cannot write thereof, but be abaſhed to range it amongſt K
the good herbs of the garden; and that forſooth is our Thiſtle: howbeit this is certaine (to the
ſhame be it ſpoken of our wanton and waſting gluttons) that the Thiſtles about Carthage the
great, & Corduba eſpecially, coſt vs ordinarily ſix thouſand thouſand Seſterces, to ſpeak with-
in compaſſe. See how vaine and prodigal we be, to bring into our kitchin and ſerue vp at our ta-
ble, the monſtruoſities of other nations, and cannot forbeare ſo much as theſe Thiſtles, which
the very aſſes and other fourfooted beaſts, haue wit enough to auoid & refuſe for pricking their
lips and muzzles. Well, ſince they be grown into ſo great requeſt, I muſt not ouer-paſſe the gar-
dinage to them belonging, and namely, how they be ordered two maner of waies, to wit, replan-
ted of yong ſets or roots in Autumn, and ſowed of ſeed before the nones of March. As for the
plants beforeſaid, they ought to be ſlipped from it, and ſet before the Ides or mids of Nouem- L
ber in any hand: or els if the ground be cold, we muſt ſtay vntil February, and then be doing with
them about the riſing of the Weſtern wind Fauonius. Manured ywis it ought to be & dunged,
This is meant of Artichokes. (I would not els) ſo faire and goodly an herbe it is; and ſo forſooth (and it pleaſe you) they pro-
ſper the better and come on trimly. They are condite alſo and preſerued in vineger (or elſe all
were mard) in delicate life honey, ſeaſoned alſo and beſpiced (I may ſay to you) with the coſtly
root of the plant Laſer-woort, yea and with Cumin; becauſe wee would not be a day without
Thiſtles, but haue them as an ordinary diſh all the yeare long.

As for the reſt of Garden-herbs behind, they need no long diſcourſe, but a light running ouer
them may ſerue well enough. Firſt and foremoſt men ſay, That the beſt ſowing of Baſil, is at the M
*11. Cal. May, *feaſt * Palilia: but ſome are of mind, that Autumne is as good: and they that would haue it
ſ. 21 of Aprill. done in winter, giue order to infuſe and ſoke the ſeed firſt in vineger. Rocket alſo and garden
Creſſes, are not dainty to grow, but be it winter or Summer, they will ſoon come vp & proſper
at al times. But Rocket of the twain, ſtands more at defiance with winter, and ſcorns al his frow-

ning

20030
copy 1

A ning looks and cold weather; as being of a contrary nature to Lectuce, for it ſtirreth vp fleſhly luſt: and therfore commonly it is ioined with Lectuce in ſallads, & both are eaten together; that the exceeding heat of the one mixt with the extreme coldnes of the other, might make a good mariage and temperature. Creſſes tooke the name in Latine * Naſturtium, *a narium tormento*, as a man would ſay, Noſe-wring, becauſe it will make one writh and ſhrink vp his noſthrils: which is the reaſon, that the word is grown into a prouerb, when we would ſignifie a thing which will put life into one that is dull and vnluſty. In Arabia, the Creſſes (by report) proue to a wonderful bigneſſe. Rue alſo is ſowed vſually in February when the Weſtern wind Fauonius bloweth, and ſoon after the Æquinox in Autumne. It cannot away with winter, for it brooketh not cold or rain, nor moiſt ground, neither will it abide muck: it liketh well to grow in dry places, and
B ſuch as lie faire vpon the Sun-ſhine; but a clay ground which is good for bricke and tile, that is alone for it and beſt of all other: it delighteth in aſhes, and therewith is it fed and nouriſhed; inſomuch as they vſe to blend aſhes & the ſeed together, for to keep away the canker worm and ſuch like. Certes we find, that in old time Rue was in ſome great account, and eſpeciall reckoning aboue other herbs: for I reade in antient Hiſtories, That *Cornelius Cethegus*, at what time as he was choſen Conſul with *Quintius Flaminius*, preſently vpon the ſaid election, gaue a largeſſe to the people of new wine aromatized with Rue. The fig-tree and Rue are in a great league & amitie; inſomuch as this herbe, ſow and ſet it when and where you will, in no place proſpereth better than vnder that tree: for planted it may be of a ſlip or ſprig. Now if the ſame be put into a bean which hath a hole pierced or bored through, it will do far better; by reaſon that the bean
C claſping the ſet cloſe, and vniting thereunto her own ſap and moiſture, cheriſheth it therewith and makes it come apace: moreouer, it will propagat and ſet it owne ſelfe, for let the top of any of her branches be bent downeward, ſo as it may but touch the ground, it will preſently take root. Of the ſame nature it is, that Baſill, but that Rue is ſomwhat later ere it come vp, & groweth not ſo faſt. When Rue is come to be of any ſtrength, there is vntoward ſarcling and weeding of it; for if it be handled, it will raiſe bliſters vpon a mans fingers, vnleſſe the hands be well gloued, or defenſed with oile. The leaues alſo of Rue are kept and preſerued, beeing made vp into little knitches or bunches.

Now as touching Ach or Parſley, the manner is to ſow it immediatly after the ſpring Equinox in March, but the ſeed would be firſt bruſed & beaten a little in a mortar: for ſome are per-
D ſuaded, that by this means it groweth thicker and more criſpe or curled: which it will doe likewiſe, in caſe after a bed be ſowed therewith, it be troden vpon with mens feet, or beaten downe with a roller or cylinder. This peculiar property hath Parſley, that it will change the colour. It was an antient cuſtome in Achaia, to do honour vnto this hearbe, by crowning thoſe that went away with victory and wan the prize in the ſolemne tourneys and ſacred games Nemei, with a chaplet of Parſly. As for Mint, men vſe to ſet it at the ſame time, of a young plant, ſo ſoone as they ſee it is ſpurt and come vp: but if it haue not ſprung, yet they let not to plant the ſpurns of the root, knotted into an head within the ground in manner of the Spongiæ in Sperage before ſaid. This herb taketh no great ioy in moiſt grounds. All Summer it looketh greene and freſh, but in winter it hath a hempen hew. A wild kind there is of Mint, named in Latin Mentaſtrum,
F which will increaſe by propagation or couching in the ground, as well as vine branches, and ſo willing it is to take, that it makes no matter which end of a ſlip be ſet downeward; for at the wrong end it wil come as well as at the other. Mint in the Greeke tongue hath changed the old name, by occaſion of the ſweet * ſmel that it carieth, whereas before time it was called Mintha, whereof we in Latine deriued our name Mentha. A pleaſant herb this is, and delectable to ſmel vnto, inſomuch as you ſhal not ſee a husbandmans bourd in the country, but all the meats from one end to the other be ſeaſoned with mints. If it be once ſet or ſown, & haue taken to a ground, it will continue there a long time. It reſembleth much the herb Peny-roiall, the nature wherof (as I haue often ſhewed) is to blow her floures again (vpon the ſhorteſt day of the yere) euen as it hangeth prickt vpon fleſh in the butchery. Much after one ſort are kept and preſerued for
F ſauce (as if they were of the ſame kind) Mint, Peni-roiall, and Nep: but aboue all, to a weake and peeuiſh ſtomack, Cumin agreeth moſt and is the beſt to get an appetite. It hath a qualitie to grow with root very eb, and ſcarſely taketh any hold of the earth, coueting to be aloft. In hot grounds and ſuch eſpecially as be rotten & mellow, it would be ſown in the mids of the ſpring. There is a ſecond ſort therof growing wild, which ſome call Cumin Ruſtick, others Thebaick,

* In Greek alſo καρδαμον: *quaſi* καρήβαμον, *quia caput tentat*, becauſe it troubleth the head with exceſſiue heat: *vel potius*, ἀπὸ τῆς καρδίας, *qui cordatos & prudentes facit*: therefore there went a by-word or prouerbe in Greek, applied to a dull, fooliſh, and blockheaded fellow, καρδαμον ἔδε: *Go, eat ſome Creſſes, learn more wit*

* ἐύοσμον, *i.* odoriferous or ſweet ſenting.

which being bruiſed or beaten into pouder, and drunk in water, is ſingular good for the pain of G
the ſtomack. The beſt Cumin in our part of the world, which is Europe, commeth from Carpetania; for otherwiſe the greateſt name goeth of that in Æthyopia and Africk. And yet ſome here be who prefer the Cumin of Egypt before all.

* A corrupt word from *Olus atrum*: as if one would ſay, *Oluſatres*. Some take this for Louach.

But * Aliſanders, which ſome Greekes call Hippoſelium, others Smyrneum, is of a ſtrange and wonderfull nature aboue all other herbes: for it wil grow of the very liquor or juice iſſuing forth of the ſtalk. It may be ſet alſo of a root: and indeed, they that gather the foreſaid juice, vſe to ſay, that it hath the very taſt and relliſh of Myrrhe: & by *Theophraſtus* his ſaying, it came firſt of Myrrh ſet into the ground. The old writers ordained, that Aliſanders ſhould be ſet or ſowed in ſtony grounds, without tending or looking to, neer to ſome * mud wall. But now in our daies it is planted in places digged & delued ouer, once or twice: yea, and at any time from the blow- H
ing of the weſtern wind Fauonius in Februarie, vntill the later Æquinox in September be paſt.

* *Iuxta macerias*, wherupon ſome Apothecaries name it *Maceranium*.

Capers likewiſe are ſet & ſowed in dry places ſpecially: but the bed muſt be digged in ſome low ground and laid hollow, inuironed round about with banks, and thoſe raiſed with a groundſell of ſtone worke, otherwiſe it would be ranging abroad and ouerſpread whole fields, & make the ground barren and vnfruitfull. It flouriſheth in Summer, and continueth green vntil the occultation or ſetting of the Brood-hen ſtar Virgiliæ; and ſandy ground is moſt familiar and agreeable to it. Touching the defects and imperfections of that kinde which groweth beyond ſea, I haue ſaid enough among the ſhrubs and plants that be ſtrangers.

The Caraway alſo is a ſtranger, as may appeare by the name of Caria, the natiue countrey therof; it beareth one of the principal ſeeds that commeth into the kitchen. It careth not much I
where it is ſown or planted, for it will grow in any ground, as well as the Aliſanders beforenamed: howbeit, the beſt commeth out of Caria, the next to it in goodnes, we haue from Phrygia.

As for Loueach or Liuiſh, it is by nature wild and ſauage, and loueth alone to grow of it ſelf among the mountains of Liguria, whereof it commeth to haue the name Liguſticum, as being the naturall place beſt agreeing to the nature of it. Set or ſowed it may be in any place whereſoeuer: howbeit, this that is thus ordred by mans hand hath not the like vertue as the other, although it be in taſt more pleaſant, & ſome call it Panax or Panace: howbeit, *Cretenas* a Greeke writer, calleth the wild Origan or Cunila Bubula, by that name. But all others in manner, attribute the name of Conyza or Conyzoides to Cunilago, *i.* Fleabane Mulket: and of Thymbra, *i.* winter Sauory, to Cunila, *i.* garden Sauory; which among vs hath another name in Latin, to wit, K
Satureia, much vſed in ſauces and ſeaſoning of our meats.

This Sauory is commonly ſown in the month of February, and hath no ſmal reſemblance of Origan, inſomuch, as they are neuer both vſed at once in ſauce or ſallads, their vertues & operations be ſo like. Andy et the Egyptian Origanum is preferred before the ſaid Sauory.

To come now to Lepidium, *i.* Dittander or Pepperwort, it was ſomtime a ſtranger alſo with vs here in Italy. It is vſually ſown after mid-February when the Weſtern wind Fauonius hath plaied his part: afterwards when it hath put forth branches, it is cut downe cloſe to the ground, and then it is laid bare and ſarcled, & the ſuperfluous roots cut away, & ſo in the end cheriſhed with muck. Thus muſt it be ſerued the two firſt yeres. For afterwards they vſe the ſame in branches at all times, if the cruell and bitter winter kill them not; for ſurely this herb is moſt impa- L
tient of cold. It groweth a good cubit in heigth, bearing leaues like to Lawrel; & the ſame ſoft and tender. But neuer is it vſed in meat without milke.

Now for Gith or Nigella Romana, as it is an herb that groweth for the paſtrie, to fit the Bakers hand; ſo Anniſe and Dil are as appropriat to the kitchen for Cooks, as the Apothecaries ſhop for the Phyſician.

Sacopenium likewiſe is an herb growing verily in gardens, but is vſed in Phyſicke onely.

Certain herbs there be that accompany others for good fellowſhip, and grow with them, as namely Poppy; for commonly ſowne it is with Coleworts, Purcellane, Rocket, and Lectuce.

* This Iunket or conceit was called *Cocetum* by *Tertullian* and *Feſtus*.

Of garden Poppies there be three kinds, firſt the white: whereof the * ſeeds in old time being made into Biskets or Comfits with hony, were ſerued vp as a banketting diſh. The ruſtical pei- M
ſants of the countrey were wont to guild or glaze (as it were) the vppermoſt cruſt of their loaues of bread with yolks of egs, and then to beſtrew it with Poppy ſeed, which would cleaue faſt to it, hauing firſt vnderlaied the bottome cruſt with * Ammi, or Anniſe ſeed and Gith: & then they put them into the ouen beeing thus ſeaſoned; which gaue a commendable taſte to their bread

when

20030
copy 1

A when it was baked. There is a ſecond kinde of Poppie called Blacke: out of the heads or bolls wherof, a white juice or liquor iſſueth by way of inciſion, like milk, and many receiue & reſerue it carefully. The third kind, which the Greekes name * Rhœas, our countreymen in Latin call the wandring or wild Poppie. It commeth vp verily of the owne accord, but in corne fields among Barly eſpecially, like vnto Rocket, a cubite high, with a red floure that ſoon wil ſhed and fall off, whereupon it tooke that name of Rhœas in Greeke. Touching other kinds of Poppie growing of themſelues, I purpoſe to ſpeake in the treatiſe of phyſicke and medicinable hearbs. Mean while this cannot be forgotten, that Poppies haue alwaies, time out of mind, been highly regarded and honoured among the Romanes; witneſſe *Tarquine* the Proud, the laſt king of Rome, who when his ſonnes Embaſſadors were come to him for to vnderſtand his aduiſe, how B to compaſſe the ſeignorie ouer the Gabians, drew them into his garden, and there by circumſtance of topping the heads of the higheſt Poppies there growing, without any anſwere parole, diſpatched them away, ſufficiently furniſhed by this demonſtration, with a double deſign, euen to fetch off the greateſt mens heads of the citie, the readieſt meanes to effect his purpoſe. * Corne Roſe.

Againe, there is another ſort of hearbs, that loue for companie to be ſet or ſowne together about the Æquinox in Autumne, namely, Coriander, Dill, Orach, Mallowes, Garden dockes or Patience, Cheruill (which the Greeks call Pæderos) and Senuie, which is of a moſt biting and ſtinging taſt, of a fierie effect, but natheleſſe very good and wholſom for mans bodie: this hearb will come of it ſelfe without the hand of man, howbeit proue it will the better if the plant be remoued and ſet elſwhere. And yet, ſow a ground once withall, you ſhall hardly rid the place of C it cleane: for the ſeed no ſooner ſheddeth vpon the ground, but a man ſhall ſee it greene aboue ground. It ſerues alſo to make a prety diſh of meat to be eaten, being boiled or ſtewed between two little diſhes in ſome conuenient liquor, in ſuch ſort, as a man ſhal not feele it to bite at the tongues end, nor complaine of any eagerneſſe that it hath. The leaues beſides vſe to be ſodden like as other pot-hearbes. Now there be of this Senuie, three kinds: the firſt beareth ſmall and ſlender leaues, the ſecond is leaued like Rapes or Turneps, the third reſembleth Rocket. The beſt Muſtard ſeed commeth out of Ægypt. The Athenians were wont to call it Napy, ſome Thlaſpi, and others Saurion.

To conclude, as touching the running wild Thyme, and Siſymbrium, *i.* Horſe-mint or Water-mint, moſt hils are repleniſhed and tapiſſed as it were therewith: and eſpecially in Thracia, D where a man ſhall ſee a mighty quantity of wild Thyme branches, which the mountain waters or land flouds carrie away and bring it downe with their ſtreame to riuers ſides, and then folke plant them. Semblably, at Sicyon there grows great ſtore, conueighed thither from the mountaines neere adjoining: and laſtly, at Athens, brought thither out of the hill Hymettus. In like manner alſo the foreſaid water-mint commeth from the hils with a ſudden daſh of rain, and is replanted accordingly. It groweth rankeſt and proſpereth beſt in the brinks and ſides of pits or wells, alſo about fiſh-ponds and ſtanding pooles.

Chap. IX.

¶ *Of Finkle or Fennell, and Hempe.*

E IT remaineth now among garden hearbes to ſpeake of thoſe that be of the Ferule kind, and namely of Fenell in particular, a hearb wherin Snakes and ſuch ſerpents take exceeding great delight, as heretofore I haue declared: and which being dried, is ſingular good to commend many meats out of the kitchin into the hall.

There is a plant reſembleth it much, named Thapſia, wherof becauſe I haue alreadie written among other forraine herbes, I will proceed forward to Hemp, which is ſo profitable and good for to make cordage. This plant muſt be ſowed of ſeed after the weſtern wind Fauonius bloweth in Februarie. The thicker that it groweth, the ſlenderer and finer it is. When the ſeed ther- of is ripe, namely, after the Æquinox in Autumn, folk vſe to rub it out and then drie it either in F the Sunne, the wind, or ſmoke. But the ſtalke or ſtem of the Hemp it ſelfe, they pluck out of the ground after Vintage: and it is the husbandmans night work by candle light to pill and cleanſe it. The beſt Hempe commeth from Alabanda, eſpecially for to make nets and toile; where bee three kinds thereof. That part of the Hempe which is next to the rind or pilling, as alſo to the inner part within is worſt: the principal of it lieth in the middeſt, and called it is Meſa. Next to the

the Alabandian Hempe for goodneſſe,is that of Mylaſium.But if you goe to the talneſſe,there G
is about Roſea in the Sabines countrey, Hempe as high as trees.

As touching the 2 kinds of Ferula, I haue ſpoken of them in my diſcourſe of forrain plants. the ſeed of Ferula or Fennell-geant, is counted good meat in Italie : for it is put vp in pots of earth well ſtopped,and will continue a whole yeare. And of 2 ſorts is this preſerued Compoſt, to wit,the ſtalks, and the Bunches whiles they be knit round and not broken & ſpread abroad. And as they cal theſe knobs which they doe condite and keep, Corymbi; ſo that Ferula,which is ſuffered to riſe vp in ſtem for to beare ſuch heads, they tearme Corymbias.

Chap. X.

¶ *The maladies incident to Garden hearbes, The remedies againſt Piſmires, Canker-wormes, and Gnats.* H

THe hearbes of the garden be ſubject to diuerſe accidents,and namely, diſeaſes; as well as corne and other fruits of the earth. For not onely Baſill by age degenerats from the owne nature into wild creeping Thyme,but Siſymbrium alſo into Calaminth. The ſeed of an old Cole-wort will bring forth Turneps:and contrariwiſe, ſow the ſeed of an old Rape & Turnep you ſhall haue Coleworts come vp of it. Cumin, if it be not kept neat and trim with much cleanſing,wil begin to decay at one ſide of the ſtalk beneath,and dy. Now hath Cumin but one onely ſtalke,and a root bulbous in manner of an Onion, it groweth not but in a light and leane ſoile. Otherwiſe,the peculiar diſeaſe appropriat to Cumin,is a kind of skurf or ſcab. Alſo Ba- I
ſil,toward the riſing of the Dog-ſtar,waxeth wan and pale. And generally, there is not an hearb but will turne yellow,if a woman come neere vnto it whiles ſhe hath her monthly ſickneſſe vpon her.

Moreouer, there be diuerſe ſorts of little beaſts or vermine engendred in the garden among the good hearbs. And namely, vpon the Nauewes,you ſhall haue gnats or flies:in radiſh Roots cankerwormes,and other little grubs:likewiſe, in Lectuce and * beet leaues. And as for theſe Beetworts laſt named,you ſhal ſee them haunted with ſnails,as well naked as in ſhels. In Leeks moreouer or Porret there ſettle other ſpeciall vermine that be noiſome to them ſeuerally, but ſuch are very ſoone caught by throwing vpon thoſe hearbes a little dung,for it will they gather to ſhroud and hide themſelues. Furthermore, *Sabynus Tyro* in his booke intituled * Cepuricon K
which he dedicated to *Mecænas*,writeth, That it is not good to touch with knife or hooke,Rue, Winter Sauerie,Mint,and Baſill. The ſame Author alſo hath taught vs a remedy againſt Emmets(that do not the leaſt miſchiefe to gardens,when they lie not to haue water at command) and that is this,to take ſea mud or ooſe and aſhes together, to temper a morter of them both, and therewith to ſtop their holes. But the moſt forcible and effectuall thing to kill them,is the hearb called Ruds or Turn-ſol. Some are of opinion,that the onely meanes to chaſe theſe ants away,is,with water wherin the pouder of a ſemi-brick or halfe-baked tile is mingled. And particularly,for to preſerue Nauewes, it is a ſingular medicine for them to haue Feni-greek ſowed among,as alſo for Beets to do the like with Cich peaſe: for this deuiſe wil driue away the Cankerworm. Bvt ſay,that this practiſe was forgotten, & that the foreſaid hearbs be alreadie come L
vp,what remedie then ? Mary,euen to ſeeth Wormwood and Houſleek(which the Latines call Sedum,the Greekes Aiezoon)and ſprinckle the decoction or broth therof among them. Now what manner of hearbe this Houſleeke is,I haue ſhewed you alreadie. It is a common ſpeech, that if a man take the ſeed of Beets and other pot-hearbes, and wet them in the juice of Houſleeke,otherwiſe called Sea-green,thoſe hearbes ſhall be ſecured againſt al theſe hurtfull creatures whatſoeuer. And generally, no Cankerwormes ſhall do harme to any herbage in the garden, if a man pitch vpon the pales about a garden the bones of a Mares head ; but he muſt bee ſure it was of a Mare,for a horſe head will not ſerue. It is a common ſaying alſo, that if a riuer Crab or Craifiſh be hung vp in the mids of a garden,it is ſingular for that purpoſe. Some there be who make no more but touch thoſe plants which they would preſerue from the ſaid vermin, M
only with twigs of the Dogge berie tree,and they hold them wariſhed and ſafe ynough. Gnats keep a foule ſtir in gardens where water runneth through eſpecially,and wherin there be ſome ſmall trees growing:but theſe are ſoone chaſed away by burning a little Galbanum.

* *Olieri.*

* Of Gardening.

Chap.

20030
copy 1

A

Chap. XI.

¶ What garden ſeeds be ſtronger, which be weaker than others. Alſo what plants proſper better with ſalt water.

NOw as touching the change and alteration in ſeeds, occaſioned by age and long keeping: ſome there be that are firme and faſt, which hold their owne wel, as namely, the ſeeds of Coriander, Beets, Leeks, garden Creſſes, Senvie or Muſtard ſeed, Rocket, Saverie, and in one word, all ſuch as be hot and bite at the tongues end. Contrariwiſe, of a weaker nature are the ſeeds of Orach, Baſil, Gourds, and Cucumbers. Generally, all ſummer ſeeds laſt longer than
B winter: and the Chibbol ſeed leaſt of any other will abide age. But take the ſtrongeſt and hardieſt that may be, you ſhall haue none good after foure yeares, I mean only for to ſow. And yet I muſt needs ſay, That Saverie ſeed wil remain in force aboue that time. Radiſhes, Beets, Rue, and Saverie find much good by being watered with ſalt water; for to theſe eſpecially it is holſome phyſick againſt many infirmities: and beſides, it is thought to giue them a pleaſant and commendable taſt, yea, and it cauſeth them to be more fruitfull. As for all other hearbes, they find benefit rather by freſh water. And ſince we are light vpon the mention of waters, thoſe are thought beſt for this purpoſe which are coldeſt and ſweeteſt to be drunk. Standing waters out of ſome pond, ſuch alſo as are conueyed into gardens by trenches and gutters, are not good for a garden, becauſe they bring in with them the ſeeds of many a weed. But aboue all other, raine
C waters comming in white ſhoures from heauen, be they that nouriſh a garden beſt, for theſe ſhoures kill the vermin alſo which are breeding therein.

Chap. XII.

¶ The maner of watering Gardens. What Herbs will proue the better by remouing and replanting. Of the iuices and ſauors that garden Herbes affourd.

THe beſt time of the day to water gardens is morning & euening, to the end that the water ſhould not be ouerheat with the Sunne. Baſill only would be watered alſo at noon. And
D moreouer ſome think, that when it is new ſown, it will make haſt to come vp very ſpeedily, if it be ſprinkled at the firſt with hot water. Generally, all herbs proue better, and grow to be greater, when they be tranſplanted, but principally Leeks and Nauews: nay this remouing and replanting of them is the proper cure of many ſorances, for from that time forward, ſubiect they will not be to thoſe iniuries that vſe to infeſt them; and namely Chibbols, Porret, or Leeks, Radiſh, Parſly, Lectuce, Rapes or Turneps, and Cucumbers. All herbs which by nature grow wild, lightly haue ſmaller leaues and ſlenderer ſtalks, in taſt alſo they be more biting and eagre, than ſuch of that kinde as grow in gardens: as wee may ſee in Saverie, Origan, and Rue. Howbeit, of all others the wild Dock is better than the garden Sorrell, which the Latines call Rumex. This garden Sorrell or foure docke is the ſtouteſt and hardieſt of all that grow: for if
E the ſeed haue once taken in a place, it wil by folks ſaying continue euer there: neither can it be killed, do what you will to the earth, eſpecially if it grow neere the water ſide. If it be vſed with meats, vnleſſe it be taken with Ptiſane, or husked Barly alone, it giueth a more pleaſant & commendable taſt thereto, and beſides maketh it lighter of digeſtion. The wild Dock or Sorrell is good in many medicines. But that you may know how diligent and curious men haue been to ſearch into the ſecrets of euerie thing, I will tell you what I haue found contriued in certaine verſes of a Poet: namely, That if a man take the round treddles of a goat, and make in euery one of them a little hole, putting therein the ſeed either of Leeks, Rocket, Lectuce, Parſly, Endiue, or garden Creſſes, and cloſe them vp, and ſo put them into the ground, it is wonderfull how they will proſper, and what faire plants will come thereof. Ouer and beſides, this would be no-
F ted, that all herbs wild, be drier and more keen than the tame of the ſame kind. For this place requireth, that I ſhould ſet downe the difference alſo of their iuice and taſts which they yeeld, and rather indeed than of Apples and ſuch like fruits of trees. The taſt or ſmack of Savery, Origan, Creſſes, and Senvie, is hot and biting; of Wormwood and Centaurie, bitter: of Cucumber, Gourds, and Lectuce, wateriſh. Of Majoram it is ſharp only: but of Parſly, Dill, and Fennell,

nell, ſharpe, and yet odorant withall. Of all ſmacks, the ſalt taſt only is not naturall. And yet otherwhiles a kinde of ſalt ſetleth like duſt, or in manner of roundles or circles of water vpon herbs: howbeit ſoon it paſſeth away, and continueth no longer than many ſuch vanities * and fooliſh opinions in this world. As for Panax, it taſteth much like pepper: but Siliquaſtrum or Indiſh Pepper more than it, and therfore no maruel if it were called Piperitis. Libanotis ſmelleth like Frankincenſe: Myrrhis of Myrrh. As touching Panace, ſufficient hath been ſpoken already. Libanotis commeth naturally of ſeed in rotten grounds, lean & ſubiect to dews: it hath a root like to Aliſanders, differing little or nothing in ſmell from Frankincenſe. The vſe of it after it be one yeare old is moſt wholſome for the ſtomacke. Some terme it by another name, Roſemary. Alſo Aliſanders, named in Greeke Smyrneum, loueth to grow in the ſame places that Roſemary doth, and the root reſembleth Myrrh in taſt. Indiſh Pepper likewiſe delighteth to be ſowed in the ſame maner. The reſt differ from others both in ſmell and taſt, as Dil. Finally, ſo great is the diuerſitie and force in things, that not only one changeth the naturall taſte of another, but alſo drowneth it altogether. With Parſly the Cooks know how to take away the ſoureneſſe and bitterneſſe in many meats: with the ſame alſo our Vintners haue a caſt for to rid wine of the ſtrong ſmell that is offenſiue; but they let it hang in certain bags within the veſſels. G

* For ſome Philoſophers held opinion, That the taſt of hearbs conſiſted of a Terrene ſubſtance and a Waterie mixed together: others (as *Democritus*) aſcribed it to their formes and figures: which *Plinie* thinketh ridiculous.

Thus much may ſerue concerning garden herbs, ſuch I mean onely as be vſed in the kitchen about meats. It remaineth now to ſpeake of the chiefe work of Nature contained in them: for all this while we haue diſcourſed of their increaſe, and the gain that may come thereof: and indeed treated we haue ſummarily of ſome plants and in generall termes. But foraſmuch as the true vertues and properties of each herb cannot throughly and perfectly be known, but by their operations in phyſick, I muſt needs conclude, that therein lieth a mighty piece of work, to find out that ſecret and diuine power, lying hidden and incloſed within: and ſuch a piece of worke, as I wot not whether there can be found any greater. For mine own part, good reaſon I had, not to ſet down and anex theſe medicinable vertues to euery herb; which were to mingle Agriculture with Phyſick, and Phyſicke with Cookerie, and ſo to make a miſh-maſh and confuſion of all things. For this I wiſt ful well, that ſome men were deſirous only to know what effects they had in curing maladies, as a ſtudy pertinent to their profeſſion; who no doubt ſhould haue loſt a great deale of time before they had come to that which they looked for in running thorough the diſcourſes of both the other, in caſe wee had handled altogether. But now, ſeeing euery thing is digeſted & ranged in their ſeueral ranks, as well pertaining to the fields, as the kitchen, and the Apothecaries ſhop; an eaſie matter it will be for them that are willing and ſo diſpoſed, to ſort out each thing, and fit himſelfe to his owne purpoſe, yea, and ioine them all at his pleaſure. H I K

20030
copy 1

THE TWENTIETH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

*SInce we are come thus far, as to treat of the greateſt and principall work of Nature, we will begin from hence-forward at the very meats which men put into their mouthes, and conuey into their ſtomacks, and vrge them to confeſſe a truth, That hitherto they haue not well knowne thoſe ordinarie means whereby they liue. And let no man in the mean time thinke this to be a ſimple or ſmall piece of knowledge and learning, going by the baſe title & bare name that it caries: for ſo he may be ſoon deceiued. For in the purſute and diſcourſe of this argument we ſhall take occaſion to enter into a large field as touching the peace and war in Nature; we ſhall handle (I ſay) a deep ſecret, euen the naturall hatred and enmitie of dumbe, deafe, and ſenſeleſſe creatures. And verily, the main point of this theame, and which may rauiſh vs to a greater wonder & admiration of the thing, lieth herin, That this mutual affection, which the Greeks call ſympathie, whereupon the frame of this world dependeth, and whereby the courſe of all things doth ſtand, tendeth to the vſe and benefit of man alone. For to what end elſe is it, that the element of Water quencheth fire? For what purpoſe doth the Sun ſuck and drink vp the water, as it were to coole his heat and allay his thirſt? and the Moon contrariwiſe breed humors, and engender moiſt vapors? and both Planets eclipſe and abridge the light one of the other? But to leaue the heauen and thoſe cœleſtiall Bodies in their maieſtie. What is the cauſe, that as the Magnet or loadſtone draweth iron vnto it, ſo there is another * ſtone abhorreth the ſame, and driueth iron from it? What ſhould the reaſon be of the Diamond, that peerleſſe ſtone, the chiefe iewell wherein our rich worldlings repoſe their greateſt ioy and delight, a ſtone otherwiſe * inuincible, and which no force and violence beſides can conquer, but that it remaineth ſtill infrangible; and yet that the ſimple bloud of a poore Goat is able to burſt it in pieces? Beſides many other ſecrets in nature, as ſtrange, yea and more miraculous. All which we purpoſe to reſerue vnto their ſeuerall places, and will ſpeake of them in order. Mean while may it pleaſe the Reader to pardon vs, and to take in good part the manner of our entrance into this matter: for albeit we ſhall deale in the beginning with the ſmalleſt and baſeſt things of all others, yet ſuch they be as are wholſome, and concerne much the health of man and the maintenance of his life. And firſt will we ſet in hand with the garden, and the herbes that wee finde there.*

* Theamedes, cap. 16. lib. 36.

* Where upon it is called *Adamas.*

CHAP. I.

¶ *Of the wilde Cucumber, and the juice thereof, Elaterium.*

THis wild Cucumber, as we haue ſaid heretofore, is far leſſe than that of the Garden. Out of the * fruit hereof there is a medicinable juice drawne, which the Phyſitians call Elaterium. For to get this juice, men muſt not ſtay vntill the * Cucumber be full ripe: for vnles it be taken betimes and cut down the ſooner, it wil leap & flurt in the handling from the ſtele whereto it hangeth, againſt their faces, with no ſmal danger of their eye-ſight. Now when it is once gathered, they keepe it ſo one whole night. The next morrow they make an inciſion and ſlit it with the edge of a cane. They vſe to ſtrew aſhes alſo thereupon, to reſtrain and keep down the liquor which

* *Semen pro fructu abuſiue.*

* Whereupon it is called *Touch me not*

which iſſueth forth in ſuch abundance: which done, they preſſe the ſaid juice forth, and receiue G
it in raine water, wherin it ſetleth: and afterwards, when it is dried in the Sunne, they make it vp
into Trochiſques. And certaine theſe Trochiſques are ſoueraigne for many purpoſes, to the
great good and benefit of mankind: For firſt and foremoſt, it cureth the dimneſſe and other de-
fects or imperfections of the eyes: it healeth alſo the vlcers of the eye lids. It is ſaid moreouer,
that if a man rub neuer ſo little of this juice vpon vine roots, there will no birds come neere to
pecke or once touch the grapes that ſhall hang thereon.

The root of this wild Cucumber, if it be boiled in vinegre and made into a liniment, and ſo
applied, is ſingular good for all kinds of gout; but the juice of the ſaid root helpeth the tooth-
ach. The root being dried and incorporat with roſin, cureth the ringworme, tettar, & wild ſcab
or skurf, which ſome cal Pſora and Lichenes: it diſcuſſeth and healeth the ſwelling kernels be- H
hind the eare; the angrie puſhes alſo and biles in other Emunctories called Pani: and reduceth
the ſtooles or skars left after any ſore, and other skarres, to their freſh and natiue colour againe.
The juice of the leaues dopped with vinegre into the ears, is a remedie for deafeneſſe. As for
the liquor concrete of this cucumber, named elaterium, the right ſeaſon of making it, is in au-
tumne: neither is there a drug that the Apothecaries hath, which laſteth longer than it doth:
howbeit, before it be three yeres old, it begins not to be in force for any purpoſe that a man ſhal
vſe it: and yet if one would occupie it freſh and new before that time, he muſt correct the fore-
ſaid Troſch es with vinegre, diſſoluing them therin ouer a ſoft fire, in a new earthen pot neuer
occupied before: but the elder they be, the better and more effectuall they are; inſomuch as (by
the report of *Theophraſtus*) Elaterium hath bin kept and continued good 200 yeares. And for I
fiftie yeares, it is ſo ſtrong & full of vertue, that it wil put out the light of a candle or lamp: for
this is the triall and proofe of good Elaterium, it being ſet neer therto, before that it puts out
the light, it cauſe the candle to ſparkle vpward and downward. That which is pale of color and
ſmooth, is better than that which is of a greeniſh graſſe color, & rough in hand; the ſame alſo is
ſomwhat bitter withall. Moreouer, it is ſaid, that if a woman deſire to haue children, & do cary
about her the fruit of this wild Cucumber faſt tied to her bodie, ſhe ſhall the ſooner conceiue
and proue with child; prouided alwaies that in the gathering, the ſaid Cucumber touched not
the ground in any caſe. Alſo if it be lapped within the wooll of a Ram, & be bound to the loins
of a woman in trauell of childbirth, ſo that ſhe be not her ſelfware therof, ſhe ſhal haue the bet-
ter ſpeed and eaſier deliuerance: but then, ſo ſoon as the infant & the mother be parted, the ſaid K
Cucumber muſt be had out of the houſe in all haſt, where the woman lyeth. Thoſe writers who
magnifie theſe wild Cucumbers, and ſet great ſtore by them, affirm; That the beſt kind of them
groweth in Arabia; and the next about Cyrenæ: but others ſay, That the principall be in Arca-
dia; That the plant reſembleth Turnſol; That betweene the leaues and branches thereof there
groweth the fruit, as big as a Wallnut, with a white taile turning vp backeward in manner of a
Scorpions taile: whereupon ſome there bee, who giue it the name of the Scorpion Cucumber.
True it is indeed, that as wel the fruit it ſelfe as the juice therof called Elaterium be moſt effe-
ctuall againſt the pricke or ſting of the Scorpion, as alſo that it is a medicine purgatiue of the
bellie, but eſpecially cleanſeth the wombe or matrice of women. The ordinarie doſe is from
Obolus. half an Obulus to a Solid [*i.* an obole or half a ſcruple] according to the ſtrength of the patient. L
i, halfe a Scripule or Scruple. A greater receit than one Obulus, killeth him or her that taketh it: but being taken within that
quantitie aboue named, in ſome broth or conuenient liquor, it is paſſing good for the dropſie,
yea, and to euacuat thoſe filthie humors thar engender the lowſie diſeaſ. Being tempered with
honey and old oile, and ſo reduced into a thin ointment or liniment, it cureth the Squinancie,
and ſuch diſeaſes incident to the windpipes.

Chap. II.

¶ *Of the Serpentine Cucumber, called otherwiſe the Wandering Cucumber: alſo of the Garden Cucumbers, Melons or Pompions.*

M

MAny there be of opinion, that the Serpentine Cucumber among vs, which others call
the wandring Cucumber, is the ſame that the former Cucumber which yeeldeth Ela-
terium. The decoction whereof is of that vertue, that what ſoeuer is beſprinckled there-
with, no myce wil come neer to touch it. The ſame being ſodden in vinegre and brought to the
conſiſtence

20030
copy 1

A conſiſtence of an ointment, is a preſent remedie to allay the pains of gout, as wel in feet, hands, knees and armes, as in any other joint whatſoeuer. Alſo, if the ſeed thereof, or the fruit alone, dried in the Sun and beaten to pouder, be drunke to the weight of 30 deniers (Romane) in one hemine or wine pint of water, it aſſwageth the pain of the reines and the loins. Tempered with womans milke, it reſolueth all ſodain tumors & ſwellings, being applied to the grieued place. But to come againe to Elaterium, it mundifieth the matrice and naturall parts of women; but if they be with child, they muſt take heed how they meddle with it, for it bringeth them to a ſhift, yea and haſteneth abortiue or vntimely birth. Good it is for al them that be ſhort winded. As for the yellow iaundiſe, it cureth it, if it be but ſnuffed vp into the noſe. Annoint or bath the face with it in the Sun, it taketh away pimples & other ſpots there. Many attribute al the ſame
B properties and effects to the Garden cucumbers: And in very deed, this fruit would not be deſpiſed, in regard of the uſe thereof in Phyſicke: for firſt and foremoſt, Take Cucumber ſeeds as many as three fingers will receiue, ſtampe them with Cumin, and giue the powder in wine to them that haue the cough, for to drinke, you ſhall ſee preſent helpe. The ſame ſeeds taken in pouder with breaſt-milke, cureth thoſe that be lunaticke and * phranticke. Alſo, the weight of one * Acetabulum, [i. much about two ounces] cureth them that haue the Dyſentery or bloudy flix. Moreouer, being taken with a like poiſe or quantity of Cumin ſeed in mead or honyed water, it is ſingular good for them that reach vp filthy matter from their lungs; as alſo for thoſe who haue * weake and diſeaſed liuers. If one drink the ſame with ſome ſweet wine, it prouokes vrine: and being injected by a Clyſtre together with Cumin, it eaſeth the paine in the kidnies
C and reines.

As for the fruit called Pompions or Melons, being eaten as meat, they cool the body mightily and make it ſoluble. The fleſhy ſubſtance of them applied to the eies, aſſuageth their pain and reſtraineth their wateriſh and rheumatick flux. Their root healeth the * wens or vlcers gathered in manner of hony-combs: which ſwellings ſome call Cerio. Being dried, it ſtaieth vomits, ſo it be brought into pouder and giuen to the weight of * foure Oboli in honyed water: but the Patient when he hath drunk it, muſt walke preſently vp on it half a mile. The ſame pouder is deterſiue and ſcouring, and therefore put into ſope and waſhing-balls. As for the rind or barke thereof, it procureth vomit indeed, but it cleanſeth the skin as wel as the other. The ſame doe the leaues of any domeſticall or garden Cucumbers or Melons, if they be made into a linl-
D ment. The ſaid leaues alſo ſtamped with honey and brought to the forme of a cataplaſme, cure the bloudy-fals or night-blains, but tempered with wine, they heale the bitings of dogs, as alſo, of the Millepeed, which the Creeks call Seps, a long worm with hairy feet, doing much harme to cattaile eſpecially; for look where it biteth, the place preſently ſwelleth and putrifieth. The very Cucumber it ſelfe is of a comfortable odor, and recouereth the faintings of the heart, and thoſe that ſwoune. Finally, if you would make a delicate ſallad of Cucumbers, boile them firſt then pill from them their rind, ſerue them vp with oile, vinegre, and honey: certain it is, they are by this meanes far ſweeter and pleaſanter than otherwiſe.

* *Phrenitick*, ſome read *Nephriticis*, and then it ſignifieth thoſe that haue the ſtone or pains of the kidnies.
* 15. drams.
* *Iocineroſi.*
* *Melicerides.*
* two ſcruples.

Chap. III.

F ¶ *Of the wild Gourd, and the Rape or Turnep,*

THere is a kind of wild * Gourd which the Greeks cal Somphos, as one would ſay, hollow and emptie (for thereupon it tooke that name) a finger thicke, growing no where elſe but among rocks and ſtony grounds. If a man chew this Gourd and ſuck out the juice thereof he ſhall find it very comfortable to the ſtomack. There is another wild gourd called Colocynthis, but that is full within, and leſſe than that of the Garden. The pale of this kind is the better, for ſuch be vſed in Phyſicke: and yet that of graſſe greene colour when it is dried, if it be taken alone, doth purge & euacuat the belly. Alſo being infuſed into the bodie by way of clyſtre, it cureth all diſeaſes of the guts, flankes, reines, and loines: it helpeth the palſie likewiſe, or the reſolution of the ſinews. After the ſeeds be taken forth, ſome fill the place with honyed water, &
F ſo ſeeth all together, vntil halfe be conſumed, and giue of this decoction the quantitie of foure Oboli, with good ſucceſſe to thoſe that be troubled with a cough: the pouder therof dryd & incorporat with ſodden hony & ſo reduced into pills and ſwallowed, is good for the ſtomack: the ſeeds be ſingular to cure the Iauniſe; but the party muſt drink honyed water preſently after it.

* This is not *Colocynthida.*

The fleſhie pulpe within mixed with wormwood and honey, takes away the tooth-ach & a collution made with the juice thereof and vinegre hot, confirmeth and faſteneth the teeth that be looſe in the head. Moreouer, if with it and oile together, one rub the backe bone, the loines and the haunches or huckle, it will immediatly rid them of their pain and ach. But I will tell you a ſtrange and wonderfull effect indeed: If a man take their ſeeds of * euen number & hang them either about the necke or armes of them that haue the ague, they will driue the acceſſe or fit away; be it any of thoſe intermittent feuers which the Greekes call Periodicall. Thus much for the wild Gourd, Colocynthis.

* It may be, he meaneth a nũber reſpectiue to the type of the ague, that is to ſay, 3 in a tertian, 4 in a quartan, 5 in a quintan, &c.

As for the domeſticall Gourd of the Garden, after it is ſcraped and pilled, take the juice thereof, and diſtill it warme into the eares, it will eaſe the paine. The inner fleſh or pulp cleanſed from the ſeed, is paſſing good for to be applied to the agnels or corns of the feet: alſo to be laid vnto thoſe impoſtumes or ſwellings, that grow to an head or ſuppuration [which the Greeks call Apoſtemata.] The liquor or decoction of the Gourd, ſodden al whole as it is, with rind, ſeed, and pulpe, doth ſtrengthen the looſe teeth, and ſtinteth their ach. Wine wherein it is boiled, is a ſingular decoction to bath the eies, for to repreſſe and ſtay the fluxe or theume that falleth vpon them. The leaues of it, together with the freſh leaues of the Cypreſſe tree newly gathered, being ſtamped and applied to wounds, be excellent to heal them. The Gourd it ſelfe encloſed within clay, and ſo baked or roſted vnder the embers, and then ſtamped and incorporate with gooſe greaſe, hath the like effect. Moreouer, the ſcrapings or ſhauings of the rind, mightily cooleth the heat of the gout, if it be not inueterat and old: the heats alſo of the head and eſpecially the * burning therein, which troubleth little infants. The ſaid parings being incorporat with the filth rubbed or curried from mens bodies in bains & ſtouves after they haue ſwet, and ſo laid vpon any part that hath S *Anthonies* fire, allaieth the heat and bringeth the place into temper: ſo doe the ſeeds alſo, vſed in like manner. The juice or liquor drawne out of the ſaid parings, being mingled with oile of roſes and vinegre, and then made into a liniment, doth mitigate the extreme heat of burning feauers. The aſhes of Gourd parings burnt & ſtrewed drie vpon any part of the bodie that is burnt or skalded, healeth them wonderfully. *Chryſippus* the Phyſician condemned Gourds, and forbad men to eat of them. Howbeit, all Phyſicians doe reſolutely agree in this, That they be paſſing good for the ſtomacke: as alſo for the exulcerations of the guts and bladder.

* *Sciriaſis.*

As for Rapes or Turneps, they likewiſe are medicinable, and haue their vſe in Phyſick, for to begin withall, if one lay them very hot to kibed or humbled heeles, they wil cure them. Alſo, if the feet be frozen and benummed with cold, lay them thereto ſodden in water, and this fomentation will reſtore them to their former heat. The hot decoction or broth of Rapes, is paſſing good for to bath the goutie members, yea if it were a cold gout. The Rape or Turnep root, raw as it grew, brayed in a mortar with ſalt, is a remedie for all diſeaſes of the feet, bee they cornes, kibes, bloudy falls, ſwellings of cold, or any other infirmities what ſoeuer. Rape ſeed bruiſed to a liniment drunken alſo with wine, is reported to be a ſoueraign medicine againſt the ſtinging of ſerpents, and any other poiſon: Howbeit many think, that it is a preſeruatiue & countrepoiſon, when it is taken in wine and oile. *Democritus* baniſhed turneps altogether from the bourd, by reaſon of the ventoſities or windineſſe that it engender. But *Diocles* on the other ſide extolled and praiſed them as much; and affirmeth, That they will pricke forward to *Venus*. The like doth *Dionyſius* report of them, and the rather (ſaith he) if they be condite with Rocket. He writeth moreouer, That if they be roſted or baked vnder the aſhes, and ſo incorporate with greaſe, will make a notable good cataplaſm for the gout and joynt-ach. The wild rape or turnep groweth commonly euery where among corne fields: it brancheth much, carieth a white ſeed, twiſe as big as that of the Poppie. This being incorporat with vrine of equall quantity, is much vſed to take away riuils, and ſo ſmooth the skin both of the face and alſo of the whole body beſides. To conclude, the roots of Eruile, Barley, Wheat, and Lupines, be good for nothing at all.

Chap. IIII.

¶ *The diuers ſorts of Nauewes: of the wild Radiſh of the Garden Radiſh, and the Parſnep.*

* *Angulosis caulibus, folio apij, flore aneti.* Ex Dioſcoride:

THe Greek writers obſerue two kinds of Nauews, which ſerue for Phyſick. The firſt ariſeth vp with * a cornered and edged ſtalk, beareth leaues r[illegible]ng Parſely, and putteth out floures

20030
copy 1

A floures like Dil: this they call Bunion: the decoction whereof being drunken with honied water, or with a dram weight of the owne iuyce, is counted ſoueraigne for the purgations that follow women for the defects of the bladder and vrine. The ſeed parched and beaten to pouder, and ſo taken in a draught of hot water, to the quantitie of foure * cyathes, cureth the bloudy flix: but it ſtoppeth vrine, vnleſſe the patient drink Lineſeed withall. The ſecond kind is named Bunias, and reſembleth both Rape and Radiſh: the ſeed of it is excellent good againſt poyſon; and therefore in antidotes and preſeruatiues it is much vſed. That there be Radiſhes wilde, we haue ſhewed heretofore. The moſt commended aboue all others is that which groweth in Arcadia: although there are of them in other countries, and thoſe counted better, only for to pro-

B uoke vrine. Otherwiſe they purge choler, and namely their rindes infuſed in wine do the ſame. Now ouer and beſides their vertues and properties related hertofore, they diſcharge and clenſe the ſtomack, cut and extenuate flegme, and withall be diureticall and procure vrine.

* a Cyath is ten drams.

There is a kind of garden Radiſh in Italy which they name Armoracia, vſed alſo in phyſick: the decoction whereof if a man take a draught of it in the morning, to the quantitie of a cyath, doth fret, break, and expell the ſtone by way of grauell. Boile the ſame in water and Vinegre, therewith bathe or anoint the place ſtung with any ſerpent, and it will heale it vp. Radiſh taken with hony in a morning next ones heart faſting, is good for the cough. The ſeed parched, and ſo chewed alone without any thing els, aſſwageth the pain of the ſmal guts, * in the flankes and hypocondriall parts. The decoction of Radiſh leaues ſodden in water and ſo drunk, or the very

C iuice of the root it ſelfe as much as two cyathes, is thought to be a ſingular medicine againſt the breeding of body-lice. Radiſhes ſtamped in a mortar, and brought into the forme of a liniment, are thought to be excellent good for hot inflammations: the rind alſo ſtamped together with hony, and laid to any bruiſed place that looketh black and blew after a freſh ſtripe, diſſolueth that cluttered bloud, and reduceth the former color. The chewing of the quickeſt & moſt biting Radiſhes keeps them awake that are giuen to ouermuch drowſineſſe, & inclined to the lethargie. The ſeed parched and afterwards ſtamped and incorporate with hony, cureth them that take their wind ſhort. The ſame is alſo held for a countrepoyſon. A defenſatiue alſo the Radiſh is againſt ſcorpions, and reſiſteth their poiſoned ſting: for let a man rub his hands well either with the iuyce of the root, or the ſeeds, he may handle ſcorpions ſafely. Do but lay a Ra-

D diſh vpon a ſcorpon he will preſently die. Moreouer, *Nicander* affirmes, that Radiſhes be paſſing good for them that haue eaten either venomous Muſhromes or Henbane. The two *Apollodores* preſcribe Radiſh to be giuen to them who ſuſpect themſelues to be poyſoned with the viſcous gum of the white Chamæleon root called Ixias; but taken diuerſly; for the one of them ſurnamed *Citieus*, giueth the ſeed ſtamped, and ſo to drink it in water: the other *Apollodorus*, of Tarentum, ordains the iuice of Radiſh for this effect and purpoſe. Moreouer, radiſhes are thought good to diminſh and extenuat the ſwelling ſpleen: they are wholſome for the liuer, & mitigate the pain of the loins. Being taken with Vineger and Senvy, they helpe them that are in a dropſie, or falne into a lethargie. *Praxagoras* is of iudgement, That Radiſhes ſhould be giuen for to eat, to them that are troubled with the Iliack paſſion, to wit, the paine and ringing of the ſmall guts. And *Pliſtonicus* appointeth them to be eaten of thoſe that be troubled with a continuall

E flux, by reaſon of a feeble ſtomack, called thereupon Cœliaci. They heale the Dyſenterie or exulceration of the guts: they euacuate alſo and rid away the filthy matter and corruption of impoſtumes gathered about the midriffe and principal parts, if they be eaten with honey. But ſome for this purpoſe would haue them luted or bedawbed with clay, and ſo roſt or bake them afterwards vnder the aſhes; and being thus prepared, they are effectuall to bring down womens termes. Being taken with vinegre and hony in maner of an oxymel, they chaſe worms out of the guts and belly. If they be ſodden to the thirds, and their decoction giuen to drink with wine, they do much good to them who haue a rupture, and their guts fallen downe into the burſe of their cods: and in this wiſe they rid and ſcoure away the cluttered & offenſiue bloud gathered in the guts and ſent thither from any other part. *Medius* the phyſitian preſcribeth them to be

F boiled and giuen to the ſame purpoſe; as alſo to thoſe that ſpit and reach vp bloud: yea and to women in childbed newly laid, for to increaſe their milk. *Hippocrates* counſelleth women whoſe haire is giuen to ſhed much, for to rub their heads with radiſh roots: alſo to apply them bruiſed in manner of a cataplaſme vnto the nauill, when they be tormented with the paines of the matrice. They will bring to the natiue & liuely colour the parts that are cicatrized or newly skar-

* Laganopotion.

* Ileoſis, Hermol. ſome read Iliaſis, & then it ſignifieth Purſiffe.

red. The ſeed bruiſed and tempered with water, and ſo laid as a cataplaſm, ſtayeth the running of cancerous or eating vlcers, which the Greekes call Phagedænæ. *Democritus* is of opinion, That much feeding vpon Radiſhes, ſtirreth vp luſt and maketh folk amorous; which peraduenture is the reaſon, that ſome haue thought they be hurtfull to the voice. The leaues of thoſe radiſhes onely that haue the longer roots, are ſaid to quicken the eye-ſight: but if a man perceiue that he hath either inwardly taken for a medicine, or applied outwardly, a radiſh root which is ouer ſtrong, he muſt preſently haue Hyſſope giuen him: for this Antipathy and natural contrarietie there is betweene theſe two hearbs, That the one correcteth the other. For them that be hard of hearing, Phyſicians vſe to inſtill the iuice of the Radiſh by drop-meale into the eares. And for them that would perbreake or vomit, the beſt way to take it, is at the end of a meale with the laſt meat. G H

* *Summo cibo*, although *Dioſcorides* ſaith *primo cibo*: and himſelfe in the former booke *Ieiunio*,

As touching Hibiſcum, like it is to the Parſnep: ſome call it Moloche Agria, others Piſtolochia: it cureth the ſores and vlcers that be in griſtles, and knitteth broken bones. The leaues thereof drunke with water, looſen the belly, and chaſe away Serpents. Applied in a liniment or otherwiſe rubbed vpon a place ſtung with Bee, Waſpe, or Hornet, they are a preſent remedie. The roots therof digged out of the ground before Sun-riſing, & enfolded or wrapped in wooll as it grew vpon the ſheepes backe, without any other artificiall colour, and namely of an ewe, which hath yeaned likewiſe an ewe lambe, is thought to be a ſingular thing for to be bound vnto the ſwelling kernels called the Kings euill, yea although they were exulcerat and ran. But ſome are of this mind, That for to doe this deed, it ſhould be gotten vp with an inſtrument of gold; and great heed ſhould be taken, that after it is once vp, it touch not the earth againe. Finally, *Celſus* giueth counſell, to lay the root thereof ſodden in wine to the gouty joynts that are without tumor and ſhew no ſwelling. I

Chap. V.

¶ *Of Staphilinus, or the Parſnep. Of Cheruill, the Skirwort: of Seſeli., Elecampane, and Onions.*

THere is a ſecond kind of Parſnep, named Staphylinus, which commonly men call the Wandring Parſnep. The ſeed bruiſed and drunke in wine, is ſingular good for them that haue ſwolne bellies, the riſing or ſuffocation of the mother in women, with the torments and pains thereto incident, it cureth, inſomuch as it reduceth the matrice into the right place: being applied alſo as a liniment with wine cuit, it helps the wrings and throwes of their belly. It is not amiſſe alſo for men to take it, for the ſeed being ſtamped together with bread crums, of each a like portion, and ſo drunk with wine, cures the belly-ach with them alſo. It prouoketh vrine: and being applied freſh and new with honey, it repreſſeth the ſpreading of fretting and running vlcers. The pouder thereof alſo being drie and ſtrewed thereupon, hath the like effect. *Dioches* aduiſeth to giue the root therof in honyed water, againſt the infirmities of liuer, ſplene, flankes, ſmall guts, loines, and reines. *Cleophantus* ſaith, that it wil helpe (in that manner taken) an old bloudie flix, which hath continued a long time. *Philiſtio* boileth the root in milke, and giueth 4 ounces thereof to them who are troubled with the ſtrangury, or piſſe by drop-meale: but with water, he giueth it for the dropſie, to thoſe alſo that with a cricke or cramp haue their necks drawne backward; for the pleuriſie, and epilepſie or falling ſicknes. Moreouer, it is commonly ſaid, that whoſoeuer hath this root about them, are ſafe enough for being ſtung with any Serpent: nay if they doe but taſt thereof before-hand, they ſhal take no harme if they be either bitten or ſtung by them: and ſay they be alreadie ſtung, let them apply it to the wounded place with hogs greaſe; and it will heale it vp. The leaues chewed help the indigeſtion & cruditie of the ſtomacke. *Orpheus* ſaid moreouer, That this root had an amatorious propertie to win loue, haply becauſe much feeding therof (as it is well knowne) doth ſollicit vnto the game of loue, and maketh folke amorous: which is the reaſon alſo that ſome haue put down in writing, That it will helpe women to conceiue. As for the Garden Parſneps they are in many other reſpects of great force and very powerfull; but the wild is more effectuall, and principally that which groweth in ſtonie grounds. The ſeed of the Garden Parſnep alſo, being drunke in wine, or vinegre and wine together, ſaueth thoſe that are ſtung with Scorpions. If a man pick his teeth and rub them all about with a Parſnep root, he ſhall be eaſed of his tooth-ach. K L M

The

20030
copy 1

A The Syrians are great Gardeners, they take exceeding paines and be moſt curious in gardening, whereupon aroſe the Prouerbe in Greeke, to this effect, *Many Worts and Pot-hearbes in Syria.* They vſe to plant in their gardens a certaine hearb very like to a Parſnep, which ſome call Ginidium, *i.* Tooth-picke Cheruill: more ſlender and ſmaller it is only, and therewith bitterer in taſt, but it worketh the like effects. They vſe to eat it both ſodden and raw, and find it agree well with the ſtomacke: for it drieth vp all the ſuperfluous humours and excrements which be bedded and deepely rooted within it.

As for the wild Skirwort that grows wandring euery where, it is like both in ſhape and operation to thoſe of the garden. It ſtirreth vp the appetite and skoureth the ſtomack of thoſe crudities which cauſed dulneſſe therin, and loathing to meat. *Opion* is verily perſuaded, that if one
B eat it with vinegre aromatized with Laſerpitium, or take it with pepper & honyed wine or elſe with the pickle of fiſh named Garum, it prouokes vrine, and putteth him or her in mind of loue delights. Of the ſame opinion alſo is *Diocles*. Furthermore, that it is a cordiall, and doth mightily corroborat and ſtrengthen the heart, vpon the recouerie of a long and dangerous ſickneſſe; and is beſides ſingular good to ſtay the ſtomacke after much caſting and vomiting. *Heraclides* was wont to giue Skirworts to them who had drunk Quick-ſiluer: ſo ſuch alſo as were but cold & could not ſufficiently perform the duties of mariage: finally, to them that being newly crept out of their beds after ſome grieuous diſeaſe, had need of reſtoratiues. *Hiceſius* was of this mind and ſaid, they were good for the ſtomacke, becauſe no man could poſſibly eat 3 Skirwort roots together: and yet he thinks that they would agree very well with thoſe weak perſons who were
C lately ſick and newly walking abroad, againſt they ſhould fall to their old drinking of wine again. But to come more particularly to the garden Skirwort, If the juice therof be drunke with Goats milke, it ſtayeth the flux of the belly called the Laske. And thus much for the Skirwort, named in Latin Siſer. But foraſmuch as the proximitie and likenes in many Greek names many a time confounds the memorie and deceiues them, cauſing them to miſtake one thing for another, I wil for vicinitie and neighborhood ſake annex vnto Siſer, the hearb Siſer or Seſeli; for me thinks they will doe very well to ſtand together: but this is an hearb very common and well known. The beſt is that which comes from Marſeils, & is therupon named Seſeli Maſſilienſe: it hath a broad flat ſeed and a yellow. A ſecond kind thereof is named Æthiopicum, with a blacker ſeed: but the third which is brought from Candie, and therefore termed Creticum, is of
D all other moſt odoriferous & ſmels ſweeteſt. The root of Seſeli or Siſer, caſts a pleaſant ſauor: and as men ſay, the Vultures alſo or Geirs feed on the ſeed. If a man or woman drinke it with white wine, it cures an old cough; it knits thoſe who are bruſen bellied, or haue ruptures; and laſtly, helps them that be much troubled with cramps or conuulſions. Alſo if it be taken to the weight or quantitie of two or three * Ligules, it cures thoſe who haue their necks drawn backward to their ſhoulders with the Spaſme; it corects the defects and faults of the liuer, it allaies the wrings and torments of the guts; and bringeth them to piſſe with eaſe and freely who are afflicted with the Strangurie. The very leaues of ſiler are alſo medicinable, for they procure eaſy childbirth: yea and in that reſpect the very dumb four-footed beaſt findeth the benefit therof: and that know the Hinds well ynough by a ſecret inſtinct of nature, who being neer their time
F and readie to calue, feed vpon this hearbe moſt of all others. Good it is againſt S. *Anthonies* fire, applied to the place in manner of a liniment. Certes, if a man eat either the leafe or the ſeed of Siler, preſently after meat, or at the latter end of repaſt, it helpeth digeſtion. It ſtaies the gurrie or running out of the belly in 4 footed beaſts, whether it be giuen ſtamped by way of a drench and ſo injected, or chewed drie among their ſalt meat. If kine or oxen be ſicke, ſtampe it and pour it down their throats, or els clyſterize them with it. As for Elecampane, if it be chewed vpon an emptie ſtomacke faſting, it confirms the looſe teeth, ſo that it be taken as it was digged forth of the earth before it touch the ground againe. Beeing confected or condite, it cures the cough. The juice of the root ſodden, expells the broad wormes bred in the guts. The pouder of it dried in the ſhadow helpeth the cough, the ſtitch and cramp, diſſolueth windines & is good
F for * the accidents incident to the throat and windpipes. It is a ſoueraign medicine againſt the pricks or ſtings of venimous beaſts. The leaues applied as a liniment, with wine, appeaſe the extream pain of the loins. As for Onions, I canot find that there be any of them grow wild. Thoſe which are ſown in gardens, I am ſure, wil with their ſmel only cauſe the eyes to ſhed tears, & by that means clarify the ſight: but if they be anointed with the juice, they will mundifie the bet-

* *Ligula* may be taken for *Cochlearei*, a ſpoonfull: it containeth three drams and a ſcruple, ſomewhat vnder halfe an ounce, as a good ſpoone will doe with vs.

* *Arterys*.

ter. It is ſaid that they will procure ſleepe, and heale the cankers or vlcers of the mouth, beeing chewed with bread. Alſo greene Onions applied with vinegre to the plaae bitten with a [mad] dog, or els drie, and laid to with Honey and Wine, ſo the plaſter or cataplaſm be not remoued, in three daies cureth the hurt without danger. In this maner alſo they wil heal * galled places. Being roſted vnder the aſhes, many vſe to apply them with Barly floure or meale, as a pulteſſe or cataplaſme to the eies that be waterie or rheumatick, as alſo to the vlcers of the priuy parts. The imunction of the eies, with the juice therof, is thought to clenſe their cicatriſes or * cloudines of the eies called the pin and web: as alſo to cure the pearle there breeding: moreouer, the bloud ſhotting or red ſtreaks, in the white, and the white ſpots appearing in the blacke circle about the apple. Moreouer, it cureth bitings & ſtings of ſerpents, yea, and heales al vlcers, being emplaſtred with honey. Alſo the exulcerations or impoſtumes within the ears, are by it & womens milke cured. And for to amend the ringing and vnkind ſound and noiſe therin, & to recouer thoſe that be hard of hearing, many haue vſed to droppe the juice of Onions together with Gooſe greaſe or els hony. Furthermore, they giue it to be drunke with water, to thoſe that ſuddenly become ſpeechleſſe and dumb. A collution alſo made with Onions, helps the tooth-ach. And being laid vpon wounds, made either with prick or bite of any venomous beaſt, and eſpecially of Scorpions, it is thought to be a ſoueraign ſalue. Many are wont (to very good effect) for to bruſe Onions, and therewith to rub thoſe parts that be troubled with a skurfe and running mange, as alſo to recouer haire where it is ſhed and gon. Being boiled, they are giuen for to be eaten, vnto thoſe who are diſeaſed with the blodie Flix or pain of the rains & loins. Their outward pilings burnt into aſhes & mingled with vinegre, cure the bitings and ſtings of ſerpents, if the place be bathed or anointed therwith, yea, and the very Onion it ſelfe being applied with vinegre, cures the ſting of that ſhrewd worme Milliped. As for all other vertues and properties of Onions, the Phyſicians are wonderful contrary one to another in their writings: for our moderne and late writers do hold and ſo haue deliuered in their books, That onions are hurtful to the parts about the heart, & other vitall members: as alſo, that they hinder digeſtion, breeding wind and ventoſities, and cauſing drought or thirſtineſſe. *Aſclepiades* and his ſect or followers, contrariwiſe affirme, That onions are ſo wholſome, that they will make them well colored who vſe to feed vpon them: and more than ſo, they ſay that if one in health euery day eat of them faſting, he ſhall be ſure to continue healthful, ſtrong, & luſty: that they be good for the ſtomack, in this regard, that they cauſe rifting and breaking of wind vpward, which is a good exerciſe of the ſtomacke: and withall, that they keepe the bodie looſe and laxatiue, yea, and open the Hæmorrhoid veines if they be put vp in maner of ſuppoſitories. Alſo, that the juice of onions and Fennell together, be maruellous good to be taken in the beginning of a * dropſie. *Item*, That their juice being incorporat with Rue and Hony, is ſoueraigne for the Squinance. As alſo that they will keep waking thoſe who are fallen into a Lethargie. To conclude. *Varro* ſaith, That if Onions be braied with ſalt and vinegre, and then dried, no woorms or vermine will come neere that compoſition.

* *Sic & attrita ſamant.*

* *Hydrôpes*, ſome read *Hypochyſes*, i. *Suffuſiones*; out of *Dioſcorides*, to wit, the Cataract.

Chap. VI.

¶ *Of cut Leekes or Porret: of bolled Leeks: and of Garlicke.*

Porret, otherwiſe called Cut-Leekes or vnſet Leeks, ſtancheth bleeding at the noſe, in caſe it be ſtamped and put vp cloſe into the noſethrils, or otherwiſe mingled with the pouder of the Gall-nut, or Mints. Moreouer, Porret ſtaieth the immoderat ſhift or fluxe of bloud, that follows women vpon a ſlip or abortiue birth, if the juice thereof be drunk in breaſt-milke. In the ſame manner it helps an old cough and al other diſeaſes of breaſt and lungs. Burnes and ſcaldings are healed with a liniment made of Porret or Leek blades: likewiſe the Epinyctides, for ſo in this place I tearme that vlcer, which in the lachrymal or corner of the eie runneth and watereth continually: ſome call it Syce, that is to ſay, a fig. And yet others there be who vnderſtand by that word [Epinyctides] the blackiſh or blew bliſtring wheals, the bloudy fals I mean and angrie chilblanes, that in the night diſquiet and trouble folk that haue them. But to come againe to our Porret: the blades thereof ſtamped and laid too, with Honie, healeth all ſores and vlcers whatſoeuer. The biting of any venomous beaſt, the ſting alſo of Serpents, are cured therwith. As for the impediments of the hearing and the ears, they be remedied with the juice of

20030
copy 1

A of Leeks and Goats gall, or els a like quantitie of honied wine inſtilled thereinto. And as for the whiſtlings or craſhing noiſes that a man ſhall heare within head otherwhiles, they are diſcuſſed with the iuice of Leeks and womans milk dropped into the eares. If the ſame be ſnuffled vp into the noſthrils, or otherwiſe conueighed that way vp into the head, it eaſeth head-ach: for which purpoſe alſo it is good to poure into the eare, when one goeth to bed and lieth to ſleepe, two ſpoonfuls of the ſaid iuice, and one of Honie. The iuice of Porret if it be giuen to drinke with good wine of the grape, againſt the ſting of ſerpents, and namely, Scorpions: likewiſe ſo taken with an * Hemine of wine, it cureth the pains of the loines or ſmall of the back. Such as ſpit or reach vp bloud, ſuch as be diſeaſed with the Phthiſick or conſumption of the lungs, ſuch alſo as haue bin long troubled with the Poſe, the Murre, Catarrhe, and other rheums, find great B help by drinking the iuice of Porret, or eating Leeks with their meat. Moreouer, Leeks are taken to be very good either for the iaundiſe or dropſie. Drinke the ſame with the decoction of husked Barley called Ptiſane, to the quantity of one Acetable, you ſhal find eaſe for the pains of the rains or kidnies. The ſame meaſure and quantity being taken with honey, mundifieth the Matrice and naturall parts of women. Men vſe to eat of Porrets or Leekes, when they doubt themſelues to haue taken venomous Muſhroms. And a cataplaſm therof cureth green wounds. Porret is a ſolicitour to wantonneſſe and carnal pleaſures: it allaieth thirſtineſſe, & diſpatcheth thoſe fumes that cauſe drunkenneſſe. But it is thought to breed dimneſſe in the eie-ſight: to ingender wind and ventoſity; howbeit, not offenſiue to the ſtomack, for that withall it maketh the belly laxatiue. Finally, it ſcoureth the pipes & cleareth the voice: thus much of Porret in blade C or cut Leeks vnſet.

* *Hemina*, is much about ten ounces.

Theſe headed Leeks that are bolled and replanted, are of the ſame operation, but more effectual than the vnſet Leeks. The iuice therof giuen with the pouder either of Gal-nuts, or * frankincenſe or els Acacia, cureth thoſe that reject or reach vp bloud. *Hippocrates* would haue the ſimple iuice therof giuen, without any thing els for that purpoſe: and hee is of opinion, that it will diſopilate the neck of the Matrice and the naturall parts of women; yea, and that they will proue fruitful and beare children the better, if they vſe to eat Leeks. Being ſtamped and laid to filthie ſores or vnclean vlcers with hony, it clenſeth them. Being taken in a broth made of Ptiſane or husked barly, it cureth the cough, ſtaieth the rheume or catarrh, that diſtilleth into the chiſt or breaſt-parts; it ſcoureth the lungs and wind-pipe, and healeth their exulcerations. The D like it doth if it be taken raw without bread, 3 bols or heads of them together each other day: and in this maner it will cure the patient, although he raught vp and ſpit out putrified and corrupt matter. After the ſame maner it cleareth the voice, & it inableth folk to the ſeruice of lady *Venus*, and auaileth much to procure ſleep. If Leeke bols or heads be ſodden in two waters, (*i.*) changing the water twice, and ſo eaten, they wil ſtop the Lask, and ſtay all inueterat fluxes whatſoeuer. The pillings or skins of Leek heads if they be ſodden, the decoction therof wil change the haire from gray to blacke, if they be waſhed or bathed therewith.

* Called *Manna Thuris*.

As touching Garlicke, it is ſingular good and of great force for thoſe that change aire, and come to ſtrange waters. The very ſent thereof chaſeth Serpents and Scorpions away. And as ſome haue reported in their writings, it healeth all bitings & ſtings of venomous beaſts, either E eaten as meat, taken in drinke, or annointed as a liniment: but principally it hath a ſpecial property againſt the Serpents called Hæmorrhoids, namely, if it be firſt eaten, and then caſt vp again by vomit, and wine. Alſo, it is ſoueraigne againſt the poiſonous biting of the mouſe called a Shrew: and no maruell, for why, it is of power to dull and kill the force of the venomous herb Aconitum, *i.* Libard bane, which by another name men cal Pardalianches, becauſe it ſtrangleth or choketh Leopards, yea, it conquereth the ſoporiferous & deadly quality of Henbane: the bitings alſo of a mad dog it healeth, if it be applied vpon the hurt or wounded place with him. As for the ſting of ſerpents verily, Garlick is exceeding effectuall, if it be taken in drink: but withal, you muſt not forget to make a liniment of it, the hairy ſtrings or beard growing to the head, the skins alſo or tails and all, wherby it is bunched, tempered all together with oile, & laid vpon F the grieued place: and thus alſo will it help any part of the body fretted or galled, yea, though it were riſen vp to bliſters. *Hippocrates* moreouer was of this opinion, that a ſuffumigation made therewith, fetcheth downe the after-birth of women newly deliuered and brought to bed: who vſed alſo with the aſhes of them burnt and reduced together with oile into the forme of a liniment, to annoint the running skalls of the head, and thereby cured and healed them vp. Some

giue

giue it boiled, others raw, to them that be ſhort-winded. *Diocles* preſcribeth it with Centaurie to G
In ſico duplici. them who are in a dropſie, he giueth it alſo to purge the belly betweene, or in two figs. But green Garlick taken in good wine, together with Coriander, doth the deed more effectually. Some are wont to miniſter it to thoſe that draw their wind ſhort, being ſtamped and put into milke. *Praxagoras* the Phyſitian ordained to drinke it with wine, againſt the Iaundiſe: alſo againſt the
* i. The wringings and torment of the vpper ſmall guts. Iliack paſſion, in oile and thick *gruel. And in that ſort he vſed to annoint the ſwelling kernels called the kings euill. In old time the maner was to giue raw garlick to ſuch as were beſtraught or out of their wits. But *Diocles* appointed, that it ſhould be boiled for phrentick perſons. Certes, if it be bruiſed and ſo laid to the throat, or otherwiſe gargled with ſome conuenient liquor, it will do much good to them that haue the ſquinancie. Take three heads or cloues of Garlick, beat them well, and together with vinegre apply them to the teeth, they will mightily aſſwage H
the paine. Or do but make a collution with the broth wherein they were boiled, and hold it in your mouth, and afterwards put ſome of the Garlicke it ſelfe within the hollow teeth, you ſhall ſee much eaſe inſue thereupon. The iuice of Garlick together with goos-greaſe, is paſſing good to be dropped into the eares, to aſſwage their pain, and bring the hearing again. Being taken in
Porrigenes, not *prurigenes*, out of *Dioſc.* drink, it cleanſeth the head from dandruffe, and killeth lice: ſo doth it alſo, if it be ſtamped and applied to the place with vineger and nitre. Seeth it in milke, or do but ſtamp it and mingle it with ſoft freſh cheeſe, and ſo eat it, you ſhall ſee how it will repreſſe and ſtay Catarrhes and Rheumes: after which manner it will make them ſpeake cleare that be hoarſe, and haue a ruſty voice. But let a man who hath the Phthiſicke, and is far gone into a Conſumption of the lungs, drink it in bean broth ordinarily, he ſhall recouer or find great eaſe. Generally, Garlicke is bet- I
ter, boiled or roſted, than raw: and yet of the twain, it is not ſo good roſted as ſodden: for in that order muſt it be taken for to help the voice and make a cleare breaſt. Alſo, being boiled in honied vineger or Oxymell, and ſo drunke, it driueth out the broad wormes and all other ſuch like
* A great deſire to goe to the ſtoole, with doing little or nothing. vermin forth of the guts. Being taken in a thicke broth or gruell, it cureth the diſeaſe * Tineſmus. Being ſodden to the conſiſtence of an Vnguent, and ſo applied as a frontal to the temples of the head, it allaieth their paine. Boiled with hony, then ſtamped and reduced to a liniment, it repreſſeth red pimples. Seeth it with good old ſeam or greaſe, or in milk, it is ſingular for the Cough. See you one to reach vp bloud, or to ſpit filthy matter? Roſt Garlick vnder the hot embers, and giue it the party to eat, with equall quantity of honie. Being taken with ſalt and oile, it is a ſoueraign remedy for them that be burſten or Spaſmaticke, that is to ſay, vexed with the K
Crampe. Applied with the fat or greaſe of an hog, it cureth all tumors and ſuſpitious impoſthumes. Being emplaſtred with brimſtone and roſin, vpon Fiſtulaes or ſuch hollow and blind vlcers, it draweth out all the filth and corruption that lieth rankling and feſtering within. But lay it to a ſore with pitch, you ſhall ſee it fetch out ſpils and ends of broken arrowes ſticking ſtill
* Called *Mentagra.* within the fleſh. The Leproſie, the running and dangerous *tettar, the red pimples alſo riſing in the skin, Garlick doth firſt fret and exulcerat; but afterwards, with Origanum, it cureth and healeth the ſame. Yea, the very aſhes of Garlick burnt, and ſo tempered with oile and the pickle,
Sacros ignes, called otherwiſe S. *Anthonies* fire. *Eriſypelas.* [Garum] that it may take the form of a liniment, doth the like. The wild fire alſo, or ſhingles, that hath gotten to a place, if it be annointed therewith, will be extinguiſhed. Be any place of the body grown black and blew by ſtripes or blows, a liniment made of Garlick burnt to aſhes L
and tempered with hony, will bring the natiue and freſh colour again quickly. There is a deepe and ſetled opinion among men, that if a man or woman do ordinarily take garlick with meat & drink, they ſhal find remedy thereby for the falling ſickneſſe. Alſo, that one head of Garlick taken in ſome ſtyptick & harſh raw wine, with Laſerpitium, to the weight of one Obulus, driues away the Quartan ague for euer. But after another ſort, if it be vſed; to wit, boiled with bruſed Beanes, and ſo eaten ordinarily with meat; there is no cough ſo tough, no vlcer within the breſt ſo foule and filthy, but it will ſtay the one, and cleanſe, yea, and heale the other, ſo as the patient ſhall recouer perfect health. Garlicke maketh folk to ſleep well, and giueth a good, freſh, and ruddy colour to the whole body. Garlicke ſtamped with green Coriander, and drunken with
* Contrary to *Galen.* ſtrong wine, increaſeth the heat of luſt, and prouoketh to Lecherie. But as many good proper- M
ties as Garlicke hath, it is not without ſome bad qualities for them againe. It maketh the eies dim, it breedeth windineſſe and ventoſitie; it hurteth the ſtomack, ouer liberally taken, & *cauſeth thirſt: but let me not forget among other vertues which it hath: namely, that if it be giuen to Hens, Cockes, and other Pulleine, among their corne, it will keepe them from the pip.

As

20030
copy 1

A As for Horſes, Mares, Aſſes, and ſuch like beaſts that cannot ſtale, or be groud and wrong in the bellie: ſtampe Garlick, and therwith rub the ſhap and naturall parts; it will prouoke the one, and eaſe the other.

Chap. VII.

¶ *Of wild Lectuce, as well that called Caprina as Eſopus. Of Iſatis and Garden Lectuce.*

THe firſt kind of Lectuce that groweth wild of it ſelfe without mans hand, is that which is commonly called Caprina, *i.* Goats Lectuce. This hearbe hath a propertie, that if it bee thrown into the ſea, it will preſently kil all the fiſhes that approch neere vnto it. The mil-
B kie juice of this Lectuce being turned thick, and ſoon after mixed with vineger, to the weight of two Oboli, and one Cyath of water put therto, is giuen with good ſucceſſe to thoſe that haue the Dropſie. The ſtalks and leaues ſtamped, with ſome ſalt ſtrewed among, and ſo applied as a cataplaſme, do heale vp the ſinews that be cut or wounded. The ſame herb being bruſed together with vineger, preſerueth a man from the tooth-ach, if he vſe two mornings euery moneth to waſh his mouth with a collution made thereof.

It ſhould ſeeme he meaneth here the *Tithymates*, which be *Lactariæ*.

A ſecond kind there is of wild Lectuce, which the Greeks name Eſopus. The leaues thereof being beaten in a mortar and with barly floure, applied as a pulteſſe, heale all vlcers: this groweth ordinarily in corn fields.

C A third ſort comming vp in the woods, is named otherwiſe * Iſatis. The leaues wherof being likewiſe beaten together with Barley-meale or floure aforeſaid, cureth green wounds.

* *Pliny* ſhould ſeeme here to be deceiued: for *Iſatis* is the ſame tha *Glaſtum*. i. Woad, and the wilde thereof indeed is leaued like lectuce which was the occaſion of his error.

A fourth kind there is beſides of wild Lectuce, named Glaſtum, *i.* Woad, wherewith diuers vſe to colour their wooll. It might be likened to the wild Dock for the leaues, but that they be more in number, and of a blacker green withall. This hearb ſtancheth bloud. It repreſſeth and cureth the fierie and eating tettars, the cankerous and filthy vlcers alſo which run and ſpread ouer the whole and ſound parts: alſo it diſſolueth ſwellings before they gather to an head, & tend to ſuppuration. The root or leaues thereof be good againſt S. *Anthonies* fire, applied in a cataplaſme or liniment. It is a ſingular remedy alſo for the ſwelled & puffed ſplene: and thus much for their properties in particular, reſpectiue to each ſeueral kind: but to ſpeak generally of them
D all that grow wild, they agree all in this, that they be white; that their ſtem growes otherwhiles to the height of a cubit; that both it and the leaues be rough in handling. Of theſe wilde Lectuces, That which hath round and ſhort leaues, ſome there be who call Hieracia; becauſe that Faulcons and ſuch like Haukes are wont to ſcrape and ſcratch this herb to get forth the iuice, wherewith they annoint and rub their eies, and thereby recouer their ſight, when they perceiue it to be darkened or dim. All the ſort of them are full of a white iuice: & the ſame of the like vertue as is the iuice of Poppies. Ordinarily is this juice gathered in harueſt by inciſion of the ſtalk: put vp it is in new earthen pots neuer occupied, and ſo reſerued for many excellent effects that it hath. For firſt and formoſt, being applied with womans milk, it healeth all maladies that the eies be ſubiect vnto, as namely, it riddeth away the cloudy webs therein, the cicatrices and
E ſcars: all filthy ſores with a burnt roof ouer them, and principally diſparcleth the miſt and dimneſſe that troubleth the eie-ſight. It is vſually alſo laid with a locke of wooll to the eies, for to repreſſe and ſtay the wateriſh humor that hath found a way thither: the ſame iuice, if one drink it, to the weight of 2 Obolij, in vineger and water, is a good purgation. Beeing taken in wine, it cureth the venomous ſtinging of ſerpents. To which purpoſe, the leaues being parched & dried againſt the fire, their tender ſtems alſo being bruſed, are drunk with vineger. A liniment made of them, is paſſing good againſt the pricking of ſcorpions; but peculiarly for the ſting of the venomous ſpiders Phalangia, there muſt be wine and vineger mixt therwith. Soueraigne defenſatiues alſo theſe wild Lectuces be, againſt other poiſons; ſaue thoſe that kill by ſtrangling and ſuffocation, or ſuch as haue a ſpecial ſpight to the blader; neither are they of any power againſt
F Ceruſſe or white lead. A cataplaſme made therof with hony and vineger, & ſo laid to the belly, purgeth the rotten humors, & expelleth the worms therof bred: their iuice is ſingular good for them that piſſe with pain and difficulty. *Cratevas* preſcribeth to giue the weight of 2 Oboli of the ſaid juice, in one Cyath of wine, to thoſe that be in a Dropſie. Some there be who draw the juice out of the garden lectuce alſo for the ſame purpoſe, but not with like effect. The peculiar

proper-

properties of which Lectuces, I haue partly written of heretofore, & namely, how they procure sleep, abate fleshly lust, coole intemperat heats, clense and strengthen the stomacke, and finally, increase bloud. Ouer and besides, they haue other properties not a few, for they resolue and discusse ventosities, they breake winde vpward, and make one rift and belch sweet, and finally help digestion, and of themselues cause no crudity in the stomack. Certes, I cannot say of any thing else but it, that being eaten, both giueth an edge to appetite, and also dulleth the same: and all according as it is taken, more or lesse. By the same reason also, if a man eat liberally of them, they will make the belly soluble: if in a meane, they will stay a Laske, and bring the bodie to costiuenesse. They cut and dissolue the grosse viscositie of slimie fleame: and as some Physitians haue written, do clarifie the senses. Moreouer, if a mans stomacke be quite gone, so that hee neither desireth to receiue any thing into it, nor can hold and keepe that which it receiueth, he shall find notable comfort by eating of garden Lectuce. But for this purpose they must be taken vnwashed, with some sharpe sauce made with vineger, to the quantitie of a certaine Oboli, yet so, as that the tart and harsh taste thereof be tempered with some wine cuit or other sweet liquour for to dip into. Moreouer, this regard ought to be had, that if the fleame lying in the stomacke, be very tough and grosse, the Lectuce would be eaten with vineger of Squilla or the sea-Onion, or else with Worme-wood Wine: and if the Cough bee also busie, then Hyssope Wine would be mingled withall. In case there bee a fluxe occasioned by feeblenesse of the stomacke, then would Garden Lectuce bee eaten together with wilde Endiue or Cichorie: and so are they good also for the hardnesse and swelling in the mid-riffe and about the heart.

White Lectuce eaten in good quantitie, helpeth the infirmities of the Bladder, and agree very well with those who be troubled in their brains, and ouercharged with melancholy. *Praxagoras* aduised also, That they should be eaten for to helpe the bloudy flix. Moreouer, if they be laid presently (in manner of a liniment, with salt) vpon a burne or scald, while it is new, and before the place blister, they will fetch out the fire and do very much good. They keepe downe and represse cancerous vlcers, that would be running and eating into the flesh, if they bee applied at the beginning with salt-petre, and afterwards with wine. Being bruised into a liniment they heale S. *Anthonies* fire, if the place be annointed therewith. If their stalkes or stemmes bee stamped with drie grout or Barley meale, and laid too as a cataplasme with cold water, they mitigat the pains that follow dislocations or lims out of ioint, they asswage also dolorous cramps and convulsions. Being applied in manner of a pulteese with wine and dry Barley groats, they do allay the griefe of red and angry wheales. Moreouer, they were wont in times past to boile them betweene two platters, and so giue them for the disease Cholera, wherin choler is so outragious, that it purgeth vncessantly both vpward and downeward. But for this purpose, there would be choise made of the faireſt and greateſt stemmes, such also as are bitter, for they bee best. Some to the same effect, make a decoction of them in milke, and so minister it vnto the patient in a clyster. These stalkes being well and throughly boiled, are said to be very wholesome for the stomacke also: like as, for to procure sleepe, the garden Lectuce is thought most effectuall, namely, that which is bitter and yeeldeth store of milk, which hertofore we haue termed Meconis. This milke Physitians prescribe with very good successe for to clarifie the eie-sight, namely, if it be mingled with womans milk, and the forehead annointed therwith in good season and betimes. After the same manner it helpeth the infirmities and diseases of the eyes, proceeding from cold causes. Other vertues and commendable properties besides I finde in Lectuce, of strange and wonderfull operations. And namely, that it cureth the diseases of the breſt, as well as Sothern-wood doth, if it be taken with the best hony of Athens. *Item*, That if any women do eat therof, they shall haue their monthly sickneſse come orderly. Also, that the seed of garden Lectuce is giuen to very great purpose against the pricke or sting of any venomous Scorpion. Moreouer, That if the seed be stamped and taken in wine, it secureth one from the imaginarie fansies of *Venus* delights, in sleepe, and the pollutions also that thereof do insue. Finally, that certain waters which vse to intoxicat and trouble the braine, shall neuer hurt them that eat any Lectuce. Howbeit, some are of opinion, that the ouermuch vse of Lectuce at meat enfeebleth the eies, and impaireth their cleare sight.

CHAP. VIII.

¶ *Of Beets and their ſundrie kinds. Of Endiue. Diuers ſorts of Cichorie. Of garden Endiue, and two kinds thereof.*

A THe Beets of both ſorts are not without their medicinable vertues: for be it the white or the blacke, if one take the root thereof freſh and new out of the ground, wet it throughly, and ſoke it well in water, and then carry it about him hanging by a ſtring or lace, it is a ſoueraigne preſeruatiue againſt the biting of ſerpents. The white Beet boiled and eaten with raw Garlick, expelleth the broad wormes in the belly. The roots of the black, ſodden after the ſame manner in water, rid away the dandruffe or vnſeemly skales within the haire of head or beard:
B And indeed generally for any vſe, the black Beet is more effectuall than the white. The iuice thereof is ſingular good for an old and ſetled head-ach. For the dizzineſſe or ſwimming in the head. Alſo, it riddeth away the ſinging and ringing in the eares, if it be dropped into them. It procureth vrine: being injected by a clyſter, it cureth the bloudy flix: it helpeth alſo the Iauniſe. Moreouer, the ſaid iuice appeaſeth the intollerable pain of tooth-ach, if the teeth be rubbed or annointed therewith. Singular it is, againſt the ſtinging of ſerpents: but then it muſt be drawne from the root only. And make a decoction of the ſaid root, it helpeth kibed heeles. As for the juice of the white Beets, it ſtaieth the rheume or wateriſh humor that falleth into the eies, if the forehead be therewith annointed. And put but a little Allum thereto, it is an excel-
C lent remedy againſt S. *Anthonies* fire. White Beets only ſtamped, although there come no oile vnto them, healeth any burne or ſcalding, if the place be therwith annointed. Moreouer, againſt the breaking out into red and angry pimples, the ſame is very good. But ſeeth Beets, and make thereof a liniment, it repreſſeth the vlcers that run and ſpread abroad. The ſame being raw, rubbed vpon the bare places, where the haire is ſhed, recouereth haire, yea, and ſtaieth the running skales of the head. The iuice of theſe Beets tempered with honey, and ſnuffed vp into the head by the noſthrils, clenſeth the braine. There is a certain meat made with * Beets & Lentils boi- * συνθέσει.
led together, which commonly is eaten with vineger for to make the body laxatiue. The ſame being ouerſodden to a thicke conſiſtence, ſtaieth both the turning of the ſtomacke, and flux of the belly.

There is a kind of wild Beet, which ſome name Limonion, others Neuroides: it hath leaues
D much leſſe and tenderer than the other, howbeit, growing thicker; & riſeth vp many times with eleuen ſtalks. The leaues of this Beet are very good for burnes and ſcalds: they reſtraine and ſtay all Fluxes by drop meale, which breed the Gout. The ſeed being taken to the quantity of one Acetabulum, cureth the bloudy flix, & healeth the vlcer of the guts that cauſeth the ſame. Some ſay, that if this Beet be ſodden in water, the decoction will ſcoure and take out any ſtain in cloths, euen the very iron-mole: likewiſe it will waſh away any ſpots in parchment.

Now as touching Endiue or garden Cichorie, furniſhed alſo it is with many properties effectuall in Phyſicke. The iuice thereof mingled with oile Roſat and vineger, allaieth the paine in the head. The ſame if it be drunk with wine, is good for the liuer and bladder. Alſo, if it be laid to the eies, it ſtoppeth the humor that hath taken a courſe thither. The wild Cichorie, that
E groweth wandering here and there abroad, ſome of our Latin writers name * Ambugia. In Æ- * or rather *Ambubia.*
gypt they cal the wild Endiue, Cichoreum; & the tame garden Endiue, Seris: the which indeed is leſſe than the other, fuller alſo of ribs and veines, As for the wild, which is Cichorie, it hath a cooling nature, being eaten as meat; but applied in forme of a liniment, it is good againſt the collection of humors that ingender impoſthumes. The juice of it ſodden, doth looſen the belly Wholeſome it is for the Liuer, the Kidnies, and the Stomack. Likewiſe, if it be boiled in vineger, it reſolueth the painfull torments occaſioned by the ſtopping or difficulty of vrine, and openeth paſſage to make water at eaſe. Moreouer, if the juice or decoction thereof be drunk with honied wine, it cureth the Iaundiſe, ſo it be without a feuer. It is comfortable alſo & helpefull to the bladder. Boiled in water, it is ſo powerfull to bring downe womens termes, that it is of
F force to ſend out the child, if it be dead in the mothers belly. The Magitians ſay moreouer, that whoſoeuer annoint their bodies all ouer with the juice of this herb and oile together, they ſhal be right amiable, and win the grace and fauor of all men, ſo as they ſhal the more eaſily obtain what ſoeuer their heart ſtands vnto. And verily, for that it is ſo ſingular and wholeſome to mans body, ſome giue it the name of χρυσίτις, others of πανάκεια:

As

As for another wild kind, ſome call it * Hedypnois, & that hath a broader leaſe than the reſt. Being ſodden, it is aſtrictiue and will ſtrengthen a weak ſtomack: and eaten raw, it bindeth the belly and ſtaieth the lask. Holeſome it is for ſuch as haue the bloudy flix, the rather if it be taken with Lentils. In ſum, as wel raw as ſodden, both kinds, the one & the other, help thoſe that haue cramps and ruptures. Comfortable it is likewiſe to ſuch as vpon occaſion of debility or ſickneſſe, haue their nature or ſeed run from them againſt their wills. G

* For that being eaten with meat, it maketh the breth ſweet.

Touching Cichory of the garden, which is very like vnto the Lectuce, there be two kindes thereof; but the green that ſeemeth to be of a wilde and ſauage nature, is the better: of a more brown and duskiſh colour it is, and a Summer herb only. The other indeed is whiter and continueth all winter, howbeit worſe of the twaine: and yet both the one and the other, are right comfortable to the ſtomack, eſpecially when it is ouercharged with wateriſh humors. Beeing eaten in a ſalad with vinegre at meat, they refreſh and coole mightily: ſo do they alſo in forme of a liniment, and by that means reſolue other humors beſides thoſe in the ſtomack. Generally the roots of all wild Cichories being ſodden with barly grouts to a gruel, and ſo ſupped off do comfort a weake ſtomack. Being reduced into a liniment, & applied to the region of the heart aboue the left pap, with vineger, they cure the trembling thereof, and the faint cold ſweats that break out vpon weakneſſe. All the ſort of theſe Cichories as well tame as wild, being taken in broth each other day, be good for gouty perſons, for ſuch alſo as reach and caſt vp bloud, ſhed their ſperm or haue the running of the reins. Howbeit *Petronius Diodotus* in his booke intituled * Contradictions, vtterly condemned the garden Endiue Seris, and alledged many reaſons and arguments to confirme that poſition of his; howbeit the whole colledge of all Phyſicians beſides ſtand againſt him. H I

* *Antilegometia*, ſome read ἀντιλογιῶν, i. floure gatherings.

Chap. IX.

¶ *Of Garden Coleworts, Lapſana, Sea Coleworts, or Soldanella; of Squilla; of other bulbous roots, as the Potatoes: and of Bulbium.*

THe commendable proprieties of the Colewoort are ſo many, that it were a long labor to diſcipher them all, conſidering that both *Chryſippus* and *Dieuches*, two Phyſitians, haue compiled each of them a booke particularly of this hearbe, wherein they haue collected their vertues, as they be appropriat and reſpectiue to euery part of mans body; yea and before al others, *Pythagoras*, and after him *Cato*, haue as amply ſet out the praiſes therof. As for *Catoes* opinion and judgement of the ſaid herb, I am the more willing in this place to ſet downe and follow diligently, becauſe it might be knowne what ſimples and what drugs they were which the old Romans vſed for their Phyſicke * 600 yeres after the foundation of the city. The Greeke writers of greateſt antiquity, haue made three kinds of Coleworts; to wit, the criſped or ruffed cole, which they called Selinas or Selinoides, for the reſemblance that the leaues haue to Parſley: theſe Coleworts be good for the ſtomack, and gently looſen the belly. The ſecond ſort is named in Greeke * Lea, with broad leaues ſpringing forth from a great ſtem: whereupon ſome haue giuen it the name of * Caulodes: theſe woorts are to no vſe at all for Phyſicke. The third is properly called by the name of Crambe; very well ſtored with leaues this is, but thoſe are ſmaller than the reſt, ſimple alſo & plain: bitterer beſides this Cole is in compariſon of others; but moſt effectuall in Phyſick. Howbeit, *Cato* preferreth before all, that which is criſp and frizled: next vnto it, the ſmooth Cole, with the large leaf & big ſtalk. He commendeth the Colewort (ſtamped raw together with vineger, honey, Coriander, Rue, Mints, and the root of Laſer) to be ſingular good for the head-ach, the miſt and dimneſſe of the eies, the appearance of ſparkling motes before them, the ſtomack and precordiall parts; if a man take faſting 2 Acetables of this compoſition. And he ſaith moreouer, that this confection is ſo ſoueraign, that they who do but bray and beat the ingredients, ſhall ſenſibly find themſelues mightily comforted and fortified thereby. And he concludeth withall, that Coleworts may be either ſtamped together with the foreſaid *ſpecies*, and ſo taken in a ſupping; or els be eaten, firſt dipped and ſoked in the forenamed liquor: as alſo that a liniment made of them, together with Rue, a little Coriander, ſome few corns of ſalt, and barley meale, is ſoueraigne to aſſwage the paines of any gout, be it in feet, hands, or any other ioint whatſoeuer. Moreouer, that a decoction made therof, doth wonderfully comfort and fortifie the ſinewes, yea and mitigate the arthriticall griefes or ioint-ach, if

* For about that time *Cato* liued.

* *i.* Smooth and plaine.

* *i.* The ſtemmic Cole.

Plinius

A if the parts be tormented therewith. Ouer and beſides, a fomentation made therewith, is ſingular for al freſh wounds, old vlcers, yea and cankers, which could not poſſibly be repreſſed or healed by any other medicines: but he appointeth firſt that they be bathed in hot water, and then a cataplaſme of the ſaid worts to be laid vpon the afflicted place, and the ſame to be refreſhed twice a day. By which manner of cure, he ſaith, that fiſtulous ſores may be healed, diſlocations ſet ſtreight, ſwellings and impoſthumes drawn outward to an head; or otherwiſe where need is, diſcuſſed & reſolued, before they tend to ſuppuration. He addeth moreouer & ſaith, that whoſoeuer eat good ſtore of ſodden Coleworts, together with oile and ſalt faſting in a morning, ſhall fall to ſleep again in the night if they were before ouercharged with watching, & in their ſleep ſhall not be troubled with dreams or other vnquiet fanſies and imaginations. Furthermore hee
B affirmeth, that worts twice boiled, are excellent good for the torments and wrings of the belly, ſo there be ioyned to the ſecond decoction, oyle, ſalt, cumin, and barly groats; and thus beeing eaten without bread, they are the better: among other effects that theſe Coleworts do work, this is not to be forgotten, that they purge cholerick humours, being taken with ſweet groſſe wine. More than that, he auoucheth, That if his vrine, who vſe to feed of Colewoorts, be reſerued, it is ſingular good for the ſinews, if the grieued part be bathed therin after it is made hot again. But becauſe you ſhould fully vnderſtand his meaning, I care not much to ſet downe his very words for to expreſſe the ſame the better. If (quoth he) you waſh little children with the ſaid vrin prepared in manner aforeſaid, they will neuer be weak and feeble in their lims. He aduiſeth moreouer, to drop the juice of Colewoorts warme into the eares with wine, and aſſureth vs that it is
C good for them that be hard of hearing. Finally, that ringworms, tettars, itch, and dry ſcabs (ſuch as be not exulcerat) are healed thereby.

Now concerning the opinion of the Greeks alſo, as touching Coleworts, I thinke it meet to ſet them down for *Catoes* ſake, I mean touching thoſe points only that he ouerpaſſed and omitted. Firſt and formoſt therefore, the Greeks hold, that the Colewort being not throughly ſodden, purgeth choler & keeps the body ſoluble; howbeit twiſe ſodden, it bindeth the belly. *Item*, That it is contrary to wine, and a very enemy to vines. And more particularly, if it be taken faſting, or in the beginning of a meale before other meat, it preſerueth a man from drunkenneſſe; and eaten after meat when a man is drunken indeed, it riddeth away the fumoſities in the brain and bringeth him to be ſober. Alſo, that it is a meat appropriate to the eies, and cleareth the
D ſight very much; inſomuch as the iuice of it raw is paſſing ſoueraigne for that purpoſe, in caſe it be mingled with the pure Atticke hony into an eie-ſalue, and therewith the corners of the eyes be but touched only. Moreouer, that it is paſſing light of digeſtion, and clarifieth all the ſenſes, if it be ordinarily eaten. *Eraſiſtratus* and all his ſchoole, doth ring and reſound again with one voice and open mouth, That there is nothing in the world better for the ſtomacke, nothing more wholſome for the ſinews; and therfore with one accord they preſcribe the vſe thereof, for thoſe that haue the palſie or reſolution of the nerues; for as many as be troubled with the trembling and ſhaking of their lims, to ſuch alſo as reach & caſt vp bloud. *Hippocrates* giueth counſell to them that be afflicted with the bloudy flix or exulceration of the guts; to thoſe likewiſe who be ſubject to the flux proceeding from the weakeneſſe of the ſtomacke, for to eat it twiſe
E ſodden with ſalt. Alſo he preſcribeth it in the cure of Tineſmos (which is a prouocation or extraordinary appetite to ſeege, without doing any thing;) and of the paine in the back or reines. And he is of this judgement, That women in childbed ſhall be good nources and haue plentie of milke, if they eat of Cabbages or Coleworts; yea and women in generall, by feeding thereupon, ſhall ſee their monthly termes duly. As for the Cole it ſelfe, if it be chewed raw, it is (by his ſaying) of force to expell a dead infant in the wombe. *Apollodorus* holdeth reſolutely, That either the ſeed or juice thereof taken in drinke, is a ſingular remedy for them who ſuſpect that they haue eaten venomous muſhrums. *Philiſtion* giueth the juice thereof in Goats milke, together with ſalt and honey, vnto ſuch as haue a cricke or cramp drawing their necks backeward, that they are not able to turne their heads. I find moreouer, that by eating Coleworts at meat
F ordinarily, and by drinking the decoction thereof, many haue been deliuered from the gout. It is an vſual medicine and approued by experience, to giue it with ſalt for the fainting ſweats & trembling of the heart, as alſo for the falling euill. Such as be troubled with the ſpleene, finde much eaſe thereby, if they continue drinking the juice therof in white wine at their meals forty daies together; like as thoſe that be ſped with the yellow jaunife, or in fits of frenſie, be cured

with gargling & drinking juice of Cole-roots raw. But againſt the Hocquet or Yex, there is a G
notable medicine made with it, together with Coriander, Dill, hony, pepper, and vineger. If the
pitch of the ſtomacke be annointed therewith, the Patient ſhall euidently perceiue, that it will
diſſolue the wind and puffing ventoſities therin. Alſo, the very water of the decoction incorpo-
rate together with barley-meale, vnto a liniment, is ſingular good for the ſtinging of Serpents,
and mundifieth filthie old vlcers: to which purpoſe alſo ſerueth the juice thereof, applied with
vineger and Fœnigreek. After the ſame manner, ſome make a cataplaſme, and applie it to gou-
tie joints. The bloudy-falls and bliſtering chilblanes, and generally all humors that ouer-run
the body and fret the skin, are allaied by the application aforeſaid. In like manner, the ſudden
miſts and dimneſſe which commeth ouer the eie-ſight, is diſcuſſed & diſpatched clean, in caſe
*Cum Sulphure illita. one do no more but chaw this herb in vineger. A liniment made with it and * brimſtone toge- H
ther, helpeth the black and blew ſpots of dead bruſed bloud lying vnder the skin, and reduceth
them to their owne colour. But if round alume and vineger be joined therewith, it cureth the
white leproſie, and dry ſcab [called of ſome S. *Magnus* euill.] And in that manner prepared, it
keepeth the haire faſt that is ready to ſhed. *Epicharmus* ſaith, That this herb is ſoueraigne good
to be implaiſtred vpon thoſe tumors and ſwellings that be incident to the priuy members, and
the rather, if the ſaid implaiſter be made with bean-meale. The ſame being applied with Rue,
is good for convulſions or crampes. Moreouer, there is a medicine preſcribed to bee made of
Coleworts and Rue-ſeed, againſt the extreme heat of feuers ardent, as alſo for the defects and
infirmities of the ſtomack, and to ſend out the after-birth in women newly laid. The powder of
Colewort leaues dry, doth expell or euacuate one way or other, the venome left behind by the I
biting of the hardy ſhrew-mouſe. Of all kinds of Coleworts, the ſweeteſt and moſt pleaſant to
*Gyma. the taſt, is the * Col-flory, although it be counted good for nothing in Phyſick, and beſides vn-
wholſome, as being hard of digeſtion and an enemy to the kidnies. Ouer and beſides, I muſt not
forget this one thing of Coleworts, That the broth or decoction thereof (ſo highly prayſed for
many good vſes that it is put vnto) if it be poured on the ground, hath but a ſtinking ſmel with
it. Wort-ſtocks being dryed and burnt into aſhes, is thought to be a cauſtick medicine or po-
tentiall cautery. The ſame aſhes mingled with old greaſe and reduced into a cataplaſme, hel-
peth the pain of the Sciatica: but with Laſer and vineger, it is a depilatory, (*i.*) keepeth the
hayre from growing againe where it was once fetched vp by the roots. The ſayd Coleſtocke
aſhes ſet ouer the fire vntill it ſiuer only, or haue one walme at the moſt, and ſo drunk with oile, K
or otherwiſe ſodden, and the decoction taken alone without oyle, is good for Spaſmes and
crampes, for inward bruiſes, and for ſuch as are falne from ſome high place. Lo, what a num-
ber of prayſe-worthy vertues are recounted of Coleworts! And is there (I pray you) no fault to
be found with them? are they blameleſſe? ywis no: for euen thoſe writers who extolled them ſo
highly, note them for making a ſtinking breath, and for hurting the teeth and gums: inſomuch
as in Egypt, they be in ſo bad a name for their bitterneſſe & vnpleaſant taſt, that no man know-
eth how to eat them. But to come again vnto *Cato*, he commendeth the effects of the wilde or
wandring Colewort infinitly aboue the reſt; inſomuch as he affirmeth, that the powder of it
dried, being gathered and incorporat with ſome conuenient liquor into the forme of a poman-
der, or otherwiſe ſtrewed vpon any poſie or noſegay, ſo as it may be receiued and drawn vp into L
*Some cal the *Polypi.* the head by the noſthrils, cureth the * filthy vlcers growing therin, and the ſtinking ſmell that
commeth from them. This Cole-wort, others call Petræa, and this is that which of all the reſt
is moſt aduerſe and the greateſt enemy to wine; this is it that the vine (by a ſecret Antipathie
in nature) doth eſpecially auoid, if it haue room to decline from it; but in caſe ſhe cannot ſhift
from it, ſhe dieth for very griefe. This plant hath the leaues growing two by two together, and
*Oleris. thoſe ſmall, round, ſmooth, and liker indeed to the young plants of * Beets than to other Cole-
worts; whiter alſo it is, and more rougher clad with a moſſie downe, than is the garden Cole-
wort. *Chryſippus* writeth, That it is a ſoueraigne medicine for flatuoſities, and ſuch as be oppreſ-
ſed with melancholy: that it is a ſingular ſalue for freſh wounds, being applied with hony; but
with this charge, That the plaſter be not taken off in ſeuen daies. Alſo, if it be ſtamped and ap- M
plyed with water, it is an excellent cataplaſme for the Kings euill, and fiſtulous inward vlcers.
Other Chirurgions and Phyſitians do affirm, that it repreſſeth running & coraſiue ſores which
eat into the fleſh, ſuch as the Greeks name Nomus. *Item*, that it doth extenuate and reſolue all
excreſcence of proud, ranke, or dead fleſh; yea, and it doth incarnat, heale vp, and skin very faire
without

Plinius

A without skar, by their ſaying. Moreouer, if it be chewed, or the iuice therof gargariſed with ho-
ney, ſo that the herb were ſodden before, it cureth the ſores in the mouth called cankers, as alſo
the mumps and inflammation of the kernels in the throat, called amygdales, or almonds. Sem-
blably, if a man take three parts of this herbe, with twaine of alume, and together with Vinegre
make a liniment thereof, it will clenſe the inueterate dry ſcab, and the mortified leproſie. *Epi-*
charmus is of opinion, That for the biting of a mad dog, a man need doe no more but lay to the
ſore a cataplaſme of this herb alone: but ſurer it were (ſaith he) and more effectual, if Laſer and
ſtrong ſharp vinegre were ioyned thereto. He addeth moreouer and ſaith, That if it be giuen to
dogs with ſome piece of fleſh it will kill them. And yet the ſeed being parched is a remedie a-
gainſt the ſting of ſerpents, and a countre-poiſon to venomous Muſhroms and Buls bloud. The
B leaues boiled and giuen with meat, or otherwiſe raw and made into a liniment together with
brimſtone and nitre, help thoſe that be diſeaſed in the ſplene. The ſame liniment mollifies the
hard ſwellings of womens breaſts. The aſhes of the root being burnt, cure the uvula, or ſwelling
of the wezil in the throat, if it be but touched therewith. Alſo a liniment thereof with honey
applied to the inflamed kernels behind the eares, repreſſeth them, yea and healeth the ſtinging
of ſerpents. I haue not yet done with the Colewort and the vertues thereof; but one inſtance
more I will giue you, to proue the wonderfull force and effect that it worketh. If any braſſe pot
caldron, or ſuch like veſſel wherin we vſe to ſeeth water ouer the fire, haue gathered in continu-
ance of time a fur or cruſt baked within, ſuch as by no waſhing or ſcouring can be rid away, bee
the ſame neuer ſo hard, deep ſetled, and inueterate; boile but a cabbage or Colewort in it, and
C the ſame will pill and go from the pot ſides.

Among wild worts we may place Lapſana, a plant growing to the height of a cubit, bearing
a furred or hairy leafe, like for all the world to the Navew, but that the floure is whiter. This
herb is commonly ſodden and eaten in pottage; and ſo taken it moderatly looſeneth the belly.

The ſea Colewort [otherwiſe named Soldanella] of all others purgeth moſt forcibly: in re-
gard of which acrimonie that it hath to ſtir the belly, Cookes vſe to ſeeth it with fat meat, and
yet is it moſt contrary to the ſtomack.

Touching Squils of Sea-Onions, Phyſitians hold that the white is the male, and the blacke
the female: but the whiteſt of them be euer beſt and of moſt vſe. The maner of preparing and
dreſſing them is after this ſort: Firſt, the dry tunicles or skins being pilled off, the reſt, which is
D quick and freſh vnderneath, muſt be cut into ſlices, & ſo infiled vpon a thred along, with a pre-
ty diſtance between euery one, and hanged vp to dry: afterward, when the morcels be ſufficient-
ly dried, they are to be put, hanging ſtil as they did by a ſtring, into a barel or veſſel of the ſtron-
geſt and quickeſt vineger that can be gotten, and therein they muſt hang ſo as they touch no
part of the ſaid veſſel: but this would be ſet in hand with 48 daies before the ſummer ſolſtice.
Which done, the barrel of Vineger beforeſaid being well luted and ſtopped cloſe with plaſtre,
muſt be ſet vnder a roofe of tiles, to receiue the heate of the Sun all the day long from morning
to night. Now when it hath bin thus ſunned ſo many days as are before named, the veſſel is re-
moued from vnder the caſe of tiles, the Squilla taken forth, and the vinegre poured out into a-
nother veſſel. This vinegre clarifieth their eie-ſight who vſe it: comfortable it is to the ſtomack
F and ſides, and aſſwageth their paine, if it be taken in ſmall quantitie once in two daies: for if a
man ſhould dring ouer-liberally of it, ſo forcible it is that it would take away his breath, and
cauſe him to ſeem dead for the time. Squilla chewed alone by it ſelfe is wholſom for the gums
and teeth. Being drunk with vineger and honey, it chaſeth out of the belly the long flat worms
and all other ſuch like vermin. If it be but held vnder the tongue while it is greene and freſh, it
allaieth thirſtineſſe in the dropſie, and cauſeth that the Patient ſhall deſire no drink. The boi-
ling of Squilla or the ſea-onion is after many ſorts: for ſome, after they haue either well luted,
or els greaſed it all ouer with fat, put it into a pot of earth, and then ſet it into an ouen or Fur-
nace to be baked. Others ſlice it into gobbets, and ſo ſeeth it between two platters. Some take
it green and dry it, then they cut it in pieces and boile it in vineger; and being thus vſed and
F prepared, apply it to the places which be ſtung with ſerpents. Others againe roſt it firſt in the
embres, and after they haue cleanſed it from the vtmoſt pilling, take the beſt of it onely in the
mids, and ſeeth the ſame again in water. Being thus baked and ſod both, it ſerueth to be giuen
in a dropſie. And if it be drunk to the quantitie of three Oboles with hony and vinegre, it pro-
uoketh vrine with eaſe. In like maner, this compoſition is good for thoſe that be troubled with

the ſplene,or haue weak and feeble ſtomacks,or be troubled with gnawing and pain there: ſuch G
alſo as canot hold their meat,but it will flote aboue and come vp again:prouided alwaies, that there be no vlcer within the body. Moreouer,it is excellent good for the wringing in the guts, the jauniſe,the old cough,with ſhortneſſe of wind. The leaues emplaſtred reſolue the wens or ſwelling kernels in the neck,commonly called the Kings euil,but they muſt lie foure daies before they be remoued. Being ſodden in oile and reduced to a liniment,and ſo applied, it mundifieth the skurfe or dandruffe of the head,the running skalls likewiſe that are bred there. It is vſed alſo(boiled vp with hony into a certain confection) taken with meat for to helpe digeſtion,and in that ſort it purgeth the intrals. Sodden in oile and tempered with roſin, it heales the chaps and clifts in the feet. The ſeed of Squilla implaſtered with honey vpon the reines of the back or the loins,eaſeth the pains. *Pythagoras* was of opinion,and ſo reported,that if the Squilla H
or Sea-onion were hanged vp in the entry of any dore,it kept out all charms, enchantments, or ſorceries. And thus much of Squilla.

Moreouer,the plants called Bulbs,being applied in form of a liniment, with brimſtone and vineger,do cure the wounds of the viſage:and ſtamped by themſelues alone,and ſo laid to,they help the contraction or ſhrinking of ſinues : and if there be wine added thereto,it clenſeth the dandruffe in head,beard,and eye-browes : but applied with honey it cureth the biting of mad dogs : howbeit *Eratoſthenes* taketh pitch in ſtead of hony for the ſaid purpoſe: who writeth beſides, That a cataplaſme of them and hony together,ſtancheth bloud in a green wound : but others ioyne Coriander and corn-meale to the reſt,properly for bleeding at the noſe. *Theodorus* cureth wild tettars and ring-wormes therewith, being applied with vinegre : and with ſtyptick I
harſh wine,or an egg,he vſeth it for the breaking out in the head. Moreouer,a liniment made of Bulbs he applieth about the rheumatick humors that fall to the eies,and by that means cureth thoſe that be bleere eyed. Semblably,the red of this kinde eſpecially reduced into a liniment, and firſt incorporat with hony and nitre,taketh away all the ſpots and blemiſhes that disfigure the face,if they be anointed with it in the ſun: but with wine and Cucumber ſodden they rid away alſo the red pimples. They be wonderfull good of themſelues alone for green wounds ; or with honied wine(according to the practiſe of *Damion*) ſo they be not remoued in fiue dayes ; and he was wont therewith to cure cracked eares alſo, and the flatuous flegmatick tumours of the cods. Others there be who apply them with meale mingled among, to aſſwage the pain of the gout. Sodden in wine,and ſo applied as a liniment to the belly,they mollifie the hardneſſe in the precordial parts and midriffe : and for the bloudy flixe, a drinke made thereof,together K
with raine water and wine,is a ſingular remedy. Being taken in pils as big as beanes,with Silphium,they are ſoueraigne for the contraction of nerues or inward crampes within the bodie. Stamped into a liniment,they reſtrain immoderat ſweats that be diaphoreticall. Comfortable they be to the nerues,and therefore they are preſcribed and giuen in caſe of the palſie. Thoſe with the red roots being made into a cataplaſm with ſalt and hony, doth ſpeedily cure the diſlocations of the feet that be out of ioynt. The bulbs of Megara eſpecially do prouoke luſt. As for thoſe that be called Hortenſij,taken with Cuit wine or Baſtard,make ſpeedy deliuerance of the child out of the mothers belly. The wild bulbs brought into the form of pils,with Laſerpitium,and ſo ſwallowed downe,do heale inward wounds and other maladies of the intrals. The L
ſeed of the garden Bulbes in wine, is a good potion againſt the ſting of the ſpiders called Phalangiæ : and the roots with vinegre ſerue for a liniment againſt the ſtings of other ſerpents. The antient phyſitians in times paſt were wont to giue the ſeed in drink to them that were out of their wits. The floure of theſe Bulbes being bruiſed into a Cataplaſme taketh away the red dapled ſpots in their legs who haue ſit neere the fire and burnt their ſhins. But *Diocles* is of opinion,that all theſe bulbous plants do dim the eie-ſight : who ſaith moreouer, That they are not ſo good boiled as roſted : and yet be they all (ſaith he) hard of digeſtion more or leſſe, according to the nature of each one that eateth them.

There is an herb which the Greekes call Bulbine,with a red bulbous root,and leaues reſembling Porret : of which there is a ſingular good ſalue made for to heale green wounds,but none M
els. To conclude,as touching the bulb called Vomitorius(of the effect that it hath to prouoke vomit) it hath blackiſh leaues,and thoſe longer than the reſt.

Plinius

Chap. X.

¶ *Of Garden Sperages, and the wilde Sperage Corruda: of Lybicum and Hormenium.*

A Of all Garden herbs, the Sperages are (by report) the beſt meat to be eaten, and agree paſſing wel with the ſtomack; and verily being taken with Cumin, they diſſolue the ventoſities in the ſtomack, and diſpatch the wind cholick, and withall they cleare the ſight paſſing well. Kindly do they mollifie the belly and keep it ſoluble. If they be ſodden in water, and
B a little wine put thereto in the boiling, and ſo giuen to drink, they are very good for the pain of the breſt & the backbone; for the diſeaſes alſo within the guts. If one take the weight of three Oboli of the ſeed, and as much of Cumin, and ſo drinke it in ſome conuenient liquor, hee ſhall find a ſingular remedy for the pain of the reins, hanch, and loines. Garden Sperages ſollicit vnto the game of loue, and procure good deliuerance of vrine; for which they had no fellow, but for feare that they will fret and exulcerate the bladder. Moſt Phyſicians doe highly commend their roots bruſed and taken in white-wine, for to expell the ſtone and grauell; as alſo to allay the pains of the reins, flanks, and loins. Some there be, who giue to drinke in ſome ſweet wine the ſaid root, for the grieuous pains of the matrice: and the ſame being well and throughly boi-
C led in vineger, is a ſoueraigne remedy for the leproſie, to as many as will vſe to drink the ſaid decoction. If a man be annointed with Aſparagus or garden-Sperage, ſtamped together with oile and ſo made into a liniment, there will not (by report) a Bee come neere for to ſting him.

The wild Sperage, ſome name it Corruda, others Lybicum, but the Athenians cal it Hormenium: this herb is more effectuall in all thoſe matters aboue rehearſed than the former, & the whiter that it is, the greater force it hath. The jaundiſe it doth diſſipat and driue away. When it is ſodden in water, the decoction thereof to the quantity of a * wine pint or ſomwhat leſſe, is * Hemina.
vſually preſcribed to them that deſire to performe the act of generation luſtily. For the ſame purpoſe alſo, the ſeed thereof and Dill, of each three oboli, is counted very good beeing taken in drinke. The juice therof boiled, is giuen againſt the ſtinging of ſerpents. The root of it and Fennell together, is thought to be moſt ſingular and of greateſt efficacy in that caſe: for piſſing
D bloud, *Chryſippus* preſcribeth to giue in two cyaths of wine for fiue daies together, three oboli of the ſeed of Aſparagus, Parſley, and Cumin; but he ſaith withall, That this medicine is nothing good for the dropſie, notwithſtanding that it is diuretical and prouoketh vrine. Alſo that it is aduerſe and contrary to the delights of *Venus*, yea and to the bladder, vnleſſe the ſame ingredients be ſodden; and yet will that decoction kill dogs if it be giuen to them. To conclude, the juice drawne out of the root therof, being firſt boiled, and ſo held in the mouth, is good for the teeth.

Chap. XI.

¶ *Of Parſley, wild Ach, of Smallach, and Ach of the mountains.*

E Parſley is in great requeſt, and no man lightly there is but loueth it: for nothing is there more ordinary, than to ſee large branches of Parſley good ſtore, ſwimming in their potage: and commonly you haue not a ſallad or ſauce ſerued to the boord, you ſee not a piece of meat farced or ſeaſoned, but Parſley carieth therein a great ſtroke, and contenteth euery body. Ouer and beſides, if it be applied as a liniment, together with honey vnto the eies, ſo that they be fomented alſo euer and anon with the hot juice of Parſley boiled, it is a ſingular remedy for the humours diſtilling thither. Alſo, if it be but ſtamped by it ſelfe alone, or els with bread or barly groats, it wonderfully helpeth the defluction falling vpon any other part, if the ſame bee laid vpon the place afflicted in maner of a cataplaſm. Moreouer, if a man perceiue that the fiſh in any pond or ſtew do miſlike and grow ſickly, it is a common practiſe to giue them green par-
F ſley to ſcoure and refreſh them. Howbeit, for all that Parſley is ſo good, there is not an herbe growing vpon the face of the earth, that learned men varie and diſagree in opinion more about, than they do in it; & yet they hold all, that there is a diſtinct difference therein by the ſex: for of Parſley there is both male & femal; mary which is the one & which the other, they accord not. *Chryſippus* ſaith, That the female hath more criſp & curled leaues than the male, and thoſe boiſtrous & hard; that the ſtalk is thick, & the taſt of the herb biting & hot. *Dionyſius* deſcribes it

to be more blackiſh, hauing a more ſtubbed & ſhort root, & that it is apt to breed little worms. G
Both of them jump in this, that it is not to be admitted to the table, nay, they forbid to eat of it at all. Making a matter of conſcience once to touch it as a meat; and why ſo? becauſe, forſooth, it is one of the viands ordained to be ſerued vp at funerall feaſts. Ouer and beſides, Parſely is thought to be an enemy to the eies, and to trouble the ſight. Alſo that the ſtem of the female ingendreth grubs & ſuch like wormes; and ſo, whoſoeuer eateth thereof, man or woman, ſhall thereby become barren. Moreouer, they affirm, that if women newly deliuered, or ſuch as nurce children, do eat of Parſly, the babes that ſuck and draw their breaſts, ſhall be ſubiect to the falling ſickneſſe. And yet of the two, the male is leſſe hurtfull: which is the very reaſon that it is not condemned among the forbidden herbs and ſuch as be held vnlawfull to be eaten. Parſley
being laid as a cataplaſme to womens breſts, doth mollifie their hardneſſe, & break the kernils. H
It giueth a pleaſant taſt to any water wherin it is ſodden: the juice of this herb, & eſpecially of the root being taken in wine, doth mitigate the pains in the loins and flanks: and being dropped into the ears, cureth the hardneſſe of hearing. The ſeed of Parſly moueth vrine, draweth downe womens floures, and fetcheth away the after-birth. Seeth the ſaid ſeed, and with the decoction bath the black and blew marks remaining after ſtripes or drie blows, it wil bring them to their own colour again. The ſame being laid as a liniment with the gleire or white of an egge vnto the reines of the backe, or being ſodden in water, and the broth drunken, eaſeth their paines and ſtrengthneth them. Being bruſed & vſed in cold water by way of a collution, it cureth the cankers or vlcers in the mouth: the ſeed drunk with wine, breaketh the ſtone of the bladder: ſo doth the root of it alſo if it be giuen in old wine. Alſo the ſaid ſeed in white wine cureth the iauniſe. I

*It ſeemeth that he meaneth by *Apiaſtrum* a kind of *Ranunculus*, i. Crow-foot, called *Flammula*, our Speere-wort, or *Apium riſus*.

As touching our wild Ach, which we call in Latine * Apiaſtrum, *Hyginus* verily nameth it Meliſſophyllon. A venomous herb this is in Sardinia, and by all writers confeſſion vtterly condemned: for ſurely I cannot chuſe but range together in one rank al ſuch as ſeem to depend vpon one name in Greeke.

But Aliſanders, which the Greeks terme Hippoſelinum is a good counterpoiſon againſt the biting of Scorpions. If the ſeed be taken in drink, it cureth the wrings & torments of the guts. The ſame being boiled and drunk with honied wine, helpeth the Strangurie and difficulty of making water. The root ſodden in wine, expelleth ſtone and grauell by vrine: it putteth away alſo the paine of the loins, flankes, and ſides. Taken in drinke, or applied as a liniment, it healeth the biting of a mad dog. The iuice thereof in drinke, heateth them that are ready to chill and K
be frozen with cold.

* Whereby, ſome read *Orthoſelinum*.

A fourth kind of Ach or Parſley ſome haue made that, which the Greeks call Oreoſelinum. A plant this is, growing to the height of a ſpan, and * vpright. The ſeed reſembleth Cumin, and is found effectuall to procure vrine and prouoke womens termes. Finally, as Smallage hath a propertie and vertue by it ſelfe to heale the pricke or ſting of the venomous Spiders: ſo this mountaine Ach or Parſley of the hill, being taken in wine, is as effectuall to bring down the naturall purgation of women.

Chap. XII.

¶ *Of Stone-Parſely, named Petroſelinum: and of Baſill.* L

THere is another kind of Ach or Parſly growing vpon rocks, which ſome cal Petroſelinum. An excellent herb for foule impoſthumes and botches, vſed in this manner: take 2 ſpoonfulls of the juice thereof, put it into a Cyathe of the juice of Horehound, and mingle all together in three Cyaths of water, and ſo drink it hot. Some haue ſet in the range of theſe Aches, that which is called Buſelinon; which differeth from the garden Parſley, in that it hath a ſhorter ſtalk, and a root of red colour: but of the ſame operation and effect it is. For both taken in drinke, and applied as a liniment, it is of great power againſt the ſtinging of ſerpents.

Alſo, *Chryſippus* mightily crieth out vpon Baſill, as being hurtfull to the ſtomack, ſuppreſſing vrine, and an enemy to a cleare ſight. Moreouer, he ſaith, that it troubleth the brains, and putteth folk beſides their wits: that it bringeth the Lithargie vpon as many as vſe it, and breedeth opi- M
lations and diſeaſes in the liuer. In which regard he ſaith, That Goats by a ſecret in Nature doe refuſe and eſchew it; concluding thereupon, that men alſo ſhould take heed thereof and auoyd it. Some there be who haue not done with it ſo: but adde moreouer and ſay, That if Baſill be

ſtam-

20030
copy 1
Plinius

A ſtamped and put vnder a ſtone, it will breed to a ſerpent: if it be chewed in ones mouth and layd abroad in the Sun, it wil ingender wormes and magots. The people of Africk are verily perſuaded, and ſo they giue out, That if one be ſtung with a ſcorpion the ſame day that he hath eaten Baſil, it is vnpoſſible for to ſcape with life. Likewiſe ſome hold opinion and would beare vs in hand, That if a man ſtamp a bunch or handfull of Baſill, together with ten ſea crabs, or as many craifiſhes of the freſh water, all the Scorpions thereabout will meet and gather together about that bait. Finally, *Diodorus* in his Empiricks or book of approued receits and medicines, ſaith, That the eating of Baſil ingendreth lice. Contrariwiſe, the later writers and modern phiſitians defend & maintain the vſe of Baſil as ſtoutly as the other blamed it: for firſt they auouch conſtantly, That Goats vſe to feed therupon. Secondly, That no man was euer known to go beſide
B himſelfe who did eat thereof. Thirdly, That Baſil taken in wine, with a little vineger put therto, cureth as wel the ſting of land ſcorpions, as the venom of thoſe in the ſea. Moreouer, they affirme vpon their knowledge by experience, That a perfume made of Baſil and vinegre is ſingular good to recouer and fetch them again that be gon in a ſwound. Alſo, that in the ſame maner prepared, it rouſeth and wakeneth thoſe that be in a lethargie and ſleep continually; yea, and mightily cooleth and refreſheth them that be inflamed & in a burning heat. A liniment made with Baſill, oile Roſat, or oile of Myrtles in ſtead thereof, with vineger, aſſwageth the paine of the head. Moreouer, being laied to the eies with wine, it ſtaieth the wateriſh rheume that runs thither. Furthermore, comfortable it is to the ſtomack (as they ſay) for being taken with Vinegre, it diſſolueth ventoſities, and breaketh wind by rifting vpward. Being applied outwardly, it
C bindeth and ſtaieth the running out or flux of the belly, and yet it cauſeth free paſſe of vrine in abundance. After the ſame maner it doth good in caſe of Iauniſe and dropſie. It repreſſeth the rage of choler that moueth both vpward and downward, yea, and ſtaieth all defluxions from the ſtomack. And therefore *Philiſtio* knew what he did well enough, when he gaue it to thoſe that were troubled with the ſtomachical flux. As alſo *Pliſtonicus* was well aduiſed, in miniſtring it ſodden, for the bloudy flix, the exulceration of the guts, and the Collicke. Some there be who giue it in wine to them who run euer and anon to the cloſe ſtoole, ſit downe and do nothing: to thoſe that reach and caſt vp bloud; yea, and to mollifie the hardneſſe of the precordiall parts. Being laid as a liniment to the nurſes paps, it reſtraineth the abundance of milk, yea and drieth it vp. There is not a better thing in the world for to be dropped into the eares of little babes
D and ſucking children, and namely with gooſe-greaſe. If the ſeed be bruſed, and ſo ſnuffed or drawn vp into the noſthrils, it prouoketh ſneeſing. The iuice moreouer laid as a liniment to the forehead, openeth the paſſages, that the rheumes or cold which lay in the head may breake away. Being taken at meat and dipped in vinegre, it mundifieth the matrice and natural parts of women. Mixed with Copperoſe or Vitriol, it taketh away warts. Finally it ſetteth folk forward to venerious pleaſure: which is the reaſon that men vſe to lay Baſil vpon the ſhap of mares or ſhe Aſſes at the time of their couering.

Chap. XIII.

¶ *Of *wild Baſil, Rocket, Creſſes, and Rue.*

* *Olymotides.* Dioſcor.

E WIld Baſill is endued with vertues and qualities ſeruing to all the purpoſes aboueſaid: but the ſame is of better operation and more effectual. And theſe properties ouer and beſides it hath by it ſelfe, namely, To cure the weakneſſe of the ſtomack, and thoſe accidents which come by often caſting or immoderat vomits. The root thereof taken in wine, is ſingular good for the apoſtumes of the matrice, and againſt the biting of venomous beaſts.

As touching Rocket, the ſeed cureth as well the venomous ſting of Scorpions, as the biting of the hardy ſhrew. The ſame chaſeth all vermin that be apt to ingender in mans body. A liniment made with it and hony together, taketh away all the ſpots that blemiſh the skinne of the face: and with vinegre repreſſeth the red pimples whatſoeuer. The black or ſwert skars remai-
F ning after wound or ſore, it reduceth to the former fair white, if it be applied with a beaſts gal. It is ſaid moreouer, that a potion therof made with wine, and giuen to thoſe who are to receiue puniſhment by the whip, will harden them in ſuch ſort, that they ſhall feele little or no ſmart at all by any ſcourging. And for ſeaſoning of all kinde of viands, it hath ſuch a pleaſant grace in any ſauce, that the Greekes thereupon haue giuen it the name of Euzomos. It is thought

more-

moreouer, that a fomentation of Rocket, bruſed and ſtamped ſomewhat before, quickeneth and G
clarifieth the eye-ſight: it eaſeth little children of the chin-cough. The root boiled in water, and ſo applied, draweth forth ſpils of broken bones. As touching the vertue that Rocket hath to procure the heat of luſt, I haue ſpoken already: yet thus much more in particular I haue to ſay, that if one do gather three leaues of wild Rocket with his left hand, ſtamp them afterward, and ſo giue them to drink in honied water, this drink mightily prouoketh that way.

As for Creſſes they haue a contrary operation, for they coole and dull the heat of the fleſh, howſoeuer otherwiſe they giue an edge to the wit and vnderſtanding, as heretofore we haue declared. Of theſe Creſſes there be two kinds. The white is purgatiue, and the * weight of a Roman denier taken in water doth euacuate cholerick humors. A liniment thereof together with bean flower applied vnto the hard kernils called the Kings euill, is a ſoueraigne remedie there- H
fore, ſo that a Colewort leafe be laid thereupon. The other kinde is more blackiſh, and purgeth the head of ill humors. It clenſeth the eies and cleareth the ſight. Taken in vineger it ſtayeth their brains that be troubled in mind: and drunk in wine, or eaten with a fig, it is ſingular good for the ſplene. If a man take it faſting euery morning with hony, it cureth the cough. The ſeed drunke in wine expelleth all the wormes in the guts: which it doth more effectually if wilde Mints be ioyned withall. With Origanum and ſweet wine it helpeth thoſe that be ſhort winded and troubled with the cough. The decoction therof when it is ſodden in goats milk, eaſeth the pains of the cheſt or breaſt. Laid to as a Cerot with pitch, it reſolueth puſhes and biles, yea and draweth forth pricks and thorns out of the body. A liniment applied with vineger, taketh off all ſpots and ſpeckles of the viſage: and if the white of an egg be put thereto, it cureth can- I
kerous ſores. Alſo being applied in forme of a ſoft vnguent to the ſplene, it cureth the infirmities thereof: but if they be little infants that are troubled therewith, there muſt be honey alſo put thereto, and then is it excellent good. *Sextius* addeth moreouer and ſaith, that a perfume thereof burnt driueth away ſerpents, & reſiſteth the poiſon of ſcorpions: as alſo that being bruſed and applied with Senvie, it is a ſingular remedie for the head-ache, and to make haire grow againe where it was fallen off: alſo, being ſtamped into a cataplaſme with a fig, and laid to the eares, it cureth the hardneſſe of hearing. Likewiſe, if the juice therof be infuſed or poured into the eares, it eaſeth the tooth-ach. Moreouer, a liniment made with it and gooſe-greaſe, ſcoures away the skales and dandruf, as alſo the ſcalls of the head. A cataplaſme made of it and leuain, ripeneth fellons, bringeth carbuncles to ſuppuration, and breaketh them. With hony it mun- K
difieth filthy corroſiue and cankerous vlcers that eat deepe into the fleſh. A liniment thereof with barly grots and vineger is good for the Sciatica and the pains of the loins: in like manner it cureth ring-worms and tettars: it mundifieth the roughneſſe about the nailes, for it is of a cauſtick nature. The beſt Creſſes are the Babylonian, and yet the wild are more effectuall than it in caſes aboue named.

* *Xpondere.*

But Rue is an herb as medicinable as the beſt. That of the garden hath a broader leafe, and brancheth more than the wilde, which is more hot, vehement, and rigorous in all operations. There is a iuice vſually preſſed out of it, being firſt ſtamped and ſprinkled a little with water in the ſtamping, and then put vp into a box of copper or braſſe, and there reſerued for to be vſed as occaſion ſerueth: this iuyce taken in a great quantity is a very poiſon and no better, eſpecially L
that which is drawne out of the Rue which groweth in Macedony about the riuer Aliacmon. But wil you heare a ſtrange and wonderful thing? the iuyce of Hemlock killeth this venimous qualitie of it. See how one poiſon is a countre-poiſon to another, inſomuch as if they annoint their hands with the iuice of hemlock, who are to gather Rue, they ſhall not be invenimed therwith. And yet as venomous otherwiſe as Rue is, it goeth into the compoſition of thoſe Antidotes which are giuen againſt poiſon, eſpecially that Rue of Galatia. And to ſpeak in general, there are none of theſe Rues, but the leaues both bruiſed alone and alſo taken in wine, ſerue for preſeruatiues: and principally againſt the herb Aconite or Libard-bane, and the viſcous gum of the herbe Chamæleon, which they call Ixias: likewiſe againſt deadly and venomous Muſhromes taken at the mouth, whether it be by way of meat or drinke. In like maner it is ſingular M
good againſt the ſtinging of Serpents: for the very Weaſels when they prepare themſelues to combat with them, vſe to eat this hearbe before-hand for to be ſecured from their venome. Auaileable it is alſo againſt the pricks of Scorpions and Hardi-ſhrewes, againſt the ſtings of Bees, hornets, and waſps, againſt the poiſon of the Cantharides and Salamanders, yea and the

biting

20030
copy 1
Plinius

A biting of a mad dogge; if it be vſed in this wiſe, namely, to take a ſaucer full or acetable of the juice and ſo drink it with wine: alſo to ſtampe or champ in the mouth the leaues thereof, and ſo lay them vpon the grieued place with honey and ſalt; or elſe to ſeeth them with vinegre and pitch. Folke ſay moreouer, that whoſoeuer is wel rubbed with the juice of Rue, or otherwiſe do but cary it about him, ſhal be ſure ynough for being either pricked, ſtung, or bitten with any of thoſe hurtfull and venomous creatures abouenamed: furthermore, that Serpents naturally doe flie from the ſmoke or fume of Rue when it burnes, and will not come neer vnto it: but the moſt ſoueraigne of all other, and ſureſt in operation is the root of the wild Rue, if it be drunke with wine. And the common ſpeech goeth of it, that the greater and ſpeedier effect will be ſeene, in caſe forſooth one drinke it without the houſe, in the open aire abroad. *Pythagoras* was of opini-
B nion, That there is a diſtinction of ſexe in this hearbe, and namely, that the male hath ſmaller leaues, and thoſe of a more darke and graſſe green color than the female, whoſe leaues are both fuller and better fed, and alſo of a more pleaſant and gaier hew. He was perſuaded alſo that Rue is hurtfull to the eies, but therein he was deceiued. For well it is known, that engrauers, caruers and painters, doe ordinarily eat Rue alone for to preſerue their eye-ſight, they take it alſo with bread or Creſſes, without any regard whether it be the wild or the gentle Rue of the garden: by report alſo, many haue vſed an inunction thereof to their eies, with the beſt honey of Athens, and therby cleared them quite of that muddines and miſt which dimmed their ſight, or elſe in ſtead of honey they haue taken breaſt-milke of a woman that lately bare a maiden-child: or no more but with the very pure juice of rue and nothing els they haue gently touched the corners
C of the eies: others haue cured the waterie humor that hath taken a running thither, onely by applying the juice of Rue together with Barley groats. If a man drink Rue with his wine, he ſhall find eaſe of his head-ach: or if he doe but annoint his temples and forehead therewith, beeing incorporat with vinegre and oile of Roſes into the forme of a liniment. But if it be an old and inueterat pain of the head, then would there a frontale be made of the ſaid juice, tempred with Barly floure and vinegre. Rue hath this vertue, to diſcuſſe and reſolue all crudities and ventoſities proceeding thereof, yea, and cureth the ſettled old paines of the ſtomack. It is of power to diſopilate or open the matrice: to ſettle the Mother into the right place when it is looſe & out of frame, in caſe a liniment be made thereof, and laid al ouer the region both of the womb and the breaſt. If Rue be eaten with figs, or ſodden to the conſumption of the one half-deale, & the
D decoction therof taken in wine, it is good for the dropſie. And in that maner they vſe to drink it for the paines of the breaſt, ſides, and loines: for coughs alſo and ſhortneſſe of breath and generally for all griefes and maladies incident to the lights, liuer, and kidneies: and laſt of all, for the ſhaking cold fits in an intermittent ague. Is a man diſpoſed to drink freely, and to ſit ſquare at it? let him before he beginne take a draught of the decoction of Rue leaues, he ſhal bear his drinke well, and withſtand the fumes that might trouble and intoxicat his brains. In one word, vſed ordinarily at meat, either raw, ſodden, or preſerued and condite any way, it is ſingular good for the purpoſes aforeſaid. Boiled with Hyſſope and taken in wine, it is ſingular for to aſſwage the torments of the belly: and being ſo prepared, it reſtraineth the flux of bloud within the bodie: like as it ſtancheth bleeding at the noſe, if it be ſtamped and put vp into the noſethrils: and
E otherwiſe a collution therof to waſh the mouth withall, doth much good to the teeth. Semblably, the juice diſtilled into the ears, allaies their pain; prouided alwaies (as I haue often ſaid alreadie) that a mean and meaſure be kept. As for the juice of the wild Rue, if it be tempered either with oile of roſes or of baies; or els mingled with Cumin & Honie, it helpeth thoſe that are hard of hearing, & diſcuſſeth the ringing ſound in the ears. Moreouer, the juice of rue ſtamped and drawne with vinegre, is excellent good to be inſtilled or let drop from on high by way of Embrochation vpon the region of the brain and temples of the head, for the phrenſie. Some put thereto wild running Thime alſo and baies; therewith annointing the head and neck of the patient. Others haue preſcribed it in caſe of Lethargie to thoſe that can do no other but ſleepe continually, for to ſmel vnto. And thoſe haue giuen counſel alſo to them that be ſubject to the
F falling ſickneſſe, for to drinke the juice thereof ſodden in foure Cyaths of water, before the fit came on them; for to preuent and auoid the intollerable cold which they ſhould endure: as alſo to thoſe that be apt to * chill for cold, to be eaten with meat, raw. Rue ſends out euen the bloudie vrine, which is gathered into the blader. And as *Hippocrates* is of opinion, If it be drunk with ſweet thicke, and groſſe wine, it cauſeth womens floures to come downe, it expelleth the after-
birth,

* *Alſioſis.* Some read *Alphioſis.* [out of *Dioſcorid.*] that is, to them that are ſubject to the white Morphew, which is a kind of Leproſie, or S. *Magnus* euil.

birth, yea, and the dead infant within the womb. And therefore he aduiſeth women in trauel to G
haue thoſe naturall parts annointed with Rue, yea, & to ſit ouer a ſuffumigation made therof.
Diocles maketh a cataplaſm with Rue, Vinegre, Hony, & Barly floure, for faintings, cold ſweats,
and tremblings of the heart. Likewiſe, againſt the torments of the ſmal guts, commonly called
the * Iliak paſſion, he appointeth to take the decoction thereof in Oile, and to receiue the ſame
in lockes of wooll, and ſo to be applied vnto the vpper region of the belly. Many doe ſet downe
two drams thereof drie, and one dram and a halfe of Brimſtone, as an excellent receit to bee ta-
ken by thoſe that reach and ſpit vp filthy and ſtinking matter: but if they caſt or ſend vp bloud,
they ſhould drinke the decoction of three branches thereof in wine. It is an ordinarie practiſe
in caſe of the Dyſenterie or bloudie Flix, to giue it ſtamped firſt with cheeſe, in wine: but they
mingle therewith Bitumen, and ſo crum or break it into their drink, againſt the difficulty of ta- H
king wind. Alſo three drams of the ſeed therof is giuen in drinke to thoſe that are fallen from a
loft, for to diſſolue the bruiſed and cluttered bloud within them. *Item*, Take one ponnd or pint
of oile, of wine one ſextar or wine quart, ſeeth the leaues of Rue herin: that oile ſo prepared, is
ſingular good for to annoint parts which are benummed, and in manner mortified and blacke
with cold. Moreouer, conſidering that it is diuretical, as *Hippocrates* thinketh, and doth prouoke
vrine; I canot but wonder at ſome, who giue it as a thing that ſtaieth vrin, & therefore appoint
it to be drunke by thoſe that cannot hold their water. The inunction thereof with Allum and
Hony, cleanſeth the dry wild ſcab & leproſy. Likewiſe with Morel or Nightſhade, hogs greaſe
and Bulls tallow, it ſcoureth the Morphew, taketh away werts, diſcuſſeth and diſpatcheth the
Kings euil and ſuch like tumors. In like manner it killeth the fretting hot humor called S. *An-* I
thonies fire, being applied to the place with vinegre, Honny, or Ceruſſe, *i.* white Lead: like as it
cureth the Carbuncle laid too, with vinegre alone. Some there be who preſcribe Laſerpitium
alſo to be joined with the reſt in this liniment: but without it they cure the chilblanes & bloud-
dy fals that be ſo angry in the night ſeaſon. Many vſe to boile Rue, & together with wax, reduce
it into a Cerot; which they apply to the ſwollen breaſts or paps of women, as alſo to the brea-
king out of phlegmatick puſtules or wheales (much like to our meaſels or ſmall pockes. Alſo
being reduced into an vnguent with the tender ſprigs or tops of Laurell, it is a ſingular remedy
for the flux or fall of humors into the burſe of the cods. And verily this Rue is counted ſo ex-
cellent an hearbe in operation this waies, and ſo reſpectiue peculiarly to thoſe parts, that it is
commonly holden for a ſoueraign remedie to heale all ruptures, if a man take the wild of that K
kind and make a liniment of it and old Swines greaſe together. Likewiſe, if any bones or lims
be broken, a Cerot made with the ſeed of Rue and wax together, is able to ſouder the fracture.
The root of Rue being reduced into a liniment, cureth bloudſhotten eies, and reſtoreth to the
natiue colour all skarres or ſpots that giue blemiſh to any part of the bodie. Among the other
properties that be reported of Rue, this is one to be wondred at, conſidering how hot it is of na-
ture (as all Phyſicians doe agree) That a bunch thereof beeing boiled in oile Roſate, and with
one ounce of Aloe brought into the forme of an ointment, ſhould repreſſe their ſiuet, who are
annointed therewith. As alſo, that ordinare vſe thereof at meat ſhould diſable folke as wel in
the act of generation, as conception: In which regard it is preſcribed vnto them that ſhed their
ſeed: and vnto ſuch as vſe to dreame in their ſleepe of amatorious matters and the delights of L
Venus. But women with child muſt beware how they eat Rue: they eſpecially muſt forbear this
hearbe: for I find that it killeth the yong child conceiued within their bodies. Thus much for
the effects that it worketh in men and women. Ouer and beſides al which, there is not an hearb
growing in the garden that is ſo much vſed for the curing of 4 footed beaſts, whether they be
broken winded and purſiue, or otherwiſe bitten & ſtung with venomous beaſts; in which caſes,
there muſt be an injection made vp into the noſthrils, of the iuice of Rue in wine. Alſo, if it
chance that a beaſt hath ſwallowed an Horſeleech in drinking, let it be taken with vinegre. Fi-
nally, in euery accident of theirs, let Rue be prepared and miniſtred reſpectiuely vnto each
griefe, according to the manner ſet downe for men in the ſemblable caſe.

M

Chap. XIIII.

¶ *Of wild Mint: of garden Mint: of Penyroiall: of Nep, and Cumin.*

WIld Mint is called in Latin Mentaſtrum: it differeth from the other in the form of the
leaues: * for ſhaped it is like Baſil, how ſoeuer in color it reſembles Penniroyal, which
is

* or, *Domine miſerere mei*, *i.* Lord haue mercie vpon me.

* All this agreeth to our Calamint: according to *Dioſcorides*.

20030
copy 1
Plinius

A is the cauſe, that ſome name it the ſauage Penyroiall. In the time of *Pompey* the Great, it was knowne by experience, that the leaues of wild Mint chewed and applied outwardly, cured the Leproſie: by occaſion, that a certaine leper minding to diſguiſe himſelfe, that hee might not for very ſhame be knowne, chaunced to annoint and beſmear his face all ouer with the juice of wild Mints. But fortune was better miſtreſſe vnto him than he expected, for beyond his expectation or intent, his good hap was to be rid of his Leproſie by that meanes. The ſame leaues ſerue for a liniment againſt the venome of Scolopendres, and the ſting of Serpents: ſo doe they alſo, if one drinke two drams of the leaues in two Cyaths of wine. Alſo, for to cure the prickes of Scorpions, they be vſed with ſalt, oile, and vinegre. But againſt Scolopendres, commonly they drink the juice or broth of the decoction. Moreouer, the wiſer ſort of people ſaue the drie leaues of wild Mints to be reduced into a pouder, as a very coun trepoiſon againſt all venome
B whatſoeuer. For being ſtrewed in the houſe, or burnt, the very air & perfume therof chaſeth away Scorpions. A drink made therewith purgeth & putrifieth women paſſing wel, ſuch I mean as be newly deliuered of childbirth: but it killeth the fruit within the womb of as many as vſe it while they go with child. There is not a medicine in the world ſo effectuall as it is for thoſe who are ſo ſtreight winded, that they cannot take their breath vnleſſe they ſit vpright: for ſuch alſo as in the cholericke paſſion, neuer giue ouer caſting vpward and purging downward. It appeaſeth alſo the paine of the loines, and eaſeth the gout, if it be applied to the place affected. The juice thereof is good to be dropped into eares that haue worms within them. It is vſually taken in drinke for the Iauniſe. A liniment made thereof, helpeth the kings euill; beſides, it is a ſingular remedie for them that by a ſtrong imagination of *Venus* in their dreames, defile and
C pollute themſelues in their ſleep. If one drinke it with vinegre, it excludeth the flat broad in the bellie. To ſcoure away the founled and ruffe, an Embrochation of it ad vinegre vpo the head in the Sun is counted ſingular.

As touching garden Mint, as the very ſmell of it alone recouereth and refreſheth the ſpirits: ſo the taſt ſtirreth vp the appetite to meat, which is the cauſe, that it is ſo ordinary in our ſharp ſauces wherein we vſe to dip our meats. Being put into milk, it wil not ſuffer it to turn or four, it keeps it from quailing and curding which is the reaſon, that they who vſe ordinarily to drink milk, take Mints therewith, for fear it ſhould coagulate or crudle in their ſtomack, & put them in daunger of ſuffocation. Some, for the ſame effect vſe to giue it in water or honied wine: and ſurely it is thought by that very propertie to hinder generation, in that it diſſolueth the due
D conſiſtence and thickneſſe which is required in naturall ſeed. And yet it is a great ſtancher of bloud indifferently in men and women: but more particularly it ſtaieth the immoderat flux of whites that many times followes women. Being taken with Amydum or ſtarch pouder in water, it reſtrains the inordinate flux occaſioned by the imbecility of the ſtomacke. *Syriation* the Phyſician vſed ordinarily to cure the apoſtumes and ſores of the Matrice, with Mint. Alſo againſt the obſtructions & other accidents of the liuer, he was wont to giue 3 Oboles thereof in honied wine. And for them that raught vp bloud at the mouth, he preſcribeth to take Mints in a broth or ſupping. The skal that little children be troubled withal, it healeth wonderful well. It is ſingular to drie vp the humors that mollifie the griſtly windpipe & the other inſtruments of the breath and voice; and when they are drie, knitteth and ſtrengthneth them. Taken in wa-
E ter and honied wine, it clenſeth the corrupt and putrified phlegmatick humors which be offenſiue to the throat and thoſe parts. The juice of Mint is excellent for to ſcour the pipes & cleer the voice, being drunk a little before that a man is to ſtrain himſelfe either in the quier, or vpon the ſtage, or at the bar; and not otherwiſe. A gargariſm of milk, wherein hath bin Rue & Coriander, beſides mints, is paſſing good to bring down the ſwelling of the vula. Being vſed in that manner with ſome Allum, it reſtraineth the mumps or inflamation of the Amygdales: & with Hony it cureth the roughnes & furring of the tongue. Being vſed alone without any other addition, it is a proper medicin for inward convulſions, as alſo for the diſeaſe of the lungs. *Democritus* ſaith, that to drink it with the juice of a Pomegranat, is a readie means to ſtay the yex &
F vomiting. The juice of greene Mints, drawne vp with the wind into the noſthrils, helpeth the ſtinking vlcers there. The hearbe it ſelfe ſtamped, repreſſeth the rage of choler that purgeth both waies vnceſſantly, but it muſt be drunk with vinegre. And in that maner it reſtrains all internal fluxions of bloud. But applied outwardly with Barly grots to the grieued place, it eaſeth the intollerable paine of the Iliak paſſion: after the ſame ſort if it be ſpread and emplaſtered, it allaieth

allaieth the ſwelling of womens breaſts. In caſe of head-ach, a liniment thereof doth well to be G
applied to the temples. Inwardly it is taken with very good effect againſt the venimous Scolopendres, the ſea Scorpions, and other ſerpents. A liniment thereof ſtaieth the wateriſh humors that haue taken a courſe to the eies, cures the skalls and breakings out of the head, and all accidents offenſiue to the tiwill or fundament. If one doe hold Mints in his hand, he ſhall not need to feare either chafing or galling in any part, vpon trauell. Beeing dropped into the eares with honied wine, it is very comfortable to that part. It is ſaid moreouer, that if a man come into a garden where Mints groweth, and bite the leaues vpon the very plant, without pluking or cropping it off, and continue this courſe 9 daies together, iterating euermore theſe words [*I doe this to cure the ſplene*] he ſhal find remedy indeed for the infirmity of that part: moreouer, let one take
as much poudred mints dried as he can wel contain with his 3 fingers ends, and drink the ſame H
with water, it will cure the head-ach or grieuous paine of the ſtomack. Likewiſe if his drink be ſpiced with the ſaid pouder, it will driue out of the belly the wormes there engendred.

The branches of Mint and penniroiall both, are vſually put into glaſſe viols with vinegre, for to be iuſuſed therein: and a man would not thinke how good this vinegre is for faintings of the heart; ſo great is the ſocietie that theſe two hearbs haue one with the other in this behalfe. For which cauſe, I remember on a time when diuers learned phyſicians were met together to confer in my chamber, they reſolued and concluded definitly, That a chaplet of Penniroyal was without compariſon far better for the giddineſſe and ſwimming of the head, than one of roſes, for a garland of Pennyroiall, if it be worne onely vpon the head, allaieth (by report) the ach thereof. More than it, it is ſaid, That the very ſent of Pennyroiall preſerueth the brain from the offence
that may come by the diſtemperature either of heat or cold, yea and from the inconuenience I
of thirſtineſſe, inſomuch as whoſoeuer haue two branches or ſprigs of Pennyroiall put into his ears, ſhall feele no acceſſiue heat though they continued in the Sun all the day long. Peniroiall being applied in form of a liniment, together with Barly groats and vinegre, aſſuageth all grieuous paines watſoeuer. Howbeit, the female of this kind is thought to be of greater operation euery way, than the male. Now hath this female a purple floure, that you may know it thereby from the other, for that of the male is white. The female Penyroiall taken in a maſh made with ſalt and barley groats in cold water, ſtaieth a keckliſh ſtomack, and keepeth it from the inordinat deſire and many offers to caſt. In the ſame manner alſo it eaſeth the paine of the breaſt and belly. Likewiſe the gnawings of the ſtomack it ceaſeth, being taken in water; as alſo immoderat vomits it repreſſeth, with vinegre and barley groats. Being ſodden in hony with a little nitre K
among, it cureth the maladies of the guts. If one drinke it with wine, it cauſeth abundance of vrine: and if the ſaid wine be made of the Amminean grapes, it expelleth the ſtone and grauell, yea and all things els which may engender inward pains. If it be taken with honey and vinegre, it prouoketh womens termes, and quieteth them when they lie gnawing and fretting inwardly, yea and ſendeth forth the after-burden. The ſame ſetleth the mother and reduceth it into the right place. It expelleth alſo the dead child within the mothers body. The ſeed of Peniroial if it be ſmelled vnto, is ſingular good to recouer their tongue againe who be ſpeechleſſe: for the falling ſickneſſe alſo, it is giuen in a cyath of vinegre. If it fortune that one muſt drink vnholeſome waters, the ſeed thereof reduced into pouder and ſtrewed therupon, correcteth all the ma-
lice thereof. If the ſame be taken in wine, it ſlaketh the itch in the bodie proceeding of hot and L
ſalt humors. The ſeed of Pennyroiall, mingled with ſalt, vinegre, and honey, if it be wel rubbed into the bodie, comforteth the ſinewes in caſe of cramps and conuulſions: and particularly helpeth thoſe who with a crieke are forced to carrie their necke much backeward. The decoction therof is a ſoueraigne drinke againſt the ſting of Serpents; and particularly of Scorpions, if it be bruiſed and taken with wine: eſpecially that which groweth in drie places. Moreouer, Penyroiall is held to be very ſoueraigne for the cankers or vlcers in the mouth, and as effectuall to ſtay the cough. The floures of Penyroial that be freſh and new gathered, if they be burnt make a ſingular perfume to kill fleas. Among many good receits that *Xenocrates* hath left vnto vs, we
find this for one, namely, That a branch of Pennyroiall wrapped within wooll, and giuen to the M
patient for to ſmell vnto before the fit come of a tertian ague, driueth it away: as alſo if it be put vnder the couerlet of the bed, and the Patient laid vpon it, it doth no leſſe. For theſe purpoſes abouenamed, the wild Penyroiall is of moſt efficacie: This hearbe reſembleth Origan, and hath ſmaller leaues than the Penyroiall of the Garden: ſome giue it the name of Dictamnus. If it

chaunce

20030
copy 1

A chance that either ſheepe or goats do taſt thereof, it prouoketh them preſently to blea: wher-
upon certain authors, changing one letter for another in Greeke, call it * βλήχωνα. This herb is ſo
hot and ardent, that if any part of the body be rubbed or annointed therewith, it will riſe into a
bliſter. If one haue taken a through-cold, and thereby gotten a cough, Phyſitians haue preſcri-
bed to vſe frictions therewith before the Patient go into the bain for to ſweat. Alſo their dire-
ction is to do the like before the cold fits of agues: as alſo in caſe of the crampe and torments
of the guts. Wonderfull good it is in all kinds of gout. If it be taken in drinke with honey and
ſalt, it is ſingular for thoſe who be diſeaſed in the liuer, as alſo for the lights: for it opens their
pipes, and diſchargeth them of the flegme that ſtuffed them, ſo as they may reach vp and voyd
the ſame with eaſe. The decoction thereof with ſome ſalt is excellent good for the ſplene and
B the bladder, yea and for all ventoſities and ſhortneſſe of breath. Semblably, the iuice prepared
and dreſſed in maner aforeſaid, bringeth the mother into the naturall place; and ſerueth as a
countre-poiſon againſt the Scolopendre both of the ſea and the land: as alſo for the pricke of
the ſcorpion, & eſpecially againſt the biting of man or woman. The root thereof being applied
freſh and green, is maruellous good to repreſſe rank vlcers, & to conſume the proud fleſh about
them. The ſame being dry and ſo applied, reduceth skars to their freſh colour and beautie of
the faire and whole skin. Thus much of Penyroyall of the garden and the field.

Great conformitie there is in operation between Peny-royal and * Nep; for being both boi-
led in water vnto the compoſition of a third part, they diſcuſſe and ſhake off the cold in Ague
fits which cauſeth the Patient to ſhake; and beſides are of validitie to bring downe womens
C monethly ſickneſſe. In ſummer time they aſſwage the extremitie of heat. Nep alſo is powerfull
againſt ſerpents, for the ſmoke and perfume of this herbe they canot abide, but will fly from it:
which is the cauſe that ſuch as be afraid of ſerpents, ſtrew Nep vnder them in the place where
they mean to repoſe and ſleepe. Being bruiſed and applied to the running fiſtulous vlcers be-
tween the noſe and the greater corner of the eye, it is counted a ſoueraign remedie. Alſo being
freſh gathered, and mixed with a third part of bread, and ſo temperat and incorporat with vine-
gre to the form of a liniment, it cureth the head-ach. The juice thereof being inſtilled into the
noſthrils whiles the Patient lieth vpon his back, ſtancheth bleeding at the noſe. The root alſo,
together with Myrtle ſeed, in warm wine cuit, and ſo gargariſed, helpeth the Squinancie. As
touching wild Cumin, it is an herb exceeding ſmall, putting forth foure or fiue leaues, and not
D aboue, and thoſe indented like a ſaw: but the garden Cumin is of ſingular vſe in phyſicke, but
principally for the pain in the ſtomack. It diſpatcheth the groſſe vapors ariſing from flegme; it
diſſolueth alſo ventoſities, if it be either bruiſed and eaten with bread, or drunk with water and
wine; in which ſort it aſſwageth the wringing torments and other pains of the guts: howbeit it
maketh folke look pale, as many as drink of it. Certes by that deuiſe, namely by ordinary drin-
king of Cumin (as it is reported) the ſchollers and followers of *Porcius Latro* (that famous and
great Rhetorician) procured themſelues pale faces, becauſe they would look like their maſter,
who indeed came to that colour by continuall ſtudy and plying his booke. Thus likewiſe not
long ſince, *Iulius Vindex*, being deſirous to be affranchiſed by *Nero*, pretending by his pale viſage
and poore look, that he had not many daies to liue, made faire ſemblance vnto *Nero* by his will
E and teſtament, that he ſhould ſhortly be his heire (which cheat the ſaid *Nero* gaped after;) and
ſo by that means *Vindex* entred ſo far within him, as hee obtained whatſoeuer he would at his
hands. Cumin reduced into the form of trochiſks or * noſe-tents, put vp into the noſthrils, ſtan-
cheth bloud. The like effect it hath, being freſh gathered and applied with vinegre. Being layd
it ſelfe alone to watering and weeping eies, it reſtraineth that humour: and in caſe the cods be
bolne or ſwelled, it is good to mix honey withall in manner of an emplaſtre. But it ſufficeth to
make a cataplaſme thereof and lay it to the belly alone, of little babes and infants ſo troubled.
Finally, to cure the jauniſe it is ſingular, giuen in white wine when the Patient hath ſweat, and
is come out of the Baine.

* or Calamintha.

* called *Errhina* or *Naſcalia*.

Chap. XV.

F ¶ * *Of Cumin Ethyopick, which reſtraineth the flix of vrine: of Capres: of Lovach or Panax: and of a kind of Marjerom named Cunila-bubula.*

* It ſeemeth that this Title is corrupt.

BVt for the purpoſe aforeſaid, namely to cure the jauniſe, the Ethyopian Cumin is the beſt,
being taken after a bath with vinegre and water: alſo licked in maner of a Loch with hony.

As for the Cumin of Africk, it is thought to haue a ſingular proprietie by it ſelfe for to helpe G
thoſe who canot contain and hold their vrin. The garden Cumin, if it be parched drie, brought
into pouder, and giuen in vinegre, helpeth the defects and infirmities of the liuer: alſo it cureth
the dizzineſſe of the head. But in caſe the acrimonie or ſharpneſſe of the vrin be ſuch, as that it
* *Indulci*: hee meaneth *paſſum*. fret and moue ſmart in the paſſage, the pouder hereof would be tempered in ſweet wine * cuit.
For the impediments of the matrice it ought to be drunk in pure wine of the grape, and withal
there muſt be applied to the place offended, a cataplaſm of the leaues vpon a lock of wool. Dri-
ed againſt the fire, bruiſed and beaten into pouder, and ſo incorporat with oile of roſes & wax,
and wrought in the end to the form of a Cerot, and then applied, it abateth the ſwelling of the
cods. But the wild Cumin is more effectuall in all the caſes aboue mentioned, than that of the
garden. Ouer and beſides, it hath a ſpeciall vertue together with oile, againſt ſerpents, ſcorpi- H
ons, and Scolopendres. Take as much of Cumin ſeed as you may comprehend within three fin-
gers, drink it in wine, it wil ſtay immoderat vomit, yea and the ſick heauing of the ſtomacke, as
if it would caſt and canot. A drinke made therewith is giuen alſo for the colique: and to that
purpoſe a liniment thereof is very commendable, or if it be applied hot in quilted bags, ſo that
the ſame be kept ſwadled down vnto the region of the gut Colon. For a woman that is giuen
to the riſing and ſuffocation of the mother, let her drink it in wine after this proportion, Three
drams of Cumin to three cyaths of wine, ſhe ſhall find that it will reſolue thoſe vapors and fu-
moſities which cauſed the foreſaid maladie. With calues tallow or ſewet, or with honey, if it
be let drop into the eares, it cureth the ſounding and tingling therein. Being applied as a lini-
ment, with hony, raiſons, and vinegre, it reſolueth the blacke and blew markes remaining after I
ſtripes. Alſo with vinegre alone it cureth the black ſpots and ſpeckles appearing in any part of
the body, if the place be bathed therewith.

An herb there is reſembling Cumin for all the world, which the Greeks cal Ammi: although
ſome there are who thinke it to be all one with the Cumin of Ethyopia. *Hippocrates* calleth it,
the roial Cumin [of Egypt;] the reaſon was, no doubt, for that he deemed that of Egypt to ex-
ceed all the reſt in goodnes. But moſt writers beſides him do think it * an herb altogether of a-
Ruellius takes it for Baſill gentle. nother nature, becauſe it is ſmaller and whiter: and yet it ſerueth to the like vſe: for at Alexan-
dria in Egypt they put it commonly vnder their loaues of bread in the bottom cruſt, when they
go to the ouen, and ordinarily it is occupied in the kitchen about ſauces. Be it what it will, it
diſſolueth ventoſities, it pacifieth the wringing torment of the guts, it prouokes vrin, and brin- K
geth down womens moneths. Being taken in wine, together with Lineſeed, to the quantitie of
two drams, it cureth the venomous ſtings of ſcorpions: but put thereto an equall quantitie of
myrrh, it hath a ſingular vertue againſt the horned ſerpent Ceraſtes. And, like to the other Cu-
min before named, it altereth the colour of as many as drink of it, and makes them looke pale.
A ſuffumigation made thereof, with raiſons and roſin, mundifieth the matrice & natural parts
of women. Finally, it is commonly ſaid, That if a woman ſmell thereto in the very act of gene-
ration, ſhe ſhal conceiue the rather by that means.

As for Capres, we haue ſufficiently written thereof amongſt other ſhrubs that be ſtrangers:
and yet it wil not be amiſſe to reiterat thus much, That a man muſt be well aduiſed how he ta-
keth any outlandiſh Capres that come from beyond-ſea: but if he wil go ſafely to work, let him L
hardly keep him to thoſe of Italy, for they are leſſe harmeleſſe than the other: for if all be true
that is commonly reported, whoſoeuer daily eat Capres, ſhall not be in danger either of palſie
or pain of ſplene. The root of capres is ſingular good to take away the white ſpotted morphue
(couſin german to the leproſie) in caſe it be ſtamped, and the place affected rubbed therewith.
Take the rind of the root, the quantitie of two drams, and drink it in wine, it helpeth, the ſwel-
led ſplene; prouided alwaies, that the Patient forbeare the vſe of bains and hot houſes: for, by
report, this courſe continued 35 daies, will cauſe the ſaid ſplene to purge away, partly by vrine,
and partly by ſeege. The ſame if it be taken in drink allaieth pain in the loins, & cureth the pal-
ſie. The ſeed of Capres ſodden in vinegre, bruiſed & applied to the teeth, or otherwiſe the root
thereof chewed only, aſſwageth the tooth-ach. A decoction of Capres in oile inſtilled into the M
ears, mitigateth their pains. The leaues and the root newly gathered, and ſo applied as a Cata-
plaſme with hony, healeth the corroſiue vlcers that eat to the very bone. Likewiſe the root re-
ſolues all thoſe glandulous ſwellings which we name the Kings euil: and if the ſame be ſodden
in water, it diſcuſſeth the tumors behind the ears, and riddeth away the worms breeding within.

It

20030
copy 1

A It cureth alſo the infirmities of the liuer. The manner is to giue the ſame in vinegre and honey for to chaſe away the vermin engendred within the guts. Boiled in vinegre, it is ſingular for the cankers or exulcerations within the mouth: howbeit, all authors doe accord, that they bee not good for the ſtomacke.

Touching Louage, which ſome call Panax, i: is * holeſome for the ſtomack. Likewiſe a proper medicine it is for convulſions and ventoſities. To conclude, there are ſome who name it Cunila Bubula, as I haue before noted, but they be deceiued. * *Vtile: nam concoctionem iuuat. Ex Dioſcor.*

CHAP. XVI.

B ¶ *Of the wilde Origan Cunila Bubula: of the Baſtard Marjoram, named Gallinacea Cunila, or Heracleoticum Origanum: of the tender Cunilago: of Roſemarie: of Garden Sauorie or Cunila, and that of the mountaines.*

OVer and beſides the garden Sauorie, there be many kinds of Cunila known in Phyſicke: and firſt that which is called Bubula, and hath ſeed like to Peniroiall, being either chewed in the mouth or applied outwardly, it is a good wound-hearb, ſo that it be not remooued but euery fiue daies. Taken in wine, it is ſingular againſt the poiſonous ſting of ſerpents, in caſe the hearbe it ſelfe be ſtamped, and laid withall vpon the ſore place: and verily it is an ordinarie thing, to rub therewith well and throughly, the wounds that they make. Semblably, the C Tortoiſes, againſt the time that they ſhould fight with Serpents, vſe this hearbe in manner of a defenſatiue, & take themſelues wel armed againſt their enemie: which is the reaſon, that ſome giue it the name of Panax. Being dried, it aſſuageth the pain of tumors, and cures the accidents that befall to the priuie members of men: or if the leaues be but ſtamped, they haue the like effect. And in one word, the operation thereof is excellent and wonderfull, if it be vſed in wine.

Another Cunila or Sauorie there is, which our countreymen call in Latine Gallinacea; the Greekes name it Origanum Heracleoticum. If it be braied and ſalt joined thereto, it is ſoueraigne for the eyes: it helpeth the cough alſo, and correcteth all faults of the liuer. If a thicke grewell or ſew be made thereof, together with floure, oile, and vinegre, ſo tempered as it may be ſupped, it cureth the pleuriſie or paines of the ſides: but aboue all, it is ſingular for the ſtinging of Serpents.

D A third kind there is, which the Greeks tearme the male, but we in Latin * Cunilago: a ſtinking ſmell it hath with it, a woodie hard root and a rough leafe: but it is generally ſaid, that the operations thereof be more effectuall, than of any other kind. It is verily thought, that if a man caſt an handfull thereof from him into any part of the houſe, al the moths and ſuch like vermin will gather about it. But to come to particulars, It hath a ſingular power againſt Scorpions if it be taken with water vinegre. Alſo if a man or woman take 3 leaues thereof, and rub his bodie thoroughly with it and oile together, there is not a Serpent ſo hardie as dare approch neare ſuch a bodie ſo perfumed. Contrariwiſe the Cunila, which is named Mollis, [*id eſt*, Soft] hath leaues and branches more hairie than the former, and thoſe ſharpe pointed like prickes. This hearbe if a man rub betweene his fingers, reſembleth honey in ſmell, and will ſticke faſt too in manner of honny. Another ſort there is of Cunila, which we, for the ſmell that it hath of Frankincenſe, call Libanotis. But both theſe, the one as well as the other, taken in wine or vinegre, cureth the biting and ſting of Serpents. If they be bruiſed or ſtamped into pouder, and ſo put into water, they kill all the fleas in the place where the ſaid water is caſt or ſpinckled. As for the garden Sauorie, it alſo hath many good properties: The juice thereof with oyle of roſes diſtilled into the eares, is very comfortable vnto them. The hearb it ſelfe taken in drink, helpeth thoſe who are ſtung with venomous Serpents. This Sauorie oftentimes doth degenerat into a baſtard kind, named Mountain Sauory. Like it is to wild running Thyme, and is effectuall alſo againſt the poyſon of ſerpents. It prouoketh vrin, and purgeth women newly deliuered, if haply they haue not ſufficient voidance. Singular it is for to help digeſtion, and ſtirreth vp appetit to meat wonderfully. In ſumme, as well the gentle Sauorie as the wild, is paſſing wholeſome for F crudities in the ſtomacke, if one ſpice his morning draught therewith faſting. It is vſed alſo to very good purpoſe in diſlocations and members out of joynt: with barley meale, water, and vigre, it is excellent for the ſtinging of waſpes, and ſuch like pricks. As touching the other kinds of Libanotis or Roſemarie, write I will more fully in due place. * Flea-bane.

G

Chap. XVII.

¶ *Of Piperitis and Origanum: of Onitis-Prasium: of Tragoriganum, and Heraclium: of Lepidium and Githor Melanthium: of Annise.*

* Ginney pepper.

PIperitis or Calecut Pepper-wort (which before we called * Siliquastrum) beeing taken in drinke, is very good for the falling sickenesse. *Castor* hath described it after another manner, namely, to be an herb rising vp with a long red stem, thicke set with joynts or little knees; bearing leaues resembling those of Lawrel; with white seed and the same smal, carying with it the tast of Pepper. The vertues of which hearb be these; To help the gumbs and teeth, to make a sweet breath, and withstand soure and stinking belches.

H

Cunila.

Origan or Orgament, which in tast (as we haue said) resembleth * Sauery, hath many kinds, & all medicinable, for there is one one sort therof sirnamed Onitis or Prasion, not vnlike to hyssope: a peculiar propertie this hearb hath being drunke in warme water, to quiet the gnawings in the stomacke, and to concoct the crudities there: but taken in white wine, to cure the venomous pricks of Spiders and Scorpions. The same applied outwardly with oile and vinegre vpon wooll, is singular good for dislocations, disjointures, spraines, contutions, and bruises.

As for Tragoriganum, it is more like vnto wild creeping Thyme: it hath vertue to prouoke vrin, to discusse and resolue all tumors or swellings. And more particularly, most effectuall it is for them that haue drunke the gum of Chamelæon, called Ixia: also against the Vipers sting: besides, for the stomacke that belcheth soure, and for the midriffe and precordiall parts. It is an approued medicine for the cough, the phrensie, and inflammation of the lungs, being with honey reduced into the forme of a Lohoch, for to be sucked downe leisurely.

I

Touching the Origan named Heracleum or Heracleoticum, the same also is diuided into three sorts: For the first is of a blacker & more duskish green, with broader leaues: also than the rest; and besides is glutinous and will cleaue to ones fingers. A second sort hath smaller leaues, softer it is & more tender in hand, not vnlike to Majoram; and this kind some would rather call Prasium. The third hath leaues of a mean bignes between the other two, not so large as the one nor so slender as the other, but not so forcible in operation as either of them both: but to return againe to our former Origanum: the best is that which groweth in Candy; for the same hath a pleasant and sweet sent besides: the next in goodnes is that which commeth from Smyrna: then after it, is the Origan that is brought from Heraclea: but that which is sirnamed * Onitis is simply the best of all others to be taken in drinke. Howbeit, the vse generally of them all in common, is to chase away serpents: by way of decoction or pottage made thereof, to cure them that be alreadie stung or wounded by them: beeing taken in drinke, to mooue vrine: and, together with the root of Panace, to helpe ruptures, convulsions, and spasmes: sodden in certaine Acetables with figs or hyssope, to the consumption of a sixt part, to cure the dropsie. At the entrance into the stouve or hot-house if it be taken good it is against the scab, the iteh, & the wild skurf. The juice with milk, is dropped into the ears, and that with very good successe. It helpeth also the mumps or inflammation of the Amygdales and Vvula; likewise the vlcers in the head. The decoction thereof taken with lie ashes in wine, is a countrepoison to kill the venom of Opium and Plastre. The measure of one Acetable, looseneth the belly. A liniment made thereof, recouereth the natiue colour of the blacke and blew marks remaining after stripes. With hony and nitre, it assuageth the paine of the teeth if they be rubbed therewith; and besides maketh them looke faire and white. It stauncheth bleeding at the nose. A decoction made therwith and barley meale, resolueth the swelling kernells and inflammations behind the eares. The pouder being incorporat in honey and gall-nuts, doth smooth and cleare the rustinesse of the windpipes, occasioned by a rheume. The leaues applied in manner of a cataplasme with honey and salt, mollifieth the splene. If the hearbe be sodden with honey and salt, and so taken by little and little, it doth cut, extenuate and make subtile, grosse fleagme, especially if blacke melancholy bee bedded therin. Stamped, and instilled into the nosthrils with oile, it cureth the iaundise. Such as be ouerwearied and tired with extreme trauell, find much aleuiation and ease by being rubbed and annointed all ouer with a liniment made thereof, with this caueat, That they come not so neer as to touch the belly with it. A plastre made with it & pitch & applied, healeth the angry bloudy-falls & chilblanes. Bruised with figs, it ripeneth felons. A pultes made with it, with oile,

* Bugle, or *Stœchas Arabica.*

K

L

M

20030
copy 1

A oile,vinegre,and barly meale,ſoftneth and reſolueth the Kings euill. A liniment made therwith and figs together, aſſwageth the paine of the ſides. Being bruiſed and reduced into a liniment with vinegre,and ſo laid to the priuy parts,it reſtraineth the flux of bloud thither; and yet it hath a propertie to euacuate the reliques of bloud in women newly brought to bed,who ought to be purged.

As touching Lepidium [*i.* Paſſe-rage] it is to be ranged among the burning and cauſticke medicines: by which faculty that it hath,and by bliſtering the skin,it taketh away any ſpot or blemiſh in the face; yet ſo,as the exulceration which it cauſeth,may be ſoone helped and skinned again with a ſalue of wax and oile of Roſes. By the ſame means it ſerueth to clenſe the le-
proſie and wild ſcabs,which it doth alwaies with eaſe and expedition,as alſo to ſmooth the ci-
B catrices or ſcars after vlcers. Moreouer,it is commonly ſaid,that if it be tied faſt vnto the arme on that ſide where the teeth do ake,it * taketh the pain quite away.

* To wit,by raiſing a bliſter, and giuing iſſue.

Gith or Nigella,the Greeke writers ſome name Melanthion, others Melaſpermon: the beſt is that which is blackeſt,and beſides of quickeſt ſent. A ſingular remedie it is for the ſores and wounds occaſioned by venomous ſerpents and ſcorpions eſpecially,if a liniment be made of it, vinegre and hony mingled together. I find alſo,that if it be burnt,the very ſmoke and fume of it will chaſe away ſerpents: but particularly againſt the poiſon of venemous ſpiders,a dramme thereof is ſufficient to be taken in drink. Being bruiſed and knit in a linnen cloath,and ſo ſmelled vnto,it reſolueth the poſe,or breaketh the cold which ſtuffeth the noſthrils. Applied as a liniment with vinegre to the forehead,or infuſed into the noſthrils, it eaſeth the head-ache. And
C if it be ſo vſed with the oile of the floure de-lis root,it ſtaieth the wateriſh humors that fall into the eies, and abateth their ſwellings. The decoction thereof in Vinegre cureth the tooth-ache,if a colluſion thereof be made and the mouth waſhed therewith. Being ſtamped and ſo applied,or but chewed in the mouth,it healeth the cankers or exulcerations within. Likewiſe a liniment made of it and vinegre clenſeth the leproſie, and the hot red pimples breaking out in the skin. If it be taken in drink,with ſome addition of nitre,it eaſeth the difficulty of breathing in ſuch as blow ſhort. It helpeth all hard ſwellings,and old feſtred impoſtumes or biles,if they be anointed therewith. If a woman be deſirous to haue ſtore of milk,let her eat and drink ther-
of continually euery day. As touching the iuyce of Gith,it is drawn & gathered after the like maner as Henbane juice. And ſemblably taken in any great quantity, it is a very poiſon: which
D is a thing to be maruelled at,conſidering that the ſeed thereof ſeaſoneth loaues of bread,& gi-
ueth a moſt pleaſant reliſh to them. Moreouer,the ſeed of Nigella clenſeth the eies,prouoketh vrin and the monthly terms in women: yea and more than ſo,I reade,that thirty grains thereof tied in a linnen cloth,and applied to a woman newly deliuered,will draw down the after-birth. They ſay alſo,that if it be ſtamped in vrin and laid to the agnels or cornes of the feet, it cureth them: as alſo that the ſmoke killeth gnats or any other flies.

As for the herb Anniſe,if it be drunk with wine it is a counterpoiſon againſt ſcorpions. And *Pythagoras* hath giuen a ſpeciall praiſe and commendation to it both raw and boiled, as to few other herbs the like: for be it green or dry,it ſerues as well for ſeaſoning of all viands,as making all ſauces,inſomuch as the kitchen canot be without it. Ouer and beſides,when bakers ſet into
E the ouen,they put Anniſe between the bottom of their loaues and the peele. And for to commend wine,Vintners vſe to put it into their Hippocras bag, through which they ſtrain Hippocras and other aromaticall wines: and indeed with bitter almonds,it giueth a pleaſant and delicate taſt vnto any wine whatſoeuer. If one chew it euery morning vpon an empty ſtomack faſting,together with the ſeed of Smyrnum and a little hony, it maketh the breath ſweeter, and taketh away all ſtinking ſauours about one; prouided alwaies,that the mouth be preſently waſhed with a colluſion of wine. It cauſeth one to look freſh and young,if it be hanged about the bed vpon trauers or curtain, or otherwiſe ſticked to the pillow or bolſter, ſo as folke may haue the ſent thereof in their noſthrils while they lie aſleep,it riddeth them of troubleſome dreams and fantaſtical viſions. It procureth a good ſtomack to meat: for ſo our idle, nice,and delicate
F wantons,euer ſince they haue giuen ouer exerciſe and trauell (which ſhould get them an appetite & ſtomack to their victuals) & betaken themſelues to ſit ſtil and do nothing,haue deuiſed this artificial means among others,& haue recourſe to Anniſe: in which regards and for theſe cauſes,ſome haue giuen it the name of Anicetum. The beſt of all commeth from Candie: the next to it is that of Ægypt; and indeed this ſerueth in ſtead of Loveach in all ſauces. If a per-

fume thereof be drawn vp into the noſe, it appeaſeth the head-ache. *Iollas* ſaith, that the Anniſe G
root bruiſed and ſtamped together with Wine, and ſo applied, ſtayeth the flux of waterie and
weeping eies. The herb it ſelf, with an equall quantitie of ſaffron and wine, yea, or braied alone
with barly grots, reſtraineth all great fluxions and diſtillations: and the ſame compoſition ap-
plied to the eyes, driueth out any thing that hath fallen into them. A liniment made therwith
and water together, conſumeth and cureth the Polypes or cankerous vlcers within the noſe-
thrils. A collution of it in vinegre, with honey and hyſſop, vſed as a gargariſme, aſſwageth the
ſquinancie. Tempered with oile of roſes it is ſoueraigne for the eares to be inſtilled into them.
Being taken dried and parched at the fire, it clenſeth the breſt of the viſcous and tough flegme
there gathered; but if it be incorporat with honey it doth the deed the better. But would you
learn for the cough a ſoueraign lohoch or confection? Take one Acetable of Anniſe, and fifty H
* i, Almonds. *bitter nuts wel clenſed and blanched: ſtamp theſe all together in a mortar, and with hony re-
duce them into the conſiſtence of an Electuarie. And yet there is one Compoſition more for
this purpoſe, and of all other the eaſieſt and ſooneſt made. *Recipe*, of Anniſe three drammes, of
Poppy ſeed two drams, temper theſe with hony, & for three mornings together take the quan-
titie of a bean faſting. And this confection is ſingular beſides againſt ſoure riftings or belch-
ing: and therefore it cureth the ventoſities which puffe vp the ſtomacke: it aſſwageth the tor-
ments and wrings of the guts, and repreſſeth the continual flux proceeding from the weakneſſe
of the retentiue facultie in the ſtomacke. But to return againe to ſimple Anniſe ſeed, a drinke
made with the decoction thereof, or the very ſmell taken vp into the noſe, ſtayeth the trouble-
ſome yex or hocquet. The decoction of Aniſe leaues doth digeſt and reſolue all crudities. The I
iuyce drawne from it when it is ſodden with parſley, if it be ſmelled vnto, ſtinteth immoderate
ſneeſing. Moreouer, Anniſe taken in drink, procureth ſleep, expelleth the ſtone and grauel, ſtai-
eth vomits, and reſolueth the tumors in the precordial parts, cauſed of windineſſe. Further, it is
a moſt ſoueraign medicine for the diſeaſes in the breſt: comfortable alſo to the neruous parts,
membranes, and ligaments, wherein the muſcles of the body be either incloſed or tied and vni-
ted together. The juice of it being boiled with oile, and ſo dropped or inſtilled into the head,
is good for the pains thereof. It is thought that there is not a better thing for the belly and the
guts than Anniſe: and therefore it is giuen ordinarily (if it be firſt parched and roſted againſt
the fire) in caſe of the bloudy flix and exulceration of the guts: alſo for the inordinate profers
to the ſiege, & riſing from it without effect or any thing diſcharged. Some put thereto Opium K
alſo, and preſcribe to make three pils thereof to the bigneſſe of a Lupine ſeed, and to take them
euery day diſſolued in a cyath of wine. *Dieuches* vſed commonly the iuyce of Aniſe, to mitigat
the pain of the loins: to giue alſo the ſeed beaten to pouder with mints in wine, for the dropſey
and tho defluxion ſtomachicall: but the root he thought to be paſſing good for the kidneyes,
vſed and taken in that maner. *Dalion* that famous Herbariſt was woont to apply Anniſe and
Parſley together in forme of a cataplaſme, to women in labour, for better ſpeed in child-birth:
alſo for the pain of the Mother, yea, he would giue it alſo to drink with Dill, vnto women when
they cried out in trauell. He applied it alſo green, with barley grotes in manner of a liniment,
to the head, for to ſtay and ſettle the brains of phrentique perſons. And being ſo prepared, he
found it ſingular good for young infants ſubiect to the Falling-ſickeneſſe, or troubled with L
crampes and contractions of ſinewes. As for *Pythagoras* verely, he ſaith confidently, That who-
ſoeuer doe but hold this hearbe in his hand, hee ſhall not be ſurpriſed with a fit of the Falling-
euill: and therefore he aduiſeth men to ſow good ſtore of it in their gardens about their hou-
ſes, to be ready euer at hand. He affirmeth moreouer, that women in labour, if they ſmel there-
to, ſhall haue more ſpeedy and eaſie deliuerance. Hee giueth counſell beſides, That immedi-
ately after the childe is borne, the mother ſhould drinke a grewell made with it and ſome bar-
ley grotes ſtrewed among. *Soſimenes* the Phyſitian was wont to mollifie and reſolue all hard
ſwellings with Anniſe & Vinegre: he vſed alſo to giue the decoction therof in oile, with ſome
ſprinckling of Nitre among, to thoſe that felt wearineſſe in their lims. Moreouer, hee aſſured
trauellers and wayfaring men, that if they drank the ſeed thereof, they ſhould find preſent help M
if they were tired. *Heraclides* gaue ordinarily of the ſeed as much as might be taken vp with
three fingers, together with two oboles of Caſtoreum, in honied wine, for the hoving & inflati-
on of the ſtomack: ſemblably, for the puffing vp and ſwelling of belly and guts. Alſo, to thoſe
that were ſtreit winded, & could not take their breath but ſitting vpright, he miniſtred the like

pro-

20030
copy 1

A proportion; to wit, as much as three fingers would contain, with equall quantitie of Henbane ſeed, in Aſſes milke. Many Phyſitians giue counſell to thoſe that would vomit luſtily, for to drink in water as they ſit at ſupper, an acetable thereof and ten leaues of Baies, bruiſed and beaten into pouder. If Anniſe ſeed be chewed, or applied hot in forme of a liniment, yea, or taken as a drink in vineger and hony, together with Caſtoreum; it helpeth the riſing of the mother and the danger of ſuffocation thereby. If a woman in child-bed preſently vpon her deliuery, drinke it with cucumber ſeed & line-ſeed together, of equall quantity, namely, as much as may be held between 3 fingers, in three Cyaths of white wine; it will ſettle the lightneſſe of the braine, and ſtay the dizzineſſe of her head. *Tlepolemus* preſcribed for feuers quartane, as much Anniſe ſeed
B as three fingers might comprehend, with the like quantity of Fennell ſeed to be taken in vineger and one Cyath of Honey. A liniment made with Anniſe and bitter nuts, allaieth the grieuous pains of the gout. There be who are of opinion, That it hath a ſpeciall vertue and property to reſiſt the poiſon of the Aſpis. Certain it is that it prouoketh vrine, allaieth thirſt and the appetite to drink, yea, and ſoliciteth to carnal luſt. Taken in wine, it gently putteth forth a kind ſweat. Moreouer, it keepeth cloths and apparel from the Moth. Generally, the freſher and newer alwaies that it is, and the blacker that it looketh, the more effectuall it is found to be. Howbeit, this one diſcommodity it hath, That it is an enemy to the ſtomacke, vnleſſe haply it bee peſtered with ventoſities.

C

Chap. XVIII.

¶ *Of Dill: of Sacopenium, and Sagapenum. Of Poppy both white and black. The manner of gathering and drawing iuice out of herbes. Alſo of Opium.*

Dill alſo hath a property to diſſolue ventoſities, to break wind and cauſe rifting; alſo to aſſuage any wrings or torments of the belly, & yet it ſtaieth the flux. The roots being reduced into a liniment with water or wine, reſtraineth the flux of watering eies. A perfume made of the ſeed as it boileth, receiued vp into the noſthrils, ſtaieth the yex. Taken as a drinke in water, it concocteth crudities, and appeaſeth the pain of windineſſe proceeding from thence. The aſhes of it burned, raiſe vp the Vvula in the throat that is fallen. Howbeit, Dill dimmeth the eie-ſight, and dulleth the vigor of genitall ſeed.

D As for our Sacopenium here in Italy, it differeth altogether from that which grows beyond ſea. For the outlandiſh kind, reſembling gum Ammoniack, is called Sagapen. Good it is for the pleuriſie and pain of the breſt, Convulſions or Spaſmes, and old ſetled Coughes; for thoſe that reach vp filthy and rotten matter; for the tumors of the midriffe and precordial parts. It cureth the ſwimming and giddineſſe of the head, the ſhaking and trembling of the joints, the crampe or convulſion that draweth the neck backward, the great ſwelled ſpleens, the pain of the bones, and all ſhaking and quiuering colds. A perfume made therewith in vineger, if a woman ſmell vnto, it helpeth the Mother that is ready to ſtop her wind. As for the other accidents, it is both giuen in drinke, and alſo rubbed into grieued parts with oile. It is thought to be ſoueraign alſo againſt poyſoned drinkes giuen by Witches and Sorcerers.

Touching garden Poppie and the ſeuerall kinds therof, I haue written already: but beſides
E them there be other ſorts alſo of the wild, whereof I promiſed to treat. Meane while, the heads of the foreſaid garden white poppy, if they be bruiſed whole as they grow with ſeed & all, and ſo drunk in wine, do procure ſleep. The ſeed it ſelfe alone cureth the Leproſie. *Diagoras* giueth counſell to cut the ſtem or ſtalk of the blacke Poppy when it beginneth to ſtrout and ſwell toward the flouring time, out of which there wil iſſue a certaine juice called Opium: but *Iollas* aduiſeth to make that inciſion when it hath bloomed, and to chuſe a faire cleare day for it, & that houre of the day when as the dew thereon is dried vp. Now would they haue them to be cut vnder the head before the bloom; but in the very head, after it hath don flouring; and verily, there is no other kind of herb wherein the head is cut, but this only. The ſaid juice of this herbe as
F well as of all other is receiued in wooll: or elſe if it run but in ſmall quantitie, they gather it with the thumbe naile, as the maner is in Lectuces: but the morrow after the inciſion, ſo much the more vigilant they muſt be to ſaue & gather that which is dried: and in very deed the iuice of Poppy commonly runneth out in great abundance, & gathereth into a thickneſſe: which afterward is ſtamped and reduced into little troſches, and dried in the ſhade. Which juice thus drawne

drawne and thus prepared, hath power not only to prouoke ſleep; but if it be taken in any great quantity, to make men dye in their ſleep: and this our Phyſitians call Opion. Certes, I haue knowne many come to their death by this meanes; and namely, the father of *Licinius Cecinna* late deceaſed, a man by calling a Pretor, who not able to indure the intollerable pains and torments of a certain diſeaſe, and being weary of his life, at Bilbil in Spaine, ſhortened his owne daies by taking Opium. By reaſon whereof, Phyſitians are growne to great variance, and be of contrary opinions as touching the vſe of the foreſaid Opium. *Diagoras* and *Eraſiſtratus* condemned it altogether as a moſt deadly thing, & would not allow that it ſhould be ſo much as injected or infuſed into the body by way of clyſter, for they held it no better than poiſon: and otherwiſe hurtful alſo to the eies. *Andreas* ſaith moreouer, That if Opium doth not preſently put out a mans eies & make him blind, it is becauſe they of Alexandria in Egypt do ſophiſticat it. But in proceſſe of time the later & modern Phyſitians did not vtterly reject it, but found a good vſe therof, as may appeare by that noble and famous Opiat confection called Diacodium. Moreouer, there be certain ordinary troſches made of Popy ſeed beaten into pouder, which with milk are commonly vſed by way of a liniment to bring ſicke patients to ſleepe. Likewiſe with oile Roſat, for the head-ach: and with the ſame oile they vſe to drop it into the eares for to mitigat their pain. Alſo a liniment made therof with breſt-milk is ſingular good for the gout. In which ſort there is a great vſe of the leaues alſo to the ſame purpoſe. And being applied as a cataplaſme with vineger, they help S. *Anthonies* fire, and all ſorts of wounds. For mine own part I would not haue it in any caſe to enter into Collyries, much leſſe vnto thoſe medicines which be ordained to driue away ague fits, or into maturatiues, no nor to go among other ingredients into thoſe remedies which are deuiſed to ſtay the flux that commeth from the ſtomack. Howbeit, in this caſe laſt ſpecified, many giue the black Poppy with wine. Al garden Poppies grow rounder in the head than the wild: for theſe beare a head longer & ſmaller, howbeit (for any vſe) of greater operation than thoſe of the garden. For the decoction therof taken as a drink, procureth ſleep to ſuch as be ouer watchfull: ſo doth a fomentation thereof, if either the viſage bee ſprinckled, or the mouth waſhed therewith. The beſt Poppies be they that grow in dry places and where it raineth ſeldome. When the heads and leaues both be ſodden & ſtamped, the iuice that is preſſed from them, Phyſitians call Meronium: and it is far weaker and duller in operation than Opium. Now to know which is good Opium indeed, the firſt and principal trial is by the noſe; for the true Opium is ſo ſtrong, that a man may not indure to ſmel it: the ſecond proof is by fire: for the right Opium will burn cleare like a candle; and when it is put forth yeeldeth a ſtinking ſent from it in the end: which ſignes are neuer to be found in that which is falſified and ſophiſticat; for this that is not right, will not ſo ſoon take a light fire, and beſides, is readie oftentimes to go out. There is another experiment by water: for the good and pure Opium being put into water, ſendeth forth a certaine miſt from it like a cloud, which floteth euen aloft: whereas the corrupt and depraued Opium gathereth into bliſters and bladders, and ſo bubleth vpon the water. And yet there is one way more admirable than the reſt to try good Opium euen by the Sun-ſhine in a Summers day: for if it be ſuch as it ought, it wil ſweat and reſolue into a thin liquor, like as when it came firſt out of the plant. To conclude, *Mneſicles* is of opinion, that the beſt means to keep and preſerue Opium, is to lay it in Henbane ſeed: but others thinke it better to let it lie among beanes.

Chap. XIX.

*Memithum.

¶ *Of the wandering Poppy, and the horned Poppy. Of* * *Glaucium or Paralium. Of Heraclium or Aprhum. Of the compoſition named Diacodium, and of the Tithymal.*

IN a middle nature betweene the garden Poppy and the wild, is to be ranged a third kinde: which becauſe it commeth vp in corne fields, but yet vnſown and of the own accord, we haue called Rhœas, and wandering Poppy. Some there be, who ſo ſoon as it is gathered, chew both hearb and head all whole as it grew, and ſo eat it. Fiue heads of this Poppy being ſodden in three hemines of wine, and ſo taken in drinke, do both purge the belly, and alſo bring the patient to ſleep.

Of theſe wild Poppies there is one kind called in Greek Ceratitis, of a dark or duskiſh green, growing vp with a ſtalke a cubit high; with a groſſe root, couered with a thicke rinde; the heads

20030
copy 1

A heads or cups wherein the ſeed lieth,bend like vnto a little horne. The leaues are leſſe and ſlenderer of this Poppy than of any other wild. The ſeed alſo is ſmal,ripe and ready to be gathered in corn harueſt;which being taken in drink,to the quantity of half an Acetable in honied wine worketh downwards and ſcoureth the belly. The leaues being ſtamped with oyle,and ſo applyed,heale the haw in horſe eies. The root taken to the quantity of an Acetable, and ſodden in two ſextars of honied wine,vntill halfe be conſumed, is giuen in drinke for the infirmities of the loins and liuer. The leaues applied as a cataplaſme with hony, healeth Carbuncles. Some call this kind, Glaucium,others Paralium;for it growes within the aire of the ſea,or els in ſome brackiſh place ſtanding much vpon Nitre.

B Another kind of theſe wild Poppies is called of ſome Heraclion,or of others, Aphron, with leaues reſembling * Sparrows,if a man look a far off. The root runneth very ebbe and ſuperficially vnder the green ſord,and the ſeed ſeemeth charged with a certaine froth or ſome. Herewith linnen cloths in ſummer time vſe to be bleached,and to get a bright white colour. This herbe beaten in a mortar to the quantity of one Acetable,and taken in white wine,helpeth the falling ſickneſſe;for it cauſeth the patient to vomit. This kinde of Poppy is the principall ingredient or Baſis to the confection named Diacodium or Arteriacum. The compoſition or making whereof enſueth in this maner: Take of this Poppy heads,or of any other of the wilde ſort, 120: let them lie in ſoke or infuſed two daies together in three ſextaries or halfe a gallon of water:and in the ſame water boyle them wel. When this decoction hath paſſed through a ſtrainer or jelly bag,ſeeth it a ſecond time with hony vp to the height or conſiſtence of a Syr-
C rupt(that is to ſay,vntill halfe be conſumed away)ouer a ſoft and gentle fire. Herunto the modern Phyſicians which came after,put too,of Saffron,of Hypociſthis,Frankincenſe,Acacia, of each ſix drams,and in the end,of groſſe cuit of Candy one ſextar. But this later compoſition ſerued onely for a ſhew and vaine oſtentation;for the ſimple and plain making of it in old time with Hony and Poppy,and no other addition beſides,was as wholeſome and profitable as this. But to come again to our wild Poppies:there is a third kind therof named Tithymalos (which ſome call Mecon,others Paralion(carrying a ſmooth leafe and a white, with a head of the bigneſſe of a Bean. The time of gathering theſe Poppies,is when the grape is in the floure: & then the manner is to dry them in the ſhade. The ſeed if it be taken in drinke, the quantitie of halfe an Acetable in mead or honied wine,purgeth the belly. But what Poppy ſoeuer it be,the head
D either green and freſh,or dry,if it be applied as a liniment to the eies,repreſſeth the flux of wateriſh humors falling to them,and mitigateth their inflammations. If Opium be giuen in pure wine ſomwhat allaied,preſently after the Scorpion hath ſtung,it is a counterpoyſon. Howbeit, ſome there be who attribute this vertue only to the blacke Poppy, namely, if either the heads or leaues be bruiſed and reduced into pouder.

*Struthio ſimilibus.ex Dioſc. i. like to Struthium: wherin *Pliny* is foulely ouerſeen to tranſlate it *paſſeré preſentantibus:* becauſe that σπαρτον ſignifieth the herb Struthium, (a Fullers weed)and the bird called a ſparrow: vpon which one abſurdity more follow ſtill to maintaine the ſame, as commonly it is ſeene. For that which followeth of bleaching,agreeeth to the foreſaid hearbe in ſome ſort.

Chap. XX.

¶ *Of the wild Purcellane or Peplium. Of Coriander and Orach.*

E THere is a wild Purcellane alſo,which they cal Peplium: more effectual,though not much, than the garden Purcellane;for there be ſtrong and wonderfull properties reported thereof for ſundry vſes. Firſt it is holden for certain,that this herb if it be eaten as meat,dulleth the poiſon of venomous arrows,of Serpents alſo called * Hæmorrhoids and * Preſters:and being laid to the hurt place, draw forth the ſaid poyſon. The juice alſo of this herb preſſed forth and drunk in wine cuit,is a remedy for thoſe that be poyſoned with Henbane. Now if the herb it ſelfe is not to be gotten,the ſeed hath the like effect. Moreouer,it is thought to be ſingular good for the aquoſities gathered within the body,and the diſeaſes cauſed thereby, as dropſies, &c.for the head-ach;for rheumatick vlcers alſo,if it be bruſed and applied with wine. Al other ſores likewiſe it healeth,if it be chewed and laid too with honey. After the ſame manner prepa-
F red,it is good to be applied to childrens heads for to temper the heat of the brain, as alſo to their nauils when they beare out more than they ſhould. For al vehement diſtillations of watery humors into the eies,as well of old folke as ſmall infants,it is counted ſingular;for to be applied to the forehead & temples,together with Barly groats:but if it be laid vnto the very eys, then would the ſame be tempered with milk and hony. Now if it chance that the eies be ready to fall out of the head,the leaues ſtamped with the ſhales of Beane cods, and applied thereto,

*So called for that they cauſe flux of Blood. * Otherwiſe named *Dipſades*,becauſe they ſet one into a burning fire,as it were, and an vnquenchable thirſt:whereupon they tooke both their names.

is

is an excellent remedy. A cataplaſme made of it, with Barly groats, ſalt, and vineger, cureth an- G
gry wheales and bliſters that break out in the skin. The ſame being chewed raw, repreſſeth the cankers in the mouth, and the ſmelling of the gums: likewiſe, it aſſuageth the tooth-ache. The iuice of it being well ſodden, cureth the ſores of the Amygdales, if the mouth & throat be waſhed therwith. And ſome put to this collution a little pouder of the ſtone Murra. And no maruell, for the very chewing only thereof doth faſten the teeth that be looſe in the head. It doth mitigate the inconuenience of crudity and indigeſtion, it ſtrengtheneth the voyce, and putteth by thirſt. A cataplaſme made therewith, hauing gal-nuts and line-ſeed among, of equal quantity, allayeth the pains and cricks in the nape or chine of the neck. Tempered with hony & white fullers clay, it is ſingular for the accidents that befall to womens breaſts. The ſeed taken with honey, is very wholſome for ſuch as be ſhort winded. Eaten in ſallads, it ſtrengtheneth the ſto- H
mack. If it be laid as a cataplaſme [to the belly and Hypochondrial region] it allaieth the heat of ardent and burning feauers; yea, & in other caſes the very chewing of it cooleth the heat of the guts and entrails. It ſtaieth vomits, eaten in vineger: or taken in drink with cumin, it is good for the bloudy flix and other inward impoſthumes and filthy ſores. Being firſt ſodden and then eaten, it is ſingular for thoſe that ſtrain hard vpon the ſtoole, and notwithſtanding many prouocations and profers, deliuer nothing. And whether it be taken in meat or drinke, it is a ſoueraigne thing for the falling ſickneſſe. For a ſhift or immoderat courſe of womens termes, it is giuen with great ſucceſſe, the quantity of one acetable meaſure in wine cuit. A liniment made with it and ſalt, is good for the hot gout & S. *Anthonics* fire. The juice if it be drunken, helpeth the reins and the bladder. It expelleth wormes and ſuch like vermine out of the belly. A good I
mitigatiue, it is of pain, if it be applied as a cataplaſme to wounds with oile and Barly groats. It mollifieth the ſtiffeneſſe and hardnes of the ſinews. *Metrodorus* in his book intituled the* Abridgement or Breuiary of thoſe roots that are to be cut vp or gathered; gaue counſell to giue this herb to women, newly laid vpon child-birth, for the immoderate and exceſſiue purgation that many times followeth them. It cooleth the heat of luſt, and repreſſeth dreames of wantonneſſe. I know my ſelfe a grand ſignior in Spain, father vnto a great perſonage, and one who had bin aduanced to the dignity of a Pretour, who carried euer about him a root of this Peplium hanging at his neck by a lace or ſmal thred, & that for the intollerable pains of the Vuula, wherto he was ſubiect; and neuer would he leaue it off, but when he went into the ſtoue or bayne: whereby he found ſuch eaſe, that he was neuer troubled afterward with the ſaid diſeaſe. Moreo- K
uer, I haue read in ſome writers, That if the head be annointed or well rubbed therewith, a man ſhall not for a yeare together find any inconuenience of a rheum diſtilling from the brain: howbeit, it is thought that the vſe thereof wil make the eyes dim.

* Ἐπιτομὴ τῶν ῥιζοτομικῶν.

Concerning Coriander, there is none found growing wild of it ſelfe without ſowing by the hand. But certaine it is, that the very beſt commeth out of Egypt: a ſpeciall and peculiar vertue it hath againſt one kind of ſerpent or venomous worm, which they call Amphisbæna [for that it ſeemeth to haue an head at both ends] whether it be inwardly taken in drinke, or outwardly applied. It healeth alſo other wounds. It cureth the night-foes or chilblans, the red angry pimples alſo, if it be but only ſtamped and layd too. There is not a ſwelling or apoſtemation gathering to an head, but a cataplaſme made with it, with hony and Raiſins, either reſolueth them, or L
quickly bringeth to maturation. If it be no more but ſtamped with vineger, it eaſeth the puſhes and biles that breed commonly in the ordinary emunctories. Three graines of Coriander ſeed ſome preſcribe to be eaten before the acceſſe or fit of a tertian ague: or more than three to bee rubbed vpon the forehead. Others there are who thinke, that to the ſame effect they are to bee laid vnder the bolſter and pillow where the patient lieth, before the Sun riſe; and then ſhall he be ſure to miſſe his fit and be wariſhed for that feuer. Indeed, Coriander whiles it is green, is of great force to coole the heat of agues. A cataplaſme thereof made with Honey or Raiſins, healeth vlcers alſo that be corroſiue and eat deep into the fleſh. In like manner ſo prepared, it is very good for the priuy members; for burns and ſcaldings, for carbuncles and for the eares. With womans milk it helps the eyes that water continually. The ſeed drunk in water, ſtaieth the flux M
of the belly & guts; yea, and in caſe of thoſe violent euacuations vpward & downward, through the rage of cholerick humors, being taken in drinke with Rue, it ſetleth and knitteth the body againe. If the ſeed of it be drunke with ſallet oile and the juice of a Pomgranat, it chaſeth forth worms out of the entrails. *Xenocrates* telleth a ſtrange thing, if it be true, namely, That if a wo

man-

20030
copy 1

A man drinke one onely grain or ſeed of Coriander, her menſtruall flux will ſtay one day; if twain, they will hold vp two daies: and proportionably, looke how many ſeeds ſhe drinketh, ſo many daies ſhal ſhe go cleare and ſee no token of them. *M. Varro* was of opinion, That if fleſh meat were poudered or corned with Coriander groſſe beaten together with vineger, it would keepe ſweet, and it were all the Summer long.

As for Orach, there is a wild kind of it growing of the owne accord: a very weed it is and no better, vtterly condemned by *Pythagoras*; as if it bred the Dropſie, ingendered the Iaundiſe, brought folk to look ill and pale, and were exceeding hard of digeſtion: and ſo far hee was out of conceit with it, that he thought nothing would like wel & proſper, no not in a garden, where this grew neere, but that it would ſenſibly decay and fade. *Dionyſius* and *Diocles* approoue this
B judgement of *Pythagoras*, and ſay moreouer, that moſt diſeaſes are bred therby. Nay, they would not haue it to be put into the pot to be ſodden, vnleſſe it had bin waſhed before in many waters. Theſe Phyſitians hold that it is a very enemy to the ſtomack, ingendring pimples, frecles, and whelks. But I muſe and maruell much why *Solon* of Smyrna ſhould write, that it hath much ado to grow and come vp in Italy. As for *Hippocrates*, he is not ſo far fallen out with it; for with it and Beets he maketh a decoction (to be injected by the Metrenchyte) to aſſwage the inflammation in the matrice & the natural parts of women. *Lycus* of Naples was wont to giue it to drink as a counterpoyſon againſt the green flies Cantharides. And he thought that a very good liniment might be made thereof, either raw or ſodden, to lay vnto biles, puſhes, fellons a breeding, and all hard tumors whatſoeuer. Semblably, that if S. *Anthonies* fire were annointed therewith,
C being incorporat with hony, vineger, and nitre; or if it were applied vnto the gouty parts, there would enſue great eaſement. Moreouer, in caſe the nailes be grown crooked, vneuen, & rugged, it is ſaid that it wil cauſe one to caſt them without any vlcer and ſore at all. Some there be who preſcribe an electuary, made with the ſeed of Orach and hony, to be giuen for the Iaundiſe: alſo if the windpipes be hoarſe with ſome fell or ſharp rheume falling downe vpon them, or, if the Amygdales on either ſide of the throat be amiſſe, it is very good to rub thoſe parts therewith. They affirme moreouer, That a ſimple decoction of it alone, moueth the body downward; but with Mallows or Lentils, prouoketh vpward and cauſeth vomit. Finally, to conclude with the wild Orach; it is vſed much to colour the haire black, and for the other aboue named purpoſes, as well as that of the gardens.

D

Chap. XXI.

¶ *Of the common Mallow. Of the Mallow Malope. Of the Mariſh Mallow or Aitæa. Of the common Docke: the ſoure Docke or Sorrell: of the water Docke: of the tall Docke called Patience: and laſtly of that Docke with the long root, called Bulapathum.*

ORaches were not ſo much diſcommended, but on the contrary ſide Mallows be as highly praiſed, as wel that of the garden as the wild. Two kinds there be of the garden mallows; diſtinguiſhed both by the largeneſſe of their leaues. The greater of thoſe that grow in gardens, the Greekes call Malopum; the other is ſuppoſed to be named Malachum; for that it
E doth mollifie and ſoften the belly. Of the wild ſort, that which carrieth a broad leafe and white roots is called * Althæa, and of ſome, Ariſtalthæa, for the excellent vertues that it hath in Phyſick. This property haue Mallows, To inrich and fatten any ground, wherſoeuer they be ſown or ſet. But this mariſh Mallow Althæa, is more effectuall than the reſt againſt all wounds by ſharp pricks or thornes, and principally againſt the ſting of Scorpions, Waſpes, and ſuch like, as alſo the biting of the Hardiſhrew mouſe. Nay, whoſoeuer be throughly rubbed or annointed before hand with any Mallow whatſoeuer, ſtamped with oyle; or do but carry it about them, they ſhall not be ſtung or bitten at all. As for the leafe of Mallowes, if it be laid vpon a Scorpion, it will be ſtreightwaies benummed. Moreouer, good counterpoiſons they be all: a liniment made
F of them being raw, together with nitre, draweth forth all pricks or ſtings remaining within the fleſh: but if leafe and root be ſodden together and ſo drunk, it repreſſeth the poiſon of the venomous fiſh called the ſea-Hare; but ſome ſay it muſt be caſt vp and vomited againe, or elſe it doth no good. Certes, ſtrange and wonderfull things be ſpoken as touching the operation of Mallows, ouer and aboue thoſe already rehearſed. But this paſſeth all the reſt, That if a man or woman

* Ἀλθαία ἀπὸ τοῦ ἀλθαίνειν. To cure or heale.

woman ſup off a ſmal draught (though it were no more but half a cyath) euery day of the juice of any mallow, it skills not which, he ſhall be free from all diſeaſes and liue in perfect health. True it is, that if they be putrified and reſolued in chamber-lie, they will heale all the ſcurfe & running ſcalls in the head; but if they be tempered with hony, a collution made thereof cureth the cankers of the mouth; and a lauature repreſſeth all tettars, ringwormes, & any ſuch wildfire running vpon the skin. A decoction of the root, clenſeth the head of dandruffe, if it be waſhed therwith, & ſetteth the teeth faſt that were looſe. Take the root of that mallow which riſeth vp with one only ſtem, prick the gums therwith about the tooth pained; do this (I ſay) till the ach be gone. The ſame root reduced into a liniment, with the faſting ſpittle of man or woman, and applied accordingly, reſolues the Kings euil, diſpatcheth the ſwelling kernels behind the ears, and diſcuſſeth biles and puſhes, without any breaking of the skin or making vlcer. The ſeed of mallows if it be taken in thick wine, deliuereth the patient from phlegmatick humors, from the rheume, and the heauing of the ſtomack making offer to caſt and cannot. The root wrapped faſt and tied within a lock of blacke wooll, preuenteth the euill accidents that may befall vnto womens breſts. The ſame ſodden in milk & taken after a ſippling ſort (in manner of a ſupping) for fiue daies together, cureth the cough. And yet *Sextius Niger* ſaith, they be hurtfull to the ſtomack. And * *Olympias* of Thebes affirmeth, That if women vſe it with gooſe greaſe, they ſhall not go their full time with childe. Others do write, That if women take an handfull of Mallow leaues in oyle and wine, they ſhall be throughly purged in their due times. This is known for a truth and reſolued by all that write or make profeſſion of Phyſicke, That a woman in labour, if ſhe ſit vpon Mallows ſtrewed vnder her ſtoole, ſhal be deliuered with greater ſpeed and expedition: but then muſt they be taken away preſently after that ſhe is laied, for feare that the very matrice follow after the child. An ordinary practice it is of ſage and diſcreet midwiues, to giue vnto women in trauell faſting, a ſmall pint of the juice of Mallows ſodden in wine: & yet thoſe that cannot contain but ſhed their naturall ſeed, are inioined to take mallow ſeed bruſed, and ſo to bind it to their arme. Moreouer, ſo good and fauorable naturally be mallows to the game of loue, as if they grew for nothing els: inſomuch as *Xenocrates* doth affirme, That if the ſeed of that Mallow which runneth vp in one ſtalk, be reduced into pouder and ſtrewed vpon that part of a woman which Nature hath hidden, ſhe will be ſo wood after the company of a man, as ſhe will neuer be ſatisfied nor contented with embracing. The like effect (ſaith he) there wil enſue, if three roots thereof be bound neere to the place of Nature. Alſo, that a decoction of Mallows miniſtred by way of clyſter, is a ſingular injection to cure the bloudy flixe, or exulceration of the guts; as alſo the extraordinary and bootleſſe deſire to the ſeege. In like manner, a fomentation thereof is very good for other accidents befalling to the ſeat or tuil. The juice of Mallows is giuen warm, the quantity of three cyaths, to melancholick perſons that be troubled in mind; and of foure, to thoſe that be ſtark mad indeed and beſides themſelues. A whole hemina of the juice drawne and preſſed from mallows boyled, is giuen at one time to thoſe that be ſubject to the falling ſickneſſe. The ſame being reduced into a liniment, is to good purpoſe applied warm vnto thoſe, who are troubled with the ſtone and grauell, with winde cholique and ventoſities, with the cramp alſo or crick that doth draw their necks backward. The leaues being ſodden in oyle, are layd with good ſucceſſe in manner of a cataplaſme, vpon the hot fretting humor called S. *Anthonies* fire: alſo to places ſcorched, burnt, or ſcalded: but for the accidents and Symptomes concurrent with wounds, they be rather laid raw with crums of bread. The juice of mallows boiled, is comfortable to the ſinews, the bladder, and the fretting or grinding of the guts. Mallows being either eaten, or their decoction miniſtred by way of injection with a metrenchyte, mollifieth the ſaid tumors in the matrice. The juice of mallows wel ſodden, either taken in drinke or applyed by way of fomentation, inlargeth the Vretere conduits, and giueth good and eaſie paſſage for the vrine. The root of Althæa is more effectual to all theſe infirmities and purpoſes aboue named, than of any other Mallow; but eſpecially in caſe of convulſions, cramps, and ruptures. If it be ſodden in water, it bindeth the belly. Boyled in white wine and applyed as a cataplaſme, it reſolueth the ſwelling kernels, commonly called the Kings euil; thoſe alſo that appeare behind the ears; yea, and the inflammations of the paps and breaſts. As for the byles or riſings called Pani, the leaues of Althæa or the Mariſh Mallow ſodden in Wine and brought to the forme of a liniment, doe diſcuſſe and rid away. The ſame, after they bee drie, and ſodden in milke, cure the Cough, how tough and ſhrewd ſoeuer it were, and that moſt ſpeedily.

G H I K L M

Hippocrates

* A woman Phyſitian, who writ of Phyſick, or at leaſtwiſe a midwife of good authoritie.

20030
copy 1

A *Hippocrates* gaue counſell to them that were wounded, & for loſſe of bloud exceeding thirſtie, for to drink the juice of Althæa roots ſodden. He ſaith moreouer, That the root it ſelfe emplaſtred with hony and roſin, is good for wounds, bruiſes, diſlocations, and ſwellings: comfortable alſo to muſcles, ſinews, or joints. He gaue it likewiſe to thoſe that were troubled with difficulty of taking wind, and with wheezing; for the dyſentery alſo or bloudy flix, to be drunken in wine. A wonderfull thing of this root, that if it be put into water, and the ſame let to ſtand abroad in the open aire, the water will gather to a thickneſſe and cruddle, yea turne white it wil like milk. To conclude, the newer and freſher Althæa is, the more effectuall you ſhal haue it in operation

Touching the Dock, the properties therof are not vnlike to thoſe of the marſh Mallow: there is a wild kind thereof, which ſome call Oxalis in Greek [*i.* wild Sorrel or Soure-dock] this herb
B reſembleth very neere that of the garden, in regard of the ſharpe pointed leaues; in colour like the white Beet, hauing a very ſmall root: our countrymen name it in Latine Rumex; other Lapathum Cantherinum: this herb being incorporat with hogs greaſe, is ſingular to mollifie all the ſwelled kernels, which ſome call the Kings euill. A ſecond ſort there is, which commonly is called Oxylapathum, *i.* Sharp pointed Docke; this commeth yet neerer to the garden Docke than the former: for it hath leaues ſharper at the point and redder, and groweth not but in mariſh grounds. There is another kind of Dock comming vp in the very water (as ſome ſay) Hydrolapathum. Yet is there one more called * Hippolapathum, bigger than the garden Docke or Sorrell; white alſo, and of a more faſt and pulpous ſubſtance. As for all the wild Dockes or
C Sorrells, they be holden medicinable to cure the ſting of Scorpions; and whoſoeuer hath any of them about him, is ſecure from the ſting or prick of Scorpions. The root, if it be ſodden in vineger and ſtrained, the juice thereof if the mouth be waſhed therewith, helpeth the teeth-ach: and if the ſame be taken in drink, it cureth the jaundiſe. The ſeed of this hearbe remooueth the tough humors bedded in the ſtomack, how hard impacted ſoeuer they be: the roots of Patience haue this peculiar property, To cauſe the nailes to fall off that grow rugged and vneuen. The ſeed taken to the weight of two drams in wine, riddeth away the bloudy flix. The ſeed of the ſharp Dock being waſhed in rain water, is ſingular good for thoſe that reach and caſt vp bloud, if there be added thereto as much Acacia as the bigneſſe of a Lentill. There be moſt excellent Trochiſques made of the leaues and root thereof, with the addition of nitre and ſome little quantity of * conuenient liquor, to incorporat and vnite them: and theſe muſt bee infuſed and
D diſſolued in vineger, at the time that they are to be vſed. As touching the garden Sorrell, there is a liniment made thereof, which being applied in manner of a frontall to the forehead, cureth the diſtillation of the watery humours to the eies. The root is ſingular for the wens or impoſthumes called Melecerides, and likewiſe of the Lepry. The decoction in wine is as good for the ſtone and grauell; as alſo to reſolue the Kings euill, and the ſwelling kernels behind the ears. If the ſeed be drunk in wine, it helpeth the ſpleen and the tumors thereof: the bloudy flix likewiſe, the ſtomachicall flux, and the vaine deſire to the ſtoole without effect. But for all theſe purpoſes, the juice of the Dock is more effectual. Ouer and aboue, it breaketh wind vpward, it prouoketh vrine, and diſcuſſeth the cloud and Miſt that troubleth the eies. If this herbe be put vp vnder the bathing tub within the baine, or otherwiſe if the body be annointed with a liniment
E thereof without oyle, before one enter into the bath, it taketh away the itch. If the root be but chewed only, it faſteneth the teeth that ſhake in the head. The ſame root ſodden in wine, ſtaieth the flux of the belly, and bindeth it; and yet the leaues make the body ſoluble. Finally (becauſe I would willingly omit nothing) *Solon* hath made mention of another Docke, called Bulapathum, nothing different from other Dockes; but that the root runneth deeper into the ground, which, if it be taken in wine, cureth the bloudy flix.

* *i.* Patience, or Monks Rheubarb.

* *Lure*, haply for *Thure*, *i.* Frankincenſe, accotding to *Cornarius*.

Chap. XXII.

¶ *Of three kinds of Senvey: of Horehound, and wilde running Thyme: of water Creſſes: of water Mints, otherwiſe called Thymbræum: of Lineſeed, and Bleets.*

F

THe herbe Senvey, whereof there be three kinds (as I haue already obſerued in my treatiſe of garden plants) *Pythagoras* hath placed in the higheſt ranke of thoſe ſimples that fume vp aloft: for there is not a thing that ſooner biteth one by the noſe, & pierceth and mounteth

teth more quickly into the brains than doth Senvey. The ſeed thereof [commonly called muſtard ſeed] being ſtamped, & with vineger reduced into a liniment, cureth the ſting of ſerpents, and namely the prick with the Scorpion. It hath beſides, a ſingular vertue to mortifie & kil the venomous quality of muſhrums. If it be but held in the mouth vntill it melt and reſolue, or otherwiſe be gargariſed with honied water, it draweth waterie fleame out of the head. Beeing chewed, it eaſeth the toothach. For the falling down of the Vvula, a gargariſme made of it with vineger and honey, is excellent. There is not a medicine ſo ſingular for the ſtomack and all the infirmities thereof, ne yet for the lungs. Being eaten at meat, it doth looſen ſuperfluous fleame, and cauſeth a man to reach and fetch it vp with eaſe; yea and to take his wind and breath at liberty. In like manner, being taken warm with the juice of Cucumber, it cureth the falling ſickneſſe. It purifieth the ſenſes: it purgeth the head by ſmelling: it keepeth the body ſoluble: it prouoketh womens monethly fleures, and vrine. A cataplaſme made therewith and applied accordingly, helpeth them that be in a dropſie: ſo it doth thoſe that be ſubject to the falling ſicknes. but then muſt it be ſtamped with three parts of Cumin and figs. If it be tempered with vineger and held to the noſe of ſuch women as with the riſing of the mother ſeeme to be ſtrangled and to lie in a trance, it raiſeth them vp again; in like ſort, it awakens thoſe who be in a fit of the lethargy: howbeit, in this caſe it is good to put thereto the ſeed of Seſeli of Candy, which they call Tordilion. But ſay that the Patients be in ſo deep a ſleep in this drowſie diſeaſe, that by ſuch means they will not ſtart vp and be raiſed; then take muſtard-ſeed and figgs, temper them with vineger into a cataplaſme, apply the ſame to the * legs or the * forehead or region of the brain rather. It hath a cauſtick or burning quality, and being applyed in form of a liniment to any part, it raiſeth pimples; by which means it cureth the old inueterat pains of the breſt, the ach of the loins, the haunch, and hucklebone, the ſhoulders or any part of the body where need is that the offenſiue humors ſetled deep within, ſhould tranſpire and be drawn outwardly to an iſſue. Now for that the nature thereof is to bliſter, in caſe the patient be timerous, & fear ſome extreme operation of that burning quality that it hath, it may be applied to the part affected between a doubled linnen cloth: otherwiſe, if the place be very thick and hard, it would be laid too without any figs at all. Moreouer, there is a good vſe of Senuy with red earth, for to make the haire come again which is faln; for ſcabs and ſcurfe, for foule morphew or the leproſie, the lowſie diſeaſe, the vniuerſall cramp that cauſeth the body to ſtand ſtiffe and ſtark, as it were all of one piece without ioint; alſo the particular cricke which ſetteth the neck backward, that it cannot ſtir. An vnction made with it and hony, cureth the eye-lids that be not ſmooth, but rugged and chapped; yea and clarifieth the eies which be ouercaſt with a muddy miſt.

* *adrevulſiones ad derivationem.*

As touching the juice of Senvie, it is after three ſorts drawne; the firſt, being preſſed forth, it is let to take a heat in the Sun gently by little and little, within an earthen pot. Secondly, there iſſueth forth of the ſmall ſtems or branches that it hath, a white milky liquor, which after it is dried and hardened in that manner, is a ſingular remedy for the tooth-ach. Where note by the way, that the ſeed & root both, after they haue bin wel ſteeped and ſoked in new wine, are ſtamped or brayed together: now if one do take in a ſupping as much of this iuice thus drawne, as may be held in the ball of the hand; it is very good to ſtrengthen the throat and chaws, to fortifie the ſtomack, to corroborat the eies, to confirm the head, and generally to preſerue all the ſenſes in their entire. And verily I know not the like wholſome medicine againe, to ſhake off and cure the lazy and lither feuers that come by fits many times vpon women. Senuy alſo being taken in drinke with vineger, breaketh the ſtone and expelleth it by grauell. There is an oyle alſo made of muſtard-ſeed, infuſed and ſteeped in oyle, and ſo preſſed out; which is much vſed to heat and comfort the ſtiffeneſſe of ſinewes occaſioned by cold; to warme alſo and bring into temper the thorough cold lying in the loins, hanches and hucklebones, whereof commeth the Sciatica. Of the ſame nature and operation that Senuie is, Adarca is thought to be (according as I haue touched in the diſcourſes of plants and trees growing wild in the woods;) which is a certain fomy ſubſtance ariſing and ſticking in the bark of certain Canes, vnder their very leaues and tufts that they beare in the head.

Concerning Horehound, which the Greekes call Praſion, others Linoſtrophon, ſome Phylopes or Philochares, an hearbe ſo well knowne and ſo common, that it needs no deſcription; many Phyſitians haue commended to be as medicinable as the beſt. And in truth, the leaues and ſeed both, being beaten into powder, are excellent good for the ſtinging of ſerpents, for the paine

20030
copy 1

A paine of the breſt and ſides,& ſingular for an old cough. Moreouer, the juice is right ſoueraign for thoſe who haue their lungs periſhed and do reach vp bloud, if the branches therof gathered and bound vp into bunches,be ſodden firſt in water with the grain called Panick, for to mitigat in ſome ſort the vnpleaſant harſhneſſe of the ſaid juice. A cataplaſme of Horehound applied vnto the Kings euill with ſome conuenient fat or greaſe,reſolueth the hard kernels. Some preſcribe a receit for the cough in this maner; Take the ſeed of green Horehound,as much as a man may comprehend with two fingers,ſeeth it with a ſmal handful of the wheat called Far,putting thereto a little oile and ſalt,and ſo ſup off the decoction faſting. Others hold, That without all compariſon there is not a medicine in the world like to the juice of Horehound and Fennel to-
B gether,firſt drawn by way of expreſſion to the quantity of 3 ſextars,& afterwards boiled to the conſumption of a third part vntill there remaine but two ſextars; then to this decoction there muſt be put one ſextar of hony,& all ſodden again to the conſumption of one third part more, vnto the height of a ſyrrup; whereof one ſpoonfull euery day taken in a cyath of water,is a drink that in this caſe hath no fellow. Horehound ſtamped and mixed with hony,is of wonderfull effect being applied to the priuy parts of a man,for any griefes incident thereto. Laid with vineger,vnto ring-worms, tettars,and any ſuch running wildfires,it purgeth and riddeth them clean away. A wholſom medicine it is to be applied as a cataplaſm,to ruptures,conuulſions,ſpaſmes, and cramps of the ſinews. Taken in drink with ſalt and vineger, it eaſeth the belly and maketh it laxatiue. It prouoketh womens terms,and ſendeth out the after-birth. The powder of it drie,
C mixed with honey,is of exceeding great efficacy to ripen a dry cough,to cure gangrenes,white-flaws,and wertwalls about the root of the nails. The juice dropped into the ears with honey,or ſnuffed vp into the noſe,cureth their infirmities; it ſcoureth away the laundiſe alſo and purgeth cholerick humors. And for all kinds of poiſons, few herbs are ſo effectuall as Horehound; for it ſelfe alone without any addition,clenſeth the ſtomack and breaſt, by reaching and fetching vp the filthy and rotten fleam there ingendred. If it be taken with hony and the floure-de-lis root, it prouoketh vrine. Howbeit,where there is danger of any exulceration in kidnies or bladder,it muſt be vſed with great warineſſe,if it be vſed at all. Moreouer,the juice of Horehound is ſaid to clarifie the eie-ſight. *Caſtor* putteth downe two ſorts of Horehound; to wit,the black and the white; but he ſetteth greater ſtore by the white than the other. He preſcribeth to take an empty egg-ſhel,and to put into it the juice of Horehound and hony,by euen portions; & when the ſaid
D egge is warm,to miniſter the ſame by way of clyſter or ſyringe,promiſing vs that the ſaid iniection will breake all inward impoſthumes; and when they be broken, clenſe and heale them throughly. Alſo a liniment (ſaith hee) made of Horehound ſtamped together with old ſwines greaſe,cureth all wounds occaſioned by the biting of mad dogs.

Touching running Thyme,ſome think it is called Serpyllum in Latine,*a ſerpendo* [*i.* of creeping] becauſe it runneth and creepeth by the ground; a property indeed of the wild kind, and eſpecialy among rocks and ſtony grounds. The garden Serpyllum,which commeth of ſeed,creepeth not,but groweth to the height of four-fingers bredth. The wilde Thyme which commeth vp of the own accord,liketh and thriueth better, hauing whiter leaues and branches than the other: this (I ſay) is thought to haue a ſpeciall vertue againſt ſerpents,and namely the Cenchris,
E the Scolopendres alſo as well of the ſea as the land; likewiſe the Scorpions, in caſe the ſprigs and leaues thereof be ſodden in wine,and ſo taken inwardly: if the ſame be burned,it yeeldeth a perfume, which with the very ſent chaſeth them all away. A ſingular power it hath againſt all venomous creatures of the ſea. Boiled in vineger,& reduced into a liniment with oile of roſes, it cureth the head-ach,if it be applied as a frontall to the forehead and temples. In like manner it helpeth the phrenſie and lethargy: but if it be giuen to drink,the weight only of four drams, it eaſeth the wrings & torments of the belly,it giueth free paſſage with eaſe to the vrine, it reſolueth ſquinancy or bringeth them to maturity,and ſtaieth vomits. And if one drinke it with water,it is excellent good for the opilation,heat, inflammations, and other accidents of the liuer. The leaues, to the weight of four oboli,are giuen in vineger,for the inflation and hardneſſe
F of the ſplene. If it be beaten to pouder and giuen in 2 cyaths of vineger and hony, it is thought a good medicine for them that ſpit and reach vp bloud.

The wild Siſymbrium or Creſſes,called of ſome Thymbræum, groweth to a foot in heigth and no higher. That which commeth vp in watery places,is like vnto garden Creſſes: but both ſorts are effectuall againſt all pricks and ſtings of Hornets,and ſuch like creatures. That which

Some take it for water Mint or Horſe-mint.

ſpringeth vp in dry ground,hath the narrower leafe of the twain,and carrieth a ſweet ſmel with G
it; whereupon it is commonly plaited amongſt other odoriferous herbes in chaplets and guirlands.But both the one and the other allaieth head-ach: likewiſe they doe ſtay the flux of wateriſh humors which diſtill into the eyes. Some put crums of bread thereto;others ſeeth them alone in wine,and vſe the decoction. Being reduced into a cataplaſme, and ſo applied euery night and taken off in the day time,it heals within foure times laying on, the angry chilblanes and bloudy-fals that trouble the feet in the night ſeaſon;yea and taketh away the ſpots & pimples ariſing in womens faces,which marreth their beauty,whether it be eaten with meat in ſubſtance,or the juice only taken in drink;it ſtaieth vomits,yexes,wringings,gnawings,and the diſſolution or feebleneſſe of the ſtomack,which cauſeth inordinat flux. Women going with child H
muſt take heed how they eat Siſymbrium,vnleſſe the fruit of their bodies be dead within them; for if it be but applyed outwardly,it will ſend it forth. If one drinke it with wine, he ſhall find that it prouoketh vrine,and the wild kind ouer and beſides,expelleth the ſtone and the grauell. Such as had need to wake and watch,namely,thoſe that be giuen to drowſineſſe and lethargie, will be raiſed from their ſleep and throughly wakened, if it be diſtilled aloft vpon their heads with vineger.

Line-ſeed is imployed with other matters in diuers medicines to many vſes,but of it ſelfe alone it cleareth the skin of womens faces,taketh out ſpots, freckles,pimples, wems, and molls that be eye-ſores, if it be applied as a liniment thereto. The juice therof quickneth and helpeth the eye-ſight. With Frankincenſe and water,or els with Myrrhe and wine,it repreſſeth the violent flux of humors to the eyes. Reduced into a cataplaſme,with honey,greaſe,or waxe,and ſo I
applyed,it reſolueth the ſwelling kernels behind the ears. The meale thereof in manner of drie barley groats,if it be ſtrewed vpon the ſtomack,helpeth the weakneſſe and queaſineſſe thereof, which maketh it ready to ouerturn. If it be ſodden in water and oile,and ſo reduced into a liniment with Anniſe-ſeed,and applyed,it cureth the ſquinancie. It muſt be wel dried and parched at the fire,in caſe it be giuen to ſtay the running out of the belly. As for thoſe that be troubled with the ſtomachicall flux,or the exulceration of the guts; a cataplaſme thereof with vineger and ſo applied,bringeth them preſent eaſe. For the griefe of the liuer,it ought to be eaten with raiſons. This ſeed is paſſing good for lohoches or electuaries to be made thereof, in the cure of the Phthiſick,and conſumption of the lungs. Lineſeed growing into floure and mingled with nitre or ſalt,or els with aſhes put thereto,is of great operation to mollifie the hardneſſe of muſ- K
cles,ſinews,joints,and the nape or chine of the neck; yea and to mitigat the inflammations of the membrans or pellicles of the brain. The ſame applyed with figs,is an excellent maturatiue, and ripeneth all impoſtumes. But if it be laid too with the root of the wild Cucumber,it draweth forth any thing that ſticketh within the body,euen the very ſpils & ſhiuers of broken bones. The ſaid pouder or floure made of Line-ſeed ſodden in wine,and applied as a cataplaſme,ſtayeth cancerous vlcers that they run no further: the ſame alſo with hony ripeneth apoſtemations of flegmatick humors,and the breaking forth of the ſmall pox. Being mingled with an equall portion of garden Creſſes,it cureth the rough nailes that grow vntowardly,and fetcheth them
*Murrha. off without any inconuenience. Incorporat with roſin and * Myrrhe, and ſo laid to the cods, it helpeth their ſwelling and inflammations: it is good alſo for ruptures of all ſorts; & with wa- L
ter it healeth the gangrene. Take of Line-ſeed & Fenigreek ſeed,of each one ſextar,ſeeth them in honied water,and make a liniment thereof,it eaſeth the paine of the ſtomack. Line-ſeed miniſtred in a clyſtre with oile and hony,cureth the deadly maladies of the guts and breaſt parts.

Bleets ſeeme to be dull,vnſauorie,and fooliſh Woorts,hauing no taſt nor quickneſſe at all: whereupon *Menander* the comicall Poet, bringeth in a husband vpon the ſtage, who to reproch his wife for her ſottiſhneſſe and want of ſenſe,giueth her the terme of Bleet. And in very truth, good it is for little or nothing,and altogether hurtfull vnto the ſtomacke. It troubleth and diſquieteth the belly, inſomuch as it driueth ſome that vſe to eat it, into the dangerous diſeaſe Cholera,working both vpward and downward without any ſtay. And yet ſome ſay,that if it be drunk in wine,it is good againſt Scorpions,and ſerueth for a prety liniment to be applied vnto M
the agnels or corners of the feet;yea and maketh a reaſonable good cataplaſm with oile,for the ſpleen,and pain of the temples. Finally,*Hippocrates* is of opinion, that much feeding of Bleets, ſtaieth the monethly courſe of womens tearmes.

A

Chap. XXIII.

¶ Of Meu, and Fenell, as well Gentle, named Fœniculum; as Wild, which is called Hippomarathrum, or Myrſineum: of Hempe, and Fenell-geant: and of Thiſtles and Artichoux.

MEu or Spicknell is not found in Italy, vnleſſe it be in ſome Phyſitians garden, and thoſe are very few that ſow or ſet it. Howbeit, there be two kinds thereof; the one, which is the better, is commonly called Athamanticum, of Prince *Athamas* the firſt inventer of this herbe, as ſome thinke; but according to other, becauſe the beſt Meu is found vpon Athamas, a
B mountaine in Theſſaly. Leafed it is like to * Anniſe, riſing vp with a ſtem otherwhile two cubits high, putting forth many roots, and thoſe blackiſh, whereof ſome run very deepe into the ground; neither is this Meu ſo red altogether as the other. If the root therof be beaten into pouder, or otherwiſe ſodden and ſo drunk in water, it cauſeth vrine to paſſe abundantly: in that order alſo it doth reſolue wonderfully the ventoſities gathered in the ſtomack. It aſſuageth mightily the wrings and torments of the guts; it openeth the obſtructions, and cureth other infirmities of the bladder and the matrice. Applied with honey, it is very good for the joints. Beeing laid as a cataplaſme with Parſley to the bottome of the belly of little children, it cauſeth them to make water.

* *Aniſo*, rather *Anetho*, Dill, after *Dioſc.* whereupon it is called of ſome, wilde Dil.

As for Fenell, the Serpents haue woon it much credit, and brought it into name, in this re-
C gard, That by taſting thereof (as I haue already noted) they caſt their old skin, and by the juice that it yeeldeth do cleare their eies: whereby we alſo are come to know, that this herbe hath a ſingular * property to mundifie our ſight, and take away the filme or web that ouercaſteth and dimmeth our eyes. Now the only time to gather and draw the ſaid juice out of Fennel, is when the ſtalke beginneth to ſwell and wax big: which after it is receiued, they vſe to dry in the Sun, and as need requireth, make an iniunction with it and honey together. There is of this juice to be had in all places: howbeit, the beſt is made in Iberia, partly of the gum that iſſueth or frieth (rather) out of the ſtalk [being brought neere to the fire;] or els drawn from the ſeed whiles it is freſh and green. There is another making thereof out of the roots, by way of inciſion, preſently after that Fennell beginneth to ſpring and put forth out of the ground, when Winter is done.
D There is another kind of wild Fenell, named by ſome Hippomarathrum, by others Myrſineum. Larger leaues this hath than that other of the Garden, and thoſe more ſharpe and biting at the tongues end: it groweth taller alſo, and ariſeth with a maine ſtem as big as a mans arm, & hath a white root. It groweth in hot grounds and thoſe that be ſtony. *Diocles* maketh mention of another kind yet of wild Fennell, with a long & narrow leafe, bearing ſeed reſembling Coriander. As touching the garden Fenell, and the medicinable vertues that it hath, it is holden, That the ſeed, if it be taken inwardly in wine, is a ſoueragne drinke for the prick of Scorpions or ſting of other Serpents. The juice thereof, if it be inſtilled by drops into the eares, killeth the wormes there. The herb it ſelfe carrieth ſuch ſway in the kitchin, that lightly there is no meat ſeaſoned nor any vineger ſauce ſerued vp without it. Moreouer, for to giue a commendable and pleaſant
E taſt vnto bread, it is ordinarily put vnder the bottome cruſt of our loues, when they be ſet into the ouen. The ſeed doth bind and corroborat a weake and feeble ſtomack, yea if it be taken in a very ague. Being beaten into pouder & drunk in cold water, it ſtaieth the inordinat heauing of the ſtomack, and the vain proffers to vomit; for the lights and the liuer, it is the moſt ſoueraign medicine of all other. Being taken moderatly, it ſtaieth the looſeneſſe of the belly, and yet prouoketh vrine. The decoction thereof appeaſeth the wrings of the guts: and taken in drink, it filleth womens breſts, and maketh them to ſtrout again with milk, when it is gone vpon ſome occaſion. The root taken in a Ptiſane of husked barly, purgeth the reins; ſo doth the ſyrrup made with the juice or decoction therof, yea and the ſeed. The root ſodden in wine, is ſingular good
G for the dropſie and the cramp. A liniment made with the leaues and vineger, and ſo applied, aſſuageth hot ſwellings and inflammations: and the ſaid leaues haue vertue to expel the ſtone of the bladder. Fennell taken inwardly any way, increaſeth ſperme or natural ſeed. A moſt friendly and comfortable herb it is to the * priuie parts, whether it be by fomenting them with a decoction of the roots boyled in wine, or by applying a liniment to them made with the ſaid roots ſtamped & incorporate with oile. Many do make a cerote thereof with wax, for ta lay vnto tumors,

* Such medicines be called ἐνδρομικὰ.

* either ſwolſ, exulcerate, or itching.

mours to places bruiſed & made black and blew with ſtripes. Alſo they vſe the root either prepared with the juice of the herb, or otherwiſe incorporat with hony, againſt the biting of dogs; and taken in wine, againſt the worm called Milleped. But for all theſe purpoſes beforeſaid, the wild Fennell is of greater operation than the garden Fennell: but this principal vertue it hath, mightily to expell the ſtone and grauell. If it be taken with any mild and ſmall wine, it is very good for the bladder [and namely the Strangury] alſo it prouoketh womens tearmes that be either ſuppreſſed or come not kindly away: to which purpoſe the ſeed is more effectuall than the root. But whether it be root or ſeed, it would be vſed in a mean & meaſure: for it is thought ſufficient to put into drink at once, as much as two fingers wil take vp. *Petridius*, who wrote the booke intituled * Ophiaca, and *Myction* likewiſe in his Treatiſe named *Rhizotomumena were of opinion, That there is not a better counterpoyſon againſt the venome of Serpents, than wild Fennell. And certes, *Nicander* himſelfe hath raunged it, not in the loweſt place of ſuch medicines.

G

* Of Serpents.
* Of cutting vp or gathering roots.

H

Concerning Hemp, at firſt it came vp without ſowing euen in the very woods, and carried a more duskiſh green leafe, and the ſame rougher. It is ſaid, that if men eat the ſeed, it wil extinguiſh vtterly their own ſeed. The juice of green Hemp-ſeed, being dropped into the eares, drieth out any wormes or vermin there ingendred, yea, and what ear-wigs or ſuch like creatures that are gotten into them: but it will cauſe head-ach withall. So forcible is this plant, that (by report) if it be put into water, it will make it to gather and coagulat. Which is the reaſon, that if horſes haue the gurry, they ſhall find help by drinking the ſaid water. The root if it be boiled in water, doth mollifie and ſoften ioints that be ſhrunk vp: it aſſuageth the pains likewiſe of the Gout, and ſuch like wicked humors that fall down vpon any part. Being yet green and reduced into a liniment and ſo applied, it is good for burnes or ſcaldings, but it muſt be often remoued and changed before it be drie.

I

As for Ferula or Fennel-geant, it carrieth a ſeed like to Dill. That kind which riſeth vp in one ſtem, and then diuideth it ſelf and brancheth forth in the head, is ſuppoſed to be the female. The ſtalks are good to be eaten boyled: and the right ſauce wherein they be ſerued vp, to giue them a more commendable taſt, is new wine and hony tempered accordingly; and ſo prepared, they be good for the ſtomack. Howbeit, if one eat ouer-liberally of them, they cauſe head-ach. Take the weight of one denier Roman of the root, beat it to pouder and drinke it in two cyaths of wine, you ſhall find it a ſoueraigne medicine againſt the ſtinging of ſerpents: but you muſt not forget meanwhile to apply the root it ſelf (ſtamped into a cataplaſme) vnto the hurt place. After this manner it helpeth the wringing torments of the guts. Make a liniment or vnguent thereof and vineger together, annoint the body therewith; it reſtraineth the immoderate ſweats that burſt out, although the Patient be ſick of a feuer. The juice of Ferula, if it be eaten (to the quantity of a Beane) doth looſen the belly. The ſmall tendrils or branches of greene Ferula, is good for all the infirmities abouenamed. Take ten grains of Ferula ſeed in pouder with wine, or ſo much of the pith within the ſtalk, it ſtancheth bloud. Some hold it good to giue a ſpoonful thereof euery fourth, ſixth, and ſeuenth day after the change of the Moon, to preuent the fits of the falling ſicknes. The nature of all theſe Fennel-geants is moſt aduerſe to Lampreies, for if they be touched neuer ſo little therewith, they will die vpon it. *Caſtor* was of opinion, That the juice is excellent good to cleare the eye-ſight.

K

L

And foraſmuch as I haue ſpoken ſomewhat of Thiſtles and Artichoux (how they ſhould be ordered) in my treatiſe of other garden plants, I will put off no longer to diſcourſe alſo of their properties and vertues in Phyſick. Of the wild Thiſtles there be two kinds: the one more ful of branches, ſhooting out immediatly from the root; the other riſeth vp in one intire ſtem, and the ſame is thicker withall. Both of them haue but few leaues, and thoſe beſet with prickles: they beare heads pointed with ſharp pricks round about in manner of caltrops. Howbeit, there is one kind, which is the Artichoke, which putteth forth a purple floure amidſt thoſe ſharpe pointed prickes, which very quickly turns into an hoarie downe, readie to flie away with euery puffe of wind: and this thiſtle the Greeks cal Scolymos. The juice of the Artichoke ſtamped & preſſed out before it bloome, bringeth haire again thicke, if the naked place be annointed therewith. The root either of Thiſtle or Artichoke, ſodden in water and ſo eaten, is as good as a ſhooing-horne to draw on pot after pot, for theſe great bibbers that deſire nothing more than to be thirſty and to make quarrell to the cup. It ſtrengtheneth the ſtomacke, and (if we may beleeue it) is

M

ſo

20030

A ſo appropriate vnto the matrice of women, that it diſpoſeth and prepareth it to conceiue men children. In good faith, *Chæreas* the Athenian, and *Glaucias* eſpecially, who ſeemeth to be moſt curious in deſcribing the nature and properties of theſe Thiſtles or Artichokes, giue out no leſſe. To conclude, if one chew them in his mouth, hee ſhall finde that they will cauſe a ſweet breath.

Chap. XXIV.

¶ *The compoſition of a Treacle which was the ordinarie and familiar medicine of King Antiochus.*

B BVt before that we go out of the garden, and leaue the herbes there growing, I think it good to ſet down one confection made of them, thought to be a moſt excellent and ſoueraigne antidote or preſeruatiue againſt the poiſon of all venomous beaſts whatſoeuer, and which for the excellency thereof was ingrauen in ſtone vpon the forefront of the temple dedicated to *Æſculapius*, in this maner following: Take of wild running Thyme the weight of two deniers; of Opopanax and * Meu of each the like quantitie; the ſeed of Dil, Fennel, Ameos, and Parſly, of each the weight of ſix deniers; of Ervil floure twelue deniers or drams. Let theſe be beaten into pouder and finely ſearced; and when they be incorporat in the beſt wine that may be had, they ought to be reduced into the form of Troſches, euery one weighing a victoriat or half denier. When occaſion is to vſe this compoſition, diſſolue one of theſe Troſches in three cyaths
C of wine, and drinke it. This is that famous Treacle or countrepoyſon which great *Antiochus* the King was wont (by report) to take againſt all venoms or poyſons whatſoeuer.

*Mei, non Milij. Ex Galen.

D

THE TVVENTY FIRST BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The nature of Floures, and namely thoſe of Chaplets and Guirlands.

E

Chap. I.

¶ *The wonderfull varietie of Floures.*

F CAto in his Treatiſe of Gardens ordained as a neceſſary point, That they ſhould be planted and inriched with ſuch herbs as might bring forth floures for Coronets and Garlands. And in very truth, their diuerſitie is ſuch, that vnpoſſible it is to decipher and expreſſe them accordingly. Whereby wee may ſee, that more eaſie it was for dame Nature to depaint & adorn the earth with ſundrie pictures, to beautifie the fields (I ſay) with all maner of colours, by her handy-worke (eſpecially where ſhe hath met with a ground to her minde, and when ſhe is in a merrie humour and diſpoſed to play and diſport her ſelfe) than for any man in the world to vtter the ſame by word of mouth. Wherin certes her admirable prouidence ſhe hath ſhewed principally

in

in this, That whereas ſhe hath giuen vnto thoſe fruits of the earth which ſerue for neceſſities & G
the ſuſtentation of man, long life and a kind of perpetuitie, euen to laſt yeares and hundreds of yeres; theſe floures of pleaſure and delight, good only to content the eye, or pleaſe the ſence of ſmelling, ſhe would haue to liue and die in one day. A great document and leſſon for vs men in generall to learne, How all things whatſoeuer that flouriſh moſt louely and be gayeſt in ſhew, ſooneſt fade and are gon ſuddenly. But to come again to the varietie of floures aforeſaid, together with their diuers mixtures: verily there is no painter with all his skil, able ſufficiently with his penſil to repreſent one liuely garland of floures indeed; whether they be plaited and intermedled in maner of noſegaies one with another, or ſet in ranks and rewes one by another; whether they be knit and twiſted cord-wiſe and in chain-work of one ſort of floures, either to wind and wreath about a chaplet, bias, or in faſhion of a circle, or whether they be ſorted round into a H
globe or ball, running one through another, to exhibit one goodly ſight and entire vniformity of a croſſe garland.

Chap. II.

¶ *Of Garlands, Coronets, Chaplets, and Noſegaies made of floures. Who deuiſed firſt the ſorting and ſetting of ſundry floures. The firſt inuention of the Coronet or Guirland, and the name of it in Latine, Corollæ: and whereupon it was ſo called.*

THe Coronets or Garlands vſed in antient time were twiſted very ſmall, and thereupon I
they were called Strophia, *i.* Wreaths: from whence came alſo womens gorgets & ſtomachers to be named Strophiola. As for the word Corona, a Coronet or Garland, long it was firſt ere it came to be vulgar and commonly taken vp, as a term chalenged either by prieſts and ſacrificers in their diuine ſeruice, or victorious captaines in their glorious triumphs. But thoſe Garlands and noſegaies being made of floures were called in Latine Serta, or Seruiæ, *à ſerendo*, *i.* of ſorting and ſetling together. The maner of which plaiting and broiding of herbes and floures, the antient Greekes took no pleaſure in: for at the beginning they vſed to crowne with branches only of trees, thoſe braue men who had woon the priſe in their ſacred games and ſolemne Tournies or exerciſes of actiuitie. But afterwards they began to beautifie and enrich their chaplets of triumph with ſundry floures entermingled together. And, to ſay a truth, the K
Sicyonians paſſed in this feat of ſorting together one with another, floures of ſweet ſauor and pleaſant color, in making of poſies and garlands. Howbeit the example of *Pauſias* the cunning painter, and *Glycera* the artificial maker of ſuch Chaplets, ſet them firſt a worke. This Painter was wonderfully enamoured vpon the ſaid *Glycera*, and courted her by all the meanes hee could deuiſe: among the reſt, he would ſeem to counterfeit and repreſent liuely with his penſil in colours, what floures ſoeuer ſhe wrought and ſet with her fingers into garlands; and ſhee againe ſtriued avie to change and alter her handiwork euery day, for to driue him to a non-plus at the length, or at leaſtwiſe to put him to his ſhifts: inſomuch, as it was a very pleaſant and worthie ſight, to behold of one ſide the works of Nature in the womans hand, and on the other ſide the artificiall cunning of the foreſaid painter. And verily there are at this day to be ſeene diuers L
painted tables of his workmanſhip: and namely one picture aboue the reſt, entituled, * Stephanoplocos, wherein hee painted his ſweet-heart *Glycera* twiſting and braiding Coronets and Chaplets, as her manner was. And this fell out to be after the hundreth Olympias was come and gon, by iuſt account.

* A Garland-maker.

Now when theſe Garlands of floures were taken vp and receiued commonly in all places for a certain time, there came ſoon after into requeſt thoſe Chaplets which are named Egyptian; and after them winter Coronets, to wit, when the earth affourdeth no floures to make them; and thoſe conſiſted of horn ſhauings died into ſundry colours. And ſo in proceſſe of time, by little and little crept into Rome alſo the name of Corollæ, as one would ſay, petty Garlands; for that theſe Winter Chaplets at firſt were ſo prety and ſmall: and not long after them, the coſtly Coronets and attires Corollaria, namely, when they are made of thinne leaues and plates and Latin, either guilded or ſiluered ouer, or elſe ſet out with golden and ſiluered ſpangles, and ſo preſented. M

Chap.

20030

A

Chap. III.

¶ *Who was the firſt that exhibited in publicke ſhew a Guirland or Chaplet of gold and ſiluer-foile. How highly Coronets were eſteemed in old time. Of the honour done to Scipio. Of plaited Coronets. And one notable Act of Queene Cleopatra.*

Craſſus the rich was the firſt man, who at the ſolemn Games and Plaies which he ſet out in Rome, gaue away in a braue ſhew, Chaplets of gold and ſiluer, reſembling liuely floures and leaues of hearbes. Afterwards, ſuch Coronets were adorned with ribband alſo, and
B thoſe were added as pendants thereto for more honour and ſtate: a deuiſe reſpectiue to thoſe * Tuſcane Guirlands and Coronets, which might haue no ſuch ribbands or lace hanging vnto them but of gold. And in truth thoſe labels a long time were plaine and without any other ſetting forth ſaue only the bare gold: vntill *P. Claudius Pulcher* came in place, who exhibited in his publicke ſhewes, the ſaid labels wrought, chaſed, and engrauen; yea, and hee garniſhed the ſaid plates of gold with glittering and twinckling ſpangles beſides. Howbeit, were theſe Coronets neuer ſo rich and precious, yet thoſe Chaplets woon and gotten at the ſolemn Games for ſome worthy feats of actiuity performed, caried alwaies the greater credit & authority. For to gaine this priſe, the Grand-ſiegniors and great men of the citie thought it no ſcorne to enter themſelues in proper perſon into the publick place of Exerciſe to trie maſtries: yea, and thither they
C ſent euery man his ſeruant and ſlaue. Hereupon grew theſe Ordinances, ſpecified among the laws of the twelue tables in theſe words: *Whoſoeuer winneth Guirland, either himſelfe in perſon, or by his monie, goods and chattels, is to be honoured in regard of his vertue.* And certes who maketh doubt, but what Priſe or coronet, either ſlaues or horſes haue obtai ned, the ſame by vertue of this law, ſhould be reputed as gotten by the money and goods of the maſter or owner of the ſaid horſes or ſlaues? But what honor might this be which is thus atchieued by ſuch a chaplet? mary that which is right great, namely, that without all fraud and contradiction, not only the party himſelfe who woon it, ſhould be crowned therewith after his death, both whiles his body lay vnder bourd within houſe, and alſo all the way that it was caried forth to the place of ſepulture or funerall fire; but euen his parents likewiſe, both father and mother [if they were then liuing.] certes, ſuch Guirlands otherwiſe though they were not woon at games or prize, but only made for
D pleaſure & paſtime, might not come abroad ordinarily, nor be commonly worn; for the law was very ſtrict and ſeuere in this caſe: we read that *L. Fulvius Argentarius* in the time of the ſecond Punicke war, vpon an information or ſpeech giuen out, That in the open day time he only looked forth of a gallerie which he had in the publicke Forum or common place at Rome, with a Garland of Roſes vpon his head; was by authoritie of the Senate committed to priſon, and was not enlarged before the end of the warre. *P. Munatius* hauing taken from the head of *Marſyas* a Chaplet of floures, and ſet it vpon his owne; and thereupon being commaunded to ward, by the Triumvirs, called vnto the Tribunes of the Commons for their lawful fauour and protection: but they oppoſed not themſelues againſt this proceeding, but deemed him worthie of this
E chaſtiſement. See the diſcipline and ſeueritie at Rome, and compare it with the looſenes of the Athenians, where yong youths ordinarily followed reuils and bankets, and yet in the forenoon would ſeeme to frequent the ſchooles of Philoſophers, to learne good inſtructions of vertuous life. With vs verily we haue no example of diſorder in this behalf, namely, for the abuſe of garlands; but only the daughter of *Auguſtus Cæſar* late Emperor, and cannoniſed as a god at Rome, who complaineth of her in ſome letters of his yet extant, & that with grone and griefe of heart, to be giuen to ſuch riot and licentious looſeneſſe, that night by night ſhe would ſeem to adorn with Guirlands the ſtatue and image of *Marſyas* the Minſtrell. We do not read in Chronicles, that the people honoured in old time any other with a Coronet of floures, but onely *Scipio* ſirnamed *Serapio*, for the neere reſemblance that he had to his baily or ſeruant ſo called, who dealt
F vnder him in buying and ſelling of Swine: in which regard he was wonderous well beloued of the commons in his Tribuneſhip, as bearing himſelf worthy of the famous and noble houſe of the *Scipioes* ſirnamed *Africani*. Howbeit, as well deſcended and beloued as he was, yet when hee died, he left not behind him in goods ſufficient to defray the charges of his funerals: the people therfore made a collection, and contributed by the poll euery man one * As: and ſo took order

by

* These Guirlands or Chaplets were called *Hetruſcæ*. For ſo ſaith *Tertullian. Præferuntur etiam illis Hetruſcæ. Hoc vocabulum eſt Cornarù &c.* to be Ædiles.

* i. three farthings.

by a generall expence, that he ſhould be honourably enterred: and as his corpes was carried in G
the ſtreets to his funeral fire, they flung floures vpon his bere out of euery window all the way.
In thoſe daies the maner was to honor the gods with chaplets of floures, and namely thoſe that
were counted patrones and protectours, as well of cities and countries, as of priuat families; to
adorne and beautifie therewith the tombs and ſepulchres of thoſe that were departed, as alſo to
pacifie their ghoſts, and other infernall ſpirits: farther than thus, there was no vſe of ſuch Guir-
lands allowed. Now of all thoſe Chaplets, moſt account was made of them wherein the floures
were platted. We find moreouer, That the Sacrificers or Prieſts of *Mars* called *Salij*, were wont
in their ſolemnities & feaſts (which were very ſumptuous) to weare Coronets of ſundry floures
ſowed together. But afterwards, Chaplets of Roſes were only in credit and reputation: vntill
that in proceſſe of time, the world grew to ſuch ſuperfluitie and ſumptuous expence, that no H
Guirlands would pleaſe men, but of the meer precious and aromaticall leaf Malabathrum: and
not content therewith, ſoone after there muſt be Chaplets fet as far as from India, yea, and be-
yond the Indians, & thoſe wrought with needle work: and the richeſt coronet was that thought
to be, which conſiſted of the leaues of Nard: or els made of fine ſilke out of the Seres country,
and thoſe of ſundry colors, perfumed beſides & al wet with coſtly and odoriferous ointments.
Further than thus they could not proceed, and ſo our dainty wanton dames reſt contented hi-
thereto, and vſe no other Chaplets at this day. As for the Greekes verily, they haue written alſo
ſeuerall Treatiſes concerning floures and Garlands: and namely, *Mneſtheus* and *Callimachus*, two
renowmed Phyſicians, haue compiled bookes of thoſe Chaplets that be hurtfull to the braine
and cauſe head-ach. For euen herin alſo lieth ſome part of the preſeruation of our health, con- I
ſidering that perfumes do refreſh our ſpirits, eſpecially when we are ſet at table to drinke libe-
rally and to make merrie, whiles the ſubtile odour of flours pierceth to the braine ſecretly ere
we be aware. Where, by the way, I cannot chuſe but remember the deuiſe of Queene *Cleopatra*,
full of fine wit, and as wicked and miſchieuous withall: For at what time as *Antonie* prepared
the expidition and journey of Actium againſt *Auguſtus*, and ſtood in ſome doubt of jealouſie
of the ſaid Queen; for al the fair ſhew that ſhe made of gratifying him and doing him all plea-
ſure, he was at his taſter, & would neither eat nor drink at her table without aſſay made. *Cleopa-*
tra ſeeing how timorous he was, and minding yet to make good ſport and game at his needleſſe
feare and fooliſh curioſitie, cauſed a Chaplet to be made for *M. Antonius*, hauing before dipped
all the tips and edges of the flowres that went to it in a ſtrong and rank poiſon, and being thus K
prepared, ſet it vpon the head of the ſaid *Antonie*. Now, when they had ſitten at meat a good
while, and drunk themſelues merrie, the Queen began to make a motion and challenge to *An-*
tonie, for to drink each of them their chaplets; and withall began vnto him in a cup of wine ſea-
ſoned and ſpiced (as it were) with thoſe floures which ſhe ware her owne ſelf. Oh the ſhrewd &
vnhappy wit of a woman when ſhe is ſo diſpoſed! who would euer haue miſdoubted any danger
of hidden miſchiefe herein? Well, *M. Antonie* yeelded to pledge her: off goeth his owne Guir-
land, and with the floures minced ſmall, dreſſeth his own cup. Now when he was about to ſet it
to his head, *Cleopatra* preſently put her hand betweene, and ſtaied him from drinking, and with-
all vttered theſe words, My deare heart and beſt beloued *Antonie*, now ſee what ſhe is whome ſo
much thou doſt dread and ſtand in feare of, that for thy ſecurity there muſt wait at thy cup and L
trencher extraordinarie taſters; a ſtraunge and new faſhion ywis, and a curioſity more nice than
needfull: lo, how I am not to ſeek of means and opportunities to compaſſe thy death, if I could
find in my heart to liue without thee. Which ſaid, ſhe called for a priſoner immediately out of
the goale, whom ſhe cauſed to drink off the wine which *Antonie* had prepared for himſelfe. No
ſooner was the goblet from his lips againe, but the poor wretch died preſently in the place: but
to come again to the Phyſicians who haue written of floures beſides thoſe abouenamed. *Theo-*
phraſtus among the Greekes hath taken this argument in hand. As for our countreymen, ſome
* Of floure gathering. haue entituled their bookes * Anthologicon: but none of them all, ſo farre as euer I could find,
wrote any Treatiſe concerning floures. Neither is it any part of my meaning at this preſent to
make Noſegaies, or plat any Chaplets, for that were a friuolous and vaine peece of work: but as M
touching floures themſelues, I purpoſe to diſcourſe ſo much as I think and find to be memora-
ble and worth the penning. But before I enter into this Treatiſe, I am to aduertiſe the Reader,
that we Romanes are acquainted with very few garden floures for Guirlands, and know in man-
ner none but Violets and roſes.

CHAP.

copy 1

Chap. IV.

¶ Of the Roſe employed in Coronets. The diuers kinds thereof: and where it is ſet and groweth.

THe plant whereupon the Roſe doth grow is more like a thorn or buſh, than a ſhrub or any thing elſe. For it will come of a very Brier or Eglantine alſo, where it wil caſt a ſweet and pleaſant ſmell, although it reach not far off. All Roſes at their firſt knitting ſeeme to be incloſed within a certain cod or huske full of graines: which ſoon after beginneth to ſwell and grow ſharp pointed into certain green indented or cut buds: then by little and little as they wax red, they open and ſpred themſelues abroad, containing in the midſt of their cup as it were certain ſmall tufts or yellow threds ſtanding out in the top. * Vſed they are exceeding much in Chaplets and Guirlands. As touching the oile Roſat, made by way of infuſion, it was in requeſt before the deſtruction of Troy, as may appeare by the poet *Homer*. Moreouer, Roſes enter into the compoſition of ſweet ointments and perfumes. Ouer and beſides, the Roſe of it ſelfe alone as it is, hath medicinable vertues, and ſerueth to many purpoſes in phyſick. It goeth into emplaſtres and collyries or eye-ſalues, by reaſon of a certain ſubtil mordacitie and penetratiue qualitie that it hath. Furthermore, many delicate and dainty diſhes are ſerued vp to the table, either couered and beſtrewed with Roſe leaues, or bedewed and ſmeared all ouer with their iuice; which doth no harme to thoſe viands, but giue a commendable taſt therto. We at Rome make moſt account of two kinds of Roſes aboue the reſt, to wit, thoſe of Præneſte, and of Capua. And yet ſome haue ranged with theſe principal Roſes, thoſe of Miletum, which are of a moſt liuely and deep red colour, and haue but twelue leaues in a floure at the moſt. The next to them are the Trachinian Roſes, not ſo red all out. Then thoſe of Alabanda, which be of a baſer reckoning, with a weak colour inclining to white. Howbeit the meaneſt and worſt of all, is the Roſe * Spineola. Moſt leaues in number it hath of all others, and thoſe in quantity ſmaller. For this would be knowne, that Roſes differ one from another either in number of leaues, more or leſſe; or els that ſome be ſmooth, others rough and pricky: alſo in colour and ſmell. The feweſt leaues that a Roſe hath be fiue: and ſo vpward they grow euer ſtill more and more, vntill they come to thoſe that haue an hundred, namely about Campain in Italy, and neere to Philippos a city in Greece, whereupon the Roſe is called in Latine Centifolia. Howbeit, the territorie of Philippi hath no ſuch ſoile as to bring forth theſe hundred-leafe Roſes: for it is the mountain Pangæus neare adioyning, vpon which they naturally doe grow, with a number of leaues I ſay, but the ſame ſmall: which being remoued & tranſplanted by the neighbor borderers, do mightily thriue in another ground, namely about Philippi aforeſaid, & proue much fairer than thoſe of Pangæus. Yet are not ſuch Roſes of the ſweeteſt kind, that are ſo double and double againe; no more than thoſe which are furniſhed with the largeſt and greateſt leaues. But in one word, if you would know a ſweet ſmelling roſe indeed, chuſe that which hath the cup or knob vnder the floure, rough & pricky. *Cæpio*, who liued in the time of *Tiberius* the Emperour, was of opinion, That the hundred-leafe Roſe had no grace at all in a garland, either for ſmel or beauty; & therfore ſhould not be put into chaplets, vnleſſe it were laſt in maner of a tuft, to make a ſur-croiſt, or about the edges as a border: no more than the Roſe Campion, which our men cal the Greek Roſe, and the Greekes name Lychnis, which lightly groweth not but in moiſt grounds, and neuer hath more than fiue leaues. The floure exceeds not the bignes of a certain violet, and carieth no ſent or ſauor at all. Yet is there another Roſe called Græcula, the floures & leaues wherof are folded and lapped one within another, neither wil they open of themſelues, vnleſſe they be forced with ones fingers, but looke alwaies as if they were in the bud, notwithſtanding that the leaues when they be out are of all others largeſt. Moreouer, there be Roſes growing from a buſh that hath a ſtalk like a Mallow, and beareth leaues reſembling thoſe of the oliue: and this kind is named in Greek Moſcheuton. Of a middle ſiſe between theſe abouenamed, is the Roſe of Autumne, commonly called Coroneola. And to ſay a truth, all the ſaid Roſes, except this Coroneola, and that which groweth vpon the brier or Eglantine before-named, haue no ſmell with them in the whole world naturally, but are brought to it by many deuiſes & ſophiſtications: yea, & the very Roſe it ſelfe, which of the own nature is odoriferous, carieth a better ſmell in ſome one ſoile than in another. For at Cyrene they paſſe all other for ſweetnes and pleaſant ſauor:

* *Vſus eius prope nimius eſt.*

* Our white Roſe.

ſauor: which is the reaſon that the oile Roſat, and ointment compounded thereof, is moſt ex- G
cellent there of all other places. And at Cartagena in Spain there be certaine timely or haſtie Roſes, that blow and floure all winter long. The climat alſo and temperature of the aire makes for the ſweetneſſe of the Roſe: for in ſome yeares yee ſhall haue them leſſe odoriferous than in others. Ouer & beſides, the place would be conſidered: for the roſes be euer more ſweet growing vpon dry than wet grounds. And indeed the Roſe buſh loueth not to be planted in a fat and rich ſoile, ne yet vpon a vein of cley, no more than it liketh to grow neere vnto riuers where the banks be ouerflowed, or in a wateriſh plot; but it agreeth beſt with a light and looſe kinde of earth, and principally with a ground full of rubbiſh, and among the ruines of old houſes. The Campain Roſe bloweth early and is very forward. The Mileſian comes as late. Howbeit thoſe of Prænеſte be longeſt ere they giue ouer bearing. As touching the maner of planting them: as H
the ground would be delued deeper than for corn, ſo a lighter ſtitch had need be taken than for Vine ſets. Thoſe that be ſowed of ſeed be lateſt of all others ere they come vp, and thriue moſt ſlowly. [Now lieth this ſeed in the cup or husk thereof iuſt vnder the very floure, and is couered all ouer with a down.] And therefore it is better to ſet ſions cut from the ſtalk, or els to ſlip the little oilets and ſhoots from the root, as the maner is in reeds and canes. After which ſort they vſe to ſet, yea & to graf one kind of a pricky & pale roſe buſh, putting forth very long twigs & ſhoots like to thoſe of the Cinq-foile roſe, which is one of the Greekiſh kind. There is no roſe buſh whatſoeuer, but proſpereth the better for cutting, pruning, yea and burning. Moreouer, it loueth to be remoued and tranſplanted as well as the Vine, and by that meanes will it come to the proof and beare beſt. As for the ſets or ſions, they ought to be foure fingers long or more a- I
boue the ground, when they be firſt put into the earth, to wit, after the occultation of the brood Hen ſtar. Then would they be tranſlated in Februarie; at what time as the Weſtern wind Favonius is aloft, and replanted with a foot diſtance one from another: but they require to be euer and anon digged about the root. They that deſire to haue Roſes blow betimes in the yeare, before their neighbours, vſe to make a trench round about the root a foot deep, and poure hot water into it, euen at the firſt when the bud of the Roſe beginneth to be knotted.

Chap. X.

¶ *Of Lillies three kinds: and the maner of planting or ſetting them.* K

NExt to the Roſe, there is not a fairer floure than the Lilly, nor of greater eſtimation. The oiles alſo and ointments made of them both haue a reſemblance and affinitie one to the other. As touching the oile of Lillies, the phyſitians call it Lirinon: & if a man ſhould ſpeak truly, a Lilly growing among Roſes becommeth and beautifieth the place very well; for it beginneth then to floure when Roſes haue halfe done. There is not a floure in the garden again that groweth taller than the Lilly, reaching otherwhile to the height of three cubits from the ground: but a weak and ſlender neck it hath, and carieth it not ſtreight and vpright, but it bendeth and noddeth downeward, as being not of ſtrength ſufficient to beare the weight of the head ſtanding vpon it. The floure is of incomparable whiteneſſe, diuided into leaues, which without-forth are chamfered, narrow at the bottom, and by little and little ſpreading broader L
toward the top: faſhioned altogether in maner of a broad mouthed cup or beaker, the brims or lips wherof turn vp ſomewhat backward round about, and lie very open. Within theſe leaues there appeare certain fine threds in maner of ſeeds: and iuſt in the midſt ſtand yellow chiues like as in Saffron. As the colour of the Lilly is twofold, ſo carieth it a double ſmell; one in the leaues which reſembleth the cup aforeſaid, and another in thoſe ſtrings or chiues; howbeit the difference is not much. Now for to make the oile and ointment of Lillies, the leaues alſo are not reiected.

There is an herb named in Latine Convolvulus [*i.* with wind] growing among ſhrubs & buſhes; which carieth a floure not vnlike to this Lilly, ſaue that it yeeldeth no ſmell, nor hath thoſe chiues within: for whiteneſſe they reſemble one another very much, as if Nature in ma- M
king this floure, were a learning and trying her skill how to frame the Lilly indeed.

Now Lillies be ſet and ſowed after the ſame maner in all reſpects as the Roſes, and grow as many waies. This vantage moreouer they haue of the roſes, That they will come vp of the verie liquor that diſtilleth and droppeth from them, like as the herbe Aliſanders: neither is there in the

20030
copy 1

A the world an herb more fruitful, inſomuch as you ſhal haue one head of a root put forth oftentimes fiue hundred bulbes orcloues.

There is beſides a red Lilly, which the Greeks in their language cal Crinon: and ſome name the floure of it Cynorrhodon. The excellent Lilly of this kind groweth in Antiochia & Laodicea, cities both in Syria: the next to that is found in Phaſelis. In a fourth place, is to be ſet the Lilly growing in Italy. There are beſides, purple Lillies, which otherwhiles riſe vp with a double ſtem: theſe differ from the reſt only in the pulpous root which they haue; and the ſame carrie a great bulbe in one entire head, and no more: ſuch they call Daffodills. A ſecond ſort there is of theſe Daffodils with a white floure, & a purple cup or bel within. Herin differ Daffodils from Lillies, for that the Daffodil leaues be toward the root, & namely thoſe in the beſt mountains of Lycia; wheras in Lillies they put forth in the ſtalk. The third kind agreeth in al points with the reſt; but that the cup in the mids of the floure, is of a graſſe greene. Al the ſort of them be late ere they floure, and begin not to blow before the retreat of the ſtar Arcturus, and about the Autumn Æquinox: but ſuch are the monſtrous deuiſes of ſome ſantaſtical ſpirits, that they inuented forſooth a new kind of artificiall * coloring and dying of Lillies: for which purpoſe, in the month of Iuly they gather their ſtems, when they begin to wither, & hang them vp in the ſmoke to drie. Now when the knobs or heads of their roots looke once bare and are ſhot out from the ſaid ſtalks, (which commonly falleth out in the month of March) they infuſe & ſteep them in the lees of deepe red wine, or ſome Greekiſh wine, for to ſuck and drinke in the colour thereof: which done, they ſet them in little trenches, whereinto they poure certaine hemines or pints of the ſaid wine: and by this means become the Lillies aforeſaid, purple. A ſtraunge and wonderfull matter that any root ſhould take a tincture ſo deep, as to bring forth a flour of the ſame die and colour.

* *Inficiendi.*

Chap. VI.

¶ *Of the Violet and the Marygold: of Bacchar, and Combretum: of Azara-bacca, and Saffron.*

IN the third ranke of floures, be ranged the * Violets: whereof be many kinds: to wit, the purple, the yellow, and the white. All of them may be ſet of plants, like as worts, and garden pot-hearbs. But of thoſe which naturally come vp & grow of their own accord in leane grounds, and thoſe expoſed to the Sunne, the purple [March] Violets, they haue a broader leafe than the reſt, & thoſe ſpring immediatly from the root, which is pulpous and fleſhy. Theſe alone be diſtinct from the reſt by a Greek name, and are called * Ia; whereupon purple cloth is likewiſe of them named Ianthina. But of thoſe which are ſowne or ſet by hand, the * yellow beare the greateſt name aboue all other. Theſe floures be diſtinguiſhed into diuers kinds, namely, into the Tuſcan Violets; and thoſe of the ſea, which haue a broader leafe but are not ſo ſweet as others. Some ſmell not at all, to wit, the * Calathian Violet with the ſmall leafe, a floure this is that Autumne yeeldeth, whereas the reſt doe flouriſh in the Spring.

D

* Note that *Viola* in *Plinie* and other authors, reacheth to our Stocke-gillofres, wall-floures and other floures, as to the purple March Violet, * ἰὸν λευκὸν *Cheiri* or Wal floures. * Some take it for a kind of Foxe gloue.

Next vnto the Violet, are the Marigolds, all of one colour. In number of leaues this floure paſſeth the Sea-violet aforeſaid, which neuer exceedeth fiue: but in recompence of that defect, this Violet goeth beyond the Marigold, in ſweet ſauour, for the Marigold carrieth a ſtrong ſent with it and an vnpleaſant. As for the hearb called * Scopia regia, it hath a ſmell nothing milder than it; although the leaues (to ſay a truth) doe ſmell, and not the floures.

E

* Which ſome take for yellow Yarrow.

Bacchar is named by ſome Ruſtick-Nard: this plant hath nothing in it odoriferous and ſenting well, but the root. Of which root, (as *Ariſtophanes* an auncient Comicall Poet teſtifieth in one of his Comœdies) they were woont in old time to make ſweet perfumes and odoriferous compoſitions for their ointments: whereupon ſome there be who call the root Barbarica, but falſly; for deceiued they are. The ſauour that this root doth caſt, draweth very neere to the ſent of Cinamon. It loueth a leane and light ſoile, and in no wiſe commeth vp in a moiſt ground.

F

As touching the hearb named Combretum, it reſembleth the ſame very much: howbeit the leaues be paſſing ſmall and as ſlender as threds, but the plant it ſelfe is taller than Bacchar: well, reſt we muſt not in the deſcription of theſe hearbes and floures only, but alſo we are to reforme and correct their error, who haue giuen to Bacchar the name of Nard-ruſtick: For there is another hearbe properly ſo called, to wit, that which the Greeks name Aſaron, [*i.* Aſara-bacca, or

Fole-foot;] a plant far different from Bacchar, as may appear by the deſcription therof, which I haue ſet down among the ſundrie kinds of Nardus. And verily I do find, that this plant is named * Aſarum, becauſe it is neuer vſed in making of guirlands and chaplets. G

*Χαρὰ τῦ, στεφανῶ, ἰ. ornare: ἢ ἀ στεφάνων, becauſe it adorneth no chaplets.

Concerning Saffron, the wild is the beſt. To plant it within any garden in Italie, is held no good husbandry, for it will not quit coſt, conſidering there is neuer a quarter ſet therewith, but it asketh a * ſcruple more in expence, than the fruit or increaſe commeth to, when all the cards be told. For to haue Saffron grow, you muſt ſet the cloues or bulbous heads of the root: and being thus planted, it prooueth larger, bigger, and fairer than the other: howbeit ſooner far it doth degenerate and become a baſtard kind: neither is it fruitfull and beareth chiues in euerie place, no not about Cyrene, where the goodlieſt floures of Saffron in the world are to be ſeen at all times. The principal Saffron groweth in Cilicia, and eſpecially vpon the mountain Corycus there: next to it, is that of Lycia, and namely vpon the hill Olympus: and then in a third degree of goodneſſe, is reckoned the Saffron Centuripinum in Sicily: although ſome there bee, who attribute the ſecond place vnto the ſaffron of the mount * Phlegra. Nothing is ſo ſubject to ſophiſtication as Saffron, and therfore the only triall of true Saffron indeed, is this. If a man lay his hands vpon it, he ſhall heare it to cracke as if it were brittle and readie to burſt: for that which is moiſt (a qualitie comming by ſome indirect means and cunning caſt) yeeldeth to the hand and makes no words. Yet is there another proofe of good Saffron, If a man after hee haue handled it, reach his hand vp preſently to his mouth, & perceiue that the aire and breath therof ſmiteth to his face and eyes, and therewith fretteth and ſtingeth them a little, for then he may be ſure that the ſaffron is right: there is a kind of garden ſaffron by it ſelf, and this commonly is thought beſt, and pleaſeth moſt, when there appeareth ſome white in the mids of the floure, and thereupon they name it Dialeucon; whereas contrariwiſe this is thought to be a fault and imperfection in the Coryſian Saffron, which is chiefe: and indeed the floure of it is blacker than any other, & ſooneſt fadeth. But the beſt ſimply in any place wherſoeuer, is that which is thickeſt and ſeemes to like beſt, hauing beſides ſhort chiues like hairs: the worſt is that which ſmelleth of muſtines. *Mutianus* writeth, that in Lycia the practiſe is to take it vp euery 7 or 8 yere, and remoue it to a plot of ground wel digged and delued to a fine mould; where, if it be replanted, it will become freſh again and youg, whereas it was ready before to decay and degenerate. No vſe there is in (any place) of Saffron floures in garlands; for the leaues are ſmall and narrow, in manner almoſt of threads. Howbeit with wine it accordeth paſſing well, eſpecially if it be of any ſweet kind: and being reduced into powder and tempered therewith, it is commonly ſprinkled ouer all the theatres, and filleth the place with a perfume. It bloometh at the ſetting or occultation of the ſtar Vergiliæ, and continueth in floure but few daies: and the leaf driueth out the floure. In the mids of winter, it is in the verdure and al green, and then would it be taken vp and gathered: which done, it ought ro be dried in the ſhadow; and the colder that the ſhade is, ſo much the better. For the root of Saffron is pulpous and full of carnoſitie; and no root liueth ſo long aboue ground as it doth. Saffron loueth a-life to be trampled and trod vpon vnder foot: and in truth, the more injurie is done vnto it for to mar it, the better it thriueth: and therefore neare to beaten paths, and wells much frequented, it commeth forward and proſpereth moſt. H I K L

* *Phlegræo* but *Turneb.* readeth *Ægæo*, according to *Dioſcor.*

Chap. VII.

¶ *Of the floures vſed in old time about coronets and guirlands: the great diuerſitie in aromaticall and ſweet ſmelling ſimples. Of Saliunca and Polium.*

SAffron was (no doubt) in great credit and eſtimation, during the flowring eſtate of Troy; for certes, the Poet *Homer* highly commendeth theſe three floures, to wit, Melilot, Saffron, and Hyacinth. Of all odoriferous and ſweet ſenting ſimples, nay of all hearbes and floures whatſoeuer, the difference conſiſteth in the colour, the ſmel, and the juice. And note this to begin withall, that ſeldome or neuer you ſhal meet with any thing ſweet in ſent, but it is bitter in taſt; and contrariwiſe, ſweet things in the mouth, be few or none odoriferous to the noſe: And this is the reaſon that wine refined, ſmelleth better than new in the lees; and ſimples growing wild, haue a better ſauor far than thoſe of the garden. Some floures, the further they be off, the more pleaſant is their ſmell: come nearer vnto them, their ſent is more dull and weaker than it M

was

20030
copy 1

A was,as namely Violets. A freſh and new gathered roſe caſteth a better ſmel afar off than neere at hand; let it be ſomwhat withered and dry,you ſhal ſent it better at the noſe than farther off. Generally,all floures be more odoriferous and pleaſant in the Spring, than at any other ſeaſon of the yeare: and in the morning they haue a quicker and more piercing ſent,than at any houre of the day beſides: the neerer to noon,the weaker is the ſmell of any herb or floure. Moreouer, the floures of new plants are nothing ſo ſweet as thoſe of an old ſtock: and yet I muſt needs ſay that floures ſmell ſtrongeſt in the mids of Summer. As for Roſes and Saffron floures they caſt the pleaſanter ſmell if they be gathered in cleare weather, when it is faire and dry aboue head: and in one word, ſuch as grow in hot countries be euer ſweeter to ſmell vnto, than in cold Climats. Howbeit in Ægypt the floures haue no good ſent at all, by reaſon that the aire is foggie
B and miſtie,with the dewes riſing from the riuer Nilus. Moreouer,certain floures there be that are ſweet and pleaſant enough,yet they ſtuffe and fil the head. Others,ſo long as they be freſh and green,haue no ſmel at all, for the exceſſiue abundance of moiſture within them; as we may perceiue in Fenigreek,which the Grecians call Buceros. Many floures caſt a quick and liuely ſmel,and yet are not without good ſtore of juice,but moiſt enough,as violets,roſes,and ſaffron: but ſuch as are deſtitute of ſuch moiſture, and yet their ſent is piercing and penetrant,they all of them be of a ſtrong ſauor alſo,as for example the Lilly of both kinds. Sothernwood & Marjeram haue a hot and ſtrong ſauor. Some herbs there be which yeeld no ſmel nor goodnes at all but in their floure only,for all their other parts be dul and good for nothing,as violets and roſes. Of garden herbes,the ſtrongeſt of ſmel be alwaies dry,as Rue,Mints,and Ach or Parſley:
C likewiſe are all ſuch as grow in dry places. Some fruits,the elder they be and the longer kept, the ſweeter is their ſauor, as Quinces: and the ſame Quinces *de gard* ſmell better when they be gathered,than if they hung ſtil vpon the tree and ſo preſerued. Others there are,that vnles they be broken,bruiſed,rubbed,and cruſhed, haue no ſmell: and ye ſhall haue thoſe that caſt no ſent at all,vnleſſe their rind or bark be taken off: as alſo ſuch as except they be caſt into the fire and burnt,yeeld no ſauor,as Frankincenſe and Myrrhe. Furthermore, all floures being bruiſed,are more bitter than they were vntouched and vnhandled. Some after they be dry retain their odor longeſt,as the Melilot. There are that make the place ſweeter where they grow,as the floure de lis,inſomuch as it perfumeth the whole tree (whatſoeuer it is) the roots whereof it toucheth. The herb Heſperis ſmels more by night than day,whereupon that name was deuiſed. * There
D are no liuing creatures which yeeld from their bodies a ſweet ſauor, vnleſſe we giue credit to that which hath bin reported of the Panthers.

* *Plinie* neuer heard of the Musk-goats nor Ciuet cats in theſe daies.

Furthermore this would not be paſſed ouer as touching the difference of odoriferous plants and their floures,in this reſpect,that many of them are neuer imployed to the making of Guirlands and chaplets,as namely the Floure-de-lis and Nard Celticke,Saliunca, which although they yeeld both of them an excellent ſauor,yet are not vſed that way. But as for the * Flour-de-lis,it is the root only therof that is comfortable for the odor: as if Nature had made the plant it ſelfe to ſerue only for phyſick vſes,and compoſitions of ſweet perfumes. The beſt Floure-de-lis is that which groweth in Illyricum or Sclauonia; and not in all parts thereof, not(I ſay) in the maritime coaſts,but farther vp into the main, among the mountaines and forreſts of Drilo
E and Narona. The next to it in goodnes commeth out of Macedon, and it hath the longeſt root of all others,but ſlender withall and whitiſh. In the third place is to be ranged the flour-de-lis of Africk or Barbary,which as it is the biggeſt in hand,ſo is it alſo the bittereſt in taſt. As touching the Illyrian Ireos,there be two ſorts of it; namely, Rhaphanitis, which is the better of the twain,ſo called for the reſemblance that it hath to the Radiſh root. The ſecond they name Rhizotomos,and it is ſomwhat reddiſh. In ſum,the beſt Ireos, if a man do but touch it wil prouoke ſneeſing. The ſtem of the Flour-de-lis groweth ſtreight and vpright to the height of a cubit. The floure is of diuers colours, like as we ſee in the rainebow,whereupon it took the name Iris. The Ireos of Piſidia is not reiected,but held to be very good. Moreouer, they vſe in Sclavonia to be very ceremonious in digging vp the root of flour-de-lis; for 3 moneths before they
F purpoſe to take it forth of the ground, the manner is to poure meade or honied water round about the root in the place where it groweth,hauing before-hand drawne a threefold circle with a ſwords point; as it were to curry fauor with the Earth,& make ſome ſatisfaction for breaking it vp and robbing her of ſo noble a plant: and no ſooner is it forth of the ground,but preſently they hold it vp aloft toward heauen. This root is of a feruent & cauſtick nature,for in the very

* Commonly called *Ireos*.

handling it raiſeth pimples and bliſters in maner of a burn,vpon their hands that gather it. A- G
nother ceremonie alſo they haue in gathering thereof, for none muſt come about this worke, but ſuch as haue liued chaſt and not touched a woman: this (I ſay) aboue all is obſerued moſt preciſely. This root aboue all others is moſt ſubiect to the worme, for not onely when it is dry, but alſo while it is within the earth, it quickly commeth to be worme-eaten. In old time the beſt Irinum or oile of Ireos was brought from the cape of Leucas and the city of Elis in Bœotia; for planted it hath bin in thoſe parts many a yeare. But now there is excellent good commeth out of Pamphylia: howbeit that of Silicia, and namely from the Septentrionall parts is moſt highly commended.

As for the plant Saliunca or Nard Celtick, ful of leaues verily it is, yet they be ſo ſhort, that handſomly they canot be knit and twiſted for garlands: a number of roots it putteth forth, to H
which the floure or herbe groweth cloſe: for ſurely a man would iudge it all herbe rather than floure, as if it were platted and preſſed flat to the root with ones hand: and in one word, reſembling a very thick tuft of graſſe by it ſelfe. This herb groweth in Auſtria and Hungarie; alſo among the Morici, and the Alps on the Sun ſide. As for that which commeth vp about the citie Eporrhedia, it is ſo pleaſant and odoriferous, that there is as much ſeeking after it as if it were ſome precious mettall; and it yeeldeth a reuenue to the City no leſſe than ſome mettall mine. And in very truth, a ſingular herbe it is in a wardrobe to lie among good cloathes, for to get them a moſt pleaſant and commendable ſmell.

Another plant there is which the Greekes vſe likewiſe in their Wardrobes, called Polium. This herbe *Muſæus* and *Heſiodus* the Poets extoll and ſet out to the higheſt degree; for they re- I
port that it is good for all things that it ſhall be imployed about; but principally, that it auaileth much to win men fame, renown, promotions, and dignities. Ouer and aboue which vertues, miraculous it is (if it be true which they ſay) * that the leaues thereof in the morning ſeeme white, about noon purple, and at the Sun-ſetting blew. Two kinds there be of it; one groweth in the plains & champian grounds, and is the greater: another in the woods, and is the leſſe. Some call it Teuthrion. The leaues reſemble the gray haires of an old man, ſpringing directly from the root, and neuer paſſe in height a hand bredth. Thus much may ſuffice concerning odoriferous floures.

* *Dioſc.* reporteth this of *Tripolium*, and not of *Polium*: wherby it ſeemeth that *Pliny* is in a fault.

Chap. VIII.

¶ *The colours of Cloth reſembling thoſe of Floures, and ſtriuing with them for the better.* K
Of Amarantus or Paſſe-velours: of Chryſocome or Chryſitis.

THe exceſſiue ryot and prodigall ſuperfluitie of men is grown to this paſſe, that hauing taken no ſmall pleaſure in ſurmounting the natural ſauor of ſimple floures, by their artificial odors and compound perfumes; they canot reſt ſo, but muſt proceed alſo in the craft and myſterie of dying cloth, to challenge the faireſt floures in the garden, and to match, if not to ſurpaſſe, the liuely colours of Natures ſetting. Of theſe tinctures I finde that there be three principal: the one in grain, which ſtriueth with that bright orient colour in Roſes: and there is not a more pleaſant thing to the eye, than to ſee the Scarlet or purple of Tyros, or to behold the double died Dibapha, or the Laconian purple. The ſecond rich dy ſtands vpon the Ame- L
thyſt colour, and reſembleth the March violet: this alſo beareth much vpon that purple, which of the ſaid violet is called Ianthinus: for now I handle dies and colors in general terms, which neuertheleſſe may be ſubdiuided into many other ſpeciall ſorts. The third is ordinarily made of the purple & porcellane ſhel-fiſhes, and that in diuers & ſundry maners; for of this tincture there are cloathes which incline much to the colour of Turnſoll; and of theſe ſome be many times of a deeper and fuller dy than others. Alſo there is another ſort which ſtandeth much on the Mallow floure, inclining to a purple: and a third ſort which reſembleth the violet that commeth late in the yere [called the purple ſtock-gillofre] and indeed this is the freſheſt & richeſt color that can be died out of thoſe fiſhes aforeſaid. Certes, the tinctures & dies now adaies are ſo liuely, as wel for ſimple colors as mixt and compound (ſuch artificiall means are deuiſed by M
our ſumptuous gallants) than in this ſtrife of Nature and art together, a man ſhal hardly iudge whether of them haue the better hand. As touching yellow, I finde that it is a moſt antient colour, and highly reputed of in old time: for the wedding vaile which the Bride ware on her marying day, was all of yellow, and women only were permitted to vſe them: which might wel be

the

20030
copy 1

A the cauſe that this color is not reckoned among thoſe that be principall, that is to ſay, common as well to men as women: for the wearing and vſing of colours indifferently by the one and the other, is that which hath giuen them their name and ſpeciall credit. Howbeit, doe what we can fo all our skill and induſtry we muſt giue place without all doubt to the purple floure-gentle, for we cannot reach poſſibly to the color thereof. Now to ſay a truth, a purple Spike rather this isr than a floure, and the ſame altogether without any ſmell. Of a ſtrange and wonderfull nature this is: it loues of all things to be cropped, and the more it is plucked, the better it commeth againe: it beginneth to ſpike or put out the floure in the month of Auguſt, and continueth vntill Autume. The beſt is that of Alexandria, for after it is gathered, it will keep the freſh and liuely colour ſtill. This maruellous propertie it hath by it ſelfe, That when all other floures doe faile
B and are gone, if it be wet in water it looketh freſh againe; and for want of others, ſerues all winter long to make chaplets & guirlands. The chiefe and principall vertue that it hath, is ſhewed in the very name Amaranthus, for ſo it is called in Greek, becauſe it neuer doth fade or wither.

But to come again to our artificiall colors, we haue one that anſwereth to the floure named Cyanos, *i.* blewbottle: likewiſe to the yellow golden floure Elichryſon. Verily none of all theſe floures or colors were in requeſt in the daies of K. *Alexander* the Great, for the Greeke authors who wrot next after his diceaſe, haue made no mention at al of them, whereby it is plaine, that they grew into a name & liking ſince their time: howbeit no man needs to make doubt or queſtion, That found out they were firſt by the Greekes: for how els ſhould it be, that their names
C which be meere Greekiſh, are currant here in Italy? Howbeit this cannot be denied, that Italie hath giuen name to the hearb Petilium, which floureth in Autumne, groweth about briers and brambles, and is only commendable for the colour ſake, which is much like to the wild Roſe or Eglantine: the leaues of which floure be ſmall, and no more than fiue. A wonderfull thing to be noted in this floure, That the head ſhould bend and nod downward ſo, as vnleſſe it bee thus (as it were) wreathed and bowed, the ſaid leaues will not ſhew out of a ſmall cup or veſſell of ſundrie colours, and encloſing within it a yellow ſeed.

As touching a daſie, a yellow cup it hath alſo, and the ſame is crowned as it were with a garland conſiſting of fiue and fifty little leaues, ſet round about in manner of fine pales. Theſe bee floures of the medow, and moſt of ſuch are of no vſe at all; no maruell therfore if they be nameleſſe: howbeit ſome giue them one tearme, and ſome another. As for Chryſocon or Chryſitis,
D no Latine denomination it hath at all: an hearbe it is, growing an hand-breadth high, putting forth certaine buttons (as it were) in the head, glittering as bright as gold, with a black root, taſting harſh and yet ſweetiſh withall: it groweth commonly in places full of ſtones & ſhadowy.

Chap. IX.

¶ *The excellencie of Chaplets and Guirlands: of Cyclaminus, and Melilot: of Trifolie or Clauer, and three kinds thereof.*

NOw that we haue gone through in manner the principall dies and richeſt colours that be it remaineth that we paſſe to the treatiſe of thoſe Guirlands, which being made of diuers colored floures, in regard only of that varietie, are delectable & pleaſing to the eye. And
E conſidering that ſome of them ſtand vpon flours, others of leaf, they may be all reduced to two principall heads. Among flours, I take to be all kinds of broom (for from them there be gathered yellow floures) and the Oleander. *Item*, the bloſſoms of the Iujube tree, which alſo is called Cappadocia, for they reſemble much the odor of the oliue blooms: as for Cyclaminum, *i.* Sowbreed, it groweth among buſhes, whereof more ſhall be ſaid in another place: a purple Coloſſian flour it caries, which is vſed to beautifie & ſet out game-coronets. To come now to chaplets made of leaues; the faireſt that goe vnto them be * Smilax and Iuy; and therein alſo their * Bindweed.
berries interlaced among, do make a goodly ſhew aboue al: of which we haue ſpoken at large in the treatiſe of ſhrubs and trees. Many kinds there are beſides of plants proper for this purpoſe,
F which we muſt be faine to expreſſe by Greeke names, foraſmuch as our countreymen haue not beene ſtudious in this behalfe, to giue any Latine names to the greateſt part of them: beſides, moſt of them are meere ſtrangers in Italy, and grow in forrain parts: howbeit, looked for it will be at our hands that we ſhould enter into the diſcourſe of them alſo, for that our purpoſe & deſigne reacheth to all the works of Nature, and is not limited & confined within the bounds of

* *Vitis alba*, of some: *Glycypicron Dodonæi*, of others.
* *Viburnum Matthioli.*

Italy. Well then, to begin withall, * Melothron, Spireon, Trigonon, * Cneoron, which *Hyginus* calleth Casia (affourd leaues very meet to make chaplets: so doth Conyza, called otherwise cunilago; Melyssophyllon named also Apiastrum, *i.* Bawme; and Melilot, which wee commonly terme Sertula Campana; & good reason, for the best in Italy is that of Campain: & in Greece, that which groweth in the promentory Sunium. Next to these the Melilot of Chalcis & Candie is wel accepted of: but grow it in what countrey it wil, rough thickets and woods it delighteth most in. And that of this hearb they were woont vsually in old time to make garlands, may appeare by the very name Sertula, which it took therupon, and retaineth still. In sauor & floure both, it commeth neare to Saffron: the hearbe otherwise of it selfe is hoary and gray. The best Melilot is counted that which hath shortest leaues, and those most plumpe and fattie withall. Semblably, the hearbe Trifoile or Clauer, hath leaues which go to the making of coronets and guirlands. And hereof there be three kinds: the first is that which the Greeks call Mynianthes, others Asphaltion, hauing a bigger leafe than the rest; an hearbe that garden-makers commonly vse: the second with a sharpe leafe, called thereupon Oxytriphyllon: the third, which is least of al other. Among these Trifoiles, I cannot but aduertise the reader, that some there be which haue strong and firme stems: as neruous as those of garden Fennell and Fennell wild, yea and as stiffe as those of Myophonos. But to returne againe to our chaplets, there bee emploied about them, both the maine stalkes of Ferula, as also the berries and purple floures of the Iuie. There is besides a kind of them, like vnto the wild roses: and in them verily the colour only is delectable, for odour they haue just none. To conclude, of Cneoron there be two kinds, the blacke and the white: both well branched and full of leaues, but the white is most odoriferous: and as well the one as the other, doe flourish after the Æquinox in Autumne.

Chap. X.

¶ *Of Origanum, and Thyme: of the Athenien honey: of Conyza, and Iupiters floure, of Southernewood and Camomile.*

As many sorts also there be of Origanum, seruing to make guirlands: as for one of them, it hath no seed; but the other which is sweet, is called Origan of Candy. In like manner, two kinds there be of Thyme, to wit, the white and the blacke: this hearb doth flourish about the Summer Solstice, at what time as Bees also begin to gather honey from it: and according to the flouring of it more or lesse, a man may guesse ful wel what season there wil be for hony: for honey-masters and such as keep Bees, hope to haue a good yere of honey when they see the Thyme to bloume abundantly. Thyme canot well away with rain, and therfore it taketh harme by shoures and sheddeth the floure. Thyme seed lyeth so close, that vnneth or hardly it can bee found; wheras the seed of Origan, notwithstanding it be exceeding smal, is euident enough and may soone be seene. But what matter maketh it, that Nature hath so hidden the seed, considering it is wel known, that it lyeth in the very floure, which if it be sowen, commeth vp as well as any other seed? See the industrie of men, and how there is nothing but they haue made trial of and put in practise! The honey of Athens carieth the name for the best honey in the world, by reason of the Thyme growing thereabout. Men therfore haue brought ouer into other countries, Thyme out of Attica, although hardly and with much ado (being sown thus in the floure as I haue said) it commeth vp. But there is another reason in Nature, why it should thriue so badly in Italy, or elsewhere, considering that the Atticke Thyme wil not continue & liue, but within the aire and breath of the sea. Certes this was an opinion receiued generally of our auncient fore-fathers, That no Thyme would doe well and prosper, but neere vnto the Sea; which should be the cause, that in Arcadia there is none of it to be found. And in those daies also, men were verily persuaded, that the Oliue would not grow but in the compasse of three hundred stadia from the Sea side: howbeit, in this our age verily we are aduertised and know for certain, That in Languedoc and the prouince of Narbon, the very stonie places are all ouergrowne and couered with Thyme, vpon which there are fed thousands of sheepe and other cattaile: in such sort, as this kind of herbage and pasturage, yeeldeth a great reuenue to the inhabitants and paisants of that countrey, by joisting and laying in of the said beasts brought thither out of far remote parts for to feed vpon Thyme.

Concerning the hearbe Conyza, which goeth also to the making of Chaplets, there be two kinds

20030
copy 1

A kinds likewiſe of it, namely, the male & the female. And theſe differ onely in leaues: for thoſe of the female Conyza be thinner, ſmaller, narrower, and growing cloſer together than the other of the male, which indeed branch and ſpread abroad more, lapping one ouer another in manner of creſt tiles. The floures alſo of the male Conyza is more bright and liuely: howbeit, both the one and the other floure late, and not before the riſing or apparition of the ſtar Arcturus. The male carrieth a ſtrong ſent: but that of the female is more penetrant; in which regard the female is better for the bite and ſting of venomous beaſts. The leaues of the female, ſmell of Hony. The root of the male, is by ſome called Libanotis, whereof we haue already written.

As touching theſe herbs following, * Dios Anthos, Majoran, the day Lillie Hemerocalles, Sothernwood, Elecampane, water Mints, and wild running Thyme, as alſo all which do branch
B and put forth ſhoots as Roſes do, ſuch ſerue only in leafe for garlands. As for the ſaid *Iupiters* floure or Dios Anthos, particularly, there is nothing in it but the colour to commend it; for ſauor it hath none, no more than another herb which the Greeks call Phlox. As for the reſt, their floures and branches both be odoriferous, except the running wild Thyme.

* or *Iouis Flos.* which ſome take to be the Columbines.

Elecampane, named in Greeke Helenium, ſprang firſt (as men ſay) from the teares of Ladie *Helena*: and therefore the beſt Elecampane is that which groweth in the Iſland of Helena. The plant is leafed like vnto wild Thyme, ſpreading & running low by the ground with little branches, nine inches or a ſpan long.

* Helenium here deſcribed agreeth not with our Elecampane.

Sothernwood doth flouriſh in Summer, and carrieth a ſweet and pleaſant ſauor, howbeit, the head it ſomwhat ſtuffeth and offendeth. The floure is of a golden colour. And ſay, that it carri-
C eth neither ſeed nor floure, yet commeth it vp of it ſelfe in void and vacant places altogether neglected and without any culture, for it doth propagat and increaſe by the tops and tips of the branches lying vpon the ground, and ſo taking root. And therefore it groweth the better if it be ſet of root or ſlip, than ſowed of ſeed. For of ſeed, much adoe there is to make it come vp: and when it is aboue ground, the yong plants are remoued and ſet, as it were in *Adonis* gardens, within pots of earth; and that in Summer time, after the maner of the herb and floure Adonium: for as well the one as the very tender, and can abide no cold: and yet as chill as they be, they may not away with ouer-much heat of the Sun, for taking harme. But when they haue gotten head once and be ſtrong enough, they grow and branch as * Rue doth.

* *Ruta vica.*

Much like vnto Sothernwood in ſent and ſmell, is Camomile: the floure is white, conſiſting
D of a number of pretty fine leaues ſet round about the yellow within.

Chap. XI.

¶ *Of Marioram, the greater and the leſſe, called in Latine Amaracus or Sampſuchum. Of Nyctygretum, Melilote, the white Violet · of Codiaminum, and wild Bulbes: of Heliochryſum, and Lychnis or Roſe Campain. And of many other herbs growing on this ſide the ſea.*

Dioclesthe Phyſitian, and the whole nation in maner of the Sicilians, haue called that herb Amaracus, which in Egypt and Syria is commonly named Sampſuchum. It commeth vp both waies, as well of ſeed as of a ſlip and branch. It liueth and continueth longer than
E the herbs beforenamed, and hath a more pleaſant and odoriferous ſent. Marjoram is as plentifull in ſeed, as Sothernewood: but whereas Sothernewood hath but one tap root and the ſame running deep into the ground, the reſt haue their roots creeping lightly aloft and eb within the earth. As for all the other herbes, they are for the moſt part ſet and ſowne in the beginning of the Autumne; ſome of them alſo in the ſpring, and namely in places which ſtand much in the ſhade, which loue to be well watered alſo and inriched with dung.

As touching Nyctygretum [or Lunaria] *Democritus* held it to be a wonderfull herb, and few like vnto it; ſaying that it reſembleth the colour of fire, that the leaues be pricky like a thorne, that it creeps along the ground: he reporteth moreouer, That the beſt kind therof growes in the
F lad Gedroſia, That if it be plucked out of the ground root and all after the Spring Æquinox, and be laid to drie in the Moonſhine for 3 daies together, it will giue light and ſhine all night long; alſo, That the Magi or Sages of Perſia, as alſo the Parthian kings vſe this herb ordinarily in their ſolemn vowes that they make to their gods: laſt of all, That ſome call it Chenomychos, becauſe Geeſe are afraid of it when they ſee it firſt; others name it Nyctilops, becauſe in the night

night ſeaſon it ſhineth and glitter eth afarre off. As for Melilote, it commeth vp euerywhere: howbeit, the beſt ſimply & wherof is made the greateſt account, is in Attica: but inwhat place ſoeuer it growes, that is moſt acc pted which is freſh & new gathered, not enclining to white, but as like vnto Saffron as is poſſible. And yet in Italie the white Melilote is the ſweeter and more odoriferous. G

The firſt floure bringing tidings of the ſprings approch, is the white bulbous ſtock-Gillofre. And in ſome warmer climates they put forth and ſhew euen in Winter. Next vnto it for their timely appearance is the purple March Violet: and then after them the Panſe, called in Latine Flammea, and in Greeke Phlox, I meane the wild kind onely.

Codiaminon bloweth twice in the yeare, namely, in the Spring and the Autumne: for it cannot abide either Winter or Summer. Somewhat later than thoſe before rehearſed, are the Daffodil and Lilly ere they flour, eſpecially in countries beyond ſea. [in Italy verily (as I haue ſaid before) they bloum not till after Roſes:] for in Greece the Paſſe-floure* Anemone is yet more lateward. Now is this Anemone the floure of certain wild Bulbes, different from that other Anemone whereof I will ſpeake in the Treatiſe of Phyſick-hearbs. Then followeth * Oenanthe, and Melanion, and of the wild ſort Heliochryſos. After them, a ſecond kind of Paſſe-flower or Anemone, called alſo Leimonia, beginneth to blow. And immediatly vpon it the pety Gladen or ſword-graſſe, accompanied with the Hyacinth: & laſt of all the Roſe ſheweth in her likenes. But quickly hath the Roſe done, and none ſo ſoone, and yet I muſt except the garden Roſe. Of all the reſt, the Hyacinths or Harebels, the * ſtock-Gillo floure, and Oenanthe or Filipendula, beare floures longeſt. But of this Oenanthe, this regard muſt bee had, that the floures bee often picked and plucked off, and not ſuffered to run to ſeed. This groweth in warme places. It hath the very ſame ſent that Grapes when they firſt bud and put out bloſſom, whereupon it took the name Oenanthe. But before I leaue the Hyacinth, I cannot chuſe but report the fable or tale that goeth thereof, and which is told 2 maner of waies, by reaſon that the floure hath certaine veines to be ſeen running in and out, reſembling theſe two letters in Greek AI, plaine and eaſie to be read: which as ſome ſay, betoken the lamentable mone [a] that *Apollo* made for his wanton minion *Hyacinthus* whome he loued, or as others make report, ſprung vp of the bloud of *Aiax* who flew himſelfe, and repreſented the two firſt letters of his name AI. H I

* Pulſatilla or Wind-floure.

* Filipendula ſuppoſed of ſome.

* or rather the Wall-flower.

Helyachryſos beareth a yellow floure like to gold, a ſmall and fine leafe, a little ſtalk alſo & a ſlender, but hard and ſtiffe withall. The Magi or Sages of Perſia vſe to weare this hearbe and floure in their Guirlands: and they be fully perſuaded, that by this meanes they ſhall win grace and fauour in this life, yea, and attaine to much honour in glorie; prouided alwaies, that their ſweet compoſitions wherewith they annoint and perfume themſelues, be kept in a veſſel or box of gold, not yet fined nor purified in the fire; which gold they call Apyron. And thus much for the floures of the Spring. K

Now ſucceed and come after in their rank, the ſummer floures, to wit, Lychnis, *Iupiters* flower or Columbine-and a ſecond kind of * Lilly: likewiſe Iphyon, and that Amaracus or Marjeram, which they cal the Phrygian. But of all others, the flower Pathos is moſt louely & beautifull: whereof there be two kinds, the one with a purple flower like vnto the Hyacinth, the other is whiter, and groweth commonly in churchyards among graues and tombs, and the ſame holdeth on flouring better, and liueth longer. The flower de-luce alſo is a Summer flower. Theſe haue their time, fade, and are ſoone gone. And then come other flowers for them in their place in Autumne, to wit, a third kind of Lillie, and Saffron: But of both theſe, the one is of a dull or no ſent at all: the other is very odoriferous, but all of them breake out and ſhew abroad with the firſt ſhower of rain in Autumne. Our-chaplet makers vſe the floures alſo of Bedegnar or white Thiſtle in their Guirlands: and no maruell, ſince that our Cookes dreſſe the young tendrells and crops thereof, for to make a daintie diſh for to content our taſt and goe pleaſantly downe the throat. Thus you ſee the order and manner of beyond-ſea floures, how and when they come abroad. In Italy it is ſomewhat otherwiſe: for the Roſe followeth immediatly after the violets: and when the Roſe is in the mids of his ruffe, in comes the Lilly to bear him company. No ſooner hath the Roſe plaied his part, but the blew-blaw entereth the ſtage: and after him the Paſſeveluer or floure-gentle. As for the Pervincle, it continueth freſh and greene all the yeare long: this hearbe windeth and runneth too and fro with her fine and ſlender twigges in manner of threads or laces, and thoſe beſet with leaues two by two in order, at euery knot or joint. L M

* Some read Cerynthus rather,

Paſſing

20030
copy 1

A Paſſing good and proper indeed for vinet and ſtory worke in borders, arbors or knots, and meet for fine and curious Gardeners: howbeit, for default of other floures, the Garland-makers borrow a little of the law, and make vp their defects with a ſupply from it. The Greeks cal it Chamædaphne.

The life of the white Violet or bulbous ſtock-Gillofre, is three yeares at moſt, and ſo long it holdeth the owne well; after that terme it doth degenerat and wax worſer. The Roſe-buſh will continue fiue yeares, without cutting downe or burning (which are the meanes to maintaine it in youth ſtill.) But as we haue already obſerued, there lieth very much in the ſoile, which would be conſidered eſpecially in floures: for in Egypt, none of all theſe aboue rehearſed, haue any odor or ſent at all; and yet the Myrtle trees there, they alone carry a moſt ſweet and pleaſant ſa-
B vor. Moreouer, in ſome tracts all theſe herbes and floures beſorenamed, do preuent in budding and blowing (two months) thoſe of other places. As for Roſe-rewes, the earth ought to be digged and opened about the roots; firſt preſently vpon the comming of the Weſtern wind Fauonius in February, and then a ſecond time about the Summer Solſtice: to conclude, theſe would be looked vnto aboue all things, that before and between thoſe times, they be kept well pruned and cleanſed from all ſuperfluities.

Chap. XII.

¶ *The order of nouriſhing and maintaining Bees. What meat is to be giuen them. Their diſeaſes, and the remedies to them belonging.*

C IN this diſcourſe of ours concerning gardens and gay floures appertaining to Garlands, requiſit it is to ſpeak of bees and bee-hiues, which become the garden very wel: conſidering the gain that commeth in ſo eaſily by them, eſpecially when they ſtand and do well. In regard therefore of theſe bees, ſo beneficiall as they be, and kept with ſo ſmall charges, a garden ought to be well planted and ſtored with Thyme, Baulme, Roſes, Violets of all kindes, Lillies, ſweet Trefoile, Beanes, Eruile, Cunila or Sauerie, Poppies, Conyza, Caſia, to wit, Lauander and Roſemary, Melilote, Meliſſophyllum, and Cerinthe. This Cerinthe is an herb bearing white leaues, and thoſe bending downward: it groweth a cubit high, and carrieth an hollow head, containing within it a certaine ſweet liquor reſembling honey: bees are moſt eager and greedy after the
D floure of this herbe, as alſo of Senuie; whereat we may well make a wonder, ſeeing that for certaine they wil not touch nor come neere to the bloſſome of the Oliue trees. And therfore good it is to ſet bee-hiues far enough from this tree. And yet of neceſſity ſome there would be planted neere vnto them, that when the bees do ſwarme or caſt, they might haue a conuenient place at hand to ſettle vpon, for feare they ſhould flie too far from the hiue. The Cornell tree alſo is not good for bees, for if they chance to taſt the floure therof, they fal preſently into a vehement lask, wherof the poore wretches (if they haue not help the ſooner) die: and therfore it would not ſtand in their way. Howbeit, there is a remedy to cure them of this flux, namely, to take ſoruiſes and ſtamp them together with hony, and ſo to giue it them: to ſet vnto them either mans vrine or beaſts ſtale or els laſt of all to ſerue them with graines of the Pomgranate, beſprinckled
E and drenched in wine of the Ammincan grape: but if you ſet broome all about their hiues, you do them an high pleaſure.

As touching their food and nouriſhment, I will tell you a wonderfull and memorable thing vpon mine own knowledge. There is a towne or Burgade called Hoſtilia, ſcituat vpon the riuer Po, the inhabitants of this village, when they ſee that their bees meat goeth low therabout, and is like to faile, take me their hiues with bees and al, and ſet them in certain boats or barges, and in the night row vp the ſaid riuer Po againſt the ſtreame fiue miles forward. The morrow morning out go the bees to ſeeke food and reliefe. Now when they haue met with meat, and fedde themſelues, they returne againe to the veſſels aforeſaid: and thus they continue daily, although they change their place and haunt; vntill ſuch time as their maſters perceiue that the hiues bee
F full, by the ſetling of their boats low within the water with their weight, and then they returne home againe downe the ſtreame, and diſcharge the hiues of the honey within.

CHAP.

G

Chap. XIII.

¶ *Of a certaine venomous and poiſonfull honey. The remedies as well againſt the ſaid Honey, as another kind that maketh folke beſides themſelues.*

SEmblably in Spain they deale with their Bees & hiues vpon Mules backs in the like caſe, and carry them vp into the countrey for to be prouided of victuals. But here it would be conſidered by the way, what paſturage it is that they be put into; for that there is ſome kind of food, which poiſoneth all the honey that is gathered from it. At Heraclea in Pontus, in ſome yeares, all the hony that the Bees do make, is found to be venomous and no better than poiſon; and yet the ſame bees in other yeres gather good and wholſome hony. Howbeit, thoſe authors who haue deliuered thus much in writing, haue not ſet downe what floures they be that yeeld this hurtfull hony: and therefore I thinke it not amiſſe to write what I haue found and knowne as touching this point. There is an herbe called Ægolethron in Greek, which killeth horſes verily, but Goats moſt of all, feeding therupon; and therfore it took that name: the floures of this herb, if it chance to be a wet and rainy Spring, do conceiue and ingender within them a certain deadly venome which doth corrupt and rot them. This may be a probable reaſon, that the foreſaid miſchiefe and bane is not alwaies felt alike. This poiſonſome honey may be knowne by theſe ſigns: firſt it will neuer thicken but continue liquid ſtil; ſecondly, the colour is more deep and reddiſh than ordinary; thirdly, it carrieth a ſtrange ſent or ſmell with it, and will cauſe one to ſneeſe preſently; laſt of all, it is more ponderous and heauy than the good and harmleſſe hony. The ſymptomes or accidents that inſue vpon the eating of this honey, are theſe, They that haue taſted thereof, caſt themſelues vpon the ground and there fall a tumbling: they ſeek by all means they can to be cooled; and no maruell, for they run all to ſweat, that one drop ouertakes the other. Howbeit, there be many remedies for this poiſon, which I will ſhew in place conuenient. Mean while, becauſe a man would not be without ſome good thing ready at hand, ſince the world is ſo ful of villany & ſet vpon ſuch ſecret miſchiefe, I muſt needs put down one good receit, and that is this: take honied wine that is old, mingle and incorporat it with the beſt hony you can meet withal, and Rue together: vſe this confection at your need. *Item*, Eat much of ſalt-fiſh, although it come vp again, and that your ſtomack do caſt it. Moreouer, this hony is ſo pernicious, that the very dogs if they chance to lick vp any excrements that paſſe from the partie ſo infected (either by reaching, ſpitting, vomit, or ſeege) they are ſure to be ſped therewith, and to feele the like torments. Howbeit, the honied wine that is made therewith, if it may haue age enough and be ſtale, is knowne for a certainty to do no creature harm. And there is not a better medicine in the world, either to fetch out ſpots in womens faces, and make their skin faire and cleare (if it be applied with Coſtus;) or to take out the black and blew marks remaining after ſtripes in eye or elſwhere, ſo it be tempered with Aloe. Another kind of honey there is in the ſame region of Pontus, and namely among the Sanni (a people there inhabiting) which becauſe it drieth folke into a fit of rage and madneſſe, they call in Greeke Mænomenon. Some attribute the occaſion hereof to the floure of the Oleander, whereof the woods and forreſts there be full. This nation ſelleth no hony at all, becauſe it is ſo venomous and deadly: notwithſtanding they do pay for tribute a huge maſſe of wax vnto the Romans euery yeare. Moreouer, in the kingdome of Perſis, and in Getulia, which lieth within Mauritania Cæſarienſis, a country confining and bordering vpon the Maſſæſuli, there be venomous hony-combs; yea, you ſhall haue in one hiue ſome hony combs full of poiſoned hony, whereas others be ſound and good: a dangerous thing no doubt, and than which, there could be no greater deceit to poiſon a number of people; but that they may be known from the reſt by their leaden and wan hew that they haue. What ſhould we think was Natures meaning and intent by theſe ſecret ſleights and hidden miſchiefes, That either the ſame Bees ſhould not euery yeare gather venomous hony; or not lay the ſame vp in all their combs differently? Was it not enough that ſhe had beſtowed vpon vs a thing, wherein poyſon might be ſooneſt giuen and leaſt perceiued? Was ſhe not content thus to indanger our liues, but ſhe muſt proceed farther, enen to incorporat poiſon her ſelfe in hony, as it commeth from the Bee, for to empoiſon ſo many liuing creatures? Certes, I am of this mind and beliefe verily, That ſhee had no other purpoſe herein, than to make men more warie what they eat, and leſſe greedy of ſweet meats to content and pleaſe the tooth. For the very

H I K L M

honey

20030
copy 1

oney indeed ſhe had not generally infected with this hurtful quality, like as ſhe had armed all Bees with ſharp pricks and ſtings, yea, and the ſame of a venomous nature; and therfore againſt theſe creatures verily ſhe hath not deferred and put off to furniſh vs with a preſent remedy: for the juice of Mallowes or of Yvie leaues ſerueth to annoint the ſtinged place, and keep it from rankling; yea, and it is an excellent thing for them that be ſtung, to take the very Bees in drink; for it is an approued cure. But this I maruell much at, That the Bees themſelues, which feed of theſe venomous herbs, that cary the poiſon in their mouths, and are the makers of this miſchievous honey, do eſcape and die not thereof? Whereof I can giue no reaſon at all, vnleſſe dame Nature, that lady and miſtreſſe of the world, hath giuen vnto theſe poore Bees a certaine Antipathy and vertue contrary vnto poiſon: like as among vs men to the *Marſi* and *Pſylli*, ſhee hath
B imprinted (as it were) a repugnancy in their bodies, to reſiſt the venome of all Serpents whatſoeuer.

Chap. XIIII.

¶ *Of a certaine kind of honey which Flies will not touch. Of Bee-hiues. How to order the ſame, and namely when Bees want meat and are in danger to be famiſhed. The manner alſo of making Wax.*

C THere is in Candy another ſtrange and wonderful thing, as touching hony, gathered about the mountaine Carina, which taketh nine miles in compaſſe: within which ſpace and circuit of ground, there is not a Flie to be had; and the honey there made, Flies wil not touch in any place whereſoeuer. By which experiment, this honey is thought to be ſingular for medicines, and therefore choiſe is made thereof before any other.

As touching Bee-hiues, they ought to ſtand on the open ſide vpon the Æquinoctiall Sunne riſing, that is to ſay, when the daies and nights be equall. And in any wiſe, regard would be had, that they open not in the Northeaſt, and much leſſe the full Weſt. The beſt Bee-hiues be made of barks and rinds of trees: the ſecond in goodneſſe be thoſe of Ferula or Fenell-geant. In the third place are ſuch as be wrought of oiſier twigs. Many haue made them of Talc, which is a kind of tranſparent glaſſe ſtone, becauſe they would ſee through them how the Bees do worke and labor within. Daubed they ſhould be if they were well ſerued, both without & within with Oxe dung. The couer and lidde thereof ought to be moueable and haue liberty to play vp and
D down behind, that it may be let down far within-forth, in caſe either the hiue be too large & of greater receit in proportion than the Bees are in number; for feare they ſhould ſlack their work and giue ouer their trauell, diſpairing euer to fill the ſame, ſeeing it ſo big and of ſo great capacity; and being thus let downe (to make their hiue ſeem the leſſe) it muſt be gently drawn vp again by little & little, that the Bees may be deceiued thereby, & not perceiue how their worke grows vpon them. In Winter time Bee-hiues ſhould be couered with ſtraw: & oftentimes perfumed with beaſts dung eſpecially; * for this is agreeable to their nature. Ouer and beſides, it killeth the wicked verm in that breed in them, Spiders, Butterflies, and Wood-worms; yea, and this property it hath moreouer, to ſtir vp and quicken the Bees, and make them more liuely and nimble about their buſineſſe. As for the Spiders aforeſaid, they verily are not ſo harmful, & be
E ſoon deſtroied: but the Butterflies do the more miſchiefe, & are not ſo eaſily rid away. Howbeit there is a way to chaſe them alſo, namely, to wait the time when the Mallow doth begin to bloſſome, to take the change of the Moone, and chuſe a faire and cleare night, and then to ſet vp certaine burning lights juſt before the Bee-hiues: for theſe Butterflies will couet to flie into the flame. But what is to be done, when you perceiue that the bees do want victuals? then it wil be good to take dry Raiſins of the Sun, and Figs, to ſtamp them together into a maſſe, and lay it at the entry of the hiue. *Item*, It were not amiſſe to haue certain locks of wool well touzed and carded, and thoſe wet & drenched in cuit either ſodden to the thirds, or to two thirds, or els ſoked in honied wine, for them to ſettle vpon and ſuck. Alſo to ſet before them in their way the raw carkaſes of Hens, naked and pulled to the bare fleſh. Moreouer, there be certain Summers
F ſo dry and continually without raine, that the fields want floures to yeeld them food, and then muſt they be ſerued with the foreſaid viands, as well as in Winter ſeaſon. When hony is to be taken forth of the hiues, the holes and paſſages for the ingreſſe and egreſſe of the bees ought to be well rubbed and beſmeared with the herb Meliſſophyllon and Geniſta bruſed and ſtamped: or elſe the hiues muſt be compaſſed about in the middeſt with branches of the White Vine,

* Conſidering that of a beaſts carkaſſe they will be engendred.

for

for feare leſt the Bees depart and flie away. The veſſels whereout hony hath been imploied, yea, and honey combes, would be well rinced and waſhed in water; which being throughly ſodden, maketh a moſt wholeſome and excellent vineger. G

As touching wax, it is made of the combes after the hony is preſſed and wrong out of them. But firſt they muſt be purified and clenſed with water, and for three daies dried in ſome darke place: vpon the fourth day they are to be diſſolued and melted vpon the fire in a new earthen pot neuer occupied before, with ſo much water as will couer the combs: and then it ſhould bee ſtrained through a panier of reeds or ruſhes; which done, the wax is to be ſet ouer the fire a ſecond time in the ſaid pot, and with the ſelf-ſame water, and ſodden again; and then it ought to run out of it into other veſſels of cold water, but thoſe firſt ſhould be al about within annointed and beſmeared with honey. The beſt wax is that which is called Punica, *i.* of Barbary, and is H white. The next in goodneſſe is the yelloweſt, and ſmelleth of hony, pure and clean without ſophiſtication; ſuch commeth from the country of Pontus; and verily I wonder much how this wax ſhould hold good, conſidering the venomous hony whereof it is made. In the third place is to be ranged the wax of Candy: for this ſtandeth much vpon that matter which they cal Propolis, wherof I haue already ſpoken in the Treatiſe of Bees and their nature. After all theſe, the wax of the Iſle Corſyca may be reckoned in the fourth rank; which becauſe it is made much of the Box tree, is thought to haue a vertue medicinable. Now the making & working of the firſt and beſt Punick white wax, is after this manner: They take yellow wax, and turne it often in the wind without the houſe in the open aire; then they let it ſeeth in ſea-water, and namely, ſuch as hath bin fet far from the ſhore out of the very deep, putting thereto Niter; this done, they ſcum I off the floure (that is to ſay, the whiteſt of it) with ſpoons; & this cream (as it wer) they change into another veſſell, which hath a little cold water in it. Then once againe they boyle it in ſea-water by it ſelfe alone, and ſet the veſſel by for to coole. After they haue done thus three times, they let it dry in the open aire vpon an hurdle of ruſhes, in the Sun and Moon, both night and day: and this ordering bringeth it to be faire and white. Now in the drying, for feare that it ſhould melt, they couer it all ouer with a fine Linnen cloth. But if they would haue it to be exceeding white indeed, they ſeeth it yet once more, after it hath bin thus ſunned and mooned. In truth, this Punick white wax, is ſimply the beſt to be vſed about medicines. If one be diſpoſed to make wax black, let him put therto the aſhes of paper: like as with an addition or Orchanet it will be red. Moreouer, wax may be brought into all manner of colours, for painters, limners, K and enamellers, and ſuch curious artificers, to repreſent the forme and ſimilitude of any thing they liſt. And for a thouſand other purpoſes men haue vſe thereof, but principally to preſerue their walls and armors withall. All other things as touching Hony and Bees, haue bin handled already in the peculiar Treatiſe to them and their nature belonging. Here an end therefore of Gardens and Gardinage.

Chap. XV.

¶ *Of hearbs which come vp of themſelues, and ſuch eſpecially as be armed with prickes.*

IT remaineth now to ſpeake of certain wild herbs growing of their own accord, which in many nations ſerue for the kitchin, and principally in Ægypt; for this countrey, although it bee moſt plentifull in corne, yet may ſeem to haue leaſt need thereof, and of all nations vnder heauen beſt able to liue without the ſame: ſo well ſtored it is with hearbs, wherof the people doth ordinarily feed: whereas in Italy here, we know as few of that kind good to be eaten, namely, Strawberries, *Tanus, Ruſcus, Creſtemarine or Sampire; as alſo Batis Hortenſiana, which ſome call French Sperage: we haue alſo the wild Parſnep of the medowes, and the Hop, but wee vſe them rather for pleaſure and delight, and to giue contentment to our taſt, than for any neceſſary food to maintain life. But to come again to Egypt, there is to be found the nobleſt plant of all others, Colocaſia, which ſome name Cyamos, [*i.* the Egyptian beane:] this herbe they gather and cut downe out of the riuer Nilus: it putteth forth a main ſtem, which being ſodden, yeel- M deth in the eating and chewing, a certaine threddy matter or woolly ſubſtance, drawing out in manner of a cob-web; but the ſtalk as it groweth vp amid the leaues, maketh a faire and goodly ſhew: for indeed the ſaid leaues be exceeding large, and comparable to the broadeſt that any tree beareth; reſembling thoſe for all the world of the Clote or great Burrhe growing in our ri-

* The fruit or berry whereof is *Vua Taminia*

vers

20030
copy 1

A vers,which we eal Perſonata. A wonderful thing it is to ſee,what ſtore they in Ægypt ſet by the commodities that their riuer Nilus doth affoord:for of the leaues of this Colocaſia(plaited & infolded naturally one within another)they make them cups of diuers forms and fa thions,out of which they take no ſmall pleaſure to drink. And now adaies this herb is planted here in Italy. Next to Colocaſia,the Ægyptians make moſt account of that Cichory,which I named before,the wild and wandring Endiue;which herb commeth vp in that country after the riſing of the Brood-hen ſtar:it floureth not all at once,but bloweth by branches one after another:a ſupple and pliable root it hath,and therefore the Ægyptians vſe it in ſtead of cords to binde withall. As for Anthalium,it groweth not in Nilus, but not far from the riuer: it beareth a fruit in bigneſſe and roundneſſe reſembling a Medlar,hauing neither kernell within,nor husk without:
B and the leafe of this plant is like to Cyperus,or Engliſh Galangale. This herbe they vſe to eat, being firſt * dreſſed and prepared in the kitchin. They feed likewiſe vpon Oetum, a plant that hath few leaues and thoſe very ſmall, howbeit a great root. Touching Aracidna and Aracos, they haue many roots verily branching and ſpreading from them,but neither leafe nor herbage ne yet any thing els appearing aboue ground. And thus much of the chiefeſt and greateſt herbs of Egypt ſerued vp to the table: the reſt are common or vulgar,and euery mans meat,by name, Condrylla,Hypochœris,Caucalis,Authriſcum,Scandix (called by ſome Tragopogon,which beareth leaues like to Saffron;) Parthenium,Strychnum,Corchorus,and * Apace,which ſheweth his head about the Æquinox: alſo Acinos,and that which they name Epipetron,and it neuer beareth floure; whereas Aphace contrariwiſe neuer giueth ouer flouring, but when one
C floure is faded and ſhed, another commeth vp, and this courſe it holdeth all Winter long; throughout the Spring alſo,euen to the heat of Summer. Many other hearbs they haue of baſe reckoning: but aboue all,they make greateſt account of * Cnicus(an herbe not knowne in Italy)not for any good meat they find in it, but for the oyle drawne out of the ſeed thereof. Of this herb there be two principall kinds; to wit,the Wild,and the Tame: the Wild is ſubdiuided into two ſpeciall ſorts, the one of a more mild and gentle nature than the other, although the ſtalks of both be alike,that is to ſay,ſtiffe and ſtreight vpright: and therefore women in old time vſed the ſtems thereof for rocks and * diſtaffes;whereupon ſome do call the herb Atractylis: the ſeed is white,big,and bitter. The ſecond is more rough and hairy,creeping long on the ground,with ſtalks more muſculous and fleſhy,and carrieth a ſmall ſeed. The herb may be ran-
D ged among thoſe that be prickly:for ſo muſt herbs be diuided into ſuch general heads;namely, that ſome be full of pricks, others cleane without and ſmooth. As for thoſe which ſtand vpon pricks,they be ſubdiuided into many members and branches. And to begin with a kind of Sperage,called alſo Scorpio,it hath no leafe at all;but inſtead therof, pricks and nothing els:ſome there be leafed indeed,but thoſe are beſet with prickes, as the Thiſtle, Sea-holly, * Liquorice, and Nettle: for the leaues of all theſe herbs be pricky & ſtinging withall. Others,beſides their leaues,haue prickles alſo,as the * bramble,& Reſt harrow or whin. Some be prouided of pricks both in leafe and ſtalk,as Phleos,which others haue called Stœbe. As for Hippophacet,it hath a prick or thorne in euery joint: but the bramble Tribulus aforeſaid, hath this property by it ſelfe,That the fruit alſo which it beareth,is ſet with pricks. Of all theſe ſorts,the Nettle is beſt
E knowne,which carrieth certain goblets and concauities,and the ſame yeelding a purple kind of downe in the floure,and it riſeth vp ſometimes aboue two cubits high. Many kinds there be of theſe Nettles; namely, the wild Nettle, which ſome would haue to be the female, and this is more milde than the reſt. In this wilde kinde is to be reckoned alſo,that which they cal Cania, and is of the twain more ægre,for the very ſtalke will ſting, and the leaues be purfled as it were and jagged. But that Nettle which carrieth a ſtinking ſauor with it,called is Herculanea. All the ſort of them are full of ſeed,and the ſame blacke. A ſtrange quality in theſe Nettles, that the very hairy downe of them(hauing no euident prickes ſticking out)ſhould be ſo ſhrewd as it is,that if one touch it neuer ſo little,preſently there followeth a ſmarting kind of itch,and anon the skin riſeth vp in pimples and bliſters,as if it had been skalt or burnt: but well knowne
F is the remedie of this ſmart,namely,to annoint the place with oyle. Howbeit this biting property that it hath,commeth not to it at the beginning when it is new comevp,but it is the heat of the Sun that fortifieth this mordacitie. And verily in the Spring when the Nettle is young and peepeth firſt out of the ground,they vſe to eat the crops therof for a pleaſant kind of meat, and many be perſuaded beſides that it is medicinable, & therefere preciſely & religiouſly feed thereupon;

* as *Theophraſtus* ſaith, ſodden in ale: *herdeaceo Zytho.*

* Thought to be *Dent de lion*

* *Carthamus*, or baſtard ſafron: but *Turnebus* ſuppoſes it to be put for *Cici*, whereof commeth *Oleum Cicinum.*

* *Colu*, although ſome read *fuſis*, i. ſpindles.

* *Glycyrrhizon* but this agreeeth not with our Liquorice.

* *Tribulus.*

* *Acetabulis.*

thereupon, as a preſervatiue to put by all diſeaſes for that preſent yeare. Alſo the root of the G
wild Nettle, if it be ſodden with any fleſh, maketh it to eat more tender. The dead nettle, which ſtingeth not at all, is called Lamium. As touching the herb Scorpio, I will write in the treatiſe of herbs medicinable.

Chap. XVI.

¶ *Of Cardnus, and Ixine: of Tribulus and Anchuſa.*

*A kind of thiſtle: ſome call it Mans bloud. *S. Mary thiſtle.

THe common Thiſtle is ful of pricky hairs, both in leafe & ſtalk: likewiſe * Acorna, * Leucacanthos, Chalceos, Cnicos, Polyacanthos, Onopyxos, Ixine, & Scolymos. As touching the Thiſtle Chamæleon, it hath no pricks in the leafe. Moreouer, theſe pricky hearbes are H
diſtinguiſhed & different one from another in this, that ſome of them be furniſhed with many ſtems, and ſpred into diuers branches, as the Thiſtle: others againe riſe vp with one maine ſtalk, and branch not as Cnecos. Alſo there be of them that be prickly only in the head, as the Eryngium or Sea-holly. Some floure in Summer, as Tetralix and Ixine. As for Scolymus, late it is alſo ere it blow, but it continueth long in the floure. Acorna differeth from it onely in the red colour and fattier juice that commeth from it. Atractylis alſo might go for Scolymus, but that it is whiter and yeeldeth a liquor like bloud: wherupon there be ſome who cal it Phonos, *i.* Murderer: this quality it hath beſides that it ſenteth ſtrong: the ſeed alſo ripeneth late, & not before Autumne: and yet this is a property common to all plants of this pricky and thiſtly kind. But all theſe herbs wil come of ſeed and root both. As for Scolymus, it differeth from the reſt of I
theſe Thiſtles herein, that the root, if it be ſodden, is good to be eaten: beſides, it hath a ſtrange nature, for all the ſort of them during the Summer throughout, neuer reſt and giue ouer, but either they floure, or they apple, or els be ready to bring forth fruit: and look when the leaues begin to wither, their prickes loſe their force and will not pierce.

* *Nonnata viſum eſt æquè in omnibus terris naſcitur: Ex Theop.* which is clean contrary to *Pliny.*

Ixine * is a rare herb and geaſon to be ſeen, and not found growing in al countries alike. Immediatly from the root it putteth forth leaus plenty; out of the mids of which root there ſwelleth out a bunch like an apple, but the ſame is couered with the foreſaid leaues: in the very top of which fruit there is contained a gum of a pleaſant taſt, called the thiſtle Maſtick. Touching the herb Cactos, which groweth alſo in Sicily and no where els, it hath a property by it ſelf; the ſtalks whereof ſhooting from the root, creep along the ground, and it carrieth a broad leafe full K
of pricks and thorns; and indeed theſe ſtalks thus running vpon the earth, the Sicilians cal Cactos, which they vſe to keep and preſerue; and being thus condited alſo, they commonly eat, as very good meat. One ſtem it hath growing vpright, which they terme Pternix, as ſweet & pleaſant as the other, but it will not abide to be kept long. The ſeed thereof is couered with a certain ſoft down, which they call Pappos, which being taken off with the husk, there remaineth a tender kernell within, which they eat, & find it as delicat as the very heart of the Date tree top, which is called the Brain: and this pith aforeſaid, the Sicilians name Aſcalia.

* ἀμμώδης. for σπαμώδης, *in Theophraſt.* *i.* like the ſeed of Seſama.

The Caltrop thiſtle Tribulus, groweth not but in moory grounds and ſtanding dead waters. Surely in other places, folke curſe it as they paſſe by, the prickes and ſpurs ſtick out ſo dangerouſly: but about the riuers Nilus and Strymon, the inhabitants do gather it for their meat: the L
nature of this plant, is to lean and bend downward in the head to the water. The leafe reſembles in form thoſe of the Elme, and they hang by a long ſtele or taile. But in other parts of the world there be two other kinds of Tribulus: the one is leafed like vnto the Cichling peaſe; the other hath leaues ſharp pointed; this ſecond kind is later ere it floure, and commonly groweth about the mounds of cloſes lying by villages and town ſides; the ſeed lieth in a cod rounder than the other, and black withall; whereas the former hath a * ſandy ſeed. Of theſe thorny and pricky plants, there is yet one kind more, namely Ononis, *i.* Reſt-harrow; for it carrieth pricks cloſe to the very branches; the leafe is like to Rue: the whole ſtalk throughout is ſet with leaues diſpoſed in manner of a garland. This plant commonly groweth after corn, it * plagueth the plough, and yet there is much adoto rid it out of a ground, ſo loth it is to die. Of plants that be prickie, M
ſome haue their ſtalkes and branches trailing by the ground, as namely that hearbe which they call Coronopus, *i.* Harts-horn, or Buck-horne Plantaine: contrariwiſe, there ſtand vpright, Orchanet, the root whereof is ſo good to colour wax and wood red. And of ſuch as be more gentle in handling * Camomile, Phyllanthus, Anemone, and Aphace. As for Crepis & * Apate, their

* And therfore it is called *reſta bouis* or *reſta ſratri*, becauſe it ſtaieth the draught of the Oxe at plough.

* *Anthemius.*

* Deceit: ſo called, becauſe the bitternes deceiueth many a one, looking like to a kind of Cichorie.

ſtalkes

20030
copy 1

A ſtalks be all leaſe. Moreouer, this would be noted, that the leaues of herbs differ one from another, as well as in trees: ſome in the length or ſhortneſſe of the ſtele whereto they hang; others in the breadth or narrowneſſe of the leaſe it ſelfe; in form alſo, whereby you ſhal haue ſome cornered, others cut and indented; likewiſe in ſent and floure, for ſome there be that continue longer in flouring than others, and blow not all at once, but one part after another, as Baſill, Tornſall, Aphaca, and Onocheile.

Chap. XVII.

¶ The difference of herbs in their leaſe: what hearbes they be that floure all the yeare long: of the Aſphodell, Piſtana, and Petie-Gladen or Sword-graſſe.

B MAny hearbes there be as well as ſome trees, which continue greene and hold their leaues from one end of the yeare to the other, as Tornſol, and Adianthum or Capillus Veneris. Another ſort there is of herbs that floure ſpike-wiſe, of which kind are Cynops, Alopecurus [*i.* Foxtaile] Stelephuros, which ſome call Ortyx, others Plantaine (of which I will write more at large among Phyſick herbs) and Thryollis. Of theſe, Alopecurus carrieth a ſoft ſpike, and a thick moſſie down, not vnlike to Fox-tails, whereupon it tooke that name in Greeke: and Stelephurus reſembleth it very much, but that the Foxtaile bloweth not all together, but beareth floures ſome at one time & ſome at another. Cichory and ſuch like, haue their leaues ſpreading vpon the ground, and thoſe put forth directly from the root, beginning to ſpring immedi-
C atly after the apparition of the ſtar Vergiliæ. As touching Parietary, there be other nations as wel as the Ægyptians, who feed vpon it: it took the name Perdicium in Latine, of the bird Perdix, *i.* the Partridge, that ſeeketh after it ſo much, and plucketh it out of the wals where it groweth: it hath many roots and the ſame thick. In like maner, the herb Ornithogale, *i.* Dogs onion, hath a ſmall ſtem and a white, but a root, * halfe a foot long. the ſame is full of bulbs like oni-
ons, ſoft alſo, and accompanied with three or foure other ſpurs growing out of it. This hearbe they vſe to ſeeth among other pot-herbs for potage. I will tell you a ſtrange quality of the herb Lotos and of Ægilops; if their ſeed be caſt into the ground, it wil not come vp in a yeare. As wonderfull is the nature alſo of the Camomile: for it beginneth to floure in the head, whereas all other herbes which blow not all at once, floure at the foot firſt. Notable is the Bur likewiſe
D and worthy to be obſerued, I mean that which ſticketh to our clothes as we paſſe by, the floure lieth cloſe and groweth within the ſaid Bur, and neuer appeareth without-forth: it is I ſay as it were hatched within, much like vnto thoſe liuing creatures that couve and quicken their egges within their belly. Semblably, about the city Opus there is an herb called Opuntia, which men delight to eat: this admirable gift the leaſe hath, That if it be laied in the ground, it will take root; and there is no other way to plant this herb, & maintain the kind. As for Iaſione, one leaſe it hath and no more: but ſo lapped and infolded, that it ſeemeth as if they were many. Touching Condrylla, the herb it ſelfe is bitter; but the juice of the root is hot and biting. Bitter alſo is Aphaca or Dent de Lion; as alſo that which is called Picris, which name it took of the exceeding bitterneſſe that it hath; the ſame floureth all the yere long. As for Squilla and Safron, they
E be both of a maruellous nature; for whereas all other hearbes put out leaſe firſt, and then knit round into a ſtem, in thoſe two a man may euidently ſee the ſtalk before the leaſe. And in Safron verily, the ſaid ſtalk thruſteth out the floure before it; but in the Sea-onion Squilla, firſt ſheweth the ſtalk, and then afterwards the floure breaketh out of it. The ſame Squilla floureth thrice in the yeare, as I haue ſaid heretofore, ſhewing thereby the three ſeaſons of ſeednes. In the range of theſe bulbous and onion-rooted plants, ſome place the root of *Cyperus, that is to ſay, of Gladiolus [*i.* Petie-gladen, Flags, or Sword-wort,] this is a ſweet root, and being ſodden or baked with bread, it giueth it a more pleaſant taſt; & beſides, it mendeth the weight of bread wel if it be wrought & kneaded with it in dough. Not vnlike to it is that herbe which they call Theſion, but that the root is harſh and vnpleaſant. Al others of the ſame kind differ in leaſe: the
F Aſphodell hath long and narrow leaues; Squilla is broad leafed, and may be handled without offence; wheras the Gladen leaſe is like a ſword blade indeed, and keen-edged according to the name [both in Greek and Latine.] The Aſphodell ſeed is good to be eaten, if it be parched or fried; ſo is the bulbous root of it alſo; but this ſhould be roſted vnder the embers, & then eaten with ſalt and oile. Ouer and beſides, if it be ſtamped with figs, it is an excellent diſh; and this

* *Semipedali*, Dioſcor. hath *Seſquipedali*; *i.* a foot and a halfe.

* *Cyperi*, or rather *Xyphij*, or *Phaſgani*.

indeed (according to *Heſiodus*) is the only way to dreſſe it. Moreouer, it is ſaid, that Aſphodels G
planted before the gates of any ferme houſe in the countrey, preſerue the place from all charms
and ſorceries. *Homer* alſo the Poet hath made mention of the Aſphodell. The root reſembleth
* *Napis*: Dioſcor. *Glandibus*, (*i.*) nuts or acornes. * Navews of a mean bigneſſe: and there is not another root with more heads, for oftentimes a
man ſhal ſee 80 bulbs cluſtred in a bunch together. *Theophraſtus* and all Greeke writers almoſt,
and namely *Pythagoras* (the chiefe prince of Philoſophers) deſcribe this plant to haue a ſtem of
of one cubit in length, yea and oftentimes of two; with leaues like to wild Porret: and the ſayd
ſtem they called Anthericon; but the root, (*i.*) thoſe bulbs reſembling onions, Aſphodelas: but
our countrymen haue named in Latin, the ſtem Albucus; but the root, Haſtula Regia. This is
the name alſo of the ſtalk, full of grains or berries; and thereof they would make two kinds [the
male and the female.] Well, the ſtem of the Aſphodell then, is commonly a cubit long, large H
and big, clean and ſmooth. Of this herb *Mago* hath written, and ordained, that it ſhould be cut
down in the going out of March and entrance of Aprill; namely, after it hath don flouring, and
before that the ſeed be ſwelled and grown to any bigneſſe: then vpon the fourth day after, when
the ſaid ſtems are ſlit and clouen, they muſt be laid abroad to drie in the Sunne: when they be
dried, they ought to be made vp into knitchets or handfuls. He ſaith moreouer, that the Greeks
name that herb Piſtana, which we cal in Latin Sagitta, growing in mariſhes and moores among
other fenny weeds. This alſo would he haue to be cut downe and gathered, betweene the Ides
of May and the end of the month of October: then, to be pilled, and ſo to be dried by little and
little with the moderat heat of the Sun. The ſame author giueth order likewiſe, that the other
kind of Gladiolus, which they call Cypiros, which alſo is an herbe growing about lakes and I
meeres, any time within Iuly ſhould be cut downe to the very root; and the third day after, to
be dried in the Sun vntill it looke white; but euery day that it lieth abroad, it muſt be brought
into the houſe before the Sun go downe; becauſe all herbs growing vpon mariſh grounds, take
harm by dewes in the night.

Chap. XVIII.

¶ *Of Ruſhes, ſix kinds; and of Cyperus: their medicinable vertues. Of Cypirus, and the ſweet Ruſh Scœnanth.*

Mago writing of the Ruſh, commonly called Mariſcon, ſaith, That for to twiſt and weaue K
into mats, it ought to be gathered out of the mariſh ground where it groweth, in Iune
vntill mid-Iuly. As for the drying of it, the ſame order muſt be obſerued in all points, as
we haue ſet downe before in the diſcourſe of other marais weeds. Hee maketh a ſecond kinde
of water Ruſhes, which I find to be called the ſea Ruſh, and of the Greekes Oxyſchœnon, *i.* the
ſharp Ruſh: which alſo is ſubdiuided into three other ſorts; for there is the barren ruſh, called
alſo the male, & in Greek Oxys: the female Ruſh bearing a black ſeed, which they call Melan-
cranis. This is thicker than the other, fuller alſo of branches and tufts. And the third more than
it, which is named Holoſchœnus. Of all theſe, Melancranis commeth vp of the own ſeed, with-
out any other kinds intermingled with it: but Oxys and Holoſchœnus, grow both together out
of one turfe. Of all others, the great Ruſh Holoſchœnus is beſt for to be wrought in mats, and L
ſuch like implements about an houſe, becauſe it is ſoft and fleſhy; it beareth a fruit hanging &
cluſtering together in maner of fiſh ſpawn. As for that ruſh, which we called the male, it grow-
eth of it ſelfe, by reaſon that his top faſteneth in the ground, and ſo taketh root by way of pro-
pagation: but Melancranis ſoweth her owne ſelfe, and commeth vp of ſeed; for otherwiſe their
race would periſh, conſidering the roots of them all euery yere do die. Theſe Ruſhes are vſed to
make leaps and weels for fiſhers at ſea, & fine & dainty wicker veſſels: alſo candle-wick & mat-
ches; eſpecially the marow or pith within, which is ſo great (eſpecially about the foot of the
Alps reaching to the ſea-ſide) that when a Ruſh is ſlit, there is found in the belly a pith almoſt
an inch broad by the ruſe. And in Egypt there be found Ruſhes ſo big, that they will ſerue to
make ſieues, rangers, and vans. In ſuch ſort, that the Egyptians can finde no matter for that pur- M
poſe, better. Some there be, that would haue the triangled or three ſquare ruſh Cyperus, to be a
ſeuerall kind by it ſelfe. This Cyperus, many there be that cannot diſtinguiſh from Cypirus,
by reaſon of the great affinity of their two names: but I mean to put a difference betweene them
both; for Cypirus is the Petie-glader or Sword-graſſe (as I haue before ſhewed) with a bulbous

or

20030
copy 1

A or onion root: the beſt of which kind, groweth in the Iſland of Crete: next to it in goodneſſe, is that of the Iſle Naxos: and in a third degree, is to placed that of Phœnice: and indeed that of Crete or Candy, in * whiteneſſe and odor commeth neere to Nard. The Naxian Cypirus hath a quicker ſent: the Phœnician Cypirus ſmelleth but a little: as for that in Egypt, it hath no ſauor at all; for there alſo groweth Cypirus. But now to come vnto the properties thereof, it hath vertue to diſcuſſe and reſolue hard ſwellings in the body. For now my purpoſe is to ſpeake of their medicinable vertues, foraſmuch as there is great vſe in Phyſicke, as well of ſuch aromaticall ſimples, as odoriferous floures. As touching Cypirus therefore, I profeſſe verily that I will follow *Apollodorus*, who forbiddeth expreſſely to take Cypirus inwardly in any drink: and yet he proteſteth, that it is moſt effectuall for them that be troubled with the ſtone, and full of grauel;
B but, by way of fomentation onely. He affirmeth moreouer, that without all doubt it cauſes women to trauell before their time, & to ſlip their vntimely fruit. But one miraculous effect thereof he reports, namely, that the Barbarians vſe to receiue the fume of this herb into their mouth, and thereby waſt and conſume their ſwelled Spleens: alſo, they neuer go forth of dores, before they haue drunk a pipe therof in that maner: for perſuaded they are verily (ſaith he) that by this means they are more youthful, liuely, and ſtrong. He ſaith moreouer, that if it be applied as a liniment with oile, it healeth all merry-gals and raw places where the fleſh is rubbed off or chafed: it helpeth the rank rammiſh ſmel vnder the arm-holes; and without faile cureth any chilling, numneſſe, and through cold. Thus much of Cypirus.

As for Cyperus, a Ruſh it is (as I haue ſaid) growing ſquare and cornered: neere the ground
C it is white; toward the top, of a dark blackiſh green, and fattiſh: the vnder leaues that be loweſt, are ſlenderer than leek-blades; the vppermoſt in the head, are ſmal, among which is the ſeed: the root is like vnto a black oliue, which if it grow long-wiſe, is called Cyperis, and is of ſingular operation in Phyſick. The beſt Cyperus is that which groweth amongſt the ſands in Africke, neere the temple of *Iupiter Ammon*: in a ſecond rank, is that of Rhodes: in a third place may bee ranged the Cyperus in Thracia: and in the loweſt degree, that of Egypt. And hereupon came the confounding of theſe two plants, Cyperus and Cypirus, becauſe both the one and the other grow there. * But the Cyperus of Egypt is very hard, and hath no ſmell at all; whereas in the other, there is a ſauor reſembling the very Spikenard. There is another herb alſo comming from the Indians, called * Cyperis, of a ſeuerall kind by it ſelfe, in forme like vnto ginger: if a man
D chew it in the mouth, it coloureth the ſpittle yellow, like as Saffron.

But to come again to Cyperus, and the medicinable properties therof, It is counted to haue a depilatory vertue for to feth off haire. In a liniment it is ſingular good for the excreſcence of the fleſh about the naile roots, or the departure and looſeneſſe therof about them; which both imperfections be called Pterygia: it helpeth the vlcers of the ſecret parts, and generally all exulcerations proceeding of rheumatick humors, as the cankers in the mouth. The root of Cyperus is a preſent remedy againſt the ſtinging of ſerpents, and ſcorpions ſpecially. Taken in drink it doth deſopilat & open the obſtructions of the matrice: but if a woman drink too much therof it is ſo forcible that it will driue the matrice out of the body. It prouoketh vrine, ſo as it expelleth the ſtone and grauell withall; in which regard alſo, it is an excellent medicine for the
E dropſie. A liniment thereof is ſingular for cancerous and eating ſores, but eſpecially for thoſe that be in the ſtomack, if it be annointed with wine or vineger tempered with it.

As concerning the ruſhes beforeſaid, their root ſodden in three hemines of water, vntill one third part be conſumed, cureth the cough. The ſeed parched againſt the fire, and ſo drunk in water, ſtaieth the flux of the belly, and ſtoppeth the immoderat courſe of womens moneths; but it procureth head-ach. As for the ruſh called Holoſchœnos, take that part of it which is next the root, and chew it; then lay it to the place that is ſtung with a venomous ſpider, it is an approoued remedie. I find one ſort more of Ruſhes, which they cal Euripice; and this property withal, That it bringeth one to ſleepe: but it muſt be vſed with moderation, for otherwiſe it breedeth
F drowſineſſe, ſib to the lethargy. Now ſeeing I am entred into the treatiſe of ruſhes, I muſt needs ſet down the medicinable vertues of the ſweet Ruſh called Squinanth; and the rather, becauſe (as I haue already ſhewed) it groweth in Syria ſurnamed Cœle. The moſt excellent Squinanth commeth out of Nabatæa, and the ſame is knowne by the addition or ſyrname Teuchites. In a ſecond place is that of Babylon. The worſt of all is brought out of Africke, and it is altogether without ſmell. Squinanth is round, of an hote and fiery * taſte, biting at the tongues end.

* *candor*: ſome reade *Color*: in colour.

* No more hath *Cypirus* in Ægypt, by his owne ſaying.

* This *Cyperis* is taken to be *Curcuma*, or *Terramerita*, called therupon corruptly, *Turmericke*.

* *Ignea mordacitatis.*

The true Squinant indeed which is not ſophiſticated, if a man rub it hard, yeeldeth the ſmel of G
a Roſe: and the fragments broken from it do ſhew red. As touching the vertues thereof, It reſol-
ueth all ventoſities, and therefore comfortable it is and good for the wind in the ſtomack: alſo
it helpeth them that puke vp choler, or reach and ſpit bloud: it ſtinteth the yex, cauſeth riſting
and breaking wind vpward; it prouoketh vrine, & helpeth the bladder. The decoction thereof
is good for womens infirmities, if they ſit therein. A cerot made therewith, and dry roſin toge-
ther, is excellent againſt ſpaſmes and cricks that ſet the neck far backward.

As concerning Roſes, the temperature thereof is hot; howbeit they knit the matrice by an
aſtrictiue quality that they haue, and coole the naturall parts of women. The vſe of Roſes is
twofold, according to the leafe of the floure, and the floure it ſelfe (which is the yellow.) The
head of the Roſe leafe, to wit, the white part thereof, is called in Latine Vnguis, *i.* the Naile. In H
the yellow floure aforeſaid, are to be conſidered ſeuerally, the ſeed, the hairy threds in the top,
the huſk and pellicle that couereth the Roſe in the bud, & the cup within: & euery one of theſe
haue their proper qualities & vertues by themſelues. The leaues are dried, or the iuice is drawn
and preſſed out of them three waies: either all whole as they be, without clipping off the white
nailes, for therein lyeth the moſt moiſture: or when the ſaid nails are taken off, and the reſt be-
hind is infuſed in the ſun, lying either in wine or oile within glaſſes, for oile roſat or wine roſat.
Some put thereto ſalt, others mingle withall either Orchanet or Aſpalathus, or els Squinanth:
and this manner of juice thus drawne and prepared, is very good for the matrice, and the bloudy
flix. The ſame leaues, with the whites taken away, are ſtamped, & then preſſed through a thicke
linnen cloth into a veſſell of braſſe; and the ſaid juice is ſodden with a ſoft fire vnto the conſi- I
ſtence of hony: and for this purpoſe, choiſe would be made of the moſt odoriferous leaues.

Chap. XIX.

¶ *The medicinable vertues of Roſes: of the Lilly and Daffodill, called Laus tibi. Of the Violet, of Bacchar, Combretum, and Azarabacca.*

HOw wine of Roſes ſhould be made, I haue ſhewed ſufficiently in the treatiſe of diuers kinds of wines. The vſe of the juice drawn out of Roſes, is good for the eares, the cankers, and exulcerations in the mouth, the gums, the Tonſils or Amygdales, for gargariſmes, for the ſtomack, the matrice, the infirmities and accidents of the tuil or fundament, and the head-ach. Taken alone, it is ſingular good for the ague; with vineger, for to procure ſleep, & to reſtrain K
the heauing of the ſtomack, and the offers to vomit. The aſhes of Roſes burnt, ſerue to trim the haires of the eiebrowes. Roſes dried and reduced into powder, repreſſe the ſweat betweene the * legs, if it be ſtrewed vpon the place. Dried Roſe leaues do repreſſe and ſtay the flux of humors into the eies. The floure [which is the yellow in the mids] procureth ſleepe. The ſame taken inwardly with vineger & water, ſtaieth the immoderat flux of women; and the whites eſpecially: alſo it repreſſeth the reaching and ſpitting of bloud. The pain of the ſtomack it appeaſeth, being taken in three cyaths of wine. The ſeed or fruit of the Roſe (which is of a Saffron colour) is beſt, ſo it be not aboue a yeare old, and the ſame dried in the ſhade. As for the black, it is nought and good for nothing. To rub the teeth with this ſeed, eaſeth the toothach: the ſame prouoketh vrine. Being applied to the ſtomack, it is comfortable: & ſo it helpes S. *Anthonies* fire, if it hath L
not run too long. If it be drawn vp by the noſthrils, it purgeth and clenſeth the head. As for the heads or knobs, if they be taken in drinke, they knit and bind the belly, and withall, do ſtay the flux of bloud vpward. The whites or nails of the Roſe leafe be ſingular for wateriſh eies, ſo they be applied dry with bread crums: the leaues verily if they be brought only into a liniment, and outwardly applied, are reputed ſoueraigne for the queaſineſſe and pain of the ſtomack, for the gnawings and other accidents which the belly and guts be ſubiect vnto; alſo for the Midriffe and other precordiall parts. Moreouer, they are good to be eaten, if they be condite and preſerued in manner of garden Dock or Patience. But in keeping of Roſe leaues, an eie would be had to them, for fear leaſt they grow to a mouldineſſe, that quickly will ſettle vp them. Drie Roſe M
leaues are of good vſe in Phyſick, yea, the very Roſe cake after the iuice & moiſture is preſſed out of the leaues, ſerueth for ſome purpoſe. For of them be made bags and quilts, yea, and drie pouders for to repreſſe ſweat, and to palliat the ſtrong ſmel therof: with this charge and caueat, that preſently after that one is come out of the ſtouve or baine, the pouder be ſuffered to dry vpon

* *Siccis fœmina aſpergunntur:* I doubt that *Pliny* read in *Dioſcorides*, μυρεψικοῖς for μύροις, (i.) *Vnguenta:* and then it carieth this ſence; that dried Roſes & powdred, enter into ſweet ointments.

20030
copy 1

A vpon the body, and then afterward waſhed off with cold water. The wild Roſe * leaues reduced into a liniment with Beares greaſe, doth wonderfully make haire to grow again, where through ſome diſeaſe it is fallen away.

* or rather the ſpungie ſubſtance growing vpon the Cancre brier and wild Roſe.

Lilly roots through their ſingular vertues and operations many waies, haue ennobled their own floures: for firſt and formoſt, if they be taken in wine, they be countrepoyſons againſt the ſting of ſerpents, and the venom of Muſhroms. Sodden in wine, and applied in maner of a cataplaſme, and ſo bound to the feet, they mollifie and reſolue the cornes; but this muſt not be vndone and remoued in three daies. Boiled with greaſe or oile, they cauſe haire to come againe euen in places that were burnt. If Lilly roots be drunk in honied wine, they do euacuat downeward at the ſiege with other ordure, the cluttered, bruiſed, and hurtfull bloud within the body. Ouer and beſides, in this maner they help the ſpleen, them that are burſten and bruiſed, & withall, bring down womens terms orderly. But if they be ſodden in wine, and ſo laid to in forme of a cataplaſm, they knit and heale ſinues that were cut aſunder. They rectifie running tettars and lepries, they ſcoure away dandruf and pilling skales in the face, they make the skin ſmooth and take away riuels and wrinkles. The leaues of Lillies boiled in vinegre are good to be layed to green wounds: reduced into a cataplaſme with Hony, Henbane, and wheat meale, incorporate and vnited all together, and ſo applied to the cods, they repreſſe the flux of humors falling to thoſe parts. The ſeed made into a liniment allayeth the heat of S. *Anthonies* fire. And in the ſame ſort the floures and leaues applied doe heale old ſores. As touching the iuice which is
C preſſed forth of the floures, of ſome it is called Mel [*i.* hony;] of others Syrium: ſingular good for to ſoften and mollifie the matrice, for to procure ſweat and to ripen impoſtumes tending to ſuppuration.

Now for Daffodils, there be two kinds of them admitted by the Phyſitians for to be vſed in medicine; the one with a purple floure, the other of a graſſe green. This later Daffodil is aduerſe and hurtfull to the ſtomack, and therfore cauſeth it to ouerturn and vomit: it ſetteth the belly alſo into a flux: contrary it is to the ſinues, and ſtuffeth the head: for which narcoticke qualitie of ſtupifying & benumming the ſences, it took the name in Greek Narciſſus, of Narce which betokeneth nummedneſſe or dulneſſe of ſence; and not of the yong boy *Narciſſus*, as the Poets do feign and fable. The roots as wel of the one as the other Daffodil, haue a pleaſant taſt as it were of honied wine: the ſame is good for burns, applied to the place with a little honey:
D and ſo it helpeth diſlocations and healeth wounds. Moreouer, a cataplaſme made of it, honey, and oatmeale, doth reſolue and ripen biles and great apoſtemations: and in that ſort it drawes forth ſpils, ſhiuers, arrow heads, and thorns, and whatſoeuer ſtick within the body. Being ſtamped and incorporat with barley groats and oile, it cureth them that be bruiſed and ſmitten with a ſtone. Mingled with meale it cleanſeth wounds, it ſcoureth the skin from all ſpots that disfigure it, yea and taketh away the black morphew. Of this floure is made the oile Narciſſinum, good to ſupple and ſoften all hard tumours, good alſo to reuiue and heat againe whatſoeuer is ſtark and benummed with extreme cold. And aboue all, this floure is excellent for the ears, howbeit it maketh the head to ake.

Of Violets there be ſome wild and of the field: others domeſticall, and growing in our gar-
E dens. The purple violets are refrigeratiue and do coole. And therefore a good liniment is made of them to be applied vnto an hot ſtomack, againſt burning inflammations. A frontall likewiſe may be made of them to be laid vnto the forehead. But a peculiar vertue they haue beſides to ſtay the running and waterie eies: as alſo to help the procidence or falling downe both of tuill and matrice, and to reduce them again into their places. Moreouer, being applied to ſwellings and impoſtumations, they reſolue the ſame without any head or ſuppuration. Guirlands being made of violets and ſet vpon the head, reſiſt the heauineſſe of the head, and withſtand the ouerturning of the brains vpon ouer-liberall drinking; yea, the very ſmel thereof will diſcuſſe ſuch fumes and vapors as would trouble and diſquiet the head. Violets being drunk with water, doe cure the Squinancie. That which is purple in the floure of the Violets, helpeth the falling euil,
F in children eſpecially, if they drink it with water. Violet ſeed reſiſteth the poiſon of ſcorpions. Contrariwiſe, the floure of the white Violet, to wit the bulbous ſtocke-Gillofre, is good to break all impoſtumat ſwellings, whereas March violets did reſolue them. But as wel the white Violets as the yellow wall-floures, are ſingular good to extenuate the groſſe bloud of womens terms, and to moue vrine. Violets, if they be freſh and new gotten, are not ſo effectuall for theſe

purpoſes

purpoſes as the dry and old gathered,and therefore they would haue a whole yeares drying be- G
fore they be vſed. The wall-floure being taken to the quantitie of halfe a cyath in three cyaths of water,ſtirreth womens fleurs,and draweth them downe. A liniment made with the root and vinegre together,do mitigate and allay the pain of the ſpleen: likewiſe it aſſwageth the gout: and being tempered with myrrh and ſaffron, it is ſingular for inflammations of the eyes. The leaues mixed with hony clenſe the head from ſcurfe and skall: reduced into a cerot, it healeth vp the chaps in the ſeat or fundament, as alſo all ſuch Fiſſures in any moiſt place whatſoeuer. And with vinegre they be good for all collections of humors and apoſtemations.

Bacchar alſo is an herb whereof there is good vſe in phyſick. Some of our countrymen haue called it in Latine Perpenſa. It affourdeth a good remedie againſt ſerpents: it qualifieth the exceſſiue heat of the head,allaieth the ach,and reſtraineth the flux of humours downe into the H
eyes. A cataplaſme is made thereof for womens breaſts,ſwelling immediatly after childbirth, for to breake the kernell. Alſo for fiſtulous vlcers, beginning to breed betweene the corners of the eies and of the noſe,and Saint *Anthonies* fire. The very odour thereof is a good inducement to ſleep. The root ſodden and taken in drink is ſingular for them that are troubled with cramps and convulſions; that haue fallen from on high; that be drawn togetther with ſpaſmes; and finally for ſuch as labor for wind. A decoction made of three or foure of the roots,boiled away to the thirds,is giuen with good ſucceſſe for an old cough. And this drink or Iuleb is very conuenient for to purge women that haue trauelled and bin deliuered before their time. It taketh away the ſtitches in the ſide,cureth the pleuriſie,and skoureth the ſtone. Herof be bags and quilts made, and thoſe if they be laid in a wardrobe among cloathes and apparel,cauſeth I
them to ſmell ſweet.

As for Combretum (which I ſaid was much like vnto Bacchar) if it be beaten to pouder and tempered with hogs greaſe it maketh a ſoueraign ſalue that healeth wounds wonderfully. Aſarum (by report) is an appropriat medicine for the liuer,if an ounce of it be taken in one hemine of honied wine. It purgeth the belly as violently as Ellebore. In caſe of the dropſy it is ſingular; as alſo for the midriffe,precordial parts,the Matrice,and the Iauniſe. If it be put into new wine when it worketh,and ſo tunned vp,it maketh a ſingular diuretick wine for to prouoke vrin. It muſt for this purpoſe be digged out of the ground when the leaues begin to put forth. Dried it ought to be in the ſhade; although it be ſubiect to corruption and mouldeth very ſoon.

K

Chap. XX.

¶ *Of French Nard,and Saffron. The medicinable vertues of Saffron,and the cake or dregs thereof. Of Saliunca,Polium,and Floure de-lis. Of Holochryſon, Chryſocome, and Melilote.*

FOraſmuch as ſome haue taken ruſtick-Nard to be the root of Bacchar,and ſo named it: the which hath put me in mind of French Nard,and the promiſe which I made in my treatiſe of ſtrange and forrein trees,to put off no longer than this place for to ſpeake of it,and the properties thereto belong. To acquit my ſelfe therefore, I will here ſet down the vertues of the ſaid Nard, as touching the vſe thereof in Phyſicke. Firſt therefore, if two drammes of French L
Nard be taken in wine,it is ſingular againſt the ſting and biting of ſerpents. *Item*,if one drinke it either in wine or water,it eaſeth the paſſions of the Collick, proceeding from the inflammation of the gut Colon. In like ſort it cureth the inflaammtion of the liuer and the reins,the ouerflowing alſo of the gal,and the Iauniſe thereupon. Taken alone by it ſelfe or with Wormewood,it is a good remedy for the Dropſie. It repreſſeth the immoderat flux of womens fleurs.

Zedoarium. As touching Setwall or Valerian,which in the foreſaid place we named Phu; the * root either beaten into pouder,or ſodden and ſo giuen in drinke,is excellent for the riſing of the Mother,which threatneth ſuffocation; for the pains of the breaſt and pleuriſie. The ſame prouoketh the courſe in womens terms,ſo it be taken in wine.

Saffron will not reſolue nor be mixed wel with hony or any ſweet thing. Howbeit,in wine or M
water,it wil diſſolue very ſoon and be incorporated therewith. A ſoueraign ſpice this is, & ſingular for many maladies. The beſt way to keep ſaffron is within a box of horn. It diſcuſſeth verily all inflammations, but principally thoſe of the eies, if together with an egge it be applied in forme of a liniment. Excellent it is for the ſuffocation of the matrice, the exulcerations

of

20030
copy 1

A of the ſtomacke,breaſt,kidnies,liuer,lungs,and bladder: and more particularly,if any of theſe parts be enflamed,a proper remedie alſo it is in that caſe. Likewiſe it cureth the cough & pleuriſie. It killeth an itch,and prouoketh vrin. Our wine-knights when they purpoſe to ſit ſquare at the tauerne and carouſe luſtily,if they drinke Saffron,neuer feare ſurfeit nor the ouerturning of their braine:and they are verily perſuaded, that this keepeth them from drunkenneſſe, and maketh them carie their drinke well. Certes, a Chaplet of Saffron vpon the head, dooth allay the fumes aſcending vp thither,and preuent drunkenneſſe. Saffron induceth ſleep,but it troubleth the braine * ſomewhat it pricketh forward to wanton luſt. The floure of Saffron reduced into a liniment with white Fullers earth,helpeth the Shingles and S. *Anthonies* fire. And ſaffron it ſelf entereth into very many compoſitions of Phyſicke. One Collyrie or *eye-ſalue there is,which B taketh the name alſo of ſaffron. And when the ointment made of Saffron called Crocinium,is ſtrained and preſſed out, the grounds which remaine is named Crocomagma, which alſo is not without ſome ſpeciall vſes,for it cureth the ſuffuſion of the eyes, or the cataract:but it cauſeth ardeur and heat of vrine more than Saffron it ſelfe. The beſt is that accounted, which if a man taſt in his mouth,doth colour his ſpittle and ſtaine his teeth.

* Nay it is a great enemie vnto it.

* *Dia crocis. Paul. Ægin.*

As touching the Flower-de-lis,the red is thought to be better than the white. Certes if little infants do wear it tied about them by way of necklace,collar,or girdle,it is ſuppoſed to be a ſingular remedie,eſpecially when they breed teeth or haue the chincough. Alſo if they be trou-
C bled with the * worms,they hold it good gently to inſtill the ſame in the body [either by drink or clyſtres.] All other operations that the Flour-de-lis hath,differ not much in effect from hony. A ſingular property it hath to clenſe the head from ſores and skalls, and generally to mundifie all impoſtumat vlcers. Two drams thereof taken with hony,eaſeth the belly,& prouoketh to the ſtoole. Giuen in ordinary drink,it ſtaieth the cough,appeaſeth wrings, & diſſolueth ventoſities in the belly. In vinegre it openeth the opilations of the ſpleene. And being taken with water and vinegre together, it is an effectuall remedie againſt the ſtinging of ſerpents and ſpiders. The weight of two drams eaten with bread or drunk in water,reſiſteth the poiſon of ſcorpions. Being made into a liniment with oile,and ſo applied,it cureth the bitings of mad dogs, and heateth the parts mortified with extreame cold. In like manner alſo it allaieth the paines of the ſinews. Reduced into an ointment with Roſin,it is ſingular for the paine of the loins and
D the gout Sciatica. This root is hot in operation. If it be drawne or ſnuffed vp into the noſe, it cauſeth ſneeſing, and purgeth the head. A liniment of it and Pome-quinces or Peare-quinces, eaſeth the head-ach: it repreſſeth alſo the vapours flying vp into the head,cauſing diſtemperature of the braine,in a ſurfeit of wine or ſtrong drinke. It helpeth ſtreightneſſe of breath, and ſuch as cannot take their winde but ſitting vpright. It prouoketh vomit, if it be taken to the weight of 2 Oboli. A cataplaſme of it and hony together, draweth forth ſpils of broken bones. The pouder of it is much vſed for Whit-flawes: and the ſame applied with wine, taketh away cornes and werts: but it muſt lie on three daies before you vnbind and take it from the place. The very chewing of it,correcteth a ſtrong and ſtinking breath: as alſo the filthie ſauour of the arme-holes. The juice thereof doth mollifie all hard tumors. It prouoketh ſleepe,but it conſumeth ſperme or natural ſeed. The Fiſſures in the ſeat,as alſo the blind and ſwelling piles in the
E fundament and all ſuperfluous excreſcences of the bodie, it cureth.

* *Tineayum vitio. Plinie* commonly taketh *Tineas* for wormes in the belly: although otherwiſe it betokeneth ſores and skals in the head.

There is a wild kind of Floure-de-lis,which ſome call Xyris: the root of this herb is good to reſolue & diſcuſſe the ſwelling kernels named the Kings euil,hot biles, & riſings in the groin. Howbeit for to work theſe effects,there be certain ceremonies preciſely to be obſerued,namely, That it be taken out of the ground with the left hand in any caſe. *Item*, that they who gather it do ſay in the gathering, For whoſe ſake they pluck it vp; and withall,name the perſon: & here in making mention of this matter, I canot but detect the knauery of theſe Harbariſts and ſimplers: Their maner is not to employ & occupie all that they haue gathered,but reſerue & keep part thereof,as alſo of ſome other hearbes,as namely of Plantaine, and if they be not well contented,nor thinke themſelues paied thoroughly for their paines in the cure,they make no more
F ado but burie and couer within the earth that part which they kept by them, in the ſame place where it was digged forth. And I beleeue verily they haue an vnhappy meaning and a certaine kind of witchcraft herin: forſooth, That the maladies which they ſeemed to haue healed,ſhould breake out and be ſore again,to the end that they might be ſet on work anew. As touching Saliunca, the decoction of it in wine and ſo taken,ſtaieth vomits, and corrobroateth the ſtomack.

Muſæus

Muſæus and *Heſiodus* the Poets haue a great opinion of Polium: for they giue counſell to all thoſe that would come to preferment & promotion, for to be anointed all ouer with a liniment thereof: ſuch alſo as be deſirous of renowme and glory, to be euer handling of it, to ſet it alſo, and maintaine it in their gardens. True it is, that ſolke do carie Polium about them ordinarily, or lay it vnder their beds for to chaſe away ſerpents. Phyſicians do ſeeth it either new & green, or drie, in wine, and therof make a liniment: or els they giue it to drink in vinegre, to thoſe that be pained with the jaundiſe; yea, & to ſuch as be newly fallen into the dropſie, they giue counſell to drinke the decoction thereof, being ſodden in wine. And of it ſo prepared, they make a liniment for to be applied vnto green wounds. Moreouer, this herb is very good to ſend out the after-burden in women newly brought to bed, and to expell the dead infant out of the mothers wombe. And otherwiſe it ſerueth well to mitigate any paines of the body. It doth purge and euacuate the bladder: and in a liniment applied to the eyes, reſtraineth their exceſſiue watering. I know not any other hearbe better to goe with other ingredients into antidots or countrepoiſons (named of the Greeks Alexipharmaca) than this. Howbeit, ſome denie all this, and are of opinion that it is hurtful to the ſtomacke, that the drinking of it ſtuffeth the head, and cauſeth women to fal into labor before their time. They ſay alſo, that this cerimonie would be preciſely obſerued, That in the very place where this plant is found, ſo ſoone as euer it is gathered it ſhould be hanged preſently vpon the necke of the partie, with a ſpeciall care that it touch not the ground firſt, and then is it an excellent remedie for the cataract in the eye. And theſe authors deſcribe this hearbe to haue leaues like Thyme, but that they be ſofter and couered ouer with a more hoarie and woollie downe. Being taken with wild Rue in raine water, ſo that it be beaten before into pouder, it doth mitigat (by report) the deadly paines cauſed by the ſting of the Aſpis, it bindeth and draweth vp a wound, it keepeth corroſiue ſores from feſtering and going farther, as well as the floures of the Pomegranate.

G

H

As namely *Dioſcorides.*

I

The hearb Holochryſos if it be taken in wine, helpeth the ſtrangury, and ſuch as cannot piſſe but by drops. And a liniment therof is paſſing good to repreſſe the flux of humors to the eyes. If it bee incorporat with Tartar or wine lees burnt into aſhes, and drie Barley groats; it mundifieth the skin, and riddeth away ring-wormes, tettars, and ſuch like wild fires.

As for Chryſocome, the root of it is hot, and yet aſtringent. It is giuen to drinke for the diſeaſes of the liuer and the lights. And being ſodden in honied water, it aſſuageth the paines incident to the matrice. It prouoketh womens monthly purgation: and being giuen in drink raw, it purgeth waterie humors gathered in the dropſie.

K

Touching Baulm, which the Greeks call Melittis or Meliſſophyllon: if Bee-hiues be rubbed all ouer and beſmeared with the juice thereof, the Bees will neuer away, for there is not a floure whereof they be more deſirous and faine, than of it : and in truth, looke in what garden there groweth abundance of this hearbe, the Bees there when they ſwarme, will be ſoone intreated to tarie, & not be haſtie to wander far abroad. The ſame is a moſt preſent remedy not only againſt their ſtings, but alſo of weſpes, ſpiders, and Scorpions. And being tempered with a little nitre, it is ſingular againſt the * ſtrangulation of the mother. Taken in wine, it pacifieth the wrings and torments of the belly. The leaues therof being ſodden with ſalt, and brought into an ointment, are ſingular good for to be applied vnto the ſcrophules or ſwelling kernills called the Kings euill: and likewiſe to the accidents of the ſeat and fundament, as the ſwelling hæmorrhoids or piles. The juice taken in drinke, bringeth women to their ordinary monethly courſes: it diſcuſſeth veutoſities, and healeth vlcers: it allaieth the paines of any gouts, and cureth the biting of mad dogs: it is good for the bloudy flix that hath run on a long time: as alſo thoſe fluxes which proceed from the imbecillitie of the ſtomack: it helpeth them that be ſtreight in the cheſt, and cannot take their wind but bolt vpright: it mundifieth alſo the vlcers within the breaſt. To conclude, it is ſaid to be a ſingular remedie & none like vnto it, for to diſpatch the webs in the eye, if they be annointed with the juice thereof and honey tempered together.

* *Dioſcorides* hath μυκητων, i. Muſhromes: whereof there be ſome that be daungerous for ſuffocation. But *Plinie* as it ſhould ſeeme, read it μαγων, and accordingly hath tranſlated it.

L

Melilot is thought alſo to be good for the eyes, if it be applied with milk or line ſeed. It aſſuageth alſo the paine of the jawes and head, if it be laid too with oile of Roſes: likewiſe it doth mitigat the paine of the ears, if it be inſtilled or dropped into them with wine cuit. Moreouer, the tumors and breaking out of the hands it helpeth. Being boiled in wine or ſtamped green, it eaſeth the griefe of the ſtomacke. The ſame effect it hath in the pain of the matrice. But if the cods be amiſſe, if the Longaon or tuill bee fallen, and beare out of the bodie; or if that part bee affected

M

20030
copy 1

A affected with other accidents, Bath the place with a decoction of it, boiled greene in water or cuit, and the patient ſhal find eaſe. But if there be an ointment made of it and oile of Roſes incorporat together, it is a ſoueraign remedie for all cancerous ſores. If it be boiled firſt in ſweet wine or cuit, it is the better for the purpoſe aforeſaid: and ſo prepared, a ſpeciall and effectuall thing it is for the wens called Melicerides: wherein is engendred matter reſembling honey.

Chap. XXI.

¶ *Of Trefoile, and Thyme: of the day Lillie Hemerocalles: of Elecampane, and Southernewood, and Cypres.*

B I Am not ignorant that folke are verily perſuaded, how that Trefoile or three leaued graſſe, is of great force againſt the ſtings of ſerpents and ſcorpions, if either 20 graines of the ſeed bee inwardly taken in wine, or warer and vinegre together; or if the leaues and the whole hearb be ſodden, and the decoction drunk: as alſo, that ſerpents are neuer ſeen to lie vnder this Trefoile. Moreouer, I know full well that diuerſe Authors renowmed and of great credit, haue deliuered in their bookes, That fiue and twentie graines of that Trefoile, which we called Menianthes, is ſufficient for a preſeruatiue and antidot againſt all poiſons whatſoeuer: beſides many other medicinable vertues which be aſcribed to this hearb. But for mine owne part, I am iuduced by the
C authoritie of the moſt graue and reuerend Poet *Sophocles*, to ſtand againſt their opinion; for hee affirmeth plainely, That Trefoile is venomous. Likewiſe, *Simus* the Phyſician doth report, that if the decoction of it ſodden, or the juice thereof ſtamped, bee poured or dropped vpon any part of the body which is ſound, it wil cauſe the ſame fiery and burning ſmart as followeth vpon a place bitten or ſtung with a ſerpent. And therefore I would thinke with them, and giue counſell alſo, that it is not to be vſed otherwiſe than a countrepoiſon. For it may bee peraduenture, th at in this as in many other, one poyſon (by a certaine antipathie and contrarietie in nature) expelleth & mortifieth another. Moreouer, this I markand obſerue in their writings, that the ſeed of the Trefoile which hath ſmalleſt leaues, if it be reduced into a liniment, is ſingular good to embelliſh womens skin, and to preſerue their beauty, if the face be anointed therwith.

Thyme ought to be gathered whiles it is in the floure, and then to be dried in the ſhade: now
D there are of Thyme two kinds, to wit, the white, which hath a woodie root, growing vpon little hills; and this is thought to be the better: the ſecond, is blacker, & caries beſides a black floure. They are thought both of them, the one as well as the other, very good to cleare the eyeſight, whether they be eaten with meats or taken as a medicine. In like maner, an electuarie or lohoch made of Thyme, is ſuppoſed to be excellent good for an old cough, and being taken with hony and ſalt, to raiſe and breake fleam, cauſing the ſame to be raught vp with more facility: alſo that if it be incorporat with hony, it will not ſuffer the bloud to clutter and congeale within the bodie. Applied outwardly as a liniment with Senuie, it doth extenuate and ſubtiliate the rheume that hath of long time fallen in the throat and windpipe: and ſo alſo it amendeth the grieuance of ſtomacke and belly. Howbeit, theſe Thymes muſt be vſed with meaſure and moderation: becauſe they ſet the body in an heat, although they be binding and make the belly coſtiue. Now
E in caſe there be an exulceration in the guts, there muſt be taken the weight of 1 denier or dram in Thyme, to euery Sextar of honey and vinegre: ſemblably, it muſt bee ordered in caſe of the pleuriſie; and when there lyeth a paine between the ſhoulders or in the breaſt. A drink made of Thyme with honey and vinegre in manner of a juleb or ſyrrup, cureth the griefe of the midriffe and precordiall parts neere vnto the heart. And verily a ſoueraign potion this is to be giuen vnto them that be troubled in mind and lunaticke, as alſo to melancholicke perſons. The ſame alſo may be giuen to thoſe who be ſubject to the epilepſy or falling ſicknes: whom the very perfume and ſmell of Thyme wil raiſe out of a fit, and fetch them again, when the diſeaſe is vpon them: It is ſaid, that ſuch ſhould lie ordinarily in a ſoft bed of Thyme. This hearb is proper for thoſe that canot draw their breath vnleſſe the ſit vpright, and to ſuch as are ſhort winded, yea,
F and good for women, in whoſe monethly courſes are either ſuppreſſed or come but ſlowly. And ſay that the infant were dead in the wombe, a decoction of Thyme, ſodden in water vnto the thirds and ſo taken, doth ſend it forth of the bodie. Men alſo doe find a great benefit by Thyme if they drinke a ſyrrup made of it with honey and vinegre, in caſe of ventoſities and inflations: alſo, if their bellies be ſwoln or their cods; yea, and when their bladder is pained: moreouer if it

be

be applied as a cataplaſme with wine, it aſſuageth all tumors, and bringeth downe ſwellings: it G
ſtaieth alſo the impetuous and violent flux of any humours to a place, readie to breed an impoſtumation. But if the ſame be applied with vinegre, it taketh away werts and hard callofities. It is good for the Sciatica and other gouts, for diſlocations and lims out of joint, being beaten to pouder, and beſtrewed vpon a quilt of wooll, moiſtned and bathed with oile, and ſo laid to the place in manner of a fomentation. A potion alſo thereof is vſually giuen in caſe of the gout, to wit, the weight of 3 Oboles, in as many cyaths of vinegre and honey. Alſo when the ſtomacke riſeth againſt meat and refuſeth it, a drage or pouder of it with ſalt, brings the appetite againe.

The day Lillie Hemerocalles, hath leaues of a pale and wanniſh green colour, otherwiſe ſoft and gentle, the root is bulbous or Onion like, and odoriferous: which if it bee laid to the bellie in manner of a cataplaſme, doth euacuat waterie humors, yea, and thick bloud that lieth cluttered within the bodie, ready to do a miſchiefe. H
The leaues make an excellent liniment to anoint the eies and the parts about it, as a defenſatiue againſt the rheum falling thither with violence; as alſo to be applied vnto the paps and breaſts of women, which ake and are pained preſently after child-birth.

Helenium, an hearbe which ſprang firſt from the teares of lady *Helena*, as I haue already ſhewed, is thought to haue a ſpecial vertue to preſerue beauty, and to maintain the skin fair, pure, and delicat, as well in the face of women, as in other parts of their body. Moreouer, a deepe opinion there is of this hearb, that whoſoeuer vſe it ſhall proue amiable and gracious, they ſhall I ſay, win loue and fauour wherſoeuer they come. Alſo there is attributed and preſcribed to this herb, if it be taken in wine, a mightie operation to procure mirth and make the heart mery, and I
it is thought to be as effectuall that way, as was that noble drinke Nepenthes (ſo highly commended in *Homer*) ſo called, for that it puts away al heauineſſe, ſorrow, and melancholy. And in faith the juice of Helenium is * paſſing ſweet and pleaſant: the root of Helenium taken in water vpon an emptie ſtomacke when a man is faſting, is very good for them that are ſtreight winded and cannot take their breath but vpright. Now is the root white within and * ſweet alſo as is the hearb. The ſame is giuen to drinke in wine againſt the ſting of ſerpents. To conclude, being beaten into pouder, it is ſaid for to kill Mice.

* So is not *Inula*, or our Elecampane. And therefore either it is not Helenium here: or elſe *Plinie* doth miſtake in this place, as in many others. * which agreeth not with ours.

As touching Abrotonum, I find that there be two kinds of it. The one of the plaines, which I take to be the male; the other of the mountaines, which I would haue to goe for the female. Neither of them both there is, but it is as bitter as Wormwood. The beſt is that which growes K
in Sicilie: next to which, that of Galatia is moſt eſteemed. The leaues are much vſed, but the ſeed much more, for to heat and chauſe any part of the bodie. And therfore it is good and comfortable for the ſinewes: it cureth the cough: it procureth them libertie of breath, who cannot fetch their wind lying or leaning with their heads: it helpeth the crampe: it conſolidateth ruptures: it eaſeth the paine of the loines, and maketh free paſſage for vrine. The right manner of the decoction as well of the one as the other, is to ſeeth them in bunches or bundles like handfulls, vntill a third part of the water be conſumed; and foure cyaths is an ordinarie draught of this decoction. The ſeed alſo being beaten into pouder, is giuen to the weight of a dram in water, for a drink. And indeed ſo taken, it comforteth the matrice and the natural parts of women.
A poulteſſe made of it and Barley meale: applied vnto dull and broad ſwellings which gather L
not quickely to an head, doth ripen them apace and bring them to ſuppuration. Alſo beeing reduced into a liniment with a quince roſted or baked, it cureth the inflammation of the eyes, if they be annointed therwith; it hath a vertue to driue away ſerpents; & in caſe one be ſtung with them alreadie, it expelleth the poiſon taken inwardly in drinke; or laid too outwardly in forme of an ointment, draweth it forth. But moſt effectually is the power thereof ſeen, in thoſe poiſoned and venomous ſtings which cauſe the bodie to ſhake, chill, and quake for cold; as namely thoſe of ſcorpions, and the ſpiders called phalangia. Moreouer, good it is alſo for other poiſons, if it be taken in drinke: and ſo it helpeth thoſe that be ſurpriſed with any extreme cold howſoeuer. This propertie likewiſe it hath, to draw forth of the bodie all ſpills or any thing elſe that ſticketh within the ſame. It drieth out of the body the worms engendred in the guts. Finallly M
it is ſaid, that if a branch therof be laid vnder the pillow where folk lieth in bed, it wil put them in mind of wantonneſſe, and prouoke them to luſt: and againſt all charmes, enchantments, and witchcrafts, which cool the heat of the fleſh, and diſable or bind any perſon from the act of generation, it is the moſt powerfull hearb of all others.

CHAP.

A

Chap. XXII.

¶ *The medicinable vertues of Leucanthemum, and Sampſuchum,* [*i. Marjerom.*]

Leucanthemum mingled with 2 parts of vinegre, and ſo giuen to drinke, is good for thoſe that be ſhort winded. As for Sampſuchum or Amacacum, that of Cyprus is moſt commended, and the ſweeteſt of all other: this hearb brought into a liniment, and applied with vinegre and ſalt, is good againſt the venom of Scorpions. Moreouer, if it be put vp into the naturall parts of a woman in forme of a peſſarie, it helpeth much to bring downe their monethly courſes: for if it be taken in drinke, it is not ſo effectuall. Appled as a liniment, after it is incor-
B porat with barley groats, it reſtraineth the flux of humors to the eyes. The juice therof when it is ſodden, diſcuſſeth and diſſolueth the ventoſities that moue pangs and wrings in the belly: a good medicine it is to prouoke vrine, and by conſequence, for thoſe that be in a dropſie. Marjoram dried, mooueth ſneeſing. Thereof is made an artificiall oile, called Sampſuchinum or Amaracinum, ſingular for to heat the ſinewes, and to mollifie their ſtiffeneſſe and hardneſſe: as alſo by the heat thereof to comfort the matrice. The leaues applied with hony, ſerue very well to reduce the black and blew marks occaſioned by ſtripes or bruiſes, to their natural and liuely colour: and brought into a cerot with wax, it is good for diſlocations of joynts.

Chap. XXIII.

C ¶ *The vertues and properties of Anemone or Windfloure, requiſit in Phyſicke.*

We haue diſcourſed of Anemone and thoſe kinds thereof, which go to the making of chaplets and guirlands: it remaineth now therefore to ſpeake of thoſe which ſerue for good vſe in Phyſicke. But firſt as touching Anemone in generall: ſome there bee who call it Phenion; and two principal kinds there be of it: The firſt groweth wild in the woods: the ſecond commeth in places wel tilled and in gardens: but both the one and the other loue ſandy grounds. As for this later kind, it is ſubdiuided into many ſpeciall ſorts: for ſome haue a deepe red skarlet floure; and indeed ſuch are found in greateſt plenty: others bear a purple floure: and there be again which are white. The leaues of all theſe three be like vnto Parſly. None of them
D ordinarily grow in height aboue halfe a foot; and in the head of their ſtemme, they ſhoot forth ſprouts in manner of the tendrils of Aſparagus. The floure hath this property, Neuer to open but when the wind doth blow; wereupon it tooke the name * Anemone in Greek. But the wild Anemone is greater and taller: the leaues alſo are larger; and the floures are of a red colour. Many writers, being carried away with an error, thinke this Anemone and Argemone to bee both one: others confound it with that wild Poppy which we named Rhœas: but there is a great difference betweene them, for that both theſe hearbes doe floure after Anemone: neither doe the Anemonæ yeeld the like juice from them, as doth either Argemone or Rhœas before-named: they haue not alſo ſuch cups and heads in the top, but only a certaine muſculoſitie at the ends and tips of their branches, much like to the tender buds of Aſparagus.

Hereupon Anemone is called Roſe-parſly * ἀπὸ τοῦ, in Greek betokeneth Wind whereupon *Ruellius* called it *Herba-uenti*: and *Gerard*, Wind-floure more properly.

E All the ſorts of Anemone or Wind-floure, bee good for the head-ach and inflammations thereof; comfortable to the matrice of women, and increaſeth their milk. Being taken inwardly in a Ptiſane or barly gruell, or applied outwardly as a cataplaſme with wooll, this hearb prouoketh their monthly tearms. The root chewed in the mouth, purgeth the head of fleame, and cureth the infirmities of the teeth. The ſame being ſodden, and laid to the eyes as a cataplaſm, repreſſeth the vehement flux of waterie humours thither. The Magicians and Wiſe men attribute much to theſe hearbes, and tell many wonders of them; namely, That a man ſhould gather the firſt that he ſeeth in any yeare, and in gathering to ſay theſe words, *I gather thee for a remedie againſt tertian and quartan agues*: which done, the partie muſt lap and bind faſt in a red cloth the ſaid floure, and ſo keep it in a ſhady place; and when need requireth, to take the ſame, and either
F hang it about the necke, or tie it to the arme or ſome other place. The root of that Anemone which beareth the red floure, if it be bruiſed and laid vpon any liuing creature what ſoeuer, raiſeth a bliſter, by that cauſtik and corroſiue vertue which it hath: and therfore it is vſed to mundifie and cleanſe filthie vlcers.

G

Chap. XXIIII.

¶ *The vertues of Oenanthe in Physicke.*

OEnanthe is an hearb growing vpon rocky and stony grounds. The leafe resembleth those of the Parsnep: roots it hath many, and those big. The stemme and leaues of this herb, if they be taken inwardly with honey and thicke sweet wine, doe cause women in labor, to haue easie deliuerance, and withall, doe clense them wel of the after-birth. Eaten in an Electuarie, or licked in a lohoch made with hony, the said leaues doe rid away the cough, and prouoke vrine. To conclude, the root also is singular for the infirmities and diseases of the bladder.

H

Chap. XXV.

¶ *The medicines made with the hearbe Heliochryson.*

HEliochryson, which others name Chrysanthemon, putteth forth little branches very faire and white: the leaues are whitish too, much like vnto Abrotonum: From the tips and ends of which branches, there hang down certaine buttons (as it were) like berries round in a circle, which with the repercussion and reuerberation of the Sun-beames, doe shine againe like resplendent gold. These tufts or buttons, doe neuer fade nor wither: which is the cause that the chaplets wherewith they crowne and adorne the heads of the gods, be made thereof: a ceremonie that *Ptolomæus* K. of Ægypt obserued most precisely. This herbe groweth in rough pla- I
ces among bushes and shrubs. If it be taken in wine, it prouoketh vrine, and womens fleures. All hard tumors and inflammations it doth discusse and resolue without suppuration. A liniment made with it & honey, is good to be applied to any place burnt or scalded. It is giuen in drinke vsually for the stlng of serpents: for the paines and infirmities also of the loines. If it be drunke in honyed wine, it dissolueth and consumeth the cluttered bloud, either in the belly and guts, or the bladder. The leaues taken to the weight of three Oboli in white wine, do stay the immoderat flux of the whites in women. This hearbe, if it be laid in wardrobes, keepeth apparel sweet, for it is of a pleasant odour.

Chap. XXVI.

¶ *The vertues and properties of the Hyacinth, and Lychnis, in Physicke.* K

THe Hyacinth loueth France very well, and prospereth there exceedingly. The French vse therewith to die their light reds or lustie-gallant, for default of graine to color their scarlet. The root is bulbous & Onion-like, well known to these slaue-coursers, who buy them at best hand: and after, tricking, trimming, and pampering them vp for sale, make gain of them: for being reduced into a liniment, they vse it with wine to annoint as well the share of youths, as the chin and cheeks, to keep them for euer being vnder-grown, or hauing haire on their face, that they may appeare young still and smooth. It is a good defensatiue against the prick of venomous spiders: and besides, allaieth the griping torments of the belly. It forciby prouoketh
ἴσως in Dioscorides, it seemeth he read περσίνη. vrine. The seed of this hearbe, giuen with * Abrotonum, is a preseruatiue against the venome of L
serpents and scorpions; it cureth the jaundise.

As touching Lychnis, that flaming hearbe surnamed Flammea, the seed of it beaten to pouder and taken in wine, is singular good against the sting of serpents, scorpions, hornets, and such like. The wild of this kind is hurtfull to the stomacke, and yet it is laxatiue and purgeth downward. Two drams thereof is a sufficient dose to purge choller, for it worketh mightily. Such an enemie it is to scorpions, that if they doe but see it, they are taken with a nummednesse that they cannot stir. In Asia or Natolia, they call the root of this hearbe Bolites, which if it be laid vpon the eies and kept bound thereto, taketh away the pin and the web, as they say.

Chap. XXVII.

M

¶ *The medicinable vertues of Pervincle, Ruscus, Batis, and Acinos.*

ALso the Peruincle, called by the Greeks * Chamædaphne, if it be stamped drie into pouder, and a spoonful thereof giuen in water to those that are full of the dropsie, it doth euacuat most speedily, the watry humors collected in their belly, or otherwise: the same root
* or rather *Daphnoides*, out of *Dioscor.*

rosted

20030
copy 1

A roſted in embres,and well ſprinkled and wet with wine, diſcuſſeth and drieth vp all tumors, being applied thereto. The iuyce thereof dropped into the ears,cureth their infirmities. A cataplaſme applied to the belly, helpeth them (as they ſay) very much, who are vexed either with gripes or fluxes of the wombe.

Concerning Ruſcus, the decoction of the root, if it be giuen in drink each other day, to them that be tormented either with the ſtone, or the wringing paines of the ſtrangurie, or to ſuch as piſſe bloud, it helpeth them. Now the preparing of this medicine, and the proportion alſo of it, is in this wiſe: The ſaid root muſt be taken out of the ground as it might be to day, and tomorrow morning betimes it would be ſodden; and a ſextar of this decoction is to be mingled with two cyaths of wine, and ſo the Patient is to drink it. Some make no ſuch ado, but take the root
B while it is green, ſtamp it, and in water draw the juice raw as it is, and ſo drink it. In ſum, it is held for certain, That there is no better thing in the world for the infirmities and diſeaſes incident to the priuy members of men, than to bruſe the tender crops of this herbe, and then with wine and vinegre to preſſe out the juice, and afterwards to drink the ſame. In like maner, * Batis is good for them that be bound and coſtiue in the belly: and a liniment of it, after it is roſted in the embres and ſtamped, is ſingular for the gout. Laſt of all, as touching the herbe Acinos, the Egyptians vſe to ſow it, as well to make guirlands thereof, as to eat it. Surely I would ſay it were Baſil, but that the branches and leaues be more hairy; for certainly it is very odoriferous. It hath a property to prouoke vrine, and womens fleures.

* Taken by the moſt part for wild Baſil.

C

Chap. XXVIII.

¶ *The medicines that Colocaſia or the Egyptian Bean doth afford.*

G *Lauſias* was of opinion, that Colocaſia was good to lenifie or mitigat the acrimony of humors within the body, and withall to help the ſtomack.

Chap. XXIX.

¶ *The medicines made of Anthalium.*

D TOuching Anthalium (wherof the Egyptians vſe much to eat) I find no other vſe of it, but only from the kitchin to the table. Indeed there is an herb much like to it in name, which ſome call * Anthyllion, others Anticellion: whereof be two kind; the one hath leaues and branches like to the Lentill, and groweth a hand breadth or ſpan high: it commeth vp in * ſandy grounds expoſed to the Sun, and is ſaltiſh in taſte. The other reſembles * Chamæpitys but that it is lower and more hairy: it beareth a purple floure, carrieth a ſtrong ſent, and loueth to grow in ſtony places. The former kind is a moſt conuenient and proper herb for the diſeaſes of the matrice and the natural parts of women. Alſo being applied as a cataplaſme with oyle Roſat and milke, it is an vmbretarie medicine. In caſe of the ſtrangury and pains of the kidnies it is giuen with good ſucceſſe to the quantitie of three drams. The other likewiſe is giuen to drink the weight of four drams with hony and vinegre, for to mollifie the hardneſſe of the ma-
E trice, to aſſwage the torments of the belly, and to cure thoſe that be taken with the falling ſickneſſe.

* Some take it for *Kali.*
* *ὑσσωπίτις. Dioſcor.* ſomewhat brackiſh.
* *Iua muſcata,* or *Arthritica.*

Chap. XXX.

¶ *Of* * *Parthenium, and the medicinable vertues that it hath.*

AS for Parthenium, ſome name it Leucanthe, others Tamnaum; but our countryman *Celſus* the Phyſitian calleth it Perdicium and Muralium. It groweth in the mounds & hedges about gardens: it bringeth forth a white floure, ſauouring like an * apple, and hauing a bitter taſte. The decoction of this herbe, if a woman ſit ouer it and receiue the fume into her body, is good to mollifie the hard tumours of the matrice and natural parts; as alſo to diſcuſſe
F all inflammations. A pouder made of this herb dried, and incorporat with honey and vinegre, [*i.* Oxymel] and ſo applied, purgeth choler aduſt and melancholy. In which regard it is good for the ſwimming and dizzineſſe of the brain, and thoſe that are giuen to breed the ſtone. Being vſed in maner of a liniment, it is good for the ſhingles and S. *Anthonies* fire: likewiſe for the Kings euil, if it be incorporate with old ſwines greaſe. The Magitians vſe it much for Tertian agues.

* Some thinke it is Mother-woort, others Feuerfew.
* Surely according to *Dioſcorid.* 3, *Plinie* ſhould haue written thus: *Flore per ambitum candido, intus melino; id eſt,* with a floure white round about: but within of a darke yellow like to honey: & this agreeth to Feuerfew.

agues: but they lay a great charge, that it ſhould in any wiſe be plucked vp with the left hand, G
and the parties preciſely named for whoſe ſake they gather it: but in any caſe they who pluck it, muſt not look behind them: which done, a leafe of the herbe muſt be put vnder the tongue of the ſick patient; and when it hath bin held ſo a little while, it muſt anon be ſwallowed down in a cyath of water.

Chap. XXXI.

¶ *Of Night-ſhade or Morell: of Alkakengi and Halicacabus, and their vſe in Phyſicke.*

NOw concerning Nightſhade or Morel, which ſome name Strychnos, others haue written H
by the name of Trychnos: would to God that the guirland-makers of Ægypt had not imployed and vſed in their chaplets the floures of two kinds of them, induced therto by the reſemblance that they haue to the Iuy floures: of which, the ſecond that hath red berries like cherries of a ſcarlet colour, contained within certain bladders, & thoſe berries ful of grains or ſeeds, ſome name * Halicacabus, others Callion: but our countreymen here in Italy call it * Veſicaria, becauſe it is good for the ſtone in the bladder. Certes this plant is more like a ſhrub, or little tree full of branches, than any herb; bearing great and large bladders, & thoſe faſhioned like a top, broad and flat at one end, and ſharp pointed at another, incloſing within it a great berry, which ripeneth in the month Nouember. The third kind of Strychnos or Solanum hath leaues like to Baſil: but I muſt but lightly touch this herb, and not ſtand long about the I
deſcription either of it or the properties which it hath; ſince my purpoſe is to treat of holſom remedies to ſaue folke, and not of deadly poiſons to kill them: for certes this herb is ſo dangerous, that a very little of the iuice therof is enough to trouble a mans brain, and put him beſide his right wits. And yet the Greeke writers haue made good ſport with this herb, and reported pretty jeaſts of it: For, ſay they, whoſoeuer taketh a dram of the iuice ſhall haue many ſtrange fantaſies appearing euidently vnto them in their dreames; if they be men, that they dally with faire women: if they be women, that they be wantons, playing and toying with men without all ſhame and modeſty; and a thouſand ſuch vain illuſions: but in caſe they take this doſe double, then they ſhall proue fooliſh indeed broad waking, yea & go beſides themſelues: let them take neuer ſo little more, it is mortal, and no remedy then but death. This is that poiſon which K
the moſt harmleſſe and beſt minded writers that euer wrot, called ſimply Dorycnion; for that ſoldiers going to battel vſed to anoint and invenom therewith the heads of their arrows, darts, and ſpeares, growing as it did ſo commonly in euery place. But other Writers, who had not ſought ſo far into the matter, nor aduiſedly conſidered of it, gaue it the name of Manicon. But thoſe that of a naughty mind, cared not ſecretly to impoiſon the whole world, haue hidden the danger thereof, and term it by a name pretending no harm; ſome calling it Neuris, others Periſſon. But as I proteſted before, I think it not good to be too curious and buſie about the deſcription of this herb, notwithſtanding I might ſeem to giue a good caueat of it by further particularizing thereof. Well, the very ſecond kind which they cal Halicacabus, is bad enough, for it is more ſoporiferous than Opium, and ſooner caſteth a man into a dead ſleep, that he ſhal ne- L
uer riſe again. Some name it Morion, others Moly: and yet it hath not wanted thoſe that haue thought it praiſe-worthy: for *Diocles* and *Euenor* haue highly commended it: and *Tamariſtus* verily hath not ſtuck to write verſes in the commendation of it: A wonderfull thing, that men ſhould ſo far ouerpaſſe themſelues, and forget all honeſty and plaine dealing: for they ſay, forſooth, that a colluſion made of this herbe confirmeth the teeth that be looſe in the head, if the mouth be waſhed therewith. And one onely fault they found in Halicacabus (otherwiſe it might be praiſed without exception) that if the ſaid collution were long continued, it would trouble the brain, & bring them that vſed it to foolerie & idleneſſe of head. But for mine own part, my meaning is not to ſet down any ſuch receits and remedies, which may bring a further danger with them, than the very diſeaſe it ſelfe for which they were deuiſed. The third kind M
alſo is commended for to be eaten as meate, although the garden Morell is preferred before it in pleaſantneſſe of taſte. Moreouer, *Xenocrates* auoucheth, That there is no maladie incident to our bodie, but the ſaid Morell is good for it. Howbeit, I make not ſo great reckoning and account of all the helpes that theſe and ſuch like herbes may afford, as I doe make conſcience

to

* *Alkakengi*, or winter-cherry * or rather for that the ſayd berry lieth within a cod like a bladder.

20030
copy 1

A to deliuer them in writing, eſpecially ſeeing we haue ſo great ſtore of ſafe and harmleſſe medicines, which we may be ſure can do no hurt. Indeed, the root of Halicacabus they vſe to drinke and make no bones at it, who would be known for great Prophets to foretell future things: and therefore it is alone for them to be ſeen furious and raging, the better to colour their knauerie and lead the world by the noſe in a ſuperſtitious conceit and perſuaſion of their diuine gift of propheſie, and ſo to feed men ſtill in their folly. But what is the remedie when a man is thus ouertaken? (for ſurely I am better content to deliuer that) Euen to giue the party thus intoxicate, a great quantity of Mede or honied water, and to cauſe him to drink it off as hot as he can. Neither wil I ouerpaſſe this one thing beſides, That Halicacabus is ſo aduerſe vnto the nature of the Aſpis, that if the root thereof be held any thing neere vnto the ſaid ſerpent, it will bring
B aſleepe and mortifie that venomous creature, which by a ſoporiferous power that it hath alſo of the own, caſteth a man into a deadly ſleep, and killeth him therewith. And therefore to conclude, hereupon it commeth, that the ſame root bruiſed and applied with oile, is a ſoueraigne and preſent remedie to them who are ſtung by the foreſaid Aſpis.

Chap. XXXII.

¶ *Of Corchorum and Cnicus.*

C THey of Alexandria in Egypt vſe to eat ordinarily of Corchorum. This herb hath leaues inwrapped and infolded one within another, after the maner of the Mulberry. Good it is (as they ſay) for the midriffe and the parts about the heart: alſo to recouer haire that is fallen away by ſome infirmitie; and likewiſe for the red pimples or ſauce-flegme in the face. I reade moreouer, that the skab or mange in kine and oxen is moſt ſpeedily cured thereby. And *Nicander* verily doth report, that it helpeth the ſtinging of ſerpents, if it be vſed before it be in the floure. As touching Cnicus, otherwiſe called Atractylis (an herb appropriate to the land of Egypt) I would thinke it meet not to vſe many words about it, but that it yeeldeth a ſoueraigne remedie againſt the poiſon of venomous beaſts; yea, and the dangerous Muſhroms if a man haue eaten them. This is certain, and an approued experiment, That whoſoeuer are wounded by the ſting of Scorpions, ſhall neuer feele ſmart or paine, ſo long as they hold that herb in
D their hand.

Chap. XXXIII.

¶ *Of Perſoluta.*

THe Chaplet-makers in Egypt ſet great ſtore by Perſoluta alſo, which they ſow and plant in their gardens onely for to make Coronets and Guirlands. Two kindes there be of it, the male and the female. It is ſaid, That the one as well as the other, if it bee put vnder man or woman in bed, they ſhal haue no minde nor power at all to play at *Venus* game, and ſpecially the man.

E

Chap. XXXIV.

¶ *Of Meaſures and Weights.*

ANd foraſmuch as we ſhall haue occaſion oftentimes in ſetting downe weights and meaſures, to vſe Greeke vocables, I care not much euen in this place to interpret thoſe words once for all. Firſt and foremoſt, the Atticke Drachma [for all Phyſitians in manner go by the poiſe of Athens] doth peiſe iuſt a Roman ſiluer denier: and the ſame weigheth alſo ſix Oboli: now one Obulus is as much in weight as ten Chalci. A Cyathus of it ſelfe alone commeth to ten drams in weight. When you ſhal reade the meaſure of Acetabulum, take it for the fourth part of Hemina, that is to ſay, fifteen drams. To conclude, Mna, which we in Latine call
F Mina, amounteth iuſt to an hundred drams Atticke.

G

THE TVVENTY SECOND BOOK OF THE HISTORIE OF NATVRE,

H

WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

A Man would thinke who did but reade the former Booke, That dame Nature and the Earth both had done their parts, and shewed their wonderfull perfection sufficiently; if he considered withall the admirable vertues of so many herbes which they haue brought forth and bestowed vpon mankinde, as well for pleasure as profit. But see what a deale of riches more I *is yet behind; and how the same, as it is harder to be found, so it is in effect more miraculous! As for those Simples whereof wee haue already written, for the most part they are such as haue serued our turne at the bourd: or else in regard of their beauty, odor, and smell, haue enduced vs to search farther into them, and to make triall of their manifold vertues and operations in Physick. But yet there remain behind many more, and those so powerfull, that they proue euidently vnto vs, how Nature hath produced nothing in vaine and without some cause: although the same be occult and hidden many times from vs, and reserued only in her closet and secret counsell.*

K

CHAP. I.

¶ *Of certaine Nations which vse herbs for procuring and preseruing of beauty.*

CEertes I do find and obserue, that there be forrein Nations who time out of mind haue been euer accustomed to annoint their bodies with the iuice of certain herbs, for to imbellish and beautifie them, as they thought. And verily in some of these * barbarous countries ye shall haue the women paint their faces, some with this herbe, and others with that: yea and among the Dakes and Sarmatians, in Transyluania, Valachia, Tartaria, & those parts, the men also marke their bodies with certain characters. But to goe no farther than into Gaule, there groweth an herb there like vnto Plantain, and they call it Glastum, [*i.* Woad] with the iuyce whereof the women of Britain, as wel the maried wiues, as yong maidens their daughters, anoint and dy their bodies all ouer, resembling by that tincture the color of Moores and Ethyopians: in which manner they vse at some solemne feasts and sacrifices to go all naked.

* All such as be neither within Greece nor Italie.

L

CHAP. II.

¶ *That Clothes be died with certaine Herbs.*

AND now of late dayes, we know there hath been taken vp a strange and wonderfull maner of dying and colouring clothes. For (to say nothing of the groin brought out of Galatia, Africke, and Portugal, whereof is made the royall Skarlet, reserued for princes only and great captains to weare in their rich mantles of estate and coats of armes:) behold, the French inhabiting beyond the Alps, haue inuented the means to counterfeit the Purple of Tyrus, the Skar-

M

20030
copy 1

A Skarlet alſo and Violet in graine; yea, and to ſet all other colours that can bee deuiſed, with the
juice only of certain hearbs. Theſe men are wiſer (beleeue mee) than their neighbours of other
nations before them: they hazard not themſelues to ſound and ſearch into the bottome of the
deepe ſea for Burrets, Purples, and ſuch ſhell-fiſhes. Theſe aduenture not their liues in ſtrange
coaſts and blind baies, where neuer ſhip hath rid at anker, offering their bodies as a prey to feed
the monſtrous Whales of the ſea, while they ſeeke to beguile them of their food in fiſhing for
the ſaid Burrets: & all to feed that, wherby as well vnchaſt dames of light behauiour might ſet
out themſelues and ſeeme more proper, to allure and content adulterous ruffians: as alſo thoſe
gallants again, ſquaring and ruffling thus in their colours, might court faire ladies and wedded
wiues; yea, and with more eaſe entrap and encompaſſe them to yeeld to their pleaſure: but theſe
B men ſtand ſafe vpon drie land, and gather thoſe hearbs for to die ſuch colors, as an honeſt min-
ded perſon hath no cauſe to blame, nor the world raſon to crie out vpon. Nay our braue mini-
ons and riotous wantons, it might beſeeme alſo to be furniſhed therewith; if not altogether ſo
glorious to the eye, yet certainly with leſſe offence and harm. But no part it is of my deſſeigne
and intent to diſcourſe vpon theſe matters at this preſent: neither will I ſtand on the thrift and
good husbandry that may be ſeen in ſuch a thing as this, leaſt I might ſeeme to colour any va-
nitie with a ſhew of commodity and frugalitie: and to limit exceſſe and ſuperfluitie within the
tearms of profit and cheapneſſe, which indeed will not be gaged and brought within any com-
paſſe. Beſides, I ſhall haue occaſion hereafter in ſome other place to make mention both of dy-
ing ſtones, and alſo of painting walls with herbs. As for the art and myſterie of Diers, if euer it
C had been counted any of the liberal Sciences, beſeeming a gentleman either to profeſſe or pra- * *Portibus au-*
ctiſe, I aſſure you I would not haue ouerpaſſed it in ſilence. And yet I promiſe you, this feat *getur auctoritas.*
grows to credit euery day more than other: and the * hauens abroad where thoſe fiſhes be taken
which furniſh them with colors, are mightily frequented and in greater name and requeſt than
euer they were. In which regard, I canot chuſe but ſhew and declare what account we ought to
make of theſe dumbe tinctures in that behalfe; I meane ſuch hearbs and ſimples, whereof there
is but baſe reckoning or none at all made: for thoſe great princes which were the firſt founders
and eſtabliſhers of the Roman Empire, did mighty things therewith, and emploied theſe herbs
in the higheſt matters of ſtate. For in the affaires of greateſt importance, namely, either in pub-
lick ſacrifice for the auerting of ſome heauy judgement of the gods threatened: or in expiation
D of any grieuous ſinne and offence committed (whether they performed diuine ſeruice to their
gods, or diſpatched honourable embaſſages to other States) they vſed their Sagmina and Ver-
benæ, by which two words verily was meant one and the ſame thing, euen ſome plain and com-
mon graſſe plucked vp with ceremoniall deuotion, turfe and all, from their caſtle hil or citadel
of Rome. And this at all times was obſerued religiouſly, that they neuer ſent their heraulds to
the enemies of the people of Rome for to clarigat, that is to ſay, to ſummone them with a lowd
voice for to make reſtitution of that which they detained of theirs; without a turfe and tuft of
the ſaid graſſe: and euermore there accompanied theſe heraulds in their train, one ſpeciall offi-
cer who had the charge to carie and tender that hearbe, who thereupon was called Verbenarius.

E

Chap. III.

¶ *Of graſſe Chaplets.*

NO Coronets verily were there euer at Rome better eſteemed, either to teſtifie the triumphant majeſtie of that victorious citie (the ſoueraign lady of the whole world) or to giue teſtimony of honour and reward for ſome notable ſeruice performed for the Commonweale, than thoſe which were made ſimply of green graſſe. The crownes of beaten gold, and enriched with pearle; the Vallare and Murall Chaplets beſtowed vpon braue knights and valiant ſouldiers, who either entred the fortified camp of the enemie ouer trench & rampier, or mounted the wals in the aſſault of a city, came nothing neer to this: the Nauall garlands giuen to ad-
F mirals and generals at ſea, for obtaining victory in that kind of ſeruice: the ciuick coronets alſo preſented vnto ſuch as had reſcued a Romane citizen, and ſaued his life, came behind theſe: and in one word, the Chaplet triumphal, which they ware who entred with triumph into Rome, was nothing comparable to theſe. And yet all theſe Guirlands abouenamed haue notable prerogatiues, and differ one from another in many reſpects. In a word, thoſe Coronets and Chaplets of honour

honor,all ſaue theſe made of graſſe, were giuen many times by ſome priuat and particular perſons,are by the captains and generals themſelues vnto their ſoldiers;yea,and otherwhiles from one Generall to another,when they were ioined together in equall commiſſion,in teſtimony of vertue and valour. G

Chap. IIII.

¶ *The ſingularitie and rare examples of ſuch Chaplets made of graſſe.*

NOw,whereas other Garlands of honour and Coronets of triumph,were alwaies either ordained by a decree from the Senat in time of peace,and after the troubles of warre ouerblowne;or granted by an act of the people,being quiet and in repoſe, when dangers were H paſt;this Chaplet of graſſe aforeſaid,it was neuer any mans hap to haue,but in ſome extremity and deſperat caſe of the whole ſtate:nor at any time adiudged to a man,but by the whole army, confeſſing with one voice and generall conſent,That by him alone they were all ſaued from the edge of the ſword,or famine. As for the reſt,the captaines and generals vſed to giue them: this onely was preſented by the ſouldiers to their chiefe leader. The ſame was called alſo an Obſidionall coronet or ſiege-garland; namely, when ſome captaine had forced the enemies to raiſe the ſiege and diſlodge,and thereby ſaued either a whole towne or campe from vtter ſhame and finall deſtruction. And Certes,if there were ſo great account made of a ciuicke garland for reſcuing the life of one only citizen of Rome (and ſuch an one perchance as was of all others the meaneſt) that whoſe fortune it was to obtain it,he was honored euer after with many priuiledges and immunities,and counted ſacred:how highly then is he to be eſteemed,who by his own valour and proeſſe hath ſaued many thouſands,and a whole army of ſuch citizens? This Chaplet then,ſo ſingular and excellent,was made of the green graſſe, or herbes taken and gathered from the very place where a man had ſaued & deliuered the beſieged. For in truth,the greateſt ſigne of victory in old time,and of yeelding to the mercy of the enemy,was this, If the vanquiſhed did take vp graſſe,and tender it vnto the conqueror:for this ſerued as a confeſſion and proteſtation,That they rendered vp all their intereſt which they might challenge in the earth(the mother that bred and fed them) yea,and the very right of ſepulture in her:which cuſtome I vnderſtand,the Germans do retaine and obſerue,euen at this day.

Made of Oke leaues and branches; I

K

Chap. V.

¶ *What captaines they were,who alone receiued the honor of a braſſe Chaplet.*

Lvcius Siccius ſyrnamed *Dentalus*,was crowned but once with this Coronet of graſſe: notwithſtanding it was his good fortune to deſerue and obtaine foureteene Ciuick garlands: to fight with his enemy in a hundred and twenty battels,and euer to return out of the field with victory:whereby we may ſee how rare a thing it was in times paſt, to ſee an army thus ſaued through the valour of their captaine,for to recogniſe by this publick preſent their only ſauior. And ſome leaders and captains haue bin honoured this way oftener than ſo: as for example,*P. Decius Mus* receiued two ſuch Coronets:for being a Colonell and knight Marſhal of the L camp,he behaued himſelfe ſo valiantly,that one was giuen him by the regiment or army which himſelfe led;and another by thoſe who had bin beſieged within their fort. And how highly he eſteemed of this honourable reward, hee teſtified by his religious deuotion and the ſacrifices which he offered thereupon to the gods: for no ſooner had hee receiued theſe Coronets; but whereas the armie aforeſaid beſieged, and by him deliuered, had beſtowed vpon him ouer and aboue for his braue ſeruice,one white Oxe, and an hundred others, which were brended, hee ſacrificed them all vnto god *Mars*. This was that *P. Decius*,who afterwards being Conſull together with that ſurly and imperious colleague of his[*T. Manlius*] ſyrnamed *Imperioſus*,devowed and yeelded himſelfe to all the diuels of hell for the ſafety of his armie, and the obtaining of victory. Moreouer,that noble and renowned *Fabius*,who ſet vpright again the declining ſtate M of the Romane Commonweale, with lying off and not fighting at all with *Annibal*, was crowned therfore with ſuch a chaplet,by authority from the Senat and people of Rome:ſuch an honor in my judgement as no man in this world can reach and attain to higher. True it is,that beforetime he had performed good ſeruice,& namely,when being Dictator,he reſcued & ſaued his

20030
copy 1

A his high* Conſtable or grand maſter of the Cauallery, together with his whole army: and yet was he not thus highly rewarded then, with this Coronet of green graſſe. For in teſtimony of thankfulneſſe, this gratuity they whom hee had ſaued, thought at that time better, namely, to crowne him (as it were) with a new name & title to his former ſtile, calling him with one voice, Father: but the honor aboue named was giuen vnto him (as I ſaid) by the general conſent as wel of Senat as people, at what time as he chaſed *Annibal* out of Italy. And in truth, neuer man yet was in this wiſe knowne to be crowned by the hands (if I may ſo ſay) of the whole Empire, but himſelfe alone. This peculiar honor obtained he aboue all others, that this Chaplet alone was offered and preſented vnto him by all the ſtates of Italy. * *M. Minutius.*

B

CHAP. VI.

¶ *What he was, who alone of all Centurions receiued this Chaplet of graſſe.*

BEſides thoſe abouenamed, I find that *M. Calphurnius Flamma*, a Colonell of a regiment of ſouldiers in Sicily, was in this manner rewarded and honored with a graſſe garland. But neuer was there known to this day any one to haue bin crowned in this wiſe, of ſo baſe degree and condition as *C. Perreius Atinas*, in that war wherein the Cimbrians were defeated, who indeed was no better than a ſimple Centurion. This Centurion hauing by his place the conduct of the formoſt band of a regiment of ſoldiers vnder Colonel *Catulus*; ſeeing vpon a time certain companies excluded out of their owne campe, by reaſon that the enemies had put themſelues
C between them and home, and there incamped; perceiuing his captaine or Colonell *Catulus* aforeſaid, timorous and doubtfull to breake through the enemies camp; put on a reſolute mind, ſlew his own Colonell, exhorted and encouraged the companies to quit themſelues like men, and follow his enſigne; and ſo he defeated his enemies and deliuered his own legion. I reade moreouer in the Chronicles, That the ſame Centurion ouer and aboue the foreſaid braue ornament of a graſſe Coronet, had this honor done vnto him, that being clad in a long robe of purple imbrodered, and aſſiſted with both the Conſuls for the time being, *Marius* and *Catulus*, he was allowed to ſacrifice vnto the gods with a noiſe of fifes and haut-boies ſounding hard by the hearth or alter fire. Furthermore, *Sylla* the Dictator hath left in writing, That when he was lieutenant Generall vnder the Conſuls, and had the leading of the army in the expedition or journy
D againſt the Marſians, the whole army preſented vnto him a Chaplet of graſſe, before the city of Nola. And in very truth hee cauſed this to be pourtraied in a painted table within a houſe of pleaſure which he had in Thuſculum, the ſame that afterwards *M. Tullius Cicero* was maſter of. Which if it were true, the more ſhame deſerued he in my conceit: and I hold and pronounce him ſo much the more accurſed and deteſtable, for taking this crowne from his own head, and loſing ſuch a braue badge of honor, in proſcribing, ouerthrowing, baniſhing, and murdering afterwards, a greater number of citizens (without all compariſon) than thoſe ſouldiers came to, whoſe liues he ſaued, at what time as he took that garland firſt vpon his head. Let him vaunt as much as he wil of the ſaid Coronet, as alſo of the proud and vain glorious title of Fœlix, *i.* happy (which addition or ſyrname he took vpon him & cauſed to be put into his ſtile) yet, when as
E through his tyranny he held beſieged thoſe Roman citizens whom he had proſcribed and confined into all parts of the world, ſurely he forewent all and yeelded that crowne vnto *Sertorius*.

Moreouer, *M. Varro* doth report, That *Scipio* ſyrnamed *Æmilianus*, was honoured with an Obſidionall Coronet in Africk (the ſame yere when as *Manlius* was Conſull) for ſauing three cohorts beſieged; as alſo three companies beſides which he led forth to deliuer the other, and by whoſe means he forced the enemy to break vp his ſiege. This is to be ſeen and read in a Table, which *Auguſtus Cæſar* late Emperor of famous memory, cauſed to be hanged vp at the baſe or foot of the ſaid *Scipios* ſtatue erected in the Forum or publick hall which himſelfe built. As for *Auguſtus* himſelfe, the Senate crowned him with an Obſidionall Chaplet, vpon the thirteenth day of September, that yeare when he was Conſull with *M. Cicero*, the ſon of that great
F *Cicero* the Orator. Whereby we may ſee, that a Ciuick Chaplet was not thought ſufficient nor any waies comparable to this Coronet. And ſetting aſide theſe aboue named, I do not find in hiſtories, of any one who was crowned with a green chaplet of graſſe. Now, this you muſt note withall, That there was not one certaine hearbe ſet out & appointed for theſe honorable Guirlands: but look what kind of herbage grew then in the place beſieged & where the danger was,

that

that very ſame they tooke, were they neuer ſo baſe weeds and of no reckoning: for as contemptible otherwiſe as they were, yet being once imploied to this vſe, they innobled & adorned the perſon himſelfe who ware them in a Chaplet. And certes, the leſſe maruel I haue if theſe things be vnknowne to vs now adaies, ſeeing as I doe, how little or no account is made euen of thoſe things which make to the maintenance and preſeruation of our health; to the cure of all dolorous griefes and maladies of the body, yea, and to the preuention of death it ſelf. But what man is there well giuen and honeſtly minded, who can containe and hold his peace, hauing ſo juſt cauſe to reproue and rebuke the maner of the world in theſe our daies? firſt and formoſt, our life was neuer ſo coſtly as now it is, in regard of the dainties, delights, and ſuperfluities, which muſt be maintained, if will liue to the faſhion of the time: and for to injoy theſe pleaſures onely, we hold our liues more ſweet and precious. Neuer were men more deſirous of long life, and neuer leſſe carefull to entertaine the means of long life. The gouernment of our health we commit to the charge of others, and ſtrangers we credit with our owne bodies, and yet ſlacke enough and negligent are they, to ordain according to our truſt and confidence, that which indeed ſhould do vs good. Thus the Phyſitians are prouided well for; they thriue alone and go away with the gains by this means. Oh good God, to ſee the folly and vanity of man! Nature hauing put ſo many good things into our own hands as ſhe hath, and willing that we ſhould inioy them for our health and pleaſure: yet we (to our great ſhame and rebuke be it ſpoken) are ſo vnhappy, as to commit our ſelues to other mens tuition, & liue vnder their warrantize and aſſurance. Full well I know, that I for my part alſo, ſhall haue but ſmall thanks of many a one for all my paines taken in writing this hiſtory of the world and Natures works: nay, I am aſſured that I make my ſelfe a laughing ſtocke, and am condemned of them for ſpending and loſing my time in ſuch a frivolous piece of worke as this is. Howbeit, this is yet my comfort and no ſmall contentment I take herein, that my labors and trauels (exceſſiue and infinit though they be) cannot be deſpiſed, but the contempt will redound likewiſe to dame Nature her ſelfe. And yet ſhe againe, as a kind and tender nurce ouer mankind, hath not failed (as I wil declare hereafter) for our good, to indue the very weeds which we tread vnder foot with medicinable vertues, yea, & hath beſtowed vpon thoſe which otherwiſe we hate & dare not approch, but with careful heed (for the ſhrewd pricks and thorns which they carry about them) ſingular properties to cure diſeaſes. For ouer and beſides thoſe whereof I made mention in the booke going next before this, there be other herbs of that pricking kinde, which are ſo wonderfull in their operation and effects, that I can neuer admire ſufficiently and comprehend her prouidence appearing in them. Furniſhed ſhee had the earth, with ſmooth & prickleſſe plants enough, in the nature of meats, for to content our tooth, & ſatisfie our appetite; ſhe had ingrauen and liuely painted in floures, notable properties in phyſick for to recouer & maintain our health; & by the ſingular beauty which ſhe gaue vnto them, to allure the heart and eye of man to look toward them, ſaying (as it were) Come and gather vs: wherin ſhe had made a good medley of profit and pleaſure together. And when ſhe had thus done, ſhe ſtaid not there, but deuiſed to bring other herbs, hideous to the eie, and vntractable in hand. As if in the forming of them in that faſhion, wee might heare her to giue a reaſon, Why ſhe ſo did? ſaying after a ſort vnto vs in an audible voice, That ſhe made them with pricks and thornes, becauſe ſhe would not haue the foure footed beaſts (as hungry and greedy after meat as they be) to eat them down, That the ſhrewd hands of ſome vngracious folk, who can let nothing ſtand, might not be euer & anon plucking and twitching at them for wantonneſſe, that people ſhould not go careleſſely trampling vpon them with their feet: finally, for feare that birds pecking & ſetling aloft vpon their tender branches would ſliue them down or knap them aſunder. Therfore (I ſay) with theſe prickles, ſeruing in ſtead of weapons as wel defenſiue as offenſiue, ſhe hath both protected and alſo armed them: and al to keep them ſafe and ſure, for the health of man, and to do him ſeruice. Lo, how euen that which wee hate and ſeem to abhorre in theſe herbs, was deuiſed for our comfort and benefit, if we had the grace to ſee it.

Chap. VII.

M

¶ *The medicinable vertues of other floures and herbs ſeruing for Chaplets. Alſo of Erynge.*

AMong thoſe hearbes which beare pricks, * Erynge or Eryngion, is ſingular: for a ſoueraigne hearbe it is againſt ſerpents, and all poyſons whatſoeuer, as if it grew for nothing els. But to come

* Sea holly.

20030
copy 1

A ecme to particulars,for ſtings & bitings of venomous creatures,the root therof to the quantity of one dram,is taken in wine. And in caſe(as moſt times it falleth out) that a feuer follow vpon ſuch accidents,then the patient muſt drinke it with water. A ſpeciall and effectuall property it hath againſt certain land-ſnakes called Cherſydri, and venomous todes, if it be reduced into a liniment,and ſo applied to the ſore. But *Heraclides* the Phyſitian is of opinion, That if the ſaid root be boiled in the broth of a gooſe, it is of more efficacie than all other, againſt the Toxica and Aconita But whereas others do boile it in ſheere water againſt the poiſons Toxica; *Appollodorus* would haue a frog ſodden withal. The herb it ſelfe is of ſubſtance hard,branching much, full of leaues,and thoſe beſet with pricks. A ſtem or ſtalk it carieth,parted by knots and joints, a cubit high & ſomwhat more. Moreouer,as there is white Erynge,ſo you ſhal haue of it black:
B The root is odoriferous. Eryngion verily commeth vp ordinarily of ſeeds and by ſetting. But it groweth alſo in rough and ſtony places of the own accord. And that which we ſee along the ſea ſhore is harder and blacker than the reſt,leaued alſo like common Ach or Perſely.

Chap. VIII.

¶ *Of the hearbe or thiſtle commonly called Centum-Capita,i. the hundred heads.*

C AS for the white Erynge,our countrymen call it in Latine Centum-capita. But they be all of one and the ſame operation and effect. And the Greeks verily make their ordinary meat as well of their ſtalks as roots,both waies,to wit,either raw or boiled,as they liſt. Certes, there be wonders reported of this herb;namely,That the root of this white Eryngion(which is very geaſon and hard to be found) reſembleth one while the male ſexe,and otherwhiles the female of our kind. But if it chance that a man do meet with that Eryngion which is like to that member which diſtinguiſheth him from a woman,he ſhall be very amiable and beloued of women. Which was the reaſon (men ſay) that lady *Sappho* was ſo enamoured on the yong knight *Phao* of Lesbos. And verily,as touching this herb,not only the Magitians,but the diſciples alſo and followers of *Pythagoras*,tell vs many vain and fooliſh tales.

But to come indeed to the vſe of it in Phyſick. Ouer and beſides thoſe vertues and properties which I haue related already,good it is to reſolue ventoſities:it eaſeth the gripes and wrings in the belly;it cureth the diſeaſes and debility of the heart;it helpeth the ſtomack and liuer. For
D the midriffe and precordial parts,it is very wholſome taken in honied water:and for the ſpleen, in vineger & water together. Alſo drunk in mead or honied water aforeſaid,it is ſingular for the kidneies,the ſtrangury,the cramp or crick that pulleth the head of a body backward: for other ſpaſmes alſo and convulſions:for the loines,the dropſie,and the falling ſickneſſe. Soueraigne it is moreouer for womens monthly fleures, whether they do ſtay vpon them,or contrariwiſe run exceſſiuely from them:and in one word,it cureth all the accidents & infirmities of the matrice. Being applied as a liniment with hony,it draweth forth any offenſiue thing ſticking within the body. And if it be laid too with ſalt,lard,or hogs greaſe,and ſo incorporat into a cerot,it heales the kings euill,the ſwelling kernels within the eares,and the flat biles and botches. It reioineth alſo the fleſh that is gone from the bone;& finally,ſoudereth and knitteth broken bones or fra-
E ctures. Taken before a man ſit downe to eat or drink,it preſerueth him from ſurfet or drunkenneſſe: and bindeth the belly. Some of our Latine writers would haue it to be gathered a little before the ſummer-ſolſtice,ſaying moreouer,That if it be applied with rain water,it helpeth al the infirmities incident to the nape of the neck;and by their report,if it be bound to the eies,it cureth the pin and the web.

Chap. IX.

¶ *Of Acanus and Liquorice.*

F SOme there be who take Acanus for a kind of Eryngium. And they deſcribe it to be a low herbe,and yet growing broad and large,full of prickes and thornes,and thoſe likewiſe bigger than ordinary;being applied outwardly,wonderfull effectuall it is (by their ſaying) to ſtanch bloud. Others there are,who haue thought Erynge and Liquorice to be all one,but they are deceiued. Howbeit,for ſome reſemblance that is between them, I think it not amiſſe to ſet down the deſcription therof immediatly after theſe Erynges. Doubtleſſe this Liquorice alſo is

to

to be counted among these thorny plants, for that the leaues stand *pricking vp sharp pointed; the same are fatty, and in handling gummy and glewie. It putteth forth many branches, and those two cubits high: it carrieth a floure in manner of the Hyacinth, and beareth fruit resembling bals of the bignesse of those which hang vpon the Plane tree. The excellent Liquorice is that which groweth in Cilicia; the next for goodnesse commeth from Pontus: and hath a sweet root which only is vsed in Physick. Taken vp this is and gathered at the setting or occultation of the Brood-hen star, and is found running along in the ground in manner of the Vine root: in colour like to the Box tree. That which is duskish and somwhat black, is thought to be the better: like as the lithe & pliable root which wil wind and turn euery way, is preferred before that which is brittle and easie to break. Great vse there is of it in those medicines which be *held vnder the tongue, so to resolue & melt leasurely, namely, after it hath bin sodden to the thirds: yea, and otherwhiles boiled to the height and consistence of hony. Somtimes they vse to bruse it; and in that manner they do lay it vpon wounds, where it doth much good: as also if it be applied to all the diseases and accidents befalling to the throat and jawes. The juice of Liquorice reduced to a thick consistence, if it be put vnder the tongue, is singular for to cleare the voice. In like manner it is supposed very wholsome for the brest and liuer. And therewith (as I haue sayd before) both thirst and hunger may be slaked and allaied. Which is the cause that some haue called it Adipson: and in that regard ministred it to those persons who be fallen into a dropsie, for to preuent and take away their thirstinesse. Therfore it is thought to be a proper remedy for the diseases of the mouth, if it be either chewed, or otherwise cast and strewed vpon the vlcers therein: and so it cureth the excrescences also and exulcerations about the roots of the nailes. Moreouer, it healeth the excoriation & soreneſſe of the bladder, assuageth the paine of the kidneies, cureth the swelling & aking piles, the fissures also in the seat, and finally the vlcers of the priuy parts. Some Physitians haue prescribed to drink in a quartaine ague, the weight of two drams of Liquorice, & one of Pepper, in a draught of water to the quantity of a smal pint or hemina: this root being chewed, staieth bleeding in a wound. To conclude, some haue written that it expelleth the stone and grauell.

*Echinatis. It seemeth that *Pliny* neuer saw Liquorice, but read it in for *Lentisci*: & indeed the leaues are like to those of the Lentiske tree.

*In lingue subditu: such as be our Ecligmata or Lochs.

G H I

Chap. X.

¶ *Of the Caltrop thistle Tribulus. The sundry kinds thereof, and the medicines which they yeeld.* K

SOme of these Thistles come vp in gardens: others grow in and about riuers only. The juice which is drawne from these, is thought to be good for the eies: for this herb being as it is of a cooling nature, is a singular remedy for inflammations and gathering of imposthumes. A good medicine for all vlcers, but those especially which break out of themselues in the mouth: it cureth likewise those of the Amygdales or almonds of either side of the throat. If it be taken in drink, it fretteth & breaketh the stone. The Thracians dwelling vpon the riuer Strymon, feed their horses fat with the leaues of this herb: and liue themselues with the kernels or fruit therof, making a kind of sweet bread therewith, which also bindeth the belly. The root if it be gathered by the chast and pure hands of a virgin discusseth and dissolueth the kings euill. The seed if it be tied to the swelling vains, assuageth their pain. Lastly, being beaten into pouder and cast into water, it killeth the fleas in any place where that water is thrown or sprinckled. L

Chap. XI.

¶ *Of Stœbe, and the medicines which it affoordeth.*

STœbe, * which some call Phleon, boiled in wine, is a soueraigne remedy for eares that run with atter: likewise for bloudshotten eies, especially vpon a stripe or stroke giuen. Beeing ministred by way of clyster, it is good for the bloudy flix and the exulceration of the guts.

*A kinde of Matfellon or Knapweed.

Chap. XII. M

¶ *Of Hippophyes and Hippope, with their medicinable vertues.*

HIppophyes is an hearbe growing in grauelly and sandy places, and namely along the sea-side, armed with white prickes or thornes: it beareth berries by clusters after the manner of

20030
copy 1

A of Iuie,and thoſe be partly white & partly red. The root is ful of a certain juice, which is good either to be condite and confected alone,or els to be reduced into Troſchs with Eruile meale: this being taken to the weight of one Obolus,purgeth cholericke humors; and a moſt wholeſome medicine it is,eſpecially with honied wine. *Ervi farina.*

Another herb ther is,named Hippope,which neither riſeth vp in ſtalk,nor beareth floure,but hath leaues only,and thoſe ſmall. The juice alſo of this herb, is wonderfull good for thoſe who are in a dropſie. Where it is to be noted, That theſe two herbs ſhould haue ſome eſpeciall properties reſpectiue to the nature of horſes, conſidering both their names are deriued from nothing elſe; for in very truth, ſome things there be which Nature hath brought forth as appropriat remedies for certain particular beaſts,whereby we may ſee her diuine power,and how wel
B appointed ſhe is and prouided for to bring forth medicines of all ſorts; ſo as the depth of her prouidence canot be ſounded,neither are we able ſufficiently to admire her wit and deſcrition in diſpoſing and digeſting her remedies according to ſundry kinds of creatures, according to diuers cauſes,and different ſeaſons: inſomuch as the remedies ſeruing one, are not fitted for another,neither are they of the ſame effect and operation at all times: nay,there is not a day almoſt in the yere throughout,but it yeeldeth a remedy reſpectiue vnto it.

Chap. XIII.

¶ *Of the Nettle,and the medicinable vertues thereof.*

C IS there any thing more hated and odious than the Nettle? and yet to ſay nothing of the oile made of it in Egypt (according as we haue ſhewed heretofore) indued ſhee is and furniſhed with many good properties ſeruing for Phyſick. For firſt,as touching Nettle ſeed, *Nicander* affirms, That it is a very counterpoiſon againſt Hemlock, venomous muſhrums,and Quickſiluer. *Apollodorus* addeth moreouer,and ſaith, That being boiled in the broth of a Tortoiſe, it is ſingular good for the poiſon of Salamanders: alſo that it is contrary to the pernicious nature of Henbane; and the deadly poyſon of ſerpents, & namely, of ſcorpions. Euen that very bitterneſſe and mordacity which the Nettle hath, cauſeth the Vvula in the mouth which is falne,to knit vp againe: the matrice alſo which is ouer-looſe and beareth downe,to ariſe into the place,
D yea and the tuill or fundament in children hanging forth of the body,to return & abide where it ought to be,only with touching theſe parts therewith. If the legs be rubbed,and the forehead eſpecially with Nettles,it is a good meanes to awake them out of their drowſie and dead ſleep, who are ſurpriſed with a lethargy. The ſame being applied with ſalt,is paſſing good for the biting of dogs. If it be bruiſed and put vp to the noſthrils, it ſtancheth bleeding at the noſe; but principally the root of it. If it be tempered with ſalt, it mundifieth cancerous and foule filthie vlcers; likewiſe it helpeth diſlocations and bones out of joint; it diſcuſſeth or ripeneth botches in the emunctories,and the ſwelling kernels behind the eares; and healeth vp the places where the fleſhy parts be gon from the bones. Nettle ſeed taken in wine cuit (as a drinke) openeth the matrice when it is ready to ſtrangle or ſuffocate a woman: and being applied with wine,it ſtai-
E eth bleeding at the noſe. If one driake Nettle ſeed after ſupper, with hony and water, to the quantity of two oboles weight,it openeth the paſſages & maketh way for to womit with greater facility: but the weight of one Obolus taken in wine, refreſheth thoſe who haue a laſſitude or wearineſſe vpon them. The ſame being parched againſt the fire and drunk to the meaſure of one Acetabulum,is ſingular for the imperfections of the matrice: and in cuit, it withſtandeth the ventoſities and inflations of the ſtomack. Giuen inwardly with hony in the form of a loch, it doth them good who labor for wind,and cannot take their breath but ſitting vpright; and after the ſame manner it cutteth fleame and clenſeth the breſt of it. Being applied in a bag, together with line-ſeed,it taketh away the ſtitch and pain in the ſides: but ſome put hyſſope therto,
F and a little pepper. A liniment made therewith,cureth the ſpleen. Being parched or roſted and ſo eaten with meat,it keepeth the body ſoluble. And *Hippocrates* affirmeth, that the ſaid ſeed is very good to be taken in drink,for to cleanſe the matrice in women: and being ſo parched and giuen to the quantity of one Acetabulum in ſweet wine cuit,it allaieth the griefe and paine of the ſaid part,in caſe withall there be a cataplaſme applied to the region thereof,together with the juice of Mallows. If it be taken in hydromel, *i.* honied water,together with ſalt, it expelleth

(by his saying) the worms in the belly. Applied in a liniment to the bare and naked places of G
the head, it causeth the haire to grow again, and bringeth all to the former beauty. Many do vse to make a cataplasme of Nettle-seed and old oile; or els stamp the leaues together with Bears grease, for the pain of the gout: and verily for that purpose, as also for the spleen, the root pouned with vineger, is no lesse effectuall. Being boiled in wine, it discusseth and driueth down risings in the groine, and such like emunctories, so it be laid too with old hogs grease salted. But the same root dry, is a very depilatorie, and fetcheth haire off. *Phanias* (the naturall Philosopher and Physitian) in a seuerall treatise which he made in the praise of Nettles, professeth, That he knoweth not the like remedy to the Nettle, boiled first and then condite, for the windpipe, the cough, the distillation and flux of the belly, the stomacke, the biles and botches in the emun- H
ctories, the swelling and inflamed kernels behind the eares, and kibed heels. The same with oile procureth sweat: and sodden with muscles, and such like shell-fishes, it moueth to the stoole: with ptisane or barly broth, it purgeth the brest, and sendeth down womens terms: applied with salt, it restraineth vlcers that be corrosiue and apt to run & spread farther. The juice also of the Nettle, serueth to many vses; for being presséd forth & laied as a liniment to the forehead in a frontall, it stancheth bleeding at the nose. The same taken in drinke, prouoketh vrine, and breaketh the stone: but if one gargle with it, it staies the Vvula from falling: as for the seed, it ought to be gathered in haruest time: & that which is brought from Alexandria, is esteemed best: for all the particular diseases aboue rehearsed, the kinder and gentler Nettles also, euen those that be yong and tender, are knowne to be of good operation; but principally that wild kind beforesaid; and this property moreouer it hath, To rid away the leprosie out of the face, if it be taken I
in wine. Finally, if a foure-footed beast will not abide to be couered or serued with the male of that kind, an ordinary practise it is, to rub the nature or shap with a Nettle, for that will make her stand to the fellow.

Chap. XIIII.

¶ *Of Lamium, and the medicinable vertues thereof.*

AS touching that dead-Nettle, which among the other kinds we named before Lamium, *i.* Archangell, it is the mildest of all others and most tractable, for the leaues bite not nor sting at all. The same, if it be applied with some corns of salt, to contusions and bruises, to K
deep burns, the Kings euill, swellings, gouts, and wounds, cureth them all. The white that it hath in the mids of the leafe, is singular for S. *Anthonies* fire, the shingles, and such like. Some there be of our Latine writers, who treating of Nettles, haue couched them in their ranks respectiuely to the time, saying, That the root of a Nettle which commeth in the Autumne, cureth the tertian ague; but it must be tied fast to the Patient: and these ceremonies are to be obserued also in the taking it forth of the ground, That the party be named for whom it is gathered; the feuer also, of what type or kind it is; yea and who be the parents of the sick person; and then hee or shee shall be sure to be deliuered of that disease. The said root, with the same circumstances, is of the like operation to driue away the quartan ague also. The selfesame authors do affirme L
moreouer, That the root of a Nettle being applied with salt, draweth forth all thorns and shiuers that stick within the flesh. Also, that a cataplasm of the leaues and hogs grease incorporat together, doth resolue the scrophules or swelling kernels called the Kings-euill: or if they are come to suppuration, eateth and worketh them forth, and doth incarnat & fil vp the place again

Chap. XV.

¶ *Of the herb Scorpius: the sundry kinds thereof, and the medicinable properties.*

* *Scorpioides.* THere is an herb called * Scorpius, which took that name of the resemblance that the head hath to a scorpions taile. Few leaues it beareth; but (according to the name) it is good a-
gainst the sting of scorpions. Another herb there is of the same appellation, & of like ef- M
fect to the other; but it sheweth no leaues at all; the stalke is smooth, and resembleth garden Sperage: in the top or head whereof, there is a pricke to be seen like a sting, which gaue occasion of the foresaid name.

CHAP.

Chap. XVI.

¶ *Of Leucacantha, and the vertues thereof good in Phyſicke,*

THe Greeks, ſome cal this Thiſtle, Leucacantha, or the white thiſtle; others, Phyllon: ſome Iſchias, others, Polygonaton; but be the name what it will, it hath a root reſembling that of * Cyperus, which if it be chewed in the mouth, allaieth the tooth-ache. *Hiceſius* ſaith likewiſe, That if either the ſeed or the juice of the root therof, be taken in drinke to the weight of eight drams, it aſſuageth the pain of the ſides and loins. The ſame alſo cureth ruptures, convulſions and crampes.

* or *Cyprus*,

B

Chap. XVII.

¶ *Of Helxine or Perdicium, called alſo Parthenium or Sideritis, and the vertues medicinable.*

AS for Helxine, ſome cal it Perdicium, becauſe Partridges delight moſt to feed thereupon; others name it Sideritis, and many giue it the name of Parthenium. Leaues it carrieth of a mixt form and reſemblance, between Plantain and Horehound. The branches or ſmall ſtalks grow in thick tufts, and thoſe be of a light reddiſh colour: the ſeed in the head, of a Bur kind which ſticketh to folks cloaths, whereupon they would haue it to be called Helxine. But in the former booke I haue deſcribed the form of the right * Helxine or Parietarie indeed. The property of this herb is to giue a tincture or die to wooll: it healeth the ſhingles and S. *Anthonies* fire: it cureth ſwellings, and all apoſtemations of humours, yea and alſo burnes. The juice thereof incorporat with ceruſe or white lead, and ſo applied, ſerueth greatly for biles and botches, S. *Anthonies* fire, tumors, gatherings and riſings in the fleſh; yea and helpeth them whoſe throat begins to ſwell. Alſo if a man take the quantity of one cyath thereof, it cureth inueterat and old coughs: it healeth all infirmities either occaſioned by phlegmatick humors, or els incident to moiſt parts: like as with oile roſat it is a proper medicine for the accidents of the amygdales about the paſſage to the throat; and for the ſwelling of veins. Moreouer, if it be reduced into the form of a cerot, with goats ſuet and wax of Cypres, and ſo applied, it cureth the gout. Moreouer, Perdicium or Parthenium (for Sideritis is another herb) our countreymen cal in Latine, * Vrceolaris; of others, Aſtericum. In leafe it is like to Baſil, ſaue only that it is blacker; it groweth vpon tile-houſes, and old decaied wals, and ſuch ruinous places. Being beaten into powder & applied with corns of ſalt, it hath the ſame operation that the Nettle Lamium, and cureth the ſelf ſame diſeaſes; and the one is vſed in like ſort as the other: & if the juice be drunk hot, it is ſingular for inward and ſecret impoſthumes ful of filthy matter, and driueth them outward. Alſo it is excellent for vlcers, ruptures, and bruiſes, whether it be that one hath tumbled head-long from ſome high downfal, or that he hath bin cruſhed by the ouerthrow of ſome waggon or chariot. It fortuned that a Page of *Pericles* a prince of the Atheniens (whom he loued intirely) hauing climed vp to the top of the lanterne or ſpire of a temple which the ſaid prince built in the caſtle or citadell of Athens, fel downe from thence; who was cured by the means of this herb, reuealed vnto *Pericles* in his ſleep by the goddeſſe *Minerva*: whereupon it tooke the name firſt of Parthenium, and is conſecrat vnto the ſaid goddeſſe: this is that Page whoſe molten ſtatue is to be ſeen at this day made of braſſe: this is (I ſay) that noble and famous image called * *Splanchnoptes*.

* Parietary of the wall.

* Where, to ſay a truth, he deſcribeth *Helxine* for *Ixine*, or *Chamæleon* the white.

* Dioſc. *Cerato Cyprino.*

* or *Vitraria*, becauſe it is vſed to ſcoure glaſſe and pipkins withall.

* Made with a deuiſe to blow coles & kindle fire for to roſt the inwards of beaſts ſacrificed: or as ſome thinke, it was the proper name of that youth.

C D E

Chap. XVIII.

¶ *Of Chamæleon the hearbe, the ſundry kindes thereof, and the vertues medicinable.*

CConcerning Chamæleon, ſome there be who name it Ixias: whereof be two kinds: the whiter hath the rougher leaues: it creepeth cloſe by the ground, and ſetteth vp ſtiffe prickles in manner of an Vrchin: the root is ſweet in taſt, but of a moſt ſtrong ſent. In ſome places it ingendreth a white kind of gum or clammie glew, vnder the wings or arm-pits (as it were) of the leaues, after the ſame manner as Frankincenſe is ſaid to breed, but eſpecially about the

F

20030 copy 1

riſing of the Dog-ſtar:& for that it is like to a kind of birdlime, it is called Ixia:our women vſe G
this inſtead of Maſtick. And the reaſon why this herb is named Chamæleon, is by occaſion of the variable leaues which it beareth, for according to the nature of the ſoile where it groweth, it changeth hew; whereby in one place you ſhall haue it blacke, in another green; here you ſhall ſee it look blew, and there yellow, and euermore altering the color. Of which Chamæleons, the white cureth ſuch as are in a dropſie, if the root be boiled, and the juice thereof taken to the quantity of a dram in ſweet wine cuit. The meaſure of one acetable of the ſame juice, if one drink in a green harſh wine made of the hedge vnripe grape, wherein certain bunches of Origanum haue lien infuſed, it is thought to be a ſingular remedy to kill the worms that breed in the guts. It auaileth much alſo to help thoſe who piſſe with difficulty: and yet this juice being H
giuen to dogs or ſwine in barly groats, killeth them. If there be water and oile mingled therto, it draweth rats and mice to it, but it is their bane, vnleſſe preſently they drinke water. Some preſcribe for to cut the root thereof into thin roundles, and to keep them enfiled vp, or hanging by a ſtring, and then to ſeeth them; for to be eaten againſt the flux of humours, which the Greekes name Rheumatiſmes. Of the black kind, ſome hath named that the male, which hath the purple floure; and the female with the violet colour. They all grow vp with one ſtem and no more, and the ſame is a cubit high, and a finger thick. The roots are good to heale ringworms, tettars, and ſuch like wild fires, if they be ſodden together with brimſtone and Bitumen: but if the ſaid root be chewed in the mouth, or a collution be made therwith ſodden in vineger, it faſtens the teeth which ſhake and be looſe in the head. The juice of this root healeth the ſcab or mange in four-footed beaſts. Herewith alſo folke vſe to kill the ticks that breed in dogges: but it ſtoppeth the I
wind of heifers and yong ſteers in maner of a ſquinancy: and therefore of ſome it is called Vlophonon and Cynozolon, in regard of the ſtrong and ſtinking ſmell that it hath. Theſe Chamæleons do beare a certain viſcous gumme, moſt proper for vlcers. And the roots of all the ſort of them, as well blacke as white, are ſingular againſt the poiſon of ſerpents.

Chap. XIX.

¶ *Of Coronopus or Harts-horne, with the medicinable vertues thereof.*

Coronopus is an herb bearing long leaues, and thoſe clouen into certain fiſſures and knags: and how ſoeuer it groweth wild, yet otherwhiles it is ſet and ſowne in gardens, for the ex- K
cellency of the root; which being roſted vnder the aſhes, is ſoueraign for the flux, & weakneſſe of the ſtomacke.

Chap. XX.

¶ *Of Orchanet or Alkanet, as well the right as the baſtard, and their properties in Phyſicke.*

THe root of Orchanet is much vſed about medicines: of the thickneſſe it is of a finger: it wil rend and cleaue in manner of the papyr reed: and it coloreth the hands of as many as handle it, with a red and bloudy colour: it prepareth wooll and woollen cloth for to take rich L
and deep colours. If it be incorporat into the form of a cerot, it healeth vlcers, eſpecially in old men; as alſo places that be burnt. It cannot be reſolued in water, but it is oile that muſt diſſolue it: and verily this is a good experiment of that which is true and nothing ſophiſticat. A dram thereof giuen in wine to drink, is ſingular good for the pain in the kidnies: but in caſe the Patient haue a feuer vpon him, then it ought to be taken in the decoction of * Balanos. In like manner is it to be vſed in the opilations or obſtructions of the liuer, of the ſpleen, and in the Iaundiſe. A liniment made of it and vineger, cureth the leproſie, and the red pimples ariſing in the face. The leaues ſtamped with hony and meale vntill they be incorporat together, and ſo applied as a cataplaſme, are thought to be good for diſlocations: but if they be taken inwardly to the quantity of two drams in honied wine, they bind and knit the belly. The root boiled in water is M
ſaid to kill fleas.

Another herb there is much like vnto it, and thereupon called Pſeudanchuſa [*i.* baſtard Orchanet] of ſome, but of others Enchuſa or Doris; and many other names it hath beſides. More full of downe or hairy moſſe it is, and leſſe fatty; but the leaues are ſmaller, more ranke and feeble.

* Haply hee meaneth *Phœnicobalanos, (i)* the Ægyptian Date: or *Oxyphœnices*, our Tamarinds, a kind of Dates appropriat for agues.

A feeble. The root yeeldeth no oleous ſubſtance, but a reddiſh juice; wherin it differeth from the right Anchuſa or Orchanet. The leaues or ſeed being taken in drinke, is a moſt effectual counterpoiſon againſt ſerpents. The ſubſtance of the leaues being applied to the places which bee ſtung, are ſoueraigne for to cure and heale them vp. The very herb it ſelfe chaſeth away all poiſon of ſerpents. There is a drink made therof, commended highly for the chine or ridge-bone of the back. The Magitians do preſcribe the leaues to be bound vnto ſome part of the Patient againſt a tertian ague, with this charge, That they be gathered with the left hand, & that in the gathering, the party or patient for whoſe ſake they are gotten, be named.

Chap. XXI.

B ¶ *Of Onochiles, Anthemis, Lotos, and Lotometra: of Turaſoll-Tricoccus: of Adiantum, and Callitrichon.*

ANother herb there is, particularly named Onochiles, which ſome call Anchuſa; others Arcebion or Onochelis; ſome Rhexias, and many Enchuſa: a ſmall herb this is; it carrieth a purple floure, leaues and branches rough: a root in harueſt time as red as bloud, otherwiſe black; and groweth in ſandy grounds: effectuall it is againſt ſerpents, and Vipers moſt of all others, both in the root and leaſe, as well eaten with meat as taken in drinke. In the full ſtrength it is in harueſt. The leaues if it be bruiſed or ſtamped, do yeeld the ſauor and ſmel of a Cucum-
C ber. If the matrice of a woman be ſlipt downe, a draught of three cyaths thereof, doth reduce it vp into the place: and together with hyſſope, it driueth out the broad wormes in the belly. For the pain of the kidnies or the liuer, it ought to be taken in mead or honied water, if the Patient haue an ague withall; otherwiſe in wine. The root brought into a liniment, cureth the Lentils or red ſpots, yea and the infection of the leproſie. And it is ſaid, That as many as haue it about them, cannot be ſtung by ſerpents. There is yet another Orchanet or Anchuſa like vnto this, in regard of the red floure which it beareth; howbeit a leſſe herb than the other, hauing the like operation, and imploied in the ſame vſes. It is reported, That if one chew it in his mouth, & ſpit it forth vpon a ſerpent, the ſame will ſurely die thereupon.

As touching Anthemis [*i.* Camomile] *Aſclepiades* the Phyſitian doth highly praiſe and commend it. Some name it Leucanthemis, others Leucanthemus; & there be, who giue it the name
D Eranthemon, becauſe it flouriſheth in the Spring: others againe name it Chamæmelon, for the ſent or ſauour that it hath of an Apple: many call it Melanthemon. Three kinds there be of it, differing onely in the floures (for none of them exceed an hand-breadth in heighth) which bee ſmall, and in forme reſemble thoſe of Rue: howbeit, theſe floures be either white, yellow, or red. In a lean ground and neer to beaten paths, this herb loueth to grow: gathered it is in the ſpring, and layed vp for to ſerue in garlands: at which time the Phyſitians alſo ſtampe the leaues and make them vp into Troſches: ſo do they alſo by the floure and the root. This vertue they haue, That if they be all mingled together to the weight of one dram, they are thought to be a ſoueraigne remedie againſt the ſting of all ſerpents. This herbe expelleth dead infants within the mothers wombe, if it be taken in drinke. It bringeth downe alſo the monthly fleurs of women;
E prouoketh vrine, and ſendeth forth the ſtone and grauell. Being chewed, it diſſolueth ventoſities, it cureth the obſtructions and defects of the liuer, it helpeth the jaundiſe, healeth the fiſtuloes between the angle of the eye and the noſe, and generally all running ſores and mattering vlcers. But of all theſe kinds, that which beareth the red purple floure hath moſt effectuall operation for the ſtone: and indeed, both the leaues, and alſo the branches of this Camomile, are ſomewhat larger than of the reſt: and ſome there be, who giue this a name it ſelfe, and call it Eranthemon As for thoſe who take lotos to be a tree only, may be conuinced euen by the authority and teſtimony of *Homer*, who among other herbes growing for the delight and pleaſure of the gods, hath named Lotos as principall. The leaues of this herbe incorporat with honey, and ſo applied, cureth the cicatrices or ſcars in the eie; the ſpots alſo appearing therein, and diſſolueth the cloudy skins which ouercaſt the ſight: there is a kind of lotos named Lotometra, com-
F ming of the garden Lotos: it carrieth a ſeed like to Millet, whereof in Ægypt the Bakers make bread; but they work & knead the floure of this ſeed with water or milk. There is not any bread in the world (by report) more wholſom and lighter than this, ſo long as it is hot; but being once cold, it is harder of digeſtion, & becommeth weighty & ponderous. This is known for certain,

20030 copy 1

that as many as liue thereof are infeſted & troubled neither with the dyſenterie or bloudy flix, G
ne yet with the troubleſome offers and ſtrains to the ſiege without doing any thing, nor any o-
ther diſeaſes of the belly: and therefore it is counted a principal remedie for thoſe maladies.
Concerning Turnſol, I haue oftentimes related the wonderfull nature thereof, namely, how it
turneth about with the ſun, although it be a cloſe and cloudy day (ſo great is the loue of this
herb to that planet:) and in the night ſeaſon for want of the Suns preſence, as if it had a great
* This is verified of the Cichory flour rather, which alſo doth regard the Sun. miſſe thereof, * it draweth in and ſhutteth the blew floure which it beareth. Two kinds there
be of this Heliotropium or Turneſol, of which the leſſe is called Tricoccum, the other Helio-
ſcopium: of the twain, this later is the taller (and yet neither of them both exceedeth halfe a
a foot in height) and putteth forth branches from the very root. The ſeed of this greater ſort li-
eth within a little cod, and is gathered in harueſt time: it groweth not but in a fat ſoil wel ma- H
nured, whereas Tricoccum comes vp euery where. I find, that if it be boiled it is a pleaſant and
delectable meat; but ſodden in milk it looſneth the belly gently and with eaſe: for otherwiſe
the bare colature of the decoction in water, if it be taken, purgeth moſt extremely. The juice
of the greater kinde ought to be drawn or gathered in ſummer at noontide; which, if it be tem-
pered with wine, becommeth more ſtrong and effectual. A property it hath being mingled with
oile of roſes, to mitigat the head-ach. The juice drawn out of the leafe, medled with ſalt, takes
away werts: whereupon our herbariſts haue called the herb in Latine Verrucaria, i. Wertwort:
whereas indeed for other better effects and operations that it hath, it deſerueth to haue ſome
denominations correſpondent thereunto: for, a countre-poiſon it is againſt ſerpents and ſcorpi-
ons, if it be drunk with wine or honied water, as *Apollophanes* and *Apollodorus* do report in their I
writings. A liniment made of the leaues cureth the rheumes and diſtillations of the braine in
* This is called *Ærdor capitis* by *Pliny* himſelfe, and is an hot diſtemperature of the head. children; which diſeaſe they call * Siriaſis. Likewiſe it helpeth contractions of ſinues, and the
drawing in of joints, although the patient be taken after the maner of the falling ſickneſſe: and
for ſuch as be thus afflicted, a fomentation made of the decoction of this herb, is very whole-
ſom and comfortable: but if one drink the colature thereof, it thruſteth forth the wormes in the
belly, and ſcoureth out the grauell in the kidnies. If Cumin be put thereto, it breaks the ſtones
ingendred and confirmed there already. Boiled it ought to be root and all, the which with the
leaues and goats tallow, being reduced into a liniment, is ſingular good for all kinds of gout.

The other kind which we call Tricoccon, and is otherwiſe named Scorpiurion, hath not on-
ly ſmaller leaues, but alſo they incline and bend downward to the ground. A ſeed it beareth re- K
ſembling the figure of a ſcorpions taile, whereupon it took that name. A liniment made there-
with is powerfull againſt all venomous beaſts, and namely the perillous ſpiders Phalangia, but
ſpecially againſt the poiſon of ſcorpions. And in truth, look who carry this herbe about them
ſhall not be ſtung. If a man make a circle or compaſſe vpon the earth with the branch of this
herb, a ſcorpion (as ſome ſay) being within the ſame, ſhall not haue the power to get forth: nay,
if the herb be laid vpon a ſcorpion, or if with the ſame being wet a man beſprinckle the ſaid
ſcorpion, it wil ſurely die out of hand. It is ſaid, that foure grains of the ſeed taken in drink, do
cure the quartan, and three the tertian: or if the very herb it ſelfe be laid vnder the patients head,
after it hath bin thrice caried about the bed, it worketh the like effect. The ſeed is of power to
ſtir vp carnal luſt. Applied with hony, it diſcuſſeth biles riſing in the emunctories. Yea & this L
Heliotropium for a certaintie cauſeth werts to fall of by the very roots: as alſo it taketh away
all excreſcences in the fundament. It draweth down by vrin the corrupt bloud in the reines and
loins, lying cluttered about the ridge bone, in caſe the ſeed be either applied as a liniment, or
ſodden in the broth of a cock or capon, and ſo ſupped off, or elſe with Beets and Lentils. As for
the vtmoſt rind of this herbe, it is ſingular for to recouer the freſh and natiue colour in places
black and blew with ſtripes. The Magitians and Wiſe-men do preſcribe for the quartan & ter-
tian agues, That the Patient ſhould tie the herbe Heliotropium, with three knots in a tertian,
and with four in a quartan, praying withall and making a vow, That he would vndo thoſe knots
after he were once cleare of the feuer: but this he muſt do before the herbe be taken out of the
ground. M

* Maidenhair. Another property as ſtrange and miraculous is reported of * Adiantum: in Summer it is
green: in winter it withereth and decaieth not: it checketh all water, for being beſpreint, da-
ſhed, and drenched quite therewith, yet it looketh as if it were dry: ſo great is the antipathy or
contrarietie between them: whereupon the Greeks gaue it that name. And otherwiſe a plant

it

A it is fit for Vinet-workes and knots in a garden. Some call it Callitrichon, others Polytrichon, both which names were giuen it for the effect that it worketh. For it coloreth the hair [black] And for this purpoſe it is ſodden in wine with the ſeed of Ach or Perſley: and a good quantity of oile is put thereto, for to make the haire curled and to grow thick, by which meanes it keeps the hair from ſhedding and falling off: 2 kinds there be of it, the white and the black, which alſo is the ſhorter. The greater kind they cal Polytrichon: the other, Trichomanes. Both of them haue pretie fine branches ſhining with a blacke color, and the leaues reſemble fearn, in which, the nether ſides vnderneath be rough, duskiſh, and browne: but all the leaues ſtand directly one a gainſt another in order, faſtened to the ſtalkes by ſlender ſteles. No root at all theſe Capillar hearbes haue: but they grow vpon ſhadowie rocks and walls, daſhed and beaten on with water:
B but moſt of all they ſeek after pits or holes of wels and ſprings, and ſtony places wherout fountains iſſue: and that is a ſtrange & maruellous thing, conſidering they be not wet with water, nor haue any ſence or feeling thereof. They haue a wonderful faculty, and the black eſpecially, to break the ſtone, and to expel it out of the body. For which cauſe, rather than for growing on ſtones and rocks, I beleeue verily it was by our countrymen called in Latin Saxifrage. To this purpoſe, as much as 3 fingers be able to pluck vp, is ordinarily taken in wine: they prouoke vrin: and reſiſt the poiſon of ſerpents and venomous ſpiders. Being boiled in wine, they ſtay the flux of the belly. A Chaplet made of them, allaieth the head-ach. And a liniment therof is thought good to be applied againſt the ſting of the Scolopendres: but it muſt be often taken off and renewed, for feare the hearb become ouer-drie and loſe all the vertue. In this wiſe it is to be vſed
C where the haire is fallen away by ſome infirmitie. Theſe hearbes diſcuſſe and reſolue the kings euill: they diſpatch and rid away the skales or dandruffe in the viſage, and heale the skals of the head. A decoction of theſe Maiden-haires, is ſingular good for thoſe who are ſhort winded: for the liuer alſo, the ſpleene, the jaundiſe, and the dropſie. An ointment made with Maiden-haire and Wormewood, eaſeth the paines of the kidney: and in caſe of ſtrangurie, procureth eaſe and free paſſage of vrine. They bring downe the after-birth in women, and their monethly tearmes. Howbeit, drink them with vinegre or the juice of the blackberrie bramble, they ſtanch bloud. A proper liniment is made thereof with oile Roſat, to annoint young children that haue the red gum and be all broken out: but firſt they would be bathed in wine. The leaues of Maiden-haire ſtamped with the vrine of a man child vnder fourteene yeares of age, and yet not vndergrowne,
D together with the ſome of ſalt petre, is ſaid to keep the bellies of women from wrinkles and riuels vpon child-bearing, if they be annointed therwith. To conclude, men ſay, That Partridges and cockes of the game will fight more luſtily, in caſe this hearbe bee entermingled with their meat. And the ſame alſo is very good for ſheepe to graſe vpon about their folds.

Chap. XXII.

¶ *Of Picris, Theſium, Aſphodill, Alimus, Acanthus or Brankurſine, Elaphoboſcum, Scandix, Iaſione. Of Caucalis, Sium, Silybum, Scolymus, or Zimonium, Sonchus, Chondrillum or Chodrilles: and of Muſhromes.*

E THe hearbe * Picris tooke the name (as heretofore we haue ſaid) of the notable bitterneſſe which it hath. The leaues thereof be * round. Excellent good it is to take away werts.

* A kind of Cichorie.
* So are none of our Cichories.

Theſium likewiſe commeth nothing behind for bitterneſſe: but it purgeth the bellie: for which purpoſe it muſt be ſtamped, ſtrained, and taken in water.

As touching the Aſphodell, it is one of the ſoueraign & moſt renowmed herbs in the world. Some haue giuen it the name Heroion. And *Heſiodus* hath written that it growes in the woods. *Dionyſius* ſaith, That there is both male and female of it. Certain it is, that the bulbous roots of the aſphodel ſodden with husked barly, is a ſingular reſtoratiue for thoſe bodies which are waſted with a conſumption, & eſpecially of the lungs: and bread made of them, wrought together with corne meale of floure into a dough, is moſt wholeſome for mans bodie. As for *Nicander*, he
F vſed to giue either the ſtem which we called Antherichon, or the ſeed, or els the Onion bulbous roots thereof, in wine, to the quantitie of three drams, as a preſeruatiue againſt ſerpents & ſcorpions: and to preuent the feare and daunger of theſe harmefull and peſtilent creatures, hee appointed the ſame to be laid vnder folks heads as they lay aſleep. Vſually alſo is this herb giuen againſt venomous fiſhes of the ſea, and the Scolopendres of the land. In Campaine, the ſhell-

ſnailes

ſnailes haue a wonderf ull ſpight againſt the maine ſtalke of this hearbe Aſphodel,for they ne- G
uer lin ſucking it,vntil they haue made it as drie as a kex. The leaues alſo are reduced into a li-
niment,for to be applied to enuenomed wounds,occaſioned by ſuch ſerpents & hurtful beaſts.
Likewiſe an ointment may bee made of the bulbous roots thereof,ſtamped together with Bar-
ley groats,for to annoint the ſinews and joynts. Good it is alſo to cut them into roundles,and
therewith together with vinegre, to rub ring-wormes and tettars. In like manner if they be ap-
plied with water,they doe cleanſe putrified and rotten vlcers,yea,and the hot apoſtemations of
the paps and the cods. Beeing ſodden in wine lees,and ſo laid to the eies with a fine linnen rag
betweene,they cure the flux of humors thither,which cauſeth the eyes alwaies to water. Gene-
rally in any diſeaſe whatſoeuer, Phyſicians vſe the root of this hearbe boiled for the moſt part,
rather than otherwiſe:likewiſe for the mor-males and vgly ſores in the legs,they vſe the pouder H
of them dried:as alſo for the fiſſures and chaps appearing in any part of the body. Now,the on-
ly fit and conuenient ſeaſon to gather theſe roots is in Autumne,at what time they bee moſt in
force. Being ſtamped raw,or ſodden,there is a juice preſſed foorth of them:which is ſoueraigne
with honey,for any pains of the bodie,whether it be the collicke,or ſeated in the muskles. And
the ſame being mixed with the drie root of Flower-de-lis,and a little quantity of ſalt,is paſſing
good for thoſe that affect a ſweet ſmel,and would palliat the ranke ſauor of any part of the bo-
dy. Moreouer,the leaues of the Aſphodel ſerue for al the former maladies,as alſo for the kings
euill:for red and flat biles,gout-roſat,ſauce-fleame,ale-pocks,and ſuch like vlcers in the face;if
the ſame be ſodden in wine,and therwith the grieued parts bathed. The aſhes of the root burnt,
bring hair againe vpon the head where it was loſt and gon,and healeth vp the chaps and rifts in I
the feet. The juice of the root ſodden in oile,is good for kibed heles,for burns or skals. To help
the hardnes of hearing,the ſame juice is to be dropped into the eares,but to aſſuage the tooth-
ach,it muſt be inſtilled into the ear of the contrary ſide. The ſame root taken in drink moderat-
ly,is ſingular for to procure vrine,to prouoke womens moneths,and to mitigat the paine of the
ſides or pleuriſie. But giuen in wine to the weight of one dram,it cureth ruptures,convulſions,
or cramps andcoughs. The ſame being chewed,helpeth forward vomites, and cauſeth them to
come with more eaſe. The ſeed,if it be taken inwardly,troubleth and wringeth the belly. *Chry-*
ſermus the Phyſician vſed to boile the root in wine, and therewith cured the ſwelling kernills
The ſeed of a kind of Roſe-mary. and inflammations behind the ears:alſo,with an addition of * Cachrys and wine,he healed the
kings euil. Some ſay,that if one take the Aſphodel root,and lay one part thereof to thoſe ſwel- K
ling kernils called the kings euill,and remoue it vpon the fourth day, letting the other part to
hang in the ſmoke;the ſaid kernils wil drie away,euen as the root doth in the chimny. *Sophocles*
(for the gout) vſed the root both waies, as well raw as boiled. In caſe of humble-heels he appli-
ed it ſodden in oile:but to them that were fallen into the jauniſe or dropſie,he gaue it in wine.
Some writers haue ſet down in their books,that if either the members of generation be anoin-
ted with a liniment made therwith and wine and hony together,or if the ſame be taken in drink
it will mightily prouoke fleſhly luſt. *Xenocrates* affirmeth, That a decoction of the root in vine-
gre taketh away the ring-worms,tettars,& running ſcabs. *Item*, If the root be boiled with Hen-
bane and Tar,and therewith the armholes and parts between the legs be well rubbed,it wil rid
away the ſtrong and rank ſauor which commeth from thence,and if the head be firſt ſhauen,& L
afterwards rubbed with the ſaid root, the haire comming afterwards will curle and frizzle the
better. *Simus* the Phyſician boileth it in wine,and ſo giueth it in drinke, for to ſcoure away the
ſtones of the kidnies. *Hippocrates* preſcribeth to giue the ſeed againſt the hardnes of the ſpleen
and the flux proceeding from thence:furthermore,the root being brought to a liniment,or the
very iuice thereof ſodden and vſed accordingly, healeth the farſins, mange,and ſcab,in horſes,
and reduceth the place to bear hair again as faire as before. Aſphodel hath a property to chaſe
away mice and rats:and if their holes be ſtopped vp therewith,they die within.

Some are of opinion,that *Heſiod*. called Aſphodel,a limon:which I take to be a meer vntruth:
for ther is an herb by it ſelf called Alimon:about which writers haue erred not a little:for ſome
ſay,that it is a ſhrub growing thick,of a white color,without any prick or thorn, bearing leaus M
like the Oliue tree,but they be ſofter: & this plant is entertained in the kitchin,there ſodden
and dreſſed for to be ſerued vp as meat to the table:the root taken to the quantity of one dram
*Alyris rather according to *Aëtius*.* in honied water,diſpatcheth the torments of the belly:it cureth alſo convulſions and ruptures.
Others affirme, that * Alimon is a ſea-wort,of a ſalt and brackiſh taſt, whereof it had the name.

The

A The leaues be round, and yet after a ſort long withall: and the whole herb is highly commended for the pleaſant taſt, and good to be eaten. Moreouer, there be two kinds of it: for the one is wild, the other is of a more ciuil and gentle nature. And both of them, by their ſaying, are good to be eaten with bread for the bloudy flixe, euen when the guts be already exulcerate: but with vinegre, for to comfort and help the ſtomack. A liniment made of Alimon raw, is ſingular for old feſtered vlcers, and the ſame mitigateth the ſymptomes that follow green wounds: as alſo aſſuageth the pains enſuing vpon ſprains and diſlocations of the foot: yea & pacifieth the grief of the bladder. The wild of this kind hath ſmaller leaues, but more effectuall it is in the remedies beforeſaid: and withall, healeth the ſcab as well in man as beaſt. Ouer and beſides, they do affirm, That if the body be rubbed with the root, the skin wil be the fairer and more ſmooth: or
B if the teeth be ſo ſerued they will be the whiter. Alſo that whoſoeuer hold the ſeed thereof vnder their tongues, they ſhall not be dry nor feel thirſt. This kind is likewiſe eaten at the boord, and both of them are kept and preſerued condite. *Crateuas* hath made mention of a third ſort, which hath longer leaues than the reſt, and more rough in the hand, in ſmel reſembling the Cipres tree; who ſaith, that it delighteth principally to grow vnder the Yuie tree: which if it be taken to the weight of 3 oboli in a ſextar of water, helpeth thoſe that haue their heads & bodies drawn far back, and ſuch as be troubled with the contraction and ſhrinking of ſinues.

As touching Acanthus or Brankurſine: an herb it is cheriſhed much is gardens, proper for vinets and ſtory-workes, bearing vpright and long leaues, wherewith beds-ſides and borders of quarters in gardens are decked and beautified. Two kinds there be of it: one with pricky leaues
C in maner of thiſtles, and the ſame jagged, which is the leſſe & lower of the twain: but the greater, which ſome in Greek call Pæderos, others Melamphyllon, is ſmooth leaued. The leaues of this Brankurſine being applied, are wondrous good for burns and diſlocations. Alſo being ſodden with meat, and eſpecially with Ptiſane or husked barly, it is ſingular for thoſe who are burſten, troubled with the crampe, and ſubiect to the conſumption of the lungs. Alſo if they be ſtamped and reduced into the form of a liniment, and laid too hot, they cure the gouts proceeding from an hot cauſe.

The herb * Bupleuron is reckoned by the Greeke writers in the number of worts that grow of themſelues: a ſtem it hath of a cubit in height, many leaues, and thoſe growing long in a ſpoke-tuft or rundle in the head, in maner of Dill; highly commended by *Hippocrates* for good
D meat; but *Glycon* and *Nicander* praiſe it as much for the vſe thereof in Phyſick: and in very truth the ſeed is powerfull againſt ſerpents. The leaues alſo or the very juice incorporate with wine into the form of a liniment, they imploy for to bring down the afterbirth of women newly deliuered: as alſo the leaues with ſalt and Wine are vſed by way of cataplaſme, for to diſſolue the ſwellings called the Kings euill. As for the root, it is vſually giuen in wine againſt venomous ſerpents, and to prouoke vrine.

* Some name it Hares eare.

* Bupreſtis is an herb about which the Greek writers haue ſhewed themſelues, namely, how inconſtant and light of credit they be; in that they haue ſo highly praiſed it to be a ſpeciall wholſom meat, yea and a ſingular remedie againſt poiſons. For the very name ſheweth euidently that it is a poiſon it ſelfe, of kine and oxen at leſtwiſe. And they themſelues do confeſſe, that
E if ſuch cattel taſt of * Bupreſtis it wil make them inraged, and fall a gadding vntil they burſt in ſunder. And therefore I will not ſpeak any more of this herb; for there is no reaſon that may induce me to deſcribe theſe venimous weeds among thoſe that ſerue for the green garlands aforeſaid made of graſſe: vnleſſe haply it be this, That ſome one or other would ſeek after this herbe to weare it in a chaplet for luſt-ſake: * which indeed they ſay it wil prouoke no leſſe that way, than if it were taken in drinke.

Heſych βύπρηστις· βοῦπρησις ἰὸς βοῦπρησις ἰὸ ἕλκος νεναμένον.

* But they meane the venomous Iuſect βοῦπρησις.

* In truth the flies Bupreſtes, which ſome take to be Cantharides, are thought to haue ſome operation in that kind.

* Elaphoboſcon is an herb growing vp with a main ſtem, after the maner of Fenel-geant: the ſame is full of knots and joints as thick as a mans finger. The ſeed is made after the faſhion of berries hanging downe in maner of Sili or Siler-mountaine; howbeit nothing bitter they are, and the leaues reſemble thoſe of Aliſanders. This herb is taken for a commendable meat; and
F in truth is kept alſo and preſerued a long time confected and condite, for a ſingular remedie to procure vrin, to allay the pain of the ſides in the pleuriſie, to heale ruptures, to cure conuulſions and cramps, to diſcuſſe ventoſities, to aſſwage the dolorous torment of the collicke, yea, and as a very countre-poyſon againſt the ſting of ſerpents and all other creatures armed with ſtings: for the report goeth, That ſtags and hindes by feeding thereupon withſtand the venom of Ser-

* Which ſome take for a kind of wild *angelica* or *Gratia dei*.

pents.

20030 copy 1

pents. The root alſo reduced into a liniment with Sal-nitrum put thereto and incorporate to- G
gether, cureth old ſores called fiſtulaes. But the ſaid root ought to be dried firſt for thoſe purpoſes, to the end that it ſhould not be full of the own juice and moiſture: and yet this humour dulleth not the vertue thereof, nor maketh it leſſe effectuall againſt the ſting of ſerpents.

Pecten veneris, wild Cheruile, or Shepheards needle.

Touching the herb * Scandix, the Greeks haue ranged it alſo among the wild worts, or pot-herbs good for to be eaten, according to *Opion* and *Eraſiſtratus*. The ſame being ſodden, knitteth the belly and ſtoppeth a laske. The ſeed taken with vinegre preſently ſtayeth the yox or hicquet: it prouoketh vrin, and ſerueth well in a liniment to heale vp burns. The juice of it being boiled to a juleb, is good for the ſtomack, liuer, kidnies, and bladder. This is the herb which *Ariſtophanes* the Comædian twitted the Tragicall Poet *Euripides* by, obiecting vnto him merily by way of a ſcoffe, that his mother, who was a gardener, vſed to ſit in the market and ſel neuer H
a good wort or pot-herb indeed, but made her markets only of Scandix. And verily I would ſay
Our Chervile. that * Anthriſcus were the ſame herb, if it had ſmaller, tenderer, and ſweeter leaues. This peculiar praiſe and commendable propertie it hath, that if the body be ouerlayed and wearied with the vſe of women, it reſtoreth the ſpirits and refreſheth them again. Yea & ſuch as be wel ſtept in yeares, and begin to droup, it maketh luſty and able to perform the act of generation youthfully. It ſtayeth the flux of the whites in women.

A kinde of ſmooth Bindweed.

Moreouer, * Iaſione is counted alſo a wilde wort, comming vp of it ſelfe and good to be eaten. This herb creepeth by the ground, full of milk it is, and beareth a white floure which ſome call Concilium. The like name and commendation there goeth of this herbe for ſtirring vnto letcherie. Being taken raw with meat in a vinegre ſauce, it breedeth plenty of milke in women. I
A ſingular reſtoratiue it is for them that feele themſelues wearing & decaying by a conſumption. A liniment made therwith and applied to the head of yong infants, cauſeth hair to come vp thicke: and by ſhutting the pores of the skin more cloſe, it is a means to retain the hair ſtill that it ſhed not eaſily.

Baſtard Parſly

As for * Caucalis, an herb like to Fenel, but that it hath a ſhort ſtalke and a white floure: it is good alſo to be eaten, and is beſides counted a cordial. A drink likewiſe is made of the juice thereof, paſſing comfortable to the ſtomack, of power to prouoke vrin, to expel grauel & ſtone, and to ſtay the itching within the bladder: it doth ſubtiliat the groſſe and tough flegm which cauſeth obſtructions in the ſpleen, liuer, and kidnies. The ſeed being taken inwardly helps forward the monthly ſickneſſe of women when it ſtayeth vpon them, and drieth vp the cholericke K
humors which flow after child-birth, or the after-burden. It is giuen alſo to men for the ſpilling of natural ſeed, or the running of the reins. *Chryſippus* is of opinion, that it is ſingular good to help women for to conceiue, if they be deſirous of children. But the maner is to drinke it in wine next the heart faſting. And as *Petricus* the Poet hath deliuered in verſe, a liniment of this herb is ſingular againſt the poiſons of venomous ſea-beaſts.

A kind of water Creſſes or Lauer.

Among theſe herbs is reckoned * Sion, a plant growing in waters of it ſelfe, with leaues like Parſly or Smallach, but that they be larger, fatter, & of a deeper blackiſh green: it beareth ſeed plentifully, and in taſt reſembleth water-Creſſes. It is thought to be excellent good for thoſe that canot make water, for the diſeaſes of the reins, and paine of the ſpleene, yea and for women whoſe monethly termes are ſuppreſſed; whether the ſubſtance thereof be taken as meat, or the L
juice of the herb decocted, or the ſeed drunk in wine to the weight of two drams. It breaks the ſtones ingendred within the body, and notwithſtanding it groweth in water, yet it euacuateth thoſe aquoſities and waterie humors which ingender the ſame. Being cliſterized it helps thoſe that haue the bloudy flix. If women anoint their faces with a liniment made of it ouer-night, it doth embelliſh their skin at one inſtant and with one dreſſing: yea, it taketh away the pimples and ſpots that disfigure the face, in maner of Lentils. This ointment is held alſo to be good for the farſins and ſuch ſores, in horſes and ſuch like beaſts, and to mitigat the grieuous paines and trouble of any ruptures.

As concerning Silybus, an herbe like vnto the white Chamæleon, and as full of thornes; it groweth abundantly in Cilicia, Syria, and Phœnice: and yet in theſe countries they make not M
ſo much account of it as to beſtow the dreſſing of it, it asketh ſo much adoe in the kitchen, before it be in caſe to be ſerued vp in the hall. And for phyſicke there is no goodneſſe in it at all.

Some take theſe for our Artichokes.

The plant * Scolymus is vſed alſo much to be eaten in the Eaſt parts, where they call it by another name Limonia: It neuer exceedeth a cubit in height: the leaues be creſted: the root blacke,

A blacke, but yet ſweet. *Eratoſthenes* commendeth it as a principal diſh for a poor mans table: and it is ſaid that it hath a ſpecial vertue to prouoke vrine: and with vinegre if it be applied, to cure the foule tettars called Lichenes, and the leproſie: alſo by the teſtimony of *Heſiodus* and *Alcæus*, if it be taken in wine, it inciteth to wantonneſſe and fleſhly pleaſures. Theſe Poets doe write, That when this hearb doth flouriſh and is at the beſt, then graſhoppers chaunt loudeſt and ſing moſt ſhril: and as women at ſuch a time be moſt deſirous of mens company and hotteſt in luſt, ſo contrariwiſe men are moſt loth to turn vnto them, and leaſt able to content their appetite: as if Nature to ſatisfie the pleaſure of theſe good wiues, had prouided againſt that faint ſeaſon, the help of the Artichoke, as a viand moſt powerful at this time to ſet their husbands in a heat, and to enable them to that buſineſſe. Moreouer, an ounce of the root cleanſed from the pith,
B. ſodden to the thirds in three hemines of the beſt Falerne wine, and either taken in drinke vpon an emptie ſtomack, preſently after that one hath ſweat, and is new come foorth of the Baine: or elſe to the quantitie of one cyath immediatly after euery meale, doth correct and take away the ſtinke and ranke ſmell of the arme-pits. And a ſtraunge thing it is, that *Xenocrates* affirmeth vpon his owne experience, and promiſeth, That this decoction is of ſuch efficacie, that it cauſeth the ſaid ſtrong ſent to paſſe away by the vrine.

Moreouer, the * Sowthiſtle is an hearbe for to be eaten, for we read in the Poet *Callimachus*, That the poore old woman *Hecale*, at what time as prince *Theſeus* fortuned on neceſſitie to take his repaſt in her ſimple cottage, made him a feaſt, and ſet before him a principal diſh of Sowthiſtles. Two kinds there be of them, the white, and the black: both, like vnto lectuce, but that they
C are full of pricks. They run vp into a ſtalke of a cubite in height, the ſame is cornered and hollow within; but breake it, and you ſhall ſee it run out with milke plentifully. The white, which hath that bright colour of the milke within it, is thought to bee as good as Lectuces, for thoſe that be ſtreight winded, and cannot take their breath but vpright. *Eraſiſtratus* ſheweth plainely, That if it be eaten, it expelleth grauell by vrine: and chewed only, it correcteth the ſtinking ſauor of the mouth, and cauſeth one to haue a ſweet breath. The juice thereof drawn to the meaſure of three ciaths, made hot in white wine and oile, and ſo taken, helpeth women in labor, that they may be ſoone deliuered, but preſently after they haue drunk it, they ought to ſtir their bodies and walke vp and down their chamber. Alſo it is vſed to be ſodden in broth, and ſo ſupped vp. The very ſtalke therof being boiled, maketh milch nources to haue good ſtore of milk, and
D the children at their breaſt to be better coloured. But moſt excellent it is for ſuch nources as feele their milk to cruddle in their breaſts. The juice thereof dropped into the ears, doth them much good, and a meaſure of one cyath drunk hot, is as good for the ſtrangurie. But in the fretting and gnawing of the ſtomack, it would be taken with Cucumber ſeed and Pine-nut kernils. Applied in form of a liniment, it cureth the apoſtemations in the fundament. A drinke is made thereof, which is a countrepoiſon againſt ſerpents and ſcorpions: but then the root alſo muſt be laid outwardly vnto the ſore place. The ſame root boiled with oile within the pill of a pomgranat, is a good remedie for the paines and maladies of the ears. Note, that all theſe vertues muſt be vnderſtood of the white Sowthiſtle. And *Cleemporus* doth accord hereunto as touching the white, but he alloweth in no wiſe to eat of the black, for he is of opinion, that it breedeth diſea-
E ſes. *Agathocles* alſo preſcribeth the juice of the white Sowthiſtle to them who haue drunk Bulls bloud, and ſuſpect themſelues poyſoned therwith. Howbeit, they be all agreed, that the blacke is refrigeratiue: in which regard it ought to be applied outwardly with Barly groats. *Zenon* declareth, That the root of the white Sow-thiſtle, cureth the ſtrangurie.

As for * Chondrillon or Chondrille, it hath leaues like to Endiue or Cichory leaues gnawed or eaten round about: a ſtem not a foot high, and the ſame full of a bitter iuice: a root like vnto * Beane, and otherwhile there be many of them together. This hearbe putteth forth cloſe to the ground a certain kind of gum like Maſtick, ſwelling out to the bigneſſe of a Bean, which being applied to the naturall parts of women, is ſaid to draw down their monthly courſes. The ſame hearbe being ſtamped root and all together, and digeſted into troſches, is thought to bee
F ſingular good againſt ſerpents: and a probable reaſon herof is collected, becauſe the field mice and rats when they are ſtung by ſerpents, haue recourſe to this hearb, and eat thereof. The juice drawne out of this herb, after it is ſodden in wine, bindeth the belly. The ſame is ſingular good to rectifie, couch and lay euen the diſorderly hairs of the eye-lids, as effectually as the beſt gum in the world. *Dorotheus* the Poet hath deliuered in his verſes, that it is good for the ſtomack, and helpeth

* Sonchus.

* Gum Succorie.

* *Dioſ.* ἁπαλὸν, i. tul and freſh: but it ſeemeth that *Plinie* read it κωνῶπιον.

20030 copy 1

helpeth digeſtion. Some hold opinion, That it is naught for women & hurtful to the eies, alſo G
that it is contrarie to the ſeed of man and doth hinder generation.

Among all thoſe things which are eaten with danger, I take that Muſhromes may iuſtly be ranged in the firſt and principal place: true it is, that they haue a moſt pleaſant and delicat taſt, but diſcredited much they are and brought into an ill name, by occaſion of the poyſon which *Agrippina* the Empreſſe conueighed vnto her husband *Tiberius Claudius* the Emperour, by their means: a daungerous preſident giuen for the like practiſe afterwards. And verily by that fact of hers, ſhe ſet on foot another poiſon, to the miſchiefe of the whole world and her owne bane eſpecially (euen her own ſonne *Nero*, the Emperor, that wicked monſter.) The venomous qualitie of ſome of theſe Muſhromes, may be ſoone known by their weak redneſſe, their mouldy hew ſo vnpleaſant to ſee to, their leaden and wan colour within-forth, their chamfered ſtreakes full of H
chinks and chaps, and finally, their edges round about pale and yellow. For others there be that haue none of all theſe markes: but are drie, and carie certain white ſpots like to drops or grains of Sal-nitre, putting foorth in the top out of their tunicles. And in truth, before that the Muſhrome is formed, the earth bringeth forth a certain pellicle or coat firſt, called in Latin Volua; for this purpoſe, that the Muſhrome ſhould lie in it: and then afterwards ſhee engendreth it encloſed within, much like as the yolke of an egge couched within the white. And ſo long as the Muſhrome is young and not come forth, but lieth as a babe within, the ſaid core or tunicle is as good meat as the Muſhrom it ſelfe: but ſo ſoon as the Muſhrom is formed, this membran breaketh, and incontinently the body or ſubſtance therof is ſpent in the ſtele or foot that beareth it vp: and ſeldom ſhall you ſee 2 Muſhromes vpon one of theſe ſteles or feet. Moreouer, theſe muſhroms take their firſt originall and beginning of a ſlimy mud, and the humor of the earth that I
is in the way of corruption: or els of ſome root of a tree, & ſuch for the moſt part as beare Maſt. It ſeemeth at the firſt, as if it were a kind of glutinous fome or froth, then it growes to the ſubſtance of a pellicle or skin, and ſoone after ſheweth the Muſhrom indeed, bred, formed, and conſummat within, as is aforeſaid. And verily al ſuch are pernicious and vtterly to be rejected neer to which when they come new out of the ground, there lay either a grieue-ſtud or leg harneis-naile or ſome ruſtie yron, or ſo much as an old rotten clout: for looke what naughtineſſe ſoeuer was in any of them, the ſame they draw and conuert into venome and poyſon. But none are able to diſcern theſe hurtful Muſhromes from others, how curious and circumſpect ſoeuer they be, ſaue only the peaſants of the country where they grow, and ſuch as haue the gathering of them. K
And here is not al the miſchiefe that lieth in them: For dangerous they be otherwiſe, and meet with more meanes to make them deadly, namely, if a ſerpents hole or neſt be neare by, or if at their firſt diſcouerie and comming forth, a ſerpent chance to breath and blow vpon them: for ſo prepared they be and diſpoſed as a fit ſubject, to enter, that preſently they will catch and entertain any poiſon. And therfore on any hand we muſt not be bold and luſty with them before the time that ſerpents be retired into the ground, & there taken vp their harbor. Which is an eaſy matter to know, by the tokens of ſo many herbs, trees, & ſhrubs, which from the time that they firſt came abroad aboue ground, vntill they haue taken vp their winrer lodging again, looke alwaies freſh and greene: and principally by the leaues of the Aſh, alone, if there were no more trees: for Aſhes neither bud and ſpring forth, but after that ſerpents come abroad, nor ſhed and L
fall away, before they be gone into the ground again. In ſumme, this would be noted, That Muſhromes be vp and down, come and gon, alwaies in a ſeuen-night ſpace. Thus much of the Muſhromes named in Latine Boleti.

Chap. XXIII.

¶ *Of other Muſhromes or Tad-ſtoles called Fungi. Of Silphium, and Laſer.*

AS touching thoſe excreſcenſes in manner of Muſhromes, which be named Fungi, they are by nature more dull and ſlow. And albeit there bee many kinds of them, yet they all take their beginning of nothing els but the ſlimy humor of trees. The ſafeſt and leaſt daunge- M
rous be thoſe, which haue a red calloſitie or outward skin, and the ſame not of ſo weak a red, as that of the Muſhromes called Boleti. Next to them in goodneſſe are the white, and ſuch as hauing a white foot alſo, bear a head much reſembling the Flamins turbant or mitre, with a tuffet or creſt in the crown. As for the third ſort that be called Suilli, as one would ſay, Swine-Muſh-

romes

A roms or Puffs, they are of al others moſt perilous, and haue the beſt warrant to poiſon folk. It is not long ſince that in one place there died thereof, all that were of one houſhold; and in another, as many as met at a feaſt and did eat thereof at the ſame bourd. Thus *Anneus Serenus*, captaine of the Emperour *Nero* his guard, came by his death, with diuers coronels and centurions, at one dinner. And I wonder much, what pleaſure men ſhould take thus to venture vpon ſo doubtfull and daungerous a meat. Some haue put a difference of theſe muſhroms, according to the ſeuerall Trees from which they ſeeme to ſpring, and haue made choiſe of thoſe that come from the Fig-tree, the * Birch, and ſuch as beare gum. For mine own part, as I haue ſaid before, I hold thoſe good that the Beech, Oke, and Cypreſſe trees doe yeeld. But what aſſurance can a man haue hereof, from their mouths who ſit in the market to ſell them? for all the ſort of thoſe
B Puffes and Toadſtooles look with a leaden hew and wan color. Howbeit, the nearer that a Muſhrome or Toadſtoole commeth to the color of a fig hanging vpon the tree, the leſſe preſumption there is that it is venomous.

* *Betula, non Ferula.*

Touching the remedies for to help thoſe who ſuſpect they haue eaten theſe dangerous muſhroms, I haue ſaid ſomwhat alreadie, and wil ſay more herafter. Mean while this would be noted, that as perilous as they be, yet ſome goodneſſe there is in them, and diuers medicines they doe yeeld. Firſt and foremoſt, *Glaucias* thinketh and affirmeth, That the Muſhromes Boleti be good for the ſtomacke. As for the ſwine muſhromes, named in Latin Suilli, they are hanged vp
C to dry infiled vpon a ruſh running through them, as wee may ſee in thoſe that come out of Bithynia. And theſe are ſuppoſed to be ſingular for thoſe fluxes and catarrhs that take a courſe to the belly and breed fluxes, called by the Greekes Rheumatiſmes: theſe cure the excreſcenſes of the fleſh, that riſe in the fundament; for they eat them down, & in tract of time conſume them quite: alſo they are good to take away the pimples and freckles that appeare vpon the skin, like to Lentils, yea and the deformities and ſpots in womens faces that disfigure their beauty: theſe muſhroms be * waſhed as lead, for to enter into collyries and eye-ſalues: and a liniment is made thereof, which being applied with water, cleanſeth filthie ſores and vlcers, cureth the skals that breake out in the head, and healeth the wounds occaſioned by the biting of dogs.

* *Lauantur vt plumbum*, ſome read *Linuntur ad plumbum*, (*i.*) a liniment is made of the for lead-ſhotte eyes, &c. *vide cap* 13. *lib.* 25.

And now for that our fine mouthed and dainty wantons who ſet ſuch ſtore by their tooth, take ſo great delight to dreſſe this only diſh with their own hands, that they may feed thereon in conceit and cogitation all the while they bee handling and preparing the ſame, furniſhed in
D this their buſineſſe with their fine kniues and raſors of amber, and other veſſels of ſiluer plate about them: I for my part alſo am content to frame and accomodate my ſelfe to their humorous fanſie, and will ſhew vnto them in generall, certaine obſeruations and rules how to order and vſe them, that they may be eaten with ſecurity. Marke then thoſe muſhroms, which in the ſeething proue hard and tough, ſuch be all of them hurtfull: Leſſe daungerous they be, if ſome ſalt-nitre be put to them whiles they be a boiling ouer the fire; prouided alwaies, that they be fully ſodden before they be taken off. Alſo, a man may be more bold to eat thoſe which be ſodden together with fleſh meat, or with the tailes or ſteles of peares. The eating alſo of peares immediatly after one hath fed vpon Muſhroms, doth kil or dull all the malice that they may haue. Alſo vinegre is of a contrary nature vnto them, and doth extinguiſh or mortifie their venomous qualitie. To conclude, all theſe muſhromes do come vp and are engendred in rain. Semblably, good
E ſhowres doe breed Silphium.

This Silphium came at the firſt from Cyrenæ (as I haue before written) but now adays, ſince time that all the Cyrenaick Silphium is deſtroied and gon (as hath bin ſaid) the greateſt ſtore thereof is brought out of Syria: howbeit ſo good it is not as that which Parthia yeelds, though it be better than that which the merchants bring ouer with them out of Media: this * Silphium is of great vſe in Phyſicke; for the leaues are ſodden in white odoriferous wine: of which decoction, there is made a drink for to cleanſe and purifie the matrice, and to expell the dead infants therein, ſo it be takn to the meaſure of one Acetabulum, immediatly after the woman hath bin in the ſtouve, and there ſwet. The root is ſingular for to cleare the windpipes, and to take away
F all the aſperity and roughnes in thoſe parts; and being applied in form of a liniment, it helpeth impoſtumat inflammations proceeding from the ranknes and ebullition of the bloud: & yet as many as take it at the mouth and eat therof, find that it is hard of digeſtion; for it breedeth ventoſities and cauſeth much belching. Hurtful alſo it is and contrarie to the free paſſage of vrine. A liniment made thereof together with wine & oile, is a moſt familiar and agreeable medicine

* *or Laſerpitium.*

20030 copy 1

for the black and blew marks remaining after ſtripes: but if the ſame with ſome adition of wax, G
be reduced into a cerot, it healeth the Kings euil. The piles or werts growing in the fundament,
with a ſuffumigation of Silphium oftentimes vſed, will fall off.

As for the liquor Laſer, iſſuing from Silphium (in that maner as I haue ſhewed) it is holden
for one of the moſt ſingular gifts that Nature hath beſtowed vpon the world, and entreth into
many excellent confections and compoſitions. Of it ſelfe alone, it reduceth thoſe to their natu-
rall heat, who are ſtaruen and benummed with extreame cold. Taken in drinke, it allaieth the
accidents and griefes of the nerues. It is both giuen to women in wine, and applied alſo in ſoft
locks of wooll to their natural parts, for to bring down their menſtrual purgation. If it be mix-
ed and incorporat with wax, it draweth and fetcheth out by the roots, the agnels or corns in the
feet, if ſo be they be ſcarified round about before with the lancer. Being diſſolued in ſome con- H
uenient liquor and taken to the quantity of a cich peaſe, it prouoketh vrin. *Andreas* the Phyſici-
an doth aſſure and warrant vs, That if it be taken in greater quantity, it breedes no windineſſe in
the ſtomacke, but helpeth digeſtion mightily both in women and alſo in old men: Who ſaith
moreouer, that it is better and more wholeſome in winter than in ſummer, and for thoſe eſpeci-
ally who drinke nothing els but water: only they muſt look to this and take heed, that there be
no exulceration within the body. A great reſtoratiue it is with meat, and quickly ſetteth them
on foot, who haue lien along and bin brought low by ſickneſſe: for Laſer if it be applied in due
time, is as good as a potentiall cautery * to raiſe a bliſter: but better it is for them who are ac-
quainted with it, than for thoſe who haue not bin vſed to it. Outwardly applied, no man makes
doubt but it is of ſingular operation, and worketh many effects: taken in drink, it extinguiſheth I
the venome left in the bodie, either by poiſoned dart, or ſerpents ſting: and if the wounds be an-
nointed with the ſame, diſſolued in water, it is the better: but particularly for the prickes of
ſcorpions, it would be applied with oile. Alſo in caſe that vlcers will not grow to any maturati-
on, nor yeeld from them conçocted matter; a pultes made of Laſer, together with barley floure
or figs, is a ſingular digeſtiue. Being laid too with Rue, or hony, or by it ſelfe alone (ſo the place
be annointed ouer it with ſome viſcous gum to keep it too that it run not off) it is excellent for
the carbuncle, and the biting of dogs. If it be ſodden in vinegre with the rind or pil of a pome-
granat, it is paſſing good for the excreſcences riſing about the tiwil, if the place be bathed with
that decoction. Being incorporat with Sal-nitre, and well wrought withall beforehand, and ſo
applied, it taketh away the hard horns and dead cornes ariſing in the feet, which commonly be K
called in Latin Morticini. Tempered with wine & ſaffron and pepper, or if it be but with mice
dung and vinegre, it is a good incarnatiue in vlcers: & an excellent drawer to the outward parts
for to fil vp the skin and make a bodie fat. A good fomentation there is made of it and wine, for
to bath kibed heels: for which purpoſe, it is boiled in oile and ſo applied. In like manner, it ſer-
ueth to ſoften hard calloſities in any place whatſoeuer: and for the foreſaid corns of the feet e-
ſpecially, if they be ſcarrified & ſcraped before, it is of great efficacy. Singula it is againſt vn-
wholſom waters, peſtilent tracts, and contagious airs; as in times ſuſpected of infection. Soue-
raigne it is for the cough, the fall of the Vvula, and an old jauniſe or ouerflowing of the gall: for
the dropſy alſo and hoarſneſſe of the throat; for preſently it skoureth the pipes, cleers the voice
again, and maketh it audible. If it be infuſed and diſſolued in water and vinegre, and ſo applied L
with a ſpunge. It aſſuageth the gout. Taken in a broth or thin ſupping, it is good for the pleuri-
ſie, eſpecially if the patient purpoſe to drink wine after it: being couered al ouer with wax to the
quantity of one cich peaſe, it is giuen very well in caſe of contractions & ſhrinking of ſinewes,
and namely to ſuch as cary their heads backward perforce, by occaſion of ſome crick or cramp.
For the ſquinance, it is good to gargarize therwith. Semblably it is giuen with leeks and vine-
gre, to thoſe that wheaze in their cheſt, and be ſhort winded, & haue had an old cough ſticking
long by them: alſo with vinegre alone, to ſuch as haue ſupped off and drunk quailed milke, that
is cluttered within their ſtomack. Taken in wine, it is ſingular for the faintings about the heart;
as alſo for colliquations and ſuch as are faln away and far gone in a conſumption, & thoſe that
be taken with the falling ſickneſs: but in honied water, it hath a ſpecial operation reſpectiue to M
the palſie, or reſolution of the tongue. With ſodden honey and Laſer together, there is made a
liniment, very proper to annoint the region of the hucklebone, where the Sciatica is ſeated; and
the ſmall of the backe, to allay the pain of the loins. I would not giue counſel (as many writers
doe preſcribe) for to put it in the concauitie or hole of a rotten tooth, and ſo ſtop vp the place
cloſe

*He meaneth by *cauterium*, κατακαυστικὸν, *medicamẽte* φαρμακευτικὸν, or μεταποιητικὸν, which doth draw humours and the bloud to the habit and outward parts: a neceſſarie courſe to be taken in Atrophia, and namely after long diſeaſes, that the body may be equally nouriſhed.

A cloſe with wax, for feare of that which might enſue thereupon: for I haue ſeene the fearfull ſequel of that experiment in a man, who vpon the taking of that medicine, threw himſelfe headlong from an high loft and brake his necke; ſuch intolerable paines he ſuſtained of the toothache: and no maruell, for do but anoint the muffle or noſe of a Bull therewith it wil ſet him on a fire & make him horn-mad: and being mingled with wine, if ſerpents (as they are moſt greedie of wine) chance to lap or lick thereof, it wil cauſe them to burſt. And therefore I would not aduiſe any to be anointed with it and hony of Athens incorporat together, howſoeuer there be ſome phyſitians who ſet down ſuch a receit. Certes, if I ſhould take in hand to particularize of the vertues that Laſer hath, being mingled with other matter in confections, I ſhould neuer make an end. But my purpoſe is to deale with ſimples only, wherein Natures work is moſt ap-
B parant & euident to be ſeen; whereas in compoſitions we go altogether by coniectures which many times deceiue vs: neither can a man be aſſured of their operation; for who is able to obſerue the iuſt proportion in theſe mixtures, either of the contrarieties and repugnances, or the concord and agreement of the ingredients in Nature? But of this point I will write more at large hereafter.

Chap. XXIV.

¶ *Of the nature and properties of Hony. Of honied water or Mead called Hydromel. How it commeth to paſſe that the manners and behauiours of men be altered by meat and viands. Of honied wine named Melitites, and of Wax. Alſo againſt the abuſe in compoſition of medicines.*

C

HOny, were it not ſo common as it is, and euery where to be had, would be as high eſteemed and of as great price as Laſer. As for this drug, Nature hath framed and made it immediatly her own ſelf; but for the getting and working of hony ſhe hath created a liuing creature of purpoſe, as we haue already ſaid: by means whereof we haue this cœleſtial liquor, which ſerueth for an infinite number of vſes, conſidering how often it entreth into mixtures and compoſitions. And firſt to ſpeak of that cereous ſubſtance Propolis, which, as it hath bin ſhewed already, offereth it ſelfe firſt to be ſeen at the very entry of the Bee-hiue. Theſe vertues medicinable it hath, namely to draw forth all pricks, thorns, and what offenſiue thing ſoe-
D uer ſticketh within the fleſh of a body; to diſſolue and diſſipate all tumours and ſwelling bunches, to concoct and mollifie any hardneſſe, to aſſuage the pains of ſinews, and finally to incarnat, heale vp, and skin any deſperat vlcers.

As touching Hony it ſelfe, of this nature verily it is, That it wil ſuffer no dead bodies to putrifie, notwithſtanding it be of a ſweet and pleaſant taſt, far from any ægreneſſe, and contrary to the nature of ſalt: for the throat, the kernels of each ſide thereof called the Tonſils or Amygdals; for the ſquinancie, and all the accidents befalling to the mouth; as alſo for the drineſſe of the tongue through extremitie of heate in feuers, it is the moſt ſoueraigne thing in the world. Hony boiled is ſingular for the inflammation of the lungs, and for the pleuriſie: alſo it cureth the wounds inflicted by the ſting or teeth of ſerpents; and helpeth thoſe who haue eaten veno-
E mous muſhroms. Being taken in dulcet or honied wine, it cureth thoſe that lie of a palſie; although indeed the ſaid honied wine alone hath many gifts and properties by it ſelfe. Hony together with oile of Roſes dropped into the ears, cureth their ſinging and pain. Good it is alſo for to kil lice and ſuch like vermin in the head, and to rid away nits: where note by the way, that if hony be diſpumed, that is to ſay, skummed and clarified, it is euermore the better for any vſe. Howbeit, the ſtomack it puffeth vp and maketh to ſwel with ventoſities: it ingendreth and encreaſeth cholerick humors, and taketh away appetite to meat: yea and ſome are of opinion, that being vſed ſimply alone, and not compounded with other things, it is hurtfull to the eies: and yet others giue counſel to touch and anoint the corners of the eies therewith, when they be exulcerat. Touching the materiall cauſe whereof honey is ingendred, the maner how, the diuers
F ſorts, the countries where it is made, the price alſo and value, with the ſundry proofs and tria's thereof, I haue written already once in my treatiſe of Bees; and a ſecond time in my diſcourſe of the nature of Floures: for ſo the order and courſe of this my Worke forced me to treat diſtinctly of thoſe matters; which, they that be deſirous to know exactly the nature of Simples, may put together and mingle again at their pleaſures. By the ſame reaſon alſo, ſince we are en-

20030 copy 1

tred into the vertues and operations of Hony, I muſt of neceſſitie handle and declare the qualitie of Hydromel or honied water, ſo neere a dependant thereto. G

Of which there be two kinds: the one is freſh and new made in haſt vpon occaſion, and preſently vſed: the other is kept and preſerued. As touching the former Hydromel, if it be made as it ſhould be of diſpumed and clarified hony, it is of ſingular vſe in that exquiſit & ſpary diet fit for ſick perſons, and namely in meats of light digeſtion, ſuch as is a thin gruell made of naked frumenty waſhed in many waters: alſo to be ioyned in reſtoratiues for to recouer the Patients ſtrength much enfeebled. Moreouer, good it is for the mouth and the ſtomacke, to mitigat the fretting humors ſetled and bedded therin, & to cool the extremity of heat: for I find in good authors, that to eaſe and mollifie the belly, it is better to be giuen cold than otherwiſe: alſo that it is a proper and conuenient drink for thoſe who chil and quake for cold: likewiſe for H
ſuch as be heartleſſe & haue ſmal or no courage at all, whom thoſe writers cal * Micropſychos.

* Some reade μικροσφύκτους out of *Dioſcor.* hauing a faint & weak pulſe.

Moreouer, there is a reaſon rendred full of infinite ſubtiltie, and the ſame fathered firſt vpon *Cato*, Why the ſame things feel not alwaies bitter or ſweet alike in euery mans taſt? for he ſaith that this diuerſitie proceedeth from thoſe little motes or * bodies that go to the making of all things: whiles ſome of them be ſmooth, others rough & rugged; ſome cornered, others round: in ſum, according as they be more or leſſe reſpectiue and agreeable to the nature of each man: this is the cauſe, that thoſe perſons who are ouer-wearied or exceeding thirſty, be more cholerick and prone to anger. Good reaſon therefore, that ſuch aſperity of the ſpirit, or rather indeed of the vital breath, ſhould be dulced and appeaſed by the vſe of ſome ſweet and pleaſant liquor which may lenifie the paſſage, and mollifie the conduits of the ſaid ſpirit, that they do not cut, I
race, and interrupt it going in & out in drawing or deliuering the wind. And in very truth, euerie man may find by experience in his own ſelf, how meat and drink doth moderat and appeaſe anger, ſorrow, heauineſſe; and any paſſion or perturbation of the mind whatſoeuer. And therefore thoſe things would be obſerued which make not onely to the nouriſhment and health of the body, but alſo ſerue for to rectifie and reform the maners and demeanor of the mind.

* Corpuſculis rerum.

Now to return again vnto our Hydromel or honied water; very good, by report, it is for the cough, and being taken warm it prouoketh to vomit: put oile thereto, and it is ſingular againſt the poiſon of Ceruſe or white lead. A countre-poiſon alſo it is and a preſeruatiue to ſuch as haue eaten Henbane and Dwale, eſpecially taken with aſſes milk, as I haue obſerued hertofore. Inſtilled into the eares, or poured into the fiſtulous ſores of the ſecret parts, it is thought to be K
excellent. Incorporat with the crums of ſoft bread, and reduced into the form of a peſſarie, and ſo put vp, it is ſingular for the infirmities of the natural parts of women; and being applied accordingly, it taketh down all ſudden ſwellings [occaſioned by windines;] cureth diſlocations, and in one word, mitigateth all pains. Thus much of Hydromel new made: for our moderne phyſitians haue vtterly condemned the vſe of that which is kept vntil it be ſtale. And this they generally hold, That it is not ſo harmleſſe as water, nor ſo ſolid and powerfull in operation as wine. Howbeit let it be long kept it turneth into the nature of wine, and (as all writers do accord) then is it moſt hurtfull to the ſtomack, and contrary to the ſinewes.

As for honied wine, the beſt and moſt wholſome is alwayes that which is made of the oldeſt wine, that is hard: and indeed with it you ſhall haue it to incorporat very eaſily; which it will L
neuer do with any that is new & ſweet: and being made of green, harſh, or auſtere wine, it doth not fill and charge the ſtomacke, no more it doth being made of boiled honey; and ingendreth leſſe ventoſities, which is an vſual thing with hony. This honey bringeth them to appetite of meat who haue loſt their ſtomack. Taken actually cold, in many it looſneth the belly; but being hot it ſtayeth and bindeth the ſame. The honied wine is very nutritiue and breedeth good fleſh. Many haue held out a long time freſh and luſty in their old age, with the nouriſhment of honied wine alone without any other food: whereof we haue one notable example of *Pollio Romilus*, who being aboue an hundred yeres old, bare his age paſſing well: whereat the Emperour *Auguſtus* of famous memorie maruelled much; and being vpon a time lodged as a gueſt in his houſe, he demanded of him, what means he vſed moſt ſo to maintaine that freſh vigour both of M
body and mind? to whom *Pollio* anſwered, By vſing honied wine within, and oile without. *Varro* ſaith, that the yellow jaundiſe was called a * Kings diſeaſe, or a ſickneſſe for a King, becauſe it was cured ordinarily with this honied wine, called Mulſe.

* Regius morbus.

As touching another kind of honied wine, named Melitites, how it is made of Muſt, or new

wine

A wine & hony together, I haue declared ſufficiently in my treatiſe of wines. But I ſuppoſe there hath bin none of this ſort confected theſe hundred yeares paſt and aboue, for that it was found to be a drink which bred ventoſities in the ſtomacke and other inward parts. Howbeit, the manner was in old time, to preſcribe it for to bee giuen in agues, to make the bodie ſoluble; prouided alwaies, that it had the due age: alſo to thoſe who lay of the gout: to ſuch likewiſe as had weake and feeble ſinews: and to women who abſtained altogether from meere wine.

Next after Honey, the treatiſe of Wax (which is correſpondent to the nature of honey) by good order followeth. Corcerning the originall working and framing thereof, the goodneſſe, the ſeueral kinds according to diuers countries, I haue written in conuenient place. This is generally obſerued, that al ſorts of wax be emollitiue, heating, and incarnatiue; but the newer and
B freſher they are, the better they are thought to be. Wax taken inwardly in a ſupping or broth, is ſingular for the bloudy flix and exulceration of the guts: ſo be the very honey-combes giuen in a gruell made of frumenty, firſt parched and dried at the fire. Contrarie it is to the nature of milk: for take ten grains of wax, made in ſmal pills of the bigneſſe of millet corns, in ſome conuenient lipuor, they will not ſuffer the milke to cruddle in the ſtomacke. If there be a riſing or ſwelling in the ſhare, the preſent remedie is to ſticke a plaſtre of white wax vpon the groine. Moreouer, to reckon vp and decipher the ſundry yſes that wax is put vnto in matters of Phyſicke, as it is mixed with other things, it is no more poſſible for a Phyſician, than to particula-
C rize of other ſimples and of their wholſom vertues, according as they enter iuto many compoſitions: which proceed all (as I haue ſaid) from the wit and artificiall inuention of man: for wee neuer find, that Cerots, Cataplaſms, Emollitiues, Plaſtres, Collyries or Eye-ſalues, Antidotes or Preſeruatiue confections, were euer of our great mother dame natures making: who indeed is the diuine worke miſtreſſe of all things; theſe are the deuiſes of Apothecaries, nay they are rather tricks proceeding from auarice and couetouſneſſe. As for Nature, ſhe hath made nothing vnperfect, her workes be abſolute all and accompliſhed in their eſſence: ordained hath ſhee no compounds, vnleſſe it be very few, wherein ſhe proceedeth vpon good cauſe and reaſon, and goeth not by blind aime and doubtfull conjectures: as namely, when according to her rule and order, ſhee doth incorporate ſome things of a drie conſtitution and ſubſtance, with a liquor, that they may pierce & enter better within the pores of the body, or els when ſhe giueth conſiſtence
D to liquid matters by ſome bodily ſubſtance, which may vnite and knit them together. To goe about for to compaſſe the vertues of euery ſimple ingredient in theſe compoſitions curiouſly by ſcruples and graines, ſauoureth of impudencie rather than a worke grounded vpon humane conjecture. For mine owne part, I haue nothing to doe with theſe drugs and far-fet wares that come from India and Arabia: I meddle not (I ſay) with theſe medicinable ſpices brought out (as it were) of another world. Theſe ſimples growing ſo far off in ſuch remote countries, pleaſe me not, neither do I thinke them meet for to cure our maladies: they were neuer brought forth by Nature for vs; no nor for them neither, where they grow: otherwiſe they were not ſuch fools (I trow) as to ſell and paſſe them away as they doe. Buy them, and ſpare not, for ſweet pomanders, perfumes, and delicat ointments: ye may buy them alſo (if you pleaſe) vpon a ſuperſtitious deuotion for the worſhip of gods; for that now we canot ſacrifice, pray, & ſerue God (forſooth)
E without Frankincenſe and Coſtus. And that our daintie ones and effeminat perſons ſhould be the more aſhamed of themſelues, I will the rather ſhew and proue, That we may both preſerue and recouer our health well enough without theſe exotical and forraine drugs: and that ech region is furniſhed ſufficiently with home-phyſicke of their owne. But now, ſince we haue taken ſo much paines as to collect the medicinable vertues of guirland-floures, of pot-hearbes alſo, harden woorts, and ſallad hearbes, How may I for very ſhame leaue out the properties of corne and grain ſeruing for Phyſick? and therefore in this place it ſhall be well done, to diſcourſe of them likewiſe.

Chap. XXV.

F ¶ *The medicinable vertues and properties of corne and graine.*

Firſt and formoſt this is holden for certain, that they be the moſt ingenious and wiſeſt creatures of all others, which liue of corn. The grains of the fine blanched wheat Siligo, being burnt, brought into pouder, and applied with Amminien wine in manner of a liniment, doe

reſtraine the flux of humors to the eies. Alſo the cornes of the ordinary wheat Triticum, being G
parched or roſted vpon a red hot yron, are a preſent remedie for thoſe who are ſcortched and
ſindged with nipping cold. The meale of the ſaid wheat ſodden in vinegre, and applied as a ca-
taplaſm, helpeth the contraction and ſhrinking vp of the ſinews: but wheat brans, with oile of
roſes, drie figges, and ſebeſten ſodden together, make a collution, the gargarizing wherewith, is
good for the inflammation of the Tonſills or Amygdales, and to cure all the accidents of the
throat. *Sextus Pompeius*, who in his daies was one of the principal peers of high Spain, & left a
ſonne behind him, who afterward was lord Pretour of Rome, ſitting on a time before his barne-
dores to ſee his corn winowed, was ſurpriſed ſodainly with a fit of the gout, and whether it were
by chance, or in a rage for the extremitie of paine, thruſt his legs aboue the knees into the heap
of wheat lying thereby: but finding his legs mightily dried hereby, and himſelfe wonderfully H
eaſed of his paine by that meanes, he neuer vſed any other remedie afterwards, but ſo ſoone as he
felt a fit of his gout comming, he plunged his feet and legs into a heap of wheat. Certes wheat
is ſuch a deſiccatiue, that it wil draw and drie vp the wine or any other liquor in a barrell which
Vide Galen, lib. 1. de Naturalibus facultatibus. is buried within it. Moreouer, the beſt experienced Chirurgians in the cure of ruptures, affirm,
That there is nothing better, than to lay the chaffe of wheat or barley hot to the grieued place;
and to foment the ſame with a decoction wherein it was ſodden.

As for the bearded wheat Far, there is a certaine worme breeding in it like to a moth or the
grub that eateth wood, which is ſingular good to make rotten teeth to fal out of the head; for if
the ſame be lapped within wax, and ſo put into the hole of the faultie tooth, it wil drop out: or
if the ſound teeth be but rubbed therewith, they will ſhed and fall forth of the head. I

Touching the graine Olyra, we haue ſaid already that it is called alſo Arinca. The Ægyptians
make thereof a certaine medicinable decoction or gruell, which they call Athara, paſſing
good for young babes; yea and it ſerueth to bath and annoint elder folke withall.

Barly meale either raw or boiled, doth diſcuſſe and reſolue, aſſuage & ripen, all impoſtumes
engendred either by way of gathering and collection of humours, or by ſome deflux and rheu-
matick deſcent. The ſame otherwhiles is ſodden in honyed water, or els with dried figs: but for
the paines of the liuer, it had need to be boiled with Oxycatre, *i.* water and vinegre together, or
els with wine. But when the caſe ſtandeth ſo, that the tumor muſt be partly diſſipated, & partly
brought to maturation, then it is better that it be incorporate in vinegre, or the lees of vinegre,
or at leaſt waies in ſodden peares or ſodden quinces. Being tempered and medled with hony, it K
is very good for the biting of the cheeſlips or many-feet worms, called Multipedes: but for the
ſting of ſerpents, it is better to mix it with vinegre; as alſo to keep ſores from feſtering and ran-
kling: but in caſe it be needful and requiſit to clenſe them from ſuppurat matter therein gathe-
red, then it would be applied with vinegre and water, with roſin alſo and gal-nuts added therto.
For inueterat and old vlcers, to bring them to maturation, it is laid too with roſin: for to ſoften
hard tumors, it is vſed either with pigeons dung, or with drie figs, or aſhes. Being applied with
Poppie or Melilot, it is ſingular for the inflammation of the nerues, of the guts & ſides: alſo for
the paines of mens priuie parts: or when the fleſh is departed from the bone. Incorporate with
pitch, and the vrine of a boy not yet vndergrowne nor fourteene yeares old, it is a proper medi-
cine for the ſwelling kernels named the Kings euill: with oile and Fenigreeke, it helpeth the tu- L
mors of the midriffe and precordiall parts: or in caſe the feuer be buſie with the Patient, then it
muſt bee vſed with honey or old greaſe. But if thoſe ſwellings tend to maturation, then wheat
meale is commonly more lenitiue, and aſſuageth pain better. The ſame being reduced into a li-
niment with the juice of Henbane, is good for the nerues; but with honey and vinegre, it taketh
away the red pimples and ſpots appearing in the skin, called Lentils.

Spelta. Touching * Zea, whereof is made the ordinary frumenty as I haue ſaid: the meale of it is
counted better in operation than the other of barley, but that of the three-moneth corn is more
moiſt and emollatiue. Tempered with red wine, and ſo applied warm, it is commended for the
pricke of Scorpions: alſo for them that reach and ſpit vp bloud: and all accidents happening to
the throat and windpipes: but with goats ſuet or butter, it is good for the cough. The floure M
or meale of Fenigreek, is the ſofteſt of al other: it healeth running vlcers, it skoureth dandruffe
or skales in any part of the body, it appeaſeth and aſſuageth the pains of the ſtomack, it cureth
the maladies incident to the feet and paps, if it be ſodden with ſal-nitre and wine, and ſo appli-
ed accordingly.

The

A The meale of Yurain or Darnell, doth clenſe old vlcers and gangrenes more than any other. Tempered with raddiſh, ſalt, and vineger, it cureth ring-worms, tettars, ſhingles, and ſuch like: with Sulphur-vif or quick brimſtone, it ſcoureth away the leproſie. Applied in a frontall to the forehead with Gooſe-greaſe, it helpeth the head-ache. Boiled in wine with Pigeons dung and Line-ſeed, it digeſteth and bringeth to maturation the ſwelling kernels named the Kings-euil, and other biles which be long ere they gather to an head and do ripen.

Of the ſundry ſorts of Barly groats or groſſe meale called Polenta, I haue ſaid enough in my Treatiſe of corn, which did require alſo the diſcourſe of ſuch things as be made of corn. It differeth from Barly meale, in that it is torrified or parched: in which regard it doth the ſtomack good. It bindeth and ſtaieth the flux of the belly: it repreſſeth alſo and ſmiteth back the fluB ſhing of humors, to the breeding of red and angry tumors. It ſerueth for a liniment tō the eies, and eaſeth head-ach, if it be applied with * Mints, or ſome other cooling herb. In like manner it cureth kibed heels, and the wounds occaſioned by ſerpents: alſo it healeth burnes and ſcalds if it be laid too with wine: and in that ſort it keepeth them from bliſtering. If meale be driuen through a ſercer or boulter, and ſo reduced to floure, and afterwards made with dough or paſte, it is a great drawer of noiſom humors to the outward parts: which is the cauſe that being applied to ſuch places which look dead & mortified, by reaſon of the bloud ſpread vnder the skin, it draweth out the ſame, ſo that the very linnen bands wherwith they be lapped & rolled, become bloudy again. But if wine cuit be ioined therewith, the operation is more effectuall. Moreouer, the ſaid floure is good to be laid vnto the calloſities and corns of the feet. For the fine floure of

C meale being ſodden with old oile and pitch, and applied ſo hot as the patient may abide it, doth wonderfully cure the ſwelling piles and all other griefs about the fundament. As touching the thick gruell or paps made with floure, it nouriſheth much, and cauſeth the body to feed wel: the paſt made of meale, wherewith they vſe to glew Papyr, is ordinarily giuen warm to good effect, for the reaching and ſpitting of bloud.

* *cum Menta*, rather *Melle*, i. honey. according to *Columella*: for Mints be hot.

As for the frumenty called Alica, it is a meere Roman inuention, and not long ago firſt deuiſed: for otherwiſe the Greeks if they had known of it, would neuer haue written as they did in the commendation of husked Barly named Ptiſana, rather than of it. And I thinke verily, that the vſe thereof was not taken vp in the daies of *Pompey* the great, and therefore the followers and diſciples of *Aſclepiades* haue left little or nothing therof in writing. That it is a ſoueraign and

D moſt wholſom thing, no man verily maketh doubt or queſtion; whether it be waſhed and ſo giuen in honied water, or whether it be ſodden and ſo vſed in a thin ſupping, or boiled higher to the conſiſtence of a thick gruel or pottage. The ſame for to ſtay the belly, and ſtop a lask, is torrified: and then afterwards ſodden with virgin-wax, as before I haue ſhewed. But a peculiar vertue it hath by it ſelfe to reſtore thoſe that are conſumed and fallen away through a long & languiſhing ſickneſſe: and then it muſt be ordered thus, Take three cyaths of the ſaid Frumentie, ſeeth it in a ſextar of faire water ouer a ſoft fire gently, vntill by little and little all the water be conſumed: now after this imbibition, when that the Frumenty hath thus drunk vp all the water, there muſt be added thereto a ſextar of Ewes milk or Goats milk, and in the end a little hony. This the patient is to take for certain daies together. And in truth, ſuch a broth or ſupping

E is this, as there is not in the world a more ſoueraigne reſtoratiue for all colliquations and conſumptions whatſoeuer, nor that will ſooner ſet vpon their feet again thoſe who be far gone and ſpent that way.

To come now to Millet, it is a grain, which being torrified aforehand for the purpoſe, ſtoppeth the lask, and diſpatcheth all collick pains and torments of the belly. Being fried and laied too hot in a bag, there is not a better thing for the griefe of the ſinews, or to alay any other pain: for, moſt ſoft it is, and lighteſt of all other, and nothing in the world retaineth heat ſo well. No maruell then if Millet be vſed ordinarily in thoſe caſes, where heat is to do good. To conclude, the meale or pouder thereof incorporat with tar, is a ſingular plaiſter to be laid vpon ſores, occaſioned by the ſting of Serpents or the prick of the vermine named Multipeda.

F As for the Panick, *Diocles* the Phyſitian called it Mel-frugum. The ſame operations and effects it hath that Millet. Being taken in wine, it is good for the dyſentery or bloudy flix: to ſuch tumors as need to euaporat and be reſolued, it is ſingular good for to be applied hot, by way of fomentation. Sodden in Goats milk, and giuen twice a day to drink, it bindeth the belly, & ſtaieth flux: and in that manner it aſſuageth the torments and wrings in the collicke.

Seſama

Seſama ſtamped or beaten into pouder,and ſo taken in wine,reſtraineth immoderat vomits. G
Reduced into a liniment,and ſo applied,it doth mitigat the inflammation of the ears,& cureth any burne or ſcalt place of the body. The ſame effects it hath when it is green & growethin the field. Ouer and beſides,a cataplaſme made thereof, being boiled in wine, is good for ſore eyes. To be eaten,it is no wholſome meat for the ſtomack: and more than that, it cauſeth a ſtinking breath. Howbeit,they hold it excellent to withſtand the venomous ſting of the Stellions, and the dangers that it may inferre: as alſo to heale the old cancerous and maligne vlcers, named Cacoethe,*i.* Morimals. There is an oile made thereof, which as I haue before ſhewed, is good for the eares.

Touching Seſamoeides,which taketh that name of the reſemblance that it hath to Seſama, but that the graine thereof is bitter,and the leafe leſſe,and it groweth in grauelly grounds: the H
ſame being taken to drink in water,purgeth chollerick humors. A liniment made of the ſeed, doth aſſuage the heat of S. *Anthonies* fire,and doth diſcuſſe and reſolue biles. And yet there is another Seſamoeides growing in Anticyra,which thereupon ſome do cal Anticyricon: otherwiſe much like it is to the herb Groundſwell, whereof I will ſpeake in place conuenient. The graine or ſeed of this Seſamoeides is giuen in ſweet wine,as a purgatiue of chollerick and flegmatick humors;to the quantity of as much as may be contained with three fingers:but to quicken the ſame,the Phyſitians vſe to put one Obole and an halfe of the white Ellebore-root or Neeſewort:which purgation they vſe in caſe of madneſſe,the melancholicke diſeaſe,the falling ſickneſſe,and the gout. By it ſelfe alone,the weight of one dram is a ſufficient laxatiue,& doth euacuat the belly.

The beſt Barley is that which is whiteſt. The iuice of Barley boiled in rain water,is made vp I
into certain troſches,which is ſingular good to be either conueied into the guts by way of clyſter,for the exulceration thereof;or els injected into the Matrice by the metrenchyte, for the vlcers therein. The aſhes of Barly burnt, are good in a liniment for Burnes,for places where the fleſh is gone from the bones,for wheales,and ſmall pocks,and for the biting of the Hardiſhrew mouſe. The ſame with a little ſprinckling of ſalt, and ſome honey amongſt, is counted a good dentifrice,to make the teeth look white,and the breath to ſmel ſweet. There is an opinion commonly receiued,That whoſoeuer vſe to eat Barly bread,ſhall not be troubled with the gout of the feet. And they ſay,that if a man take nine barly corns,& with euery one of them draw three imaginary circles about a felon with his left hand:and when he hath ſo done,throw them all into the fire;preſently it ſhall be cured. There is an herb which the Greeks cal Phœnicea,and our countrymen in Latine Hordeum * Murinum. This herb or weed being beaten to pouder,& taken in wine,is ſingular to bring down the courſe of womens fleurs. K

Hippocrates the famous Phyſitian,hath made one * intire book in the praiſe of Ptiſana,which is a groat made of Barly: but all the vertues and properties thereof are now attributed vnto our Frumenty Alica, and that goeth away with all the commendation. * And yet a man may ſee how much more harmleſſe it is than Alica. *Hippocrates* commended it only for a ſupping,as being ſlippery & eaſie to be taken,good to put away thirſt,not ſwelling in the belly,paſſing quickly and eaſily through the body,and ſuch a kinde of meat as might alone of all others be giuen twice a day in a feuer to thoſe who were vſed to it: ſo farre was hee in opinion from them who L
would famiſh all diſeaſes,& cure them by *faſting & vtter hunger. Howbeit,he forbad to giue it whole in ſubſtance to be ſupped off, & allowed nothing but the very ſimple juice and broth of Ptiſane or husked Barly: neither allowed he it in the beginning of an ague fit, ſo long as the feet continued cold,for during that time he would not admit ſo much as a thin potion therof. Now beſides the Alica or frumenty made of Zea,there is another which commeth of the common wheat,more glutinous and better indeed for the exulceration of the wind pipes.

As touching Amylum or ſtarch pouder,it dimmeth the eyeſight,& is hurtful to the throat, and is nothing good to be eaten,contrary to the common receiued opinion. It ſtaieth the inordinat flux of the belly,repreſſeth the rheum into the eies, it healeth vlcers, and cureth puſhes, wheals,and blains,and reſtraineth fluxes of bloud. It mollifieth the hardneſſe growing in the M
eye-lids. To ſuch as caſt vp bloud,it is vſually giuen in an egge. In pain of the bladder, halfe an ounce of Amylum made hot ouer the fire vntill it ſiuer,with one egge and as much cuit as will go into three eg-ſhels,taken immediatly after the bath or hot houſe,is a ſingular remedy:moreouer,oatmeale ſodden in vineger,taketh away moles and freckles of the skin.

The

*It groweth indeed commonly vpon new wals,although the name ſeemeth to come from *Mures*, *i.* Mice and Rats: rather than *Muri*, *i.* Wals.

* This booke goeth now vnder this title, *De ratione victus in morbis acutis.*

* *Contra, quanto innocentior eſt alica.*

* He glanceth at *Diatritos*, *i.* faſting three daies together

A The very ordinary bread, which is our daily food, hath an infinit number of medicinable faculties. Bread crums being applied with water and common oile, or els with oile of Roſes, doth mollifie impoſtumes: & with honied water aſſuageth any hardnes, wonderfully. Giuen in wine, it is good to diſcuſſe and reſolue. It is of force alſo to bind and knit where need is, and ſo much the rather, if it be giuen with vineger. Alſo it is ſingular againſt the ſharp & eager flux of fleam, which the Greeks cal Rheumes: likewiſe for bruiſed places vpon ſtripes or blows; yea, and for diſlocations. And in very deed, for all theſe purpoſes, leauened bread, called of the Greeks Autopyros, *i.* downright made, is better than any other. Moreouer, a liniment thereof applied with vineger, is good for whitflaws and the calloſities of the feet. Moreouer, ſtale bread and bisket, ſuch as ſea-faring men do eat, being ſtamped & ſod again, is good to bind the belly: for ſinging
B men and choriſters who are deſirous to haue a cleare voice, for ſuch alſo as be ſubject to rheums falling from the head, it is the wholſomeſt thing in the world, to eat dry bread in the beginning of meals. The Sitanian bread, *i.* that which is made of three months corn, being incorporat with hony, is a faire medicine to cure either the black prints remaining after ſtrokes, or the ſcailing and pilling of the face. White bread crums ſoked either in hot or cold water, yeeld vnto ſicke men a meat of light digeſtion. The ſame being applied with wine, cureth ſwelled eies. And ſo it healeth the breaking out in the head, eſpecially if dry Myrtles be put thereto. It is an ordinary thing to preſcribe vnto them that are giuen to ſhaking, for to eat faſting bread ſoked in wa-
C ter, preſently after they come forth of the bath. The perfume of bread burnt, taketh away all other euill ſmels that may be in a bed chamber: & being put into thoſe Hippocras bags through which wines be ſtrained, it altereth the naughty taſt which they haue.

Furthermore, euen Beanes haue their properties which ſerue in Phyſicke: for being fried all whole as they be, and ſo caſt piping hot into ſharp vineger, they help the collicke and pangs of the belly. Bruiſed and ſo eaten, or ſodden with Garlick, they be excellent good againſt coughes that were thought paſt cure and remedileſſe; yea, and impoſthumes in the breſt grown to ſuppuration; but the patient ought to feed thereof continually euery day. Alſo if one chew them faſting, and ſo apply them to a fellon, they are thought paſſing good either to ripen or to diſcuſſe the ſame. Boiled in wine, and ſo laid too, they aſſuage the ſwellings of the cods and priuy parts ſeruing to generation Bean floure ſodden in vineger, doth ripen and breake all tumors: in like manner it diſſolueth black bruiſed bloud lying vnder the skin, and healeth burns. *M. Varro* is of
D opinion, that it is good for the voice. Bean ſtalks and bean cods burnt to aſhes, and ſo incorporat with old Swines ſeam, is good for the Sciatica and all inueterat pains of the ſinews. The very husks of beans alone ſodden to the thirds, do ſtop the lask and running out of the belly.

The beſt Lentils be they that are moſt tender, and ask leaſt ſeething: alſo ſuch as drink much water. Lentils verily do dim the eie-ſight, and breed ventoſities in the ſtomacke: but taken in meat they ſtay the flux of the guts, and the rather if they be throughly ſodden in rain water: but in caſe they be not fully boiled, they do open the belly and make the body laxatiue: the eſcares or roofs remaining vpon cauterized or bliſtered ſores, they break and make to fall off: & thoſe vlcers which are within the mouth, they mundifie and clenſe. Applied outwardly, they appeaſe the pains of all impoſthumes, eſpecially if they be exulcerat and ful of chaps: and reduced into
E a cataplaſm with melilote or a quince, they are ſingular for to repreſſe the flux of humors to the eyes: but for to keep impoſtumes and tumors from ſuppuration, they are laied too with Barley groats, or the groſſe meale thereof torrified. The juice of Lentils after they be ſodden, is good for the exulcerations of the mouth, and the genitors: likewiſe with an addition of oile Roſat or Quince, for the inflammation of the ſeat or fundament. But if the parts affected and exulcerat do require ſtronger and ſharper remedies, the ſame would be applied with the rind of a pomgranat, and a little hony put thereto. And to the end that the ſaid cataplaſme ſhal not dry quickly, they vſe to put thereto Beet leaues. Lentils ſodden throughly in vineger, ſerue for a cataplaſm to be laid vpon the ſwelling kernels called the Kings euill, and other fell biles, whether they be ripe or in the way only of maturation. Applied with honied water, they be very good for any
F clifts and chaps: but with the pill or rinde of a pomgranat, for Gangrenes. In like manner, with barly groats they be appropriat for the gout, the kidnies, the naturall parts of women, for kibes, and ſuch vlcers as be hardly brought to cicatrice. Thirty grains of Lentils ſwallowed down by way of Bole, are ſingular for the feebleneſſe and diſſolution of the ſtomacke. In dyſenteries or bloudy flixes, in the violent rage of cholerick humors which cauſe euacuations both vpward & downe-

20030 copy 1

downward, Lentils do effectuat their operation much more, if they be ſodden in three waters. G
For which purpoſe alſo better it is to torrifie them firſt, and then to pound or beat them ſmall,
that they may be giuen to the patient as fine as may be, either by themſelues alone, or els with
a Quince, with Pears, Myrtle berries, wild Cichory, black Beets or Plantain. Howbeit, note thus
much, That Lentils are nought for the Lungs, for head-ache, for all neruous parts, and the gall;
and this ill property they haue beſides, to keep the patient from ſleep. Being ſodden in ſea-wa-
ter, they are good for puſhes and angry wheales, for S. *Anthonies* fire, and the accidents that be-
fall womens breaſts: but if they be boiled in vineger, they diſcuſſe all hard tumors, & the kings
euil. They that haue but weak and bad ſtomacks, vſe verily to put Lentils to thicken their pot-
tage and gruels, inſtead of Barly groats, and find thereby much eaſe. If they be halfe ſodden in H
water, afterwards braied or ſtamped, & then let paſſe through a tamiſe, that the brans might be
ſeparat from the reſt, they are thought very good for burns: but then, within a while as the cure
goeth forward, they muſt be applied with honey alſo put thereto. Finally, if they be ſodden in
Oxycrat or water and vineger together, they help the ſwelling bunch of the throat called Bron-
chocele.

There is a kind of mariſh or moory Lentils [called Ducks meat] growing of it ſelfe in ſtan-
ding waters. This herb is by nature refrigeratiue: in which regard, it ſerueth to make a liniment
vſed for inflammations and hot impoſthumes: but principally for all manner of gouts, either
alone or mingled with Barly groats. The ſame hath vertue to knit & conſolidat ruptures, when
the bowels are fallen downe.

Moreouer, there be wild Lentils, called by the Greeks Elelisphacos, by others, Phacos. Theſe I
be lighter than the tame Lentils which are ſowed, bearing a ſmaller leafe, drier alſo, & more o-
doriferous than the other. Of which wild Lentils, there is a ſecond ſort, carying a ſtrong ſmel: in
ſomuch as the former kind is counted the milder. Theſe Lentils haue leaues formed to the fa-
ſhion of quince leaues, but that they be leſſe and white, and commonly they are ſodden branch
and all together. Their medicinable vertues be, to bring down the monthly ſickneſſe of women,
to prouoke vrines, and to heale the wounds occaſioned by the venomous prick of the ſea puffin
or fork-fiſh. Now the nature of this fiſh is to benum and mortifie the place which is ſtrucken.
Of theſe Lentils and Wormwood, there is a drink made, good for the dyſentery, or bloudy-flix.
The ſame taken with wine, draweth down womens fleurs that ſtay vpon them: but if their bare
decoction be drunk, it wil ſtay them when they flow immoderatly. The herb alone applied out- K
wardly, repreſſeth the ouermuch bleeding of freſh wounds: it cureth the ſores occaſioned by
the ſtinging of ſerpents. The decoction thereof in wine, doth mitigate the itching of the cods,
if they be bathed and fomented therewith.

Our moderne Herbariſts in theſe daies, doe call that in Latine Saluia, (*i.*) Sange, which the
Greeks name Elelisphacos. An herb it is much reſembling Mints, of a gray and hoary colour,
and withall odoriferous. Beeing applied to the naturall parts of women, it fetcheth away the
dead infant within the womb: it riddeth the ears alſo and feſtered vlcers of thoſe wormes and
vermin which breed therein.

Moreouer, there is a kind of wild Cich-peaſe bearing leaues like to the other of the garden,
and which be ſowed, ſaue that their ſmell is ſtrong & vnpleaſant. If a man feed largely of them, L
they ſtir the belly and moue to the ſiege, they breed ventoſities, cauſe the collick and wringing
of the guts. Howbeit, if they be parched or torrified they are reputed the wholſomer.

The Cichling or pety Cich-peaſe, is thought to be better and more wholſome to the belly
than the other: but the meale as wel of the one as the other, doth heale the running ſores & ſcales
of the head: howbeit, the wild better than the reſt. Moreouer, theſe ciches are taken to be good
for the falling ſickneſſe, the ſwellings of the liuer, and the ſting of Serpents. They procure wo-
mens termes, and prouoke vrine, and eſpecially the grain it ſelfe rather than the leafe. The ſame
are ſingular for tettars and ring-worms, for inflammations of the cods, for the jaundiſe & drop-
ſie. But all the ſort of them be hurtfull to the bladder and kidnies, eſpecially if they be exulce-
rat. For gangrenes and thoſe morimall vlcers called Cacoethe, they be better, in caſe they bee M
tempered with honey. Some there be, who for to be ridde of all kinde of Warts, take as many
Cich-peaſe as there be warts, and with euery one of them touch a wart, and that, vpon the firſt
day after the change of the Moon: which done, they tie the foreſaid Peaſe or Ciches in a little
linnen bag, and fling them away backward behind them: and they are perſuaded that the warts

will

A will be gone by this means. But our Latine Phyſitians are of opinion, That the blacke ciches which be called Ram-ciches, ſhould be well and throughly ſodden in water and ſalt: of which decoction they preſcribe vnto the patient for to drinke two cyaths, in difficulty of making water, for to expell the ſtone, and rid away the jaundiſe. Their leaues and ſtalks of ſtraw being ſodden in water ouer a good fire, yeeld a decoction, which beeing vſed as hot as may be ſuffered, doth mollifie the calloſities & hardneſſe growing about the feet: ſo doth a liniment alſo made of the very ſubſtance it ſelfe, ſtamped and applied hot.

The Columbine ciches ſodden in water, are thought to leſſen and ſhorten the ſhaking fits in tertian and quartan agues. The black cich-peaſe being beaten to pouder with halfe the quantity of gall-nuts, and incorporat with ſweet wine cuit, called Paſſum, and ſo applied, cureth the
B vlcers of the eyes.

As touching Eruile, ſomewhat I haue ſaid already touching the properties thereof, when I made mention of it among other kinds of pulſe. And indeed the old writers haue attributed as great power & vertue vnto it as to the Colewort. Being laid to with vineger, it cureth the hurts that come by the ſting of ſerpents, or the teeth of man & crocodile. There be writers of approued authority, who affirm for certain, That if a man doe eat Eruile faſting euery day, it will diminiſh and waſt the ſwelling of the ſpleen. The meale of Eruile (as *Varro* reporteth) taketh away the ſpots and moles of any part of the body. And in truth, this pulſe is ſingular to repreſſe corroſiue and eating vlcers: but aboue all, it is moſt effectuall in the ſores of womens breſts: applied with wine, it breaketh carbuncles. Being torrified and incorporat with hony, and reduced
C into an electuarie or bole, and ſo taken as much as an hazell nut, it amendeth the ſuppreſſion or difficulty of voiding vrine, diſſolueth ventoſities, openeth obſtructions, and helpeth other accidents of the liuer, the prouocations and proffers to the ſtoole without doing any thing: reuiueth thoſe parts that miſlike and feele no benefit or nutriment of meat, which they cal in Greek Atropha. In like manner it cureth ſhingles, ring-worms, and tettars, if it be firſt ſodden in vineger ſo applied, and not remoued vntil the fourth day. If it be laid too with hony, it keepeth biles from ſuppuration. A fomentation made with the decoction thereof in water, helps kibed heels, & the itch. And it is generally thought, That if a man drink it euery day next his heart vpon an empty ſtomack, it will make the whole body looke with a better and more liuely colour. Contrariwiſe, the common opinion is, That it is not good to be eaten ordinarily as meat; for it mo-
D ueth to vomit, troubleth the belly, lieth heauy vpon the ſtomack, and fumeth vp into the head: it breedeth ache and heauineſſe in the knees. But if it haue lien many daies in ſteepe, after that imbibition of water, it becommeth more mild, and is a moſt wholſom prouender for horſe and oxen. The green cods of Eruile before they waxe hard, if they be ſtamped with their ſtalkes and leaues together, do colour and die the haires of the head *blacke.

As touching wild Lupines, they be inferior to thoſe which come of ſeed, in all reſpects, but only in biterneſſe. And verily there is not a thing more commendable, wholſome, and light of digeſtion than white Lupines, if they be eaten dry. They are brought to be ſweet and pleaſant by hot aſhes or ſcalding water. Beeing eaten at meales vſually, they make a freſh colour and chearfull countenance. Bitter Lupines are very good againſt the ſting of the Aſpides. Dry Lu-
E pins husked & clenſed from their skins & applied to black & mortified vlcers, ful of dead fleſh, with a linnen cloth between, reduce them to a liuely colour, and to quick fleſh again. The ſame ſodden in vineger, diſcuſſe the kings euill, and the ſwelling kernels & impoſtumations behind the ears. The broth or collature of them being ſodden with Rue and Pepper, may be giuen ſafely, although it were in an ague, to thoſe that bee vnder thirty yeares of age, for to expell the wormes in the belly. As for young children who haue the wormes, it is good to lay Lupines to their bellie whiles they be faſting. All others are to take them torrified, either by way of drink in a kind of wine cuit, or els in electuary after the maner of a lohoch. The ſame do giue an edge to the ſtomacke, and quicken the appetite to meat. The meale or pouder of Lupines wrought with vineger into a dough or paſte, and ſo reduced into a liniment, and vſed in a bain or ſtouve,
F repreſſeth and keepeth down all wheales and itching pimples which are ready to breake forth: and of it ſelfe is ſufficient to drie vp vlcers. It bringeth to the natiue and liuely colour al places blacke and blew with ſtripes. Medled with Barly groats, it aſſuageth all inflammations. For the weakneſſe of the huckle bone, the haunch, and loins, the wilde Lupines are counted more effectual than the other. A fomentation with the decoction of theſe wild Lupins, maketh the skin more

* For that color in old time was beſt eſteemed, and thereby chaſte Matrons were knowne from wanton harlots, who affected yellow haire. *Alex. ab Alex.* 6.18.l.5.

20030 copy 1

more ſmooth and beautifull, taking away all ſpots and freckles. But if the ſame or garden Lupines be boiled to the height and conſiſtence of hony, they do clenſe the skin from black morphew and the leproſie. Theſe alſo if they be applied as a cataplaſme, do break carbuncles, bring down, or els ripen the ſwelling kernels named the kings euil, and other biles and botches, which of their nature be long ere they gather to head. Boiled in vineger, they reduce places cicatrized, to their naturall colour, and make them look faire & white again. But if they be throughly ſodden in rain water, of the collature that paſſeth from them, there is made an abſterſiue and ſcouring lie in manner of ſope, moſt excellent for to foment, gangrenes, ſmall pocks, & running vlcers. A drink made thereof, is ſingular for the ſpleene: and if hony be put thereto, it prouokes womens fleurs, which make no haſt downward. Take raw Lupines, ſtamp them with drie figges and vineger into a cataplaſme, and apply them to the ſpleen, it is an excellent remedy. The root alſo ſodden in water, prouoketh vrine forcibly. Lupines boiled in water with the herb Chamæleon, do cure the diſeaſes incident to ſheep and other ſuch ſmal cattell, if they do but thinke of this decoction. Let them be ſodden in the mother or lees of wine, or mingle both their decoctions therewith: they do heale the farſins, ſcab, and mange of all other foure-footed beaſts what ſoeuer. The fume of them as they burne, killeth gnats. G H

Concerning Irio, I ſaid before in the treatiſe of corne and pulſe, that it was like Seſama, and named by the Greeks Eryſimon, whereas the Gaules do call it Velarum. This plant brancheth very much, and beareth leaues like to Rocquet, but that they be ſomewhat narrower, and brings forth ſeed reſembling that of Creſſes. This Irio taken with hony in form of a lohoch, is excellent good for the cough, and thoſe who reach out filthy matter from their cheſt. Giuen it is for the jaundiſe, the diſeaſes of the loins, for the pleuriſie, the torments and wrings of the collicke, and the fluxes occaſioned by the debility and weakneſſe of the ſtomacke. Applied in form of a liniment, it is ſingular good for the inflammations behind the ears, for the cancerous vlcers alſo, and the ſymptoms thereto belonging. Laid to the cods with water, and otherwhiles with hony, it altereth their diſtemperature of heat, and the inflammations whereto they are ſubject. And ſoueraigne it is for infants. Likewiſe a cataplaſme made of it, with figs and hony, is ſingular for the accidents and griefes of the fundament, as alſo for the gout and pains of the joints. Taken in drink, it is an effectuall counterpoiſon. It cureth thoſe who are ſhort winded. Applied outwardly with old hogs-greaſe, it helpeth fiſtulous ſores, ſo there be care had that none of it go into the vlcers. I K

As for the graine Horminum, it hath a ſeed reſembling Cumin, as I haue ſaid before: otherwiſe it is like to * Porret: and groweth to the height of a ſpan or nine inches. Two kindes there be of it: whereof the one hath a blacker ſeed than the other, and ſomewhat long. * This hath power to prouoke luſt, and is much vſed for the pin and web, for the perle alſo in the eye: the other hath a whiter ſeed and rounder. Both the one and the other if they be ſtamped, draw forth pricks and thornes out of the body, if a liniment be made of them alone, and applied with water. But a cataplaſme of the leaues with vineger, or alone by themſelues, or elſe with honey, diſcuſſe and reſolue biles without ſuppuration. In like manner they diſpatch fellons, if they be taken before they grow to any head, and generally all tumors proceeding from ſharp and hot humors. And thus much of grain. L

* μέγιον for μάραβον, i. Horehound.

* He confoundeth (as it ſhould ſeeme) the vertues of Horminum, i. Clarie the hearbe, with the graine called alſo Horminum.

A ſtrange thing that Nature hath ſo ordained, That the very peſtilent weeds which plague corne, ſhould haue their vſe in Phyſicke. For firſt and formoſt there is Darnel, which albeit *Virgill* termeth Infœlix, *i.* vnhappy, yet if it be ground and ſodden in vineger, and ſo applied, it cureth tettars and dry ſcabs joined with a great itch: and the ſooner doth it the deed, the oftner it is remoued and changed. Darnell floure laid too, with Oxymell, cureth the gout & other pains. And to ſay a truth, the manner of this cure differeth from the reſt. For the preparing of which medicine, the ſaid floure muſt be ordered in this manner, & after this proportion: for euery ſextar of vineger, it ſufficeth to diſſolue therein two ounces of hony; take then three ſextars of this mixtion, and put thereto two ſextars of Darnell meale, ſodden to a thicke conſiſtence: which done, temper all together, and apply this cataplaſme to the grieued and pained members. The ſame meale draweth forth ſpils of broken and ſhiuered bones. M

A weed there is, called Miliaria, for that it killeth the grain Millet. Beat this to pouder, and mingle it with wine, then poure this drench with an horne downe the throat of laboring jades: they ſay it will cure their gouts.

As
